BIFACE ATTRIBUTES KEY

PORTION

1-Complete, 2-Proximal, 3-Distal, 4-Medial, 5-Lateral,

ARTIFACT TYPE

1-Projectile Point, 2-Hafted Scraper, 3-Hafted Drill

BLADE SHAPE

1-Straight, 2-Parallel, 3-Excurvate, 4-Recurvate, 5-Incurvate, 6-Broken

DISTAL END SHAPE

1-Acute, 2-Reworked, 3-Rounded, 4-Broken

STEM SHAPE

1-Straight, 2-Rounded, 3-Expanded, 4-Pointed, 5-Contracted, 6-Broken

BLADE CROSS-SECTION SHAPE

1-Biconvex, 2-Plano-convex, 3-Flattened

BLADE EDGE FEATURES

1-Serrated, 2-Crushed, 3-Beveled, 4-Ground, 5-No Special Features

HAFTING ELEMENT FEATURES

1-Thinned, 2-Beveled, 3-Ground, 4-Fluted, 5-Broken, 6-Unfinished, 7-Snapped

BREAKAGE TYPE

1-Impact, 2-Transverse, 3-Thermal, 4-Other

PREHISTORIC CERAMICS ATTRIBUTES KEY

RIM FORM

1-Rounded; 2-Flattened; 3-Diagonal; 4-Square; 5-Flattened on Interior

LIP DECORATION TYPE

1-Hollow; 2-Dowel; 3-Simple Stamped; 4-Dowel Punctations

DESIGN ELEMENT

1-Plain; 2-Burnished/Smooth; 3-Dowel; 4-Hollow Dowel; 5-Gastropod Shell Punctate
6-Fine Incised; 7-Bold Incised>2mm; 8-Simple Stamped; 9-Check Stamped
10-Fabric Impressed; 11-Lunate/Fingernail Punctate; 12-Finger Pinched
13-Drag Jab; 14-Punctate over Incised; 15-Other Punctate; 16-Zoned Design
17-Weathered Indeterminate

COLOR

1-Black; 2-Brown; 3-Buff; 4-Gray

TEMPER

1-Fiber; 2-Sand; 3-Fiber&Sand; 4- No Temper; 5-Other

(Key at End of Table)

PREHISTORIC CERAMICS ATTRIBUTES KEY

RIM FORM

1-Rounded; 2-Flattened; 3-Diagonal; 4-Square; 5-Flattened on Interior

LIP DECORATION TYPE

1-Hollow; 2-Dowel; 3-Simple Stamped; 4-Dowel Punctations

DESIGN ELEMENT

1-Plain; 2-Burnished/Smooth; 3-Dowel; 4-Hollow Dowel; 5-Gastropod Shell Punctate
6-Fine Incised; 7-Bold Incised>2mm; 8-Simple Stamped; 9-Check Stamped
10-Fabric Impressed; 11-Lunate/Fingernail Punctate; 12-Finger Pinched
13-Drag Jab; 14-Punctate over Incised; 15-Other Punctate; 16-Zoned Design
17-Weathered Indeterminate

COLOR

1-Black; 2-Brown; 3-Buff; 4-Gray

TEMPER

1-Fiber; 2-Sand; 3-Fiber&Sand; 4- No Temper; 5-Other

Appendix D. Zooarcheological Analysis of 9RI86, Lisa D. O'Steen

Zooarcheological Analysis of 9RI86

Introduction

A total of 317 vertebrate and 34 invertebrate (snails) faunal remains was recovered from two block excavation units, 10 prehistoric features, and seven historic features at 9RI86 (Tables 1, 2, and 3). Ten percent (N=35) of the remains are identifiable to family, genus, or species. A minimum of one opossum, one cow, one cotton rat, one catfish and one mourning dove (1.4 percent of total remains) were identified from the collections analyzed. No mollusca or amphibian remains were identified. Most of the unidentified large mammal fragments may represent deer, but, because of their fragmentary condition, could not be definitely identified to the species level. Differential preservation probably resulted in a lower rate of recovery for very small bones, especially fish. The terrestrial snails in Feature 395 are considered to be commensal species that were attracted to the decaying organic remains in the pit. However, it is also possible that snails were occasionally consumed by site residents.

Methods

The faunal collections submitted for zooarcheological analysis was recovered from excavation units and features at 9RI86 that represent both prehistoric and historic cultural deposits. Faunal remains were collected from both fine screened soil samples and 0.25 in screen. Following analysis, faunal remains were sorted into three groups by provenience and cultural affiliation, i.e., Late Archaic, Mississippian, and mixed prehistoric and historic.

Vertebrate faunal remains were identified using standard zooarcheological analysis techniques, and a comparative skeletal collection. The minimum number of individuals (MNI) is calculated for each species, genus, and family, (where appropriate) from the sample proveniences. MNI is calculated using paired left and right elements (White 1953), and where possible, comparative age, sex, and size of animals. The MNI for species in this sample is probably lower than it should be because the carcasses and bones were cut, chopped, or broken into numerous portions prior to, or after, preparation and disposal. MNI is calculated separately for the Late Archaic features, the Mississippian feature, and the mixed prehistoric and historic material. Problems related to MNI calculation have ben discussed by Grayson (1973), and include a small sample size, the method by which analytical units are determined, and the fact that MNI emphasizes the number of small species over large one.

Biomass is calculated using a program developed by Irvy Quitmyer and Stephen Hale of the Florida State Museum in Gainesville (Hale, et al. 1985). Although there are acknowledged problems with this formula (Grayson 1981; Miller 1984), it is the most time efficient method available for calculating relative quantities of meat provided by particular animals, and is used only as an indicator of the relative importance of different species in the represented diet. A small sample size and a formula that emphasizes the representation of large species over small ones are biases that must be considered.

Modifications of bone such as burning, bone pathologies, rodent and carnivore gnawing, and cut marks were recorded. No cut marks or bone pathologies were identified in this assemblage. Much of the bone (especially from the prehistoric features) was burned, and some evidence of rodent scavenging was detected. The results of these analyses are detailed below.

Results

Fish. Two fragments of a burned catfish spine (Ariidae) and ten fragments f unidentified fish bone (3.4 percent of total remains) were found in Feature 395, a Mississippian pit (Table 2). Fish elements included scales, vertebrae, spine and rib fragments. Fish contributed approximately two percent of the estimated biomass in Feature 395. Burning was noted on the catfish spine and four other fish bone fragments (50.0 percent of fish bone).

Reptiles. Part of the carapace and plastron of a small box turtle (*Terrapene carolina*) was identified in Feature 395 (Table 2). Although these remains represent one individual, they provided approximately 10 percent of the estimated biomass in the feature.

Birds. A total of 36 fragments (10.3 percent of total remains) of bird bone in identified from the samples at 9RI86. Of these, only one (the distal ulna of a mourning dove [*Zenaidura macroura*]) is identifiable of the species level (Table 2). Birds provided approximately seven percent of the biomass in Feature 395. Unidentified medium-large bird remains were found in Feature 395 and the mixed historic and prehistoric deposits (Tables 2 and 3). Birds provided between 1.7 and 7.3 percent of estimated biomass in the Mississippian and historic proveniences (Tables 2 and 3). Burning was noted on 34 bird elements in the sample (94.4 percent of bird bone).

Mammals. A total of 208 mammal remains (59.3 percent of total remains) was recovered from the sample proveniences (Tables 1, 2 and 3). One cow (*Bos taurus*) mandible fragment was identified from historic Feature 17. An opossum (*Didelphis marsupialis*) and a probable cotton rat (*Sigmodon hispidus*) (Feature 395) are the only identifiable mammal species among the prehistoric features. Mammals provided the largest amount of estimated biomass n Feature 395 (81.4 percent) and the mixed context proveniences (98.3 percent; Tables 2 and 3).

Modifications noted on mammal bone consisted of burning and rodent gnaw marks. Ninety four (45.2 percent of mammal bone) unidentified medium-large mammal bones were burned. Two medium-large mammal shaft fragments were rodent gnawed.

Bone Modifications. Thirty eight percent (N=133) of bone in the 9RI86 collection is burned. Eleven fragments (35.5 percent) of bone from the Late Archaic features, 107 fragments (37.9 percent) of bone from Feature 395, and 15 fragments (39.5 percent) of bone from mixed prehistoric and historic contexts are burned. One mammal shaft fragment from Late Archaic Feature 413 was rodent gnawed (3.2 percent), as was a bone awl from Feature 395 (0.4 percent). No evidence of bone pathology was found, and no cut marks were identified.

Discussion

The 9RI86 sample is extremely small and therefore difficult to compare with analyses of contemporary sites in the region. While the remains in Mississippian Feature 395 appear to be the best preserved in the sample (including fish scales), there is evidence of differential preservation on the site. Large pieces of burned bone have apparently survived better than smaller fragments of unburned bone.

The information provided by bone remains from 9RI86 suggests that medium to large mammals provided a significant portion of the Late Archaic diet (and that large mammal bone fragments have survived better). The Mississippian diet represented in Feature 395 shows the greatest diversity of exploited species, and includes fish and turtles, species that are most active in warm weather. The box turtle and fish provided approximately 11 percent of the estimated biomass in the feature. However, mammals do dominate the feature in terms of biomass, followed by box turtle, birds and fish.

The mixed prehistoric and historic faunal remains reflect the same pattern of represented classes of animals and preservation as the prehistoric remains (with the exceptions of fish and reptile remains in Feature 395 and the cow mandible in Feature 17).

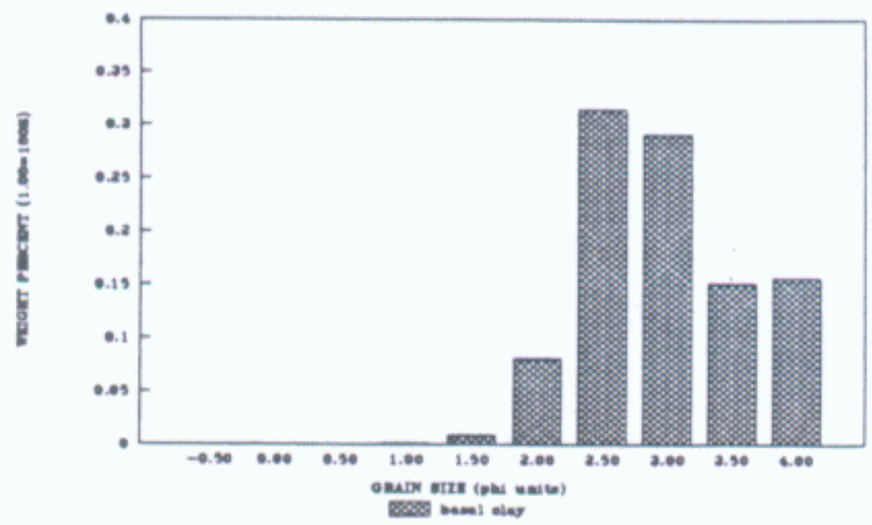
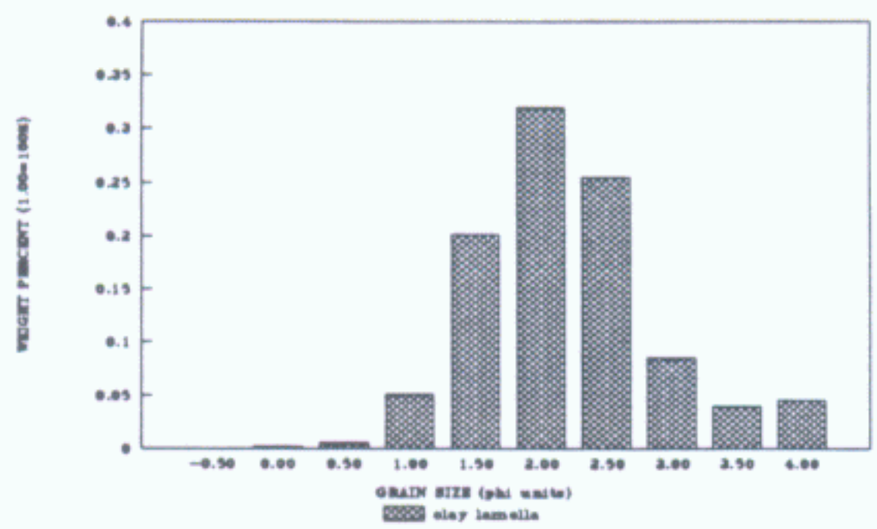
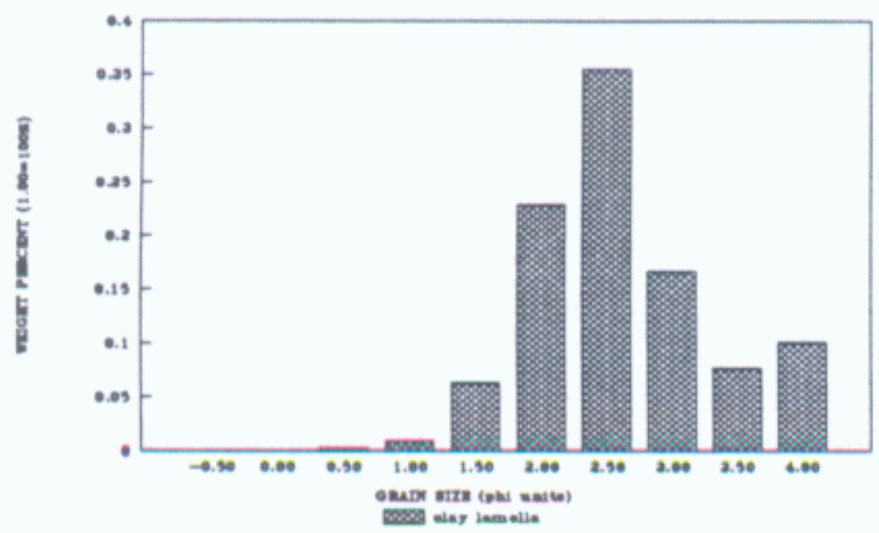
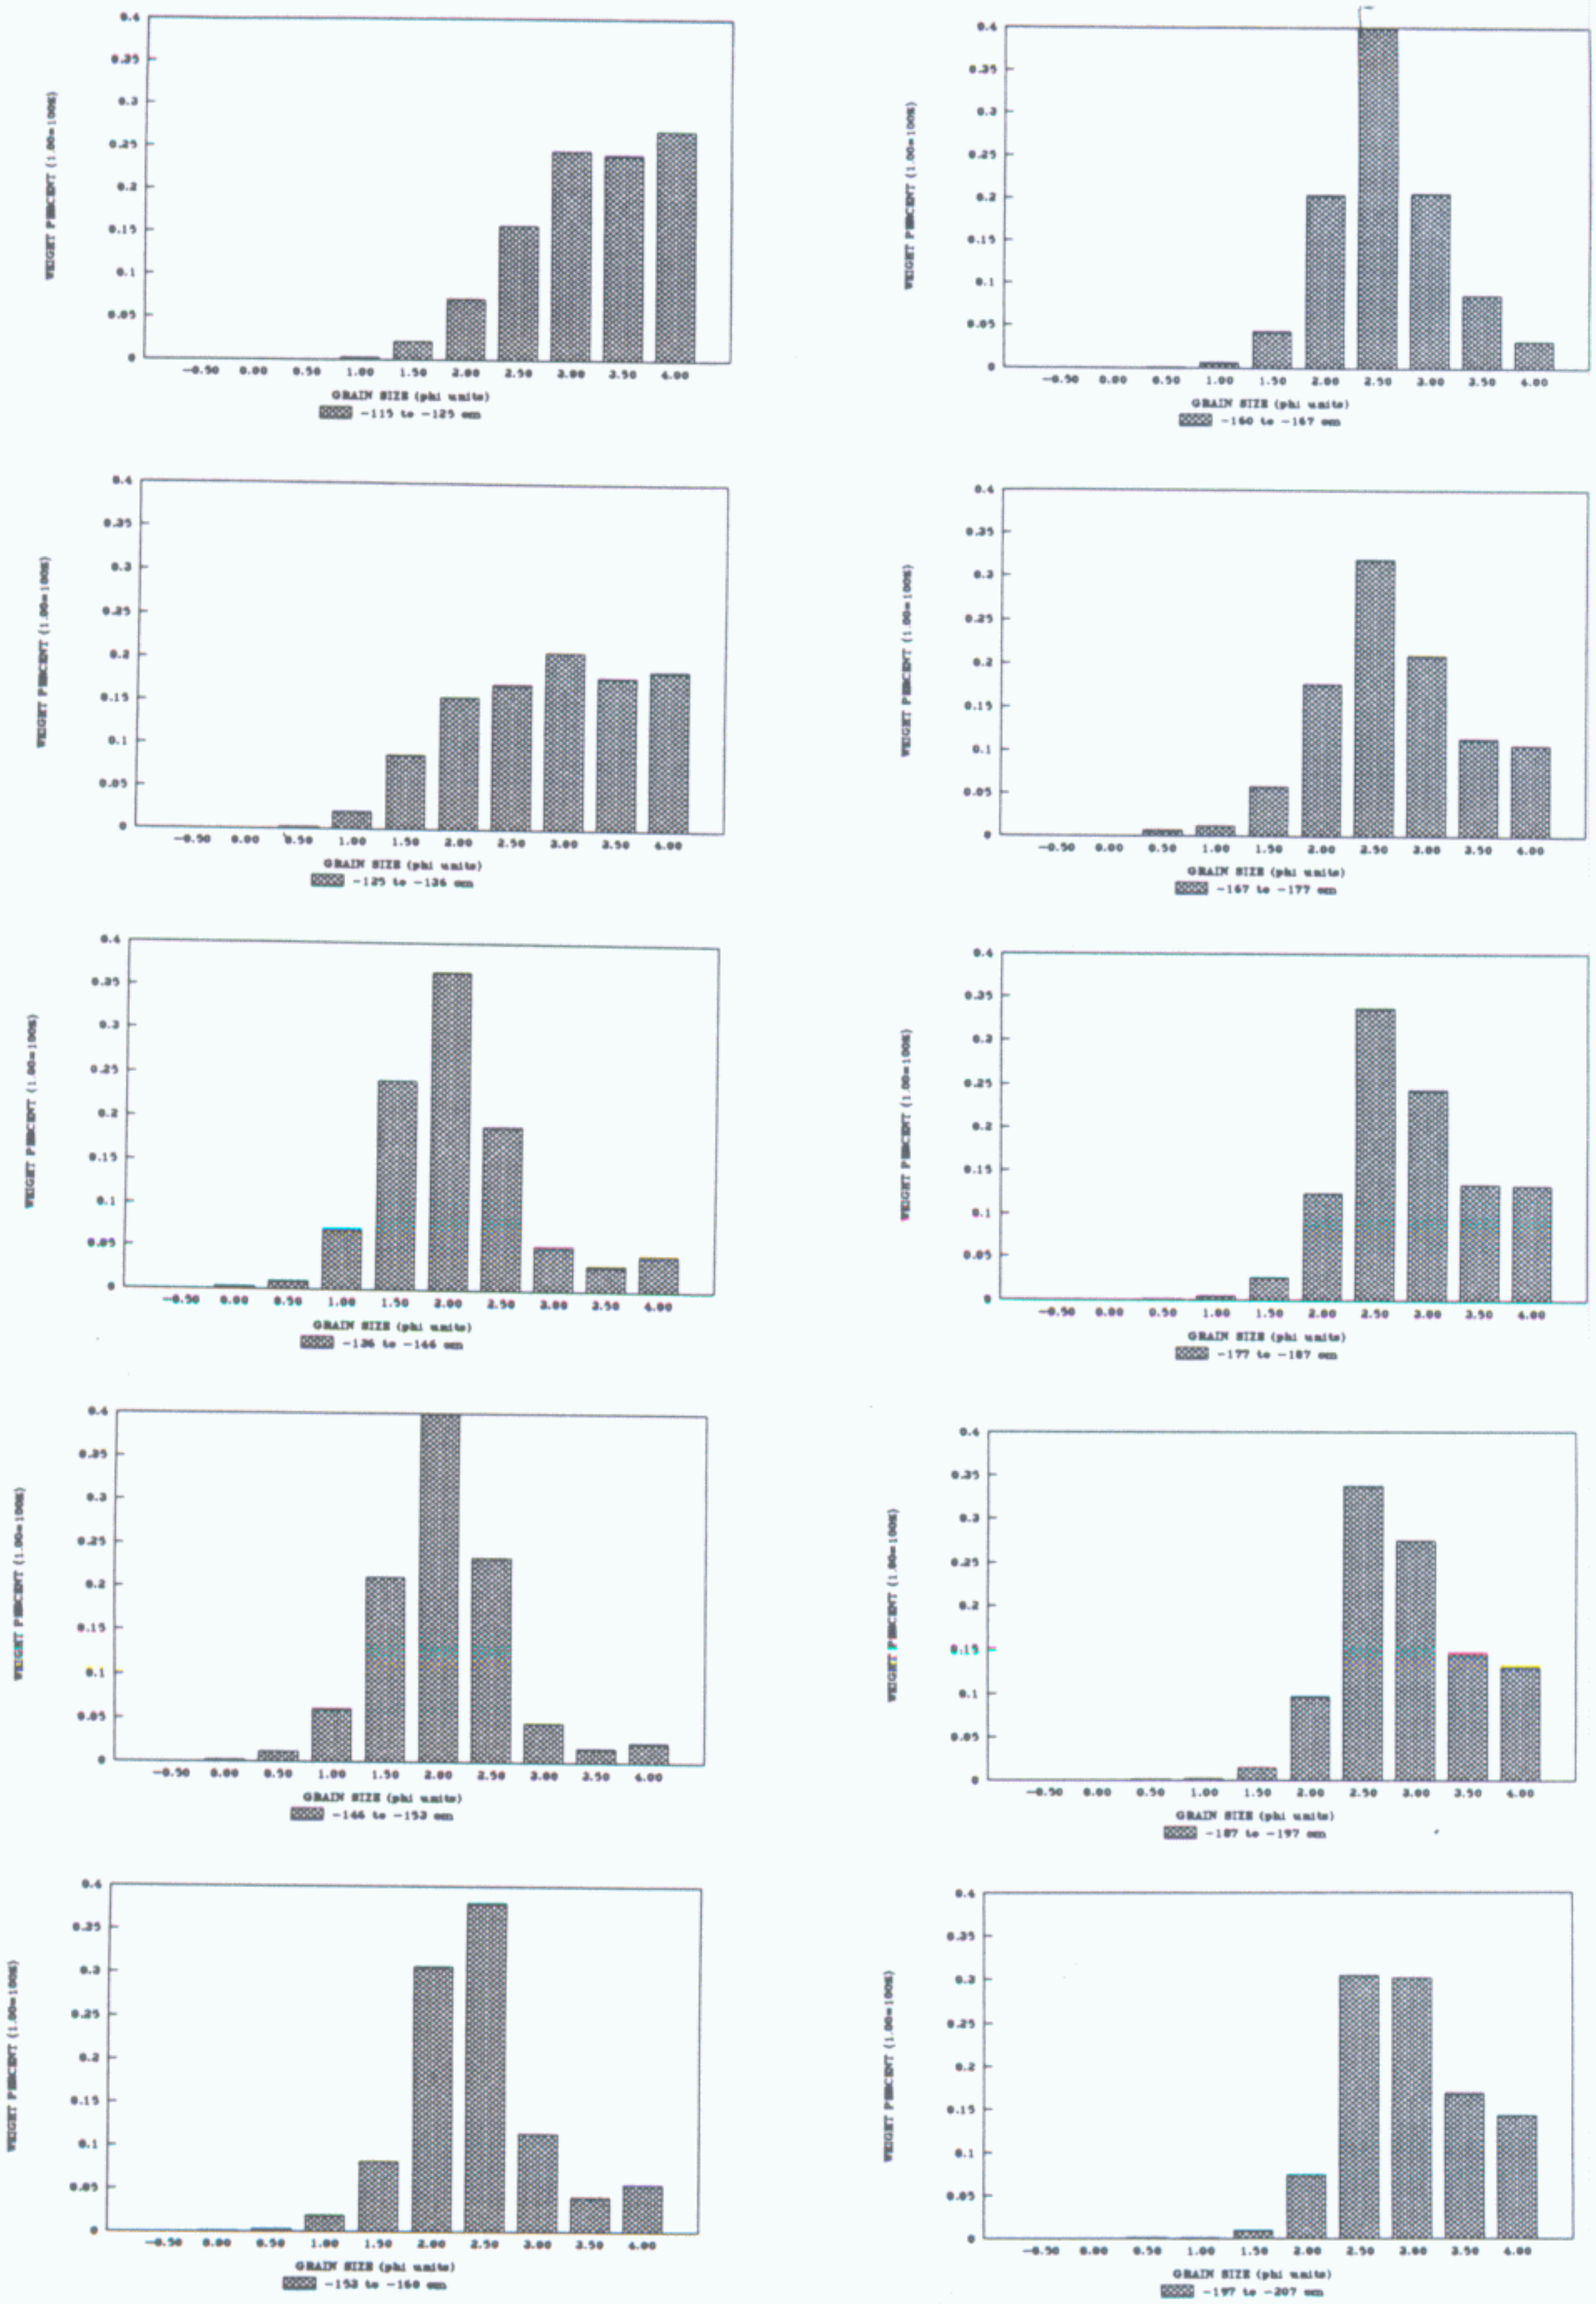
Data measured in grams of nearest 1/2 phi intervals. Calculations are in weight percent of 1/2 phi intervals and phi intervals (wentworth sizes).



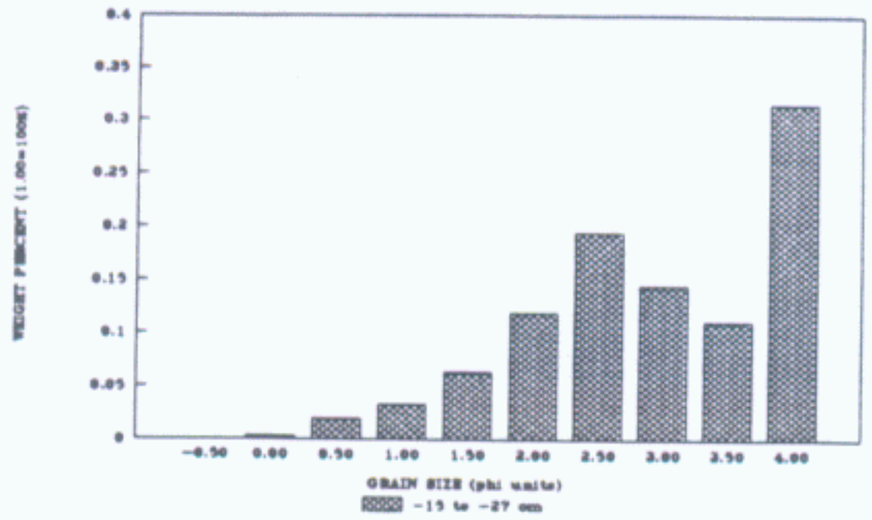


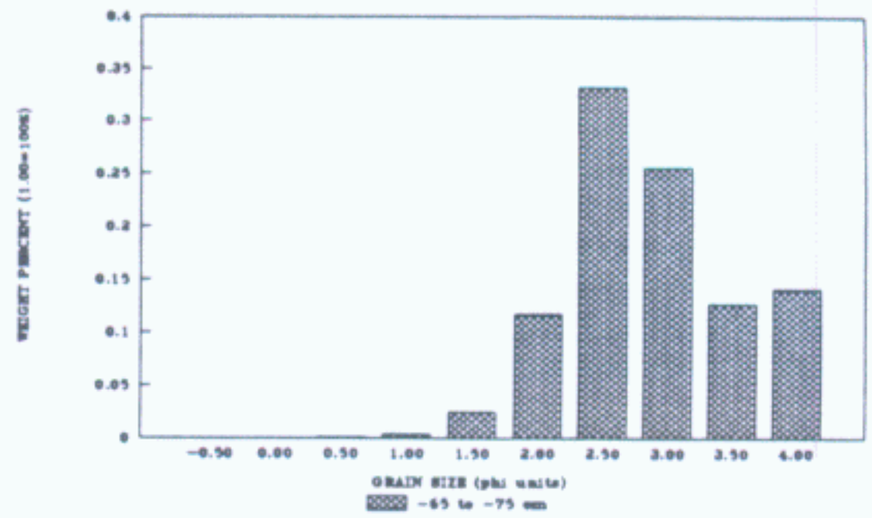


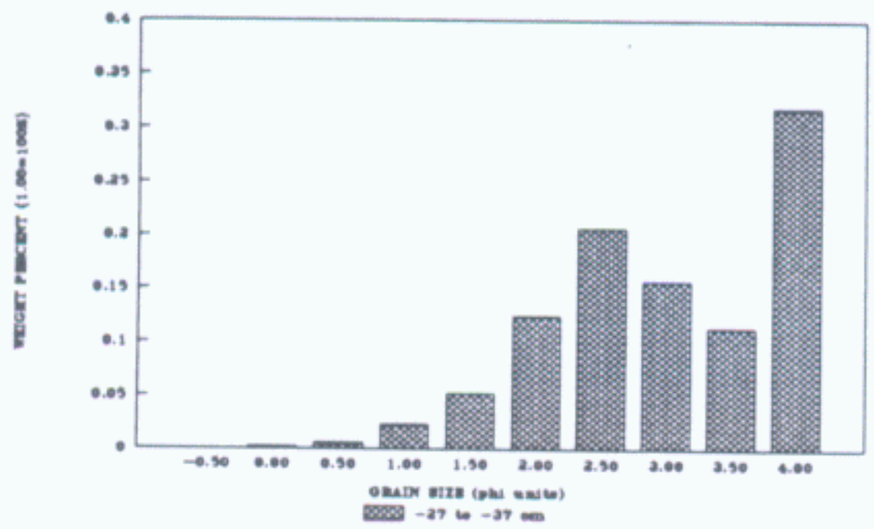
Histograms of grain size distributions for clay samples from near base of 9RI86, Trench 3. Letters correspond with sample letters on Figure .

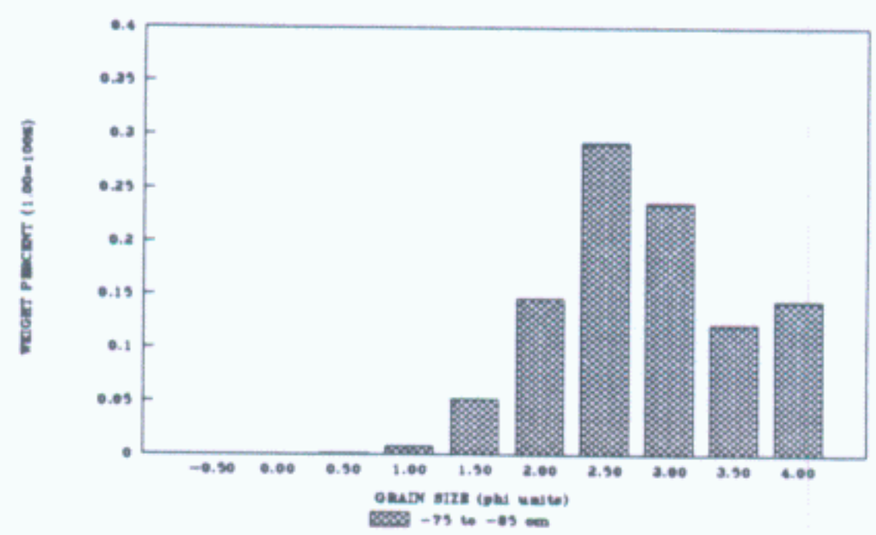


Histograms of grain size distributions for samples from 9RI86, Trench 3. Subsurface depths indicate sampling intervals.

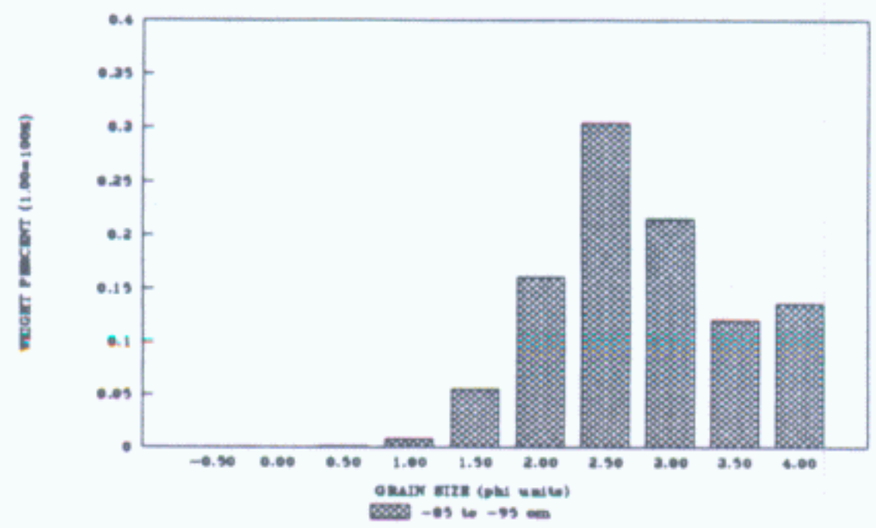


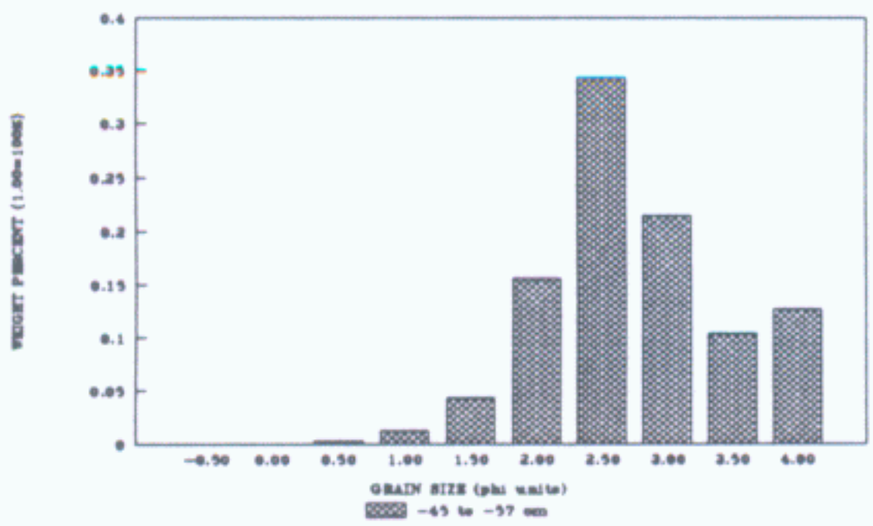


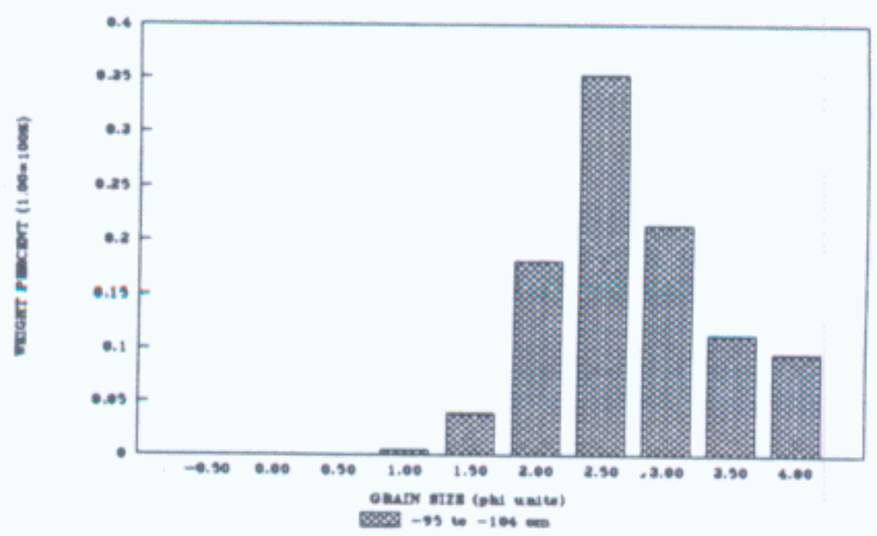


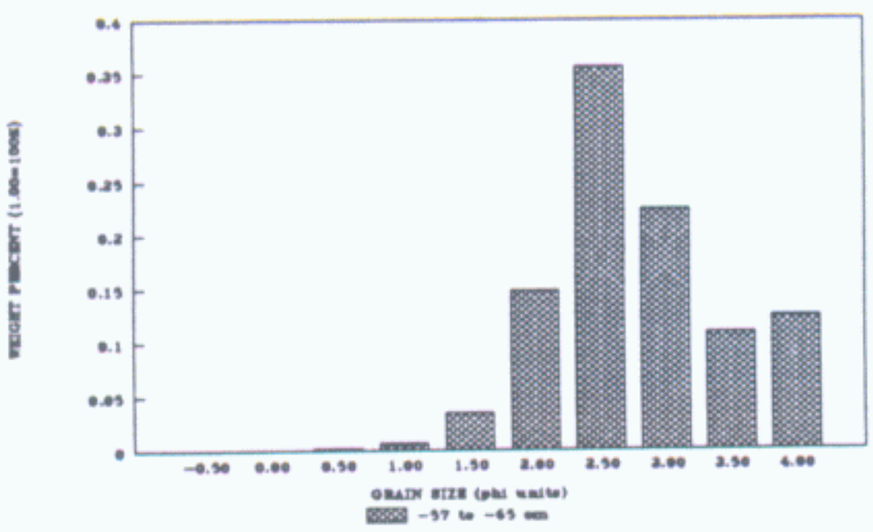


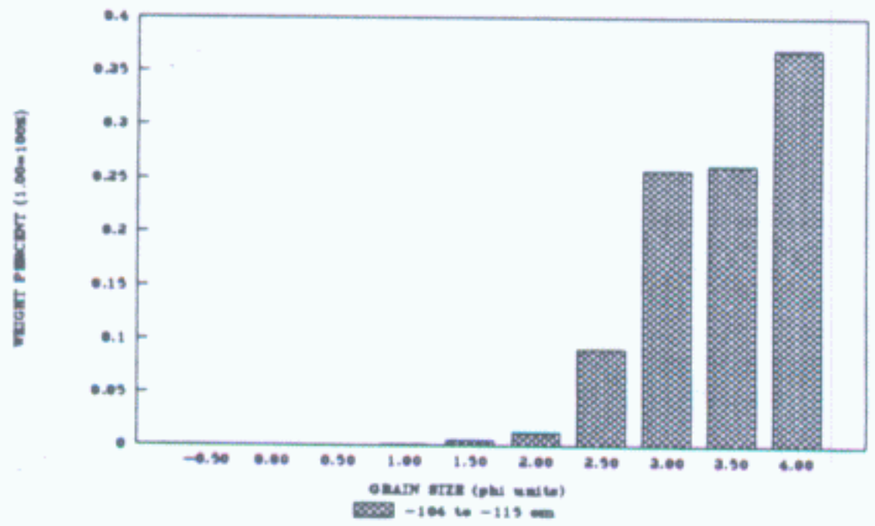
Sample from -37 to -45 cm destroyed.



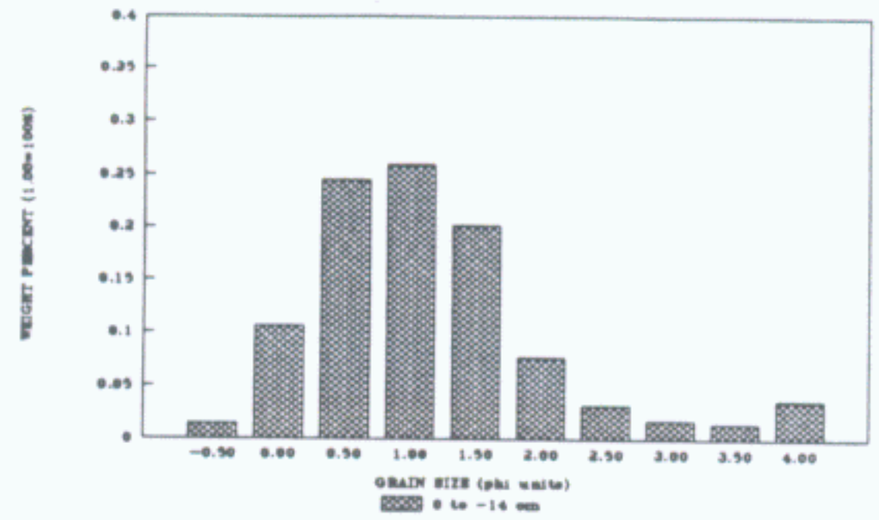


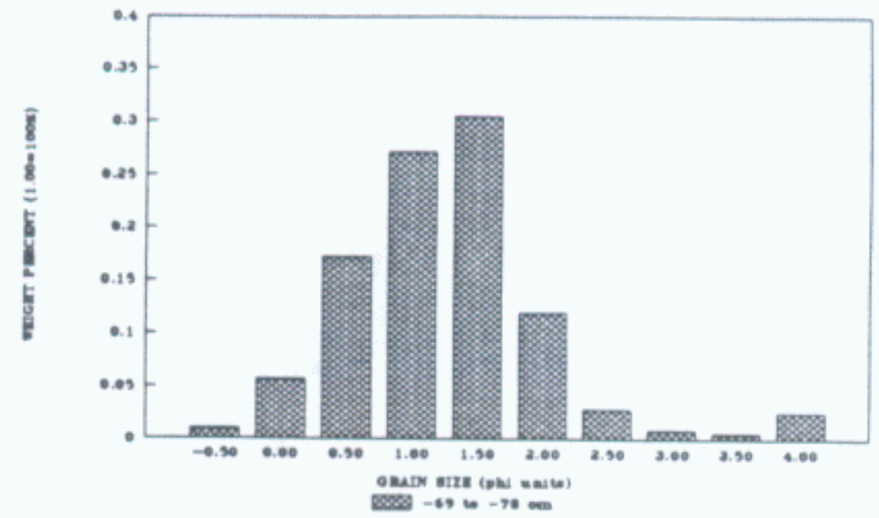


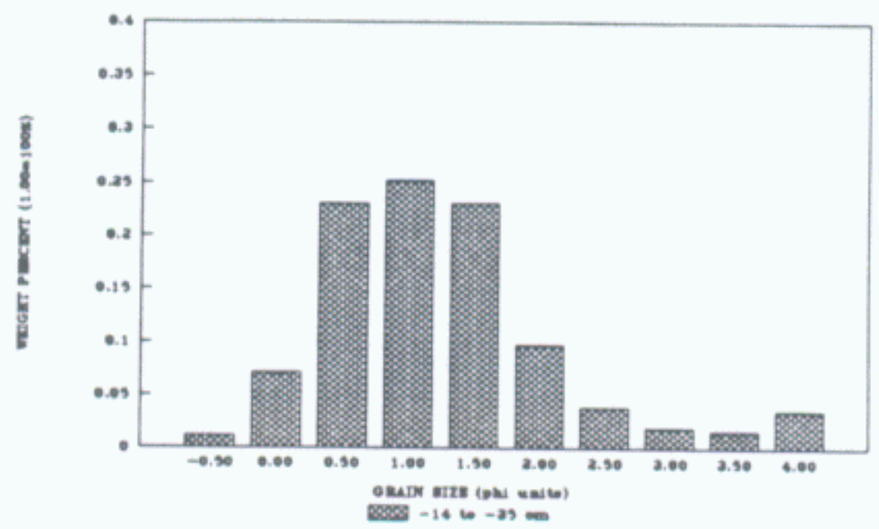


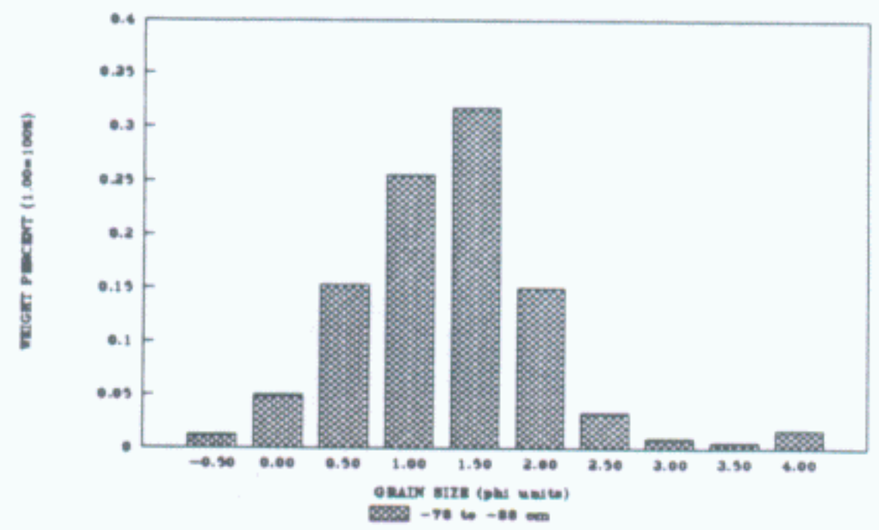


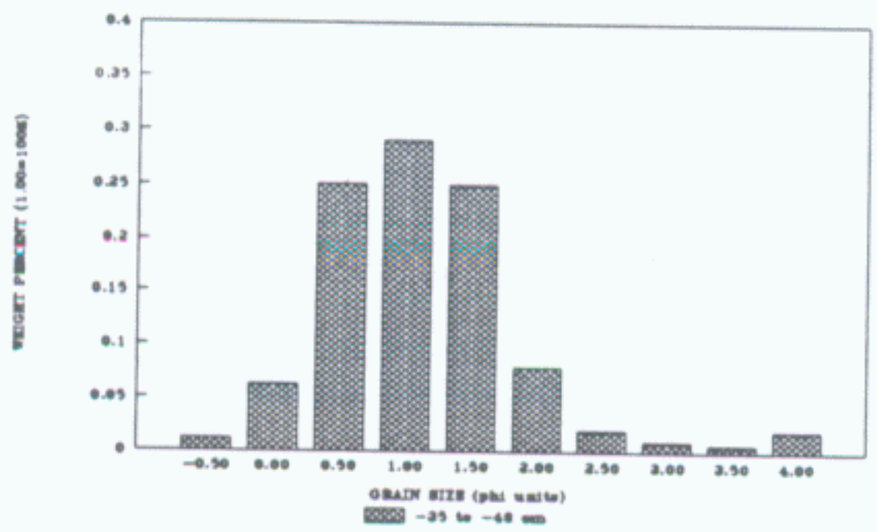
Histograms of grain size distributions
for samples from 9R186, Trench 3.
Subsurface depths indicate sampling intervals.

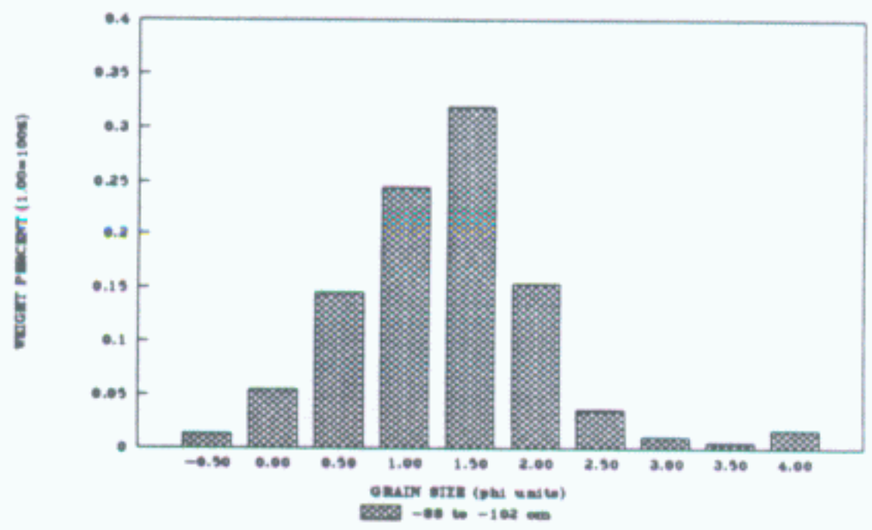


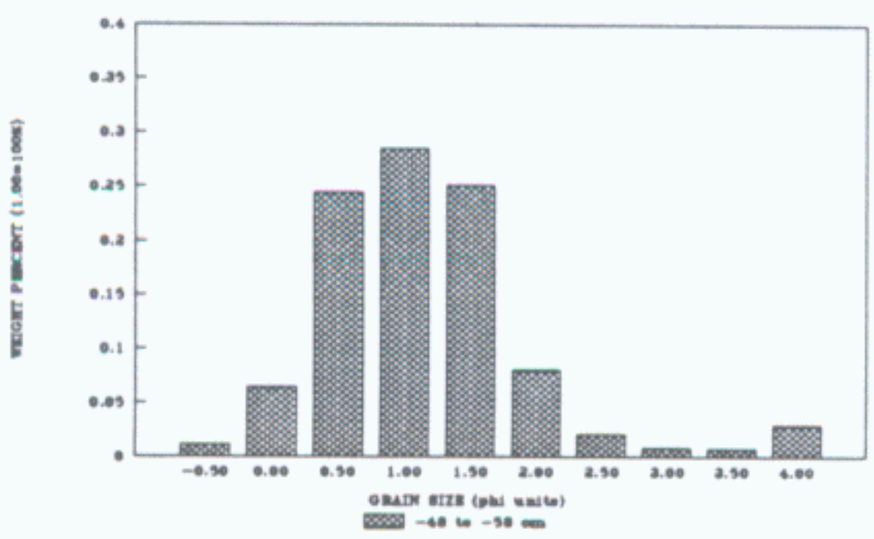


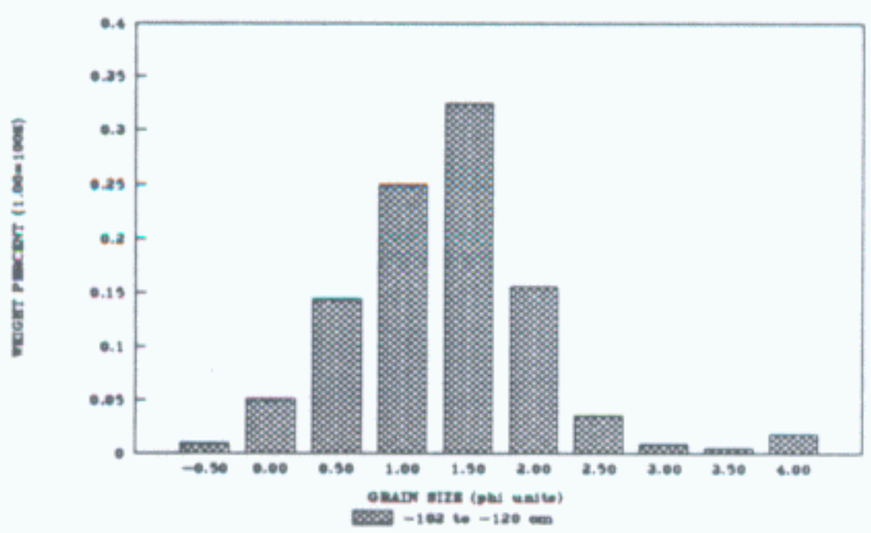


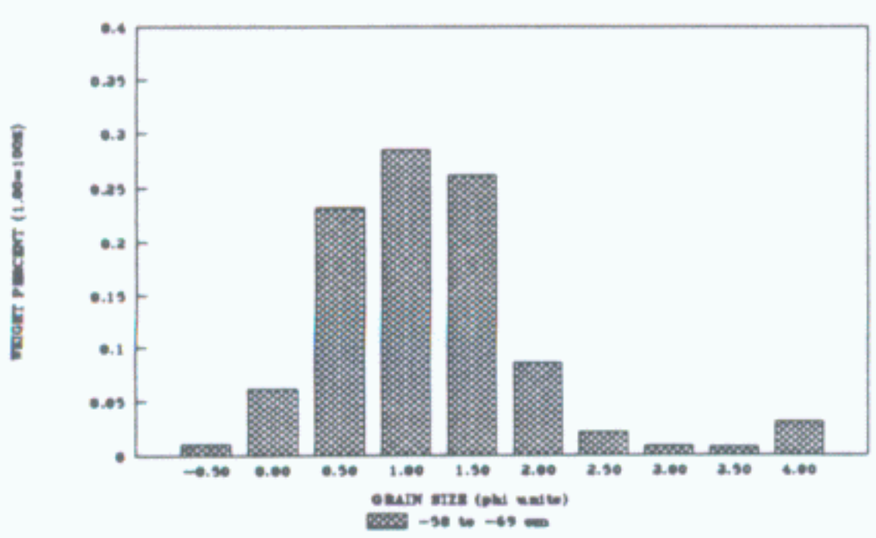




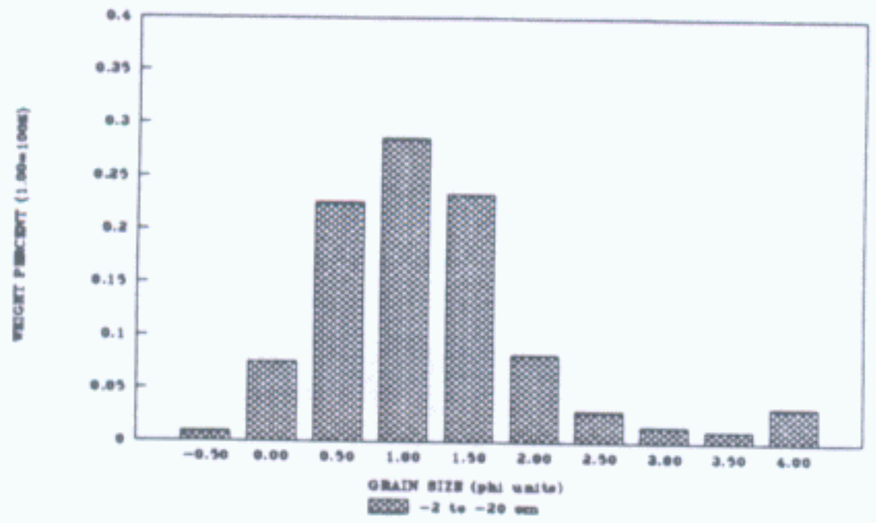


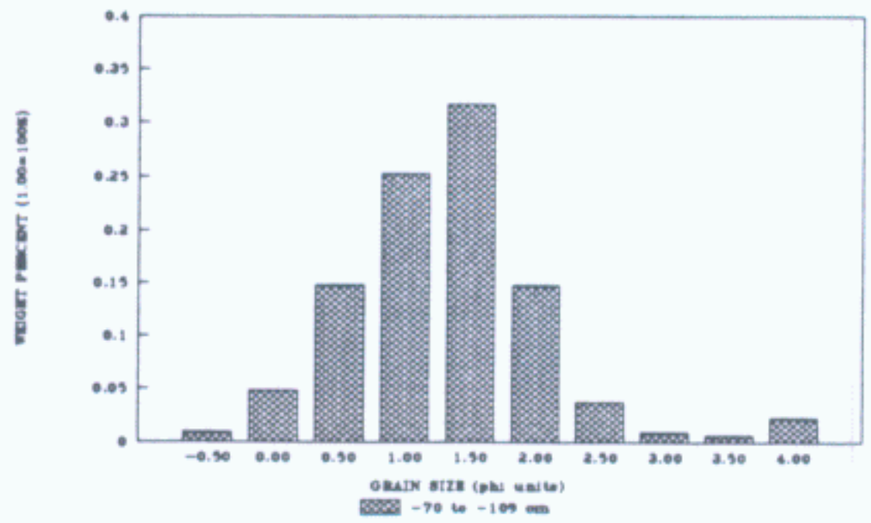


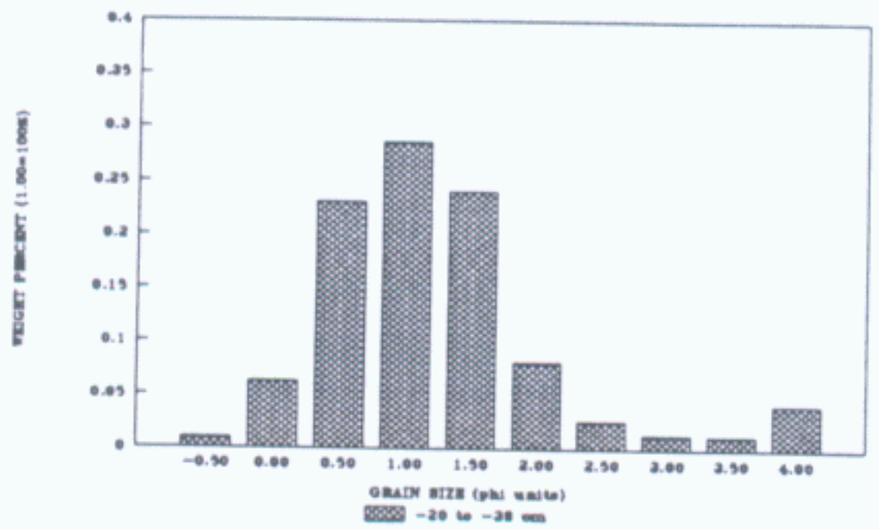


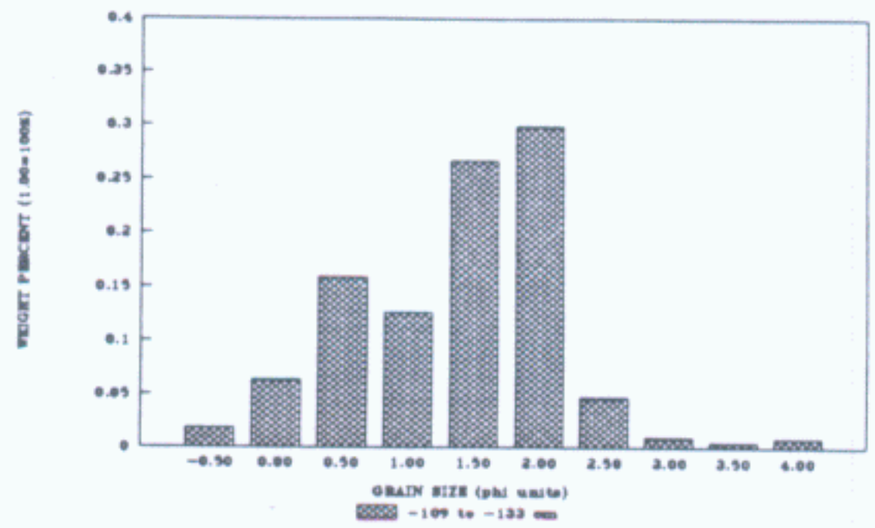


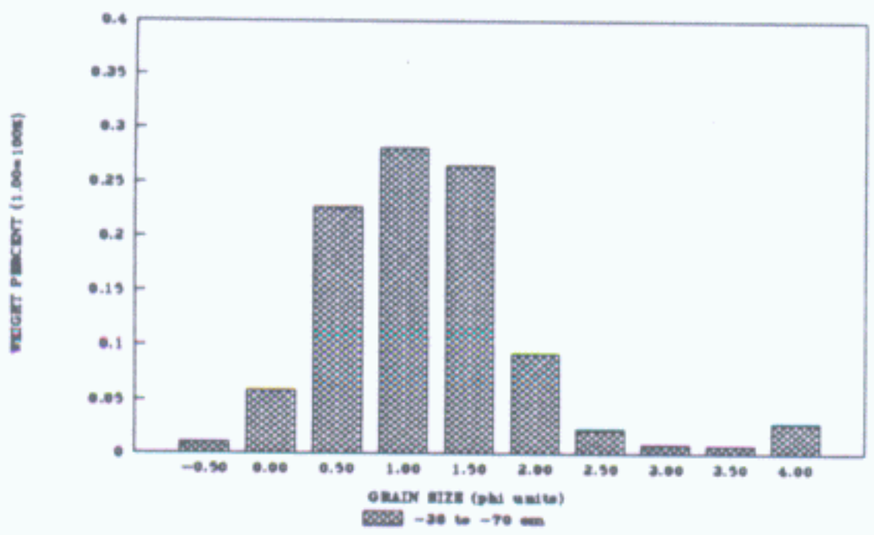
Histograms of grain size distributions for samples from 9RI178, Test Unit 9. Subsurface depths indicate sampling intervals.

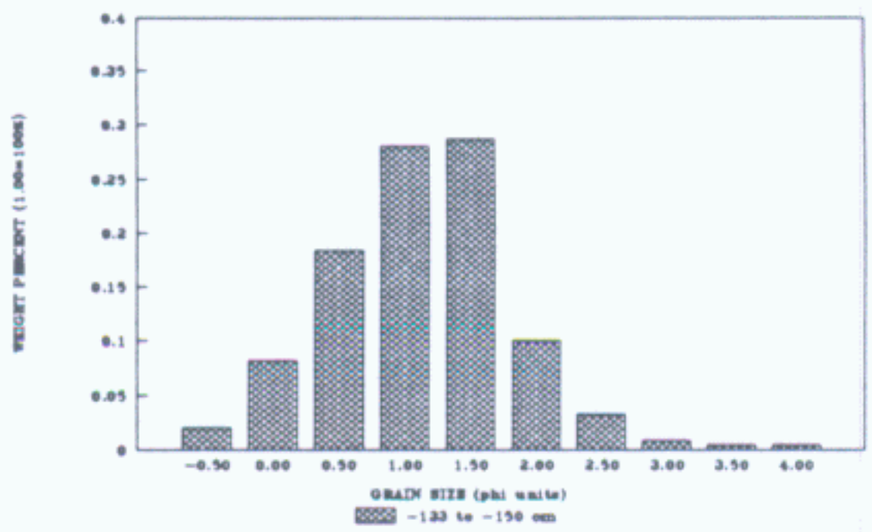




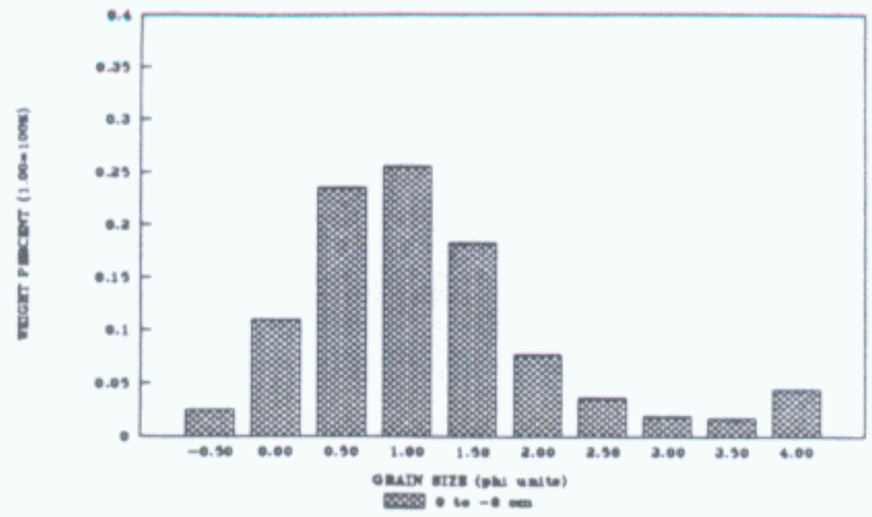


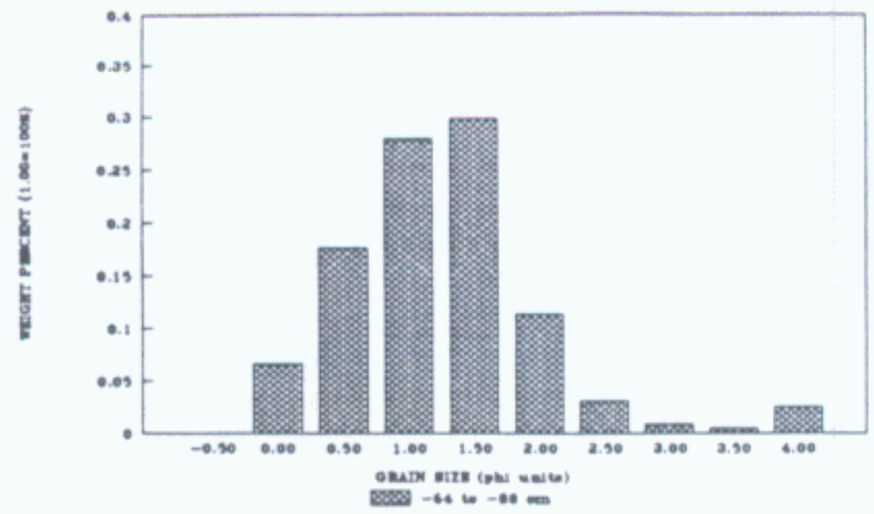


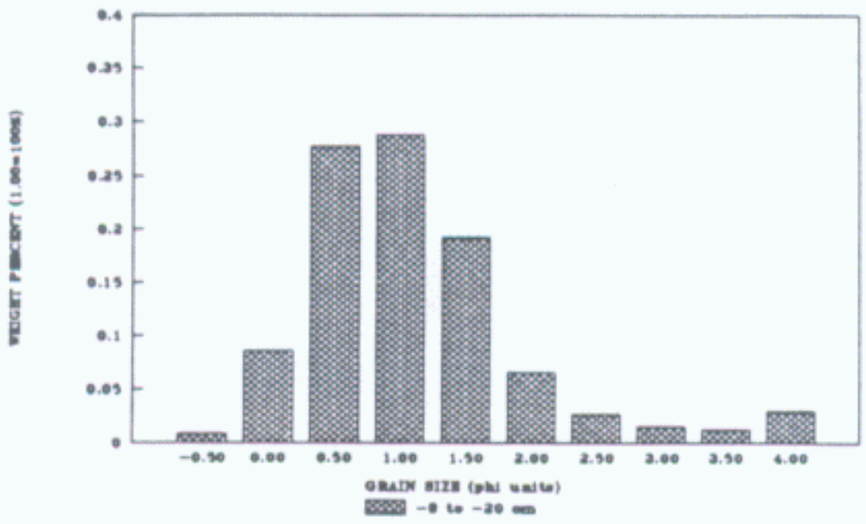


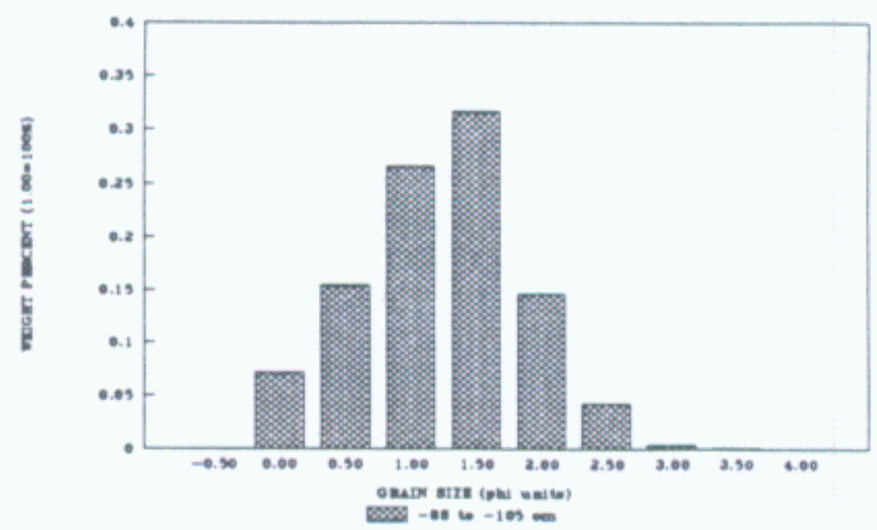


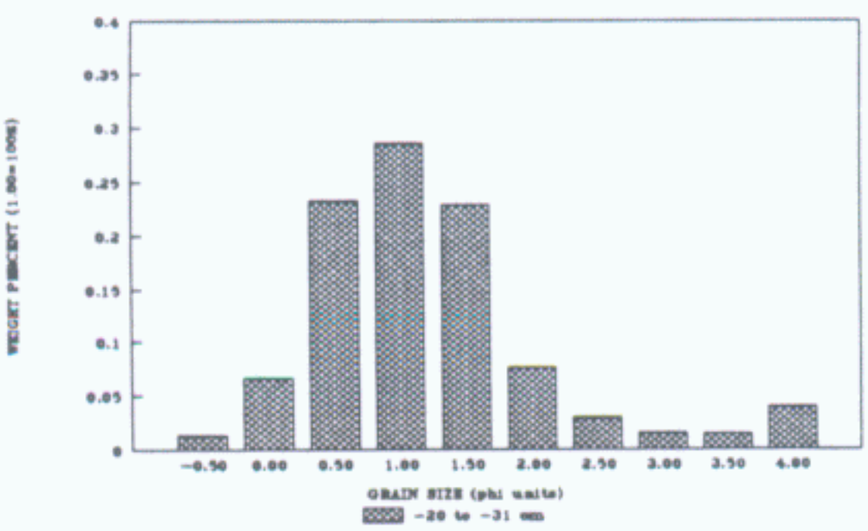
Histograms of grain size distributions for samples from 9RI178, Test Unit 1. Subsurface depths indicate sampling intervals.

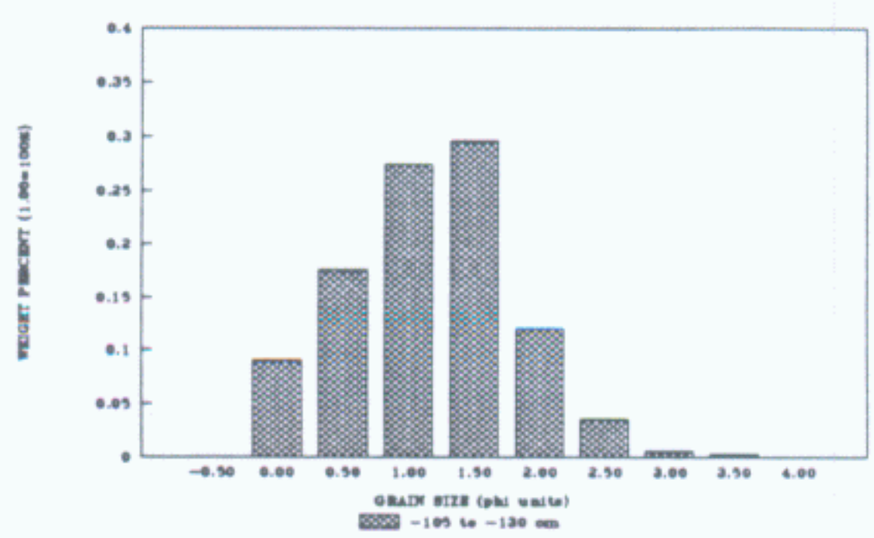


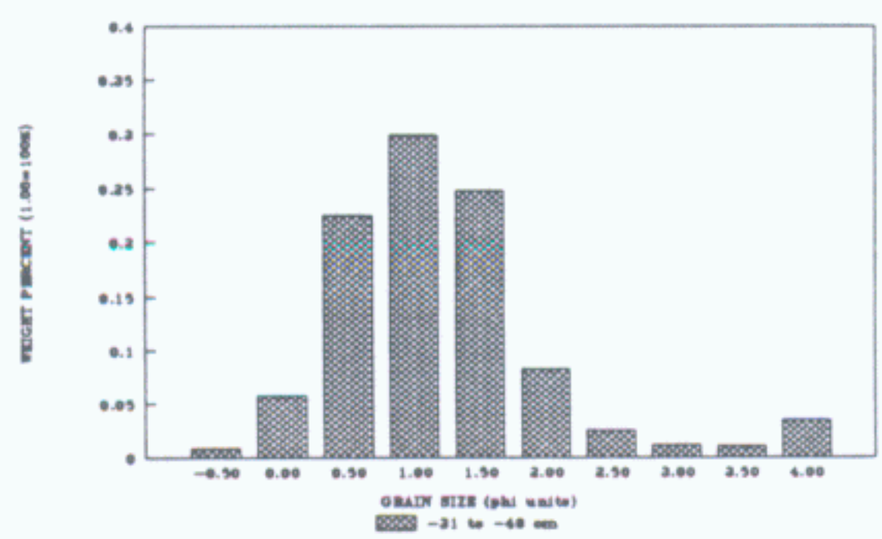


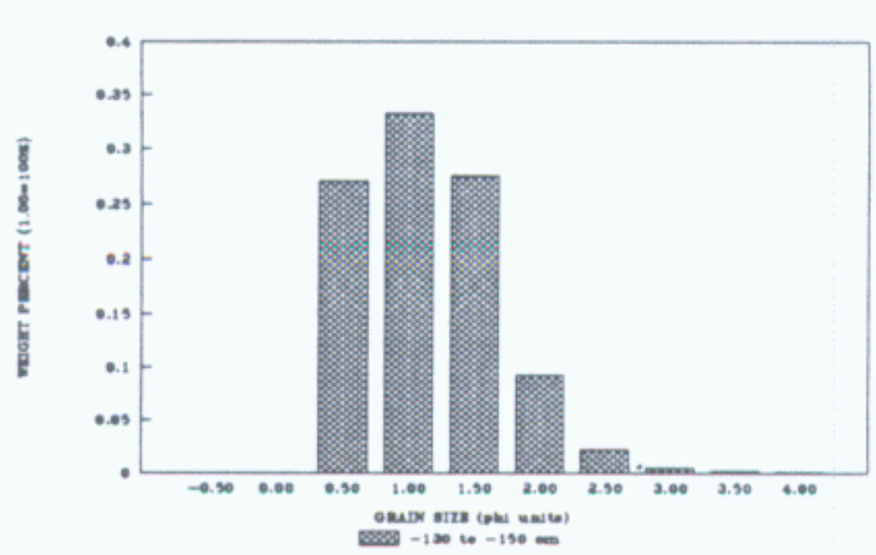


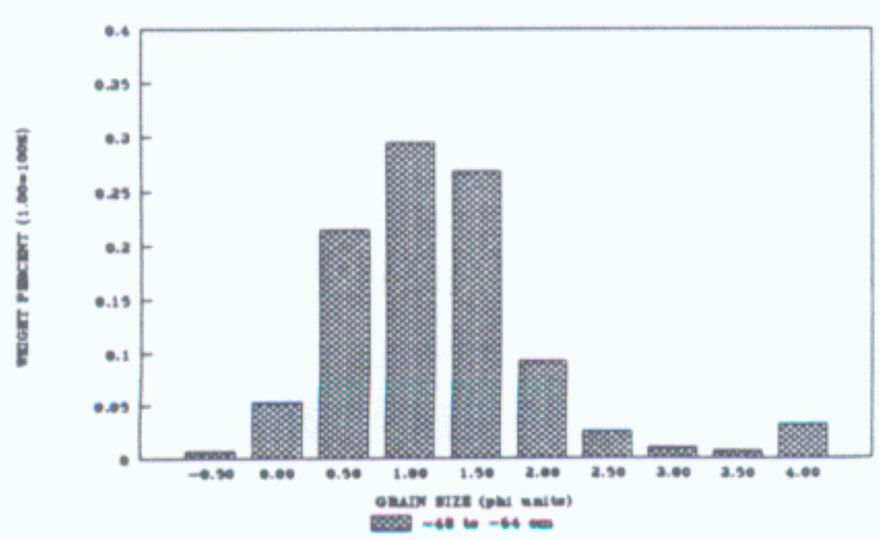












Histograms of grain size distributions for samples from 9RI178, Test Unit 3. Subsurface depths indicate sampling intervals.

Dan Elliott
Southeastern Archeological
Services, Inc.
565 N. Milledge Avenue
Athens, GA 30601

Dear Dan:

I received the following samples from you for pollen analysis.

Sample #	Description
1	core V-1 (40-45 cm)
2	core V-1 (46-52 cm)
3	core V-6 (104-109 cm)
4	core V-6 (168-174 cm)
5	core V-8 (178-183 cm)
6	core V-8 (214-218 cm)
7	soil strata 30 cm below Late Archaic horizon
8	Feature 63
9	Feature 338
10	Feature 361
11	Feature 373
12	Feature 381

All 12 samples were processed using modifications of the procedures discussed in Faegri and Iverson (1975).

Faegri, K. and Iverson, J. (1975). Textbook of Pollen Analysis. 295 pp. Hafner Press, New York.

About 1 cc of sediment from each of the samples was treated with KOH to remove organic matter and humic acids. The samples were then washed through a 180 μ mesh to remove large particles and sand. All of the samples were very sandy and this removed a large part of the sample. The samples were then treated with 10% HCl to remove any carbonates. Foaming indicated that all samples contained small amounts of calcium carbonate. The 12 samples were then subjected to HF (hydrofluoric acid) treatment to remove silica. The samples

An Equal Opportunity/Affirmative Action Institution

were heated with 48% HF in an actively boiling waterbath for 20 minutes and then left standing in a fume hood overnight.

At this stage it was realized that the samples contained a large volume of fine sand and clay that would require multiple treatments by HF to remove. Six samples were selected and were subjected to three further HF treatments before the samples were treated with EtHO (ethanol) and were then washed with 10% HCl. Acetolysis was not carried out as there was no organic matter left in the samples. After the samples were dehydrated with ethanol and TBA, silicone oil was added and the six samples were examined with a Jenaval Contrast Research Microscope at 250 x to 500 x magnification.

None of the six samples contained a significant number of pollen grains for meaningful counts to be made. Three of the samples contained no visible pollen grains. The other three samples contained a few grains of pine, oak and grass (perhaps 5-6 grains per slide) which may represent contamination by modern pollen

Given the poor results of the six samples processed to conclusion I did not feel justified in further processing of the other samples. HF treatments are difficult and laborious (HF is extremely dangerous) and the chances of finding pollen appeared slim. The remaining six samples were, therefore, not processed to conclusion.

The lack of pollen probably reflects the sandy nature of the sediments and soils which increases oxidation of the pollen grains and their rapid destruction.

The six samples processed to conclusion were as follows:

Sample #	Comments
1	no pollen
3	few pine and oak
6	no pollen
9	no pollen
10	few pine, grass, oak
11	few pine and grass

These samples were selected for analysis as they appeared to be representative of the total group of 12 (i.e. some from cores some from features).

I regret that I have no earth-shattering data for you but perhaps next time we will be a little more fortunate.

Sincerely,

George A. Brook.

Dr. George A. Brook
Professor of Geography, Associate Director of the Center for Archaeological Sciences, and Curator of the Plant Microfossil Laboratory, Georgia Museum of Natural History
