B. Construct Safety Features
   Construct either of the following safety features at both ends of the detour bridge:
   1. Guard rail
      Construct according to the Construction Details shown in the plans.
   2. Precast median barrier according to Ga. Std. 4960 and 4961
      When the precast median barrier option is selected, construct the barrier as follows:
      a. Place the precast median barrier on both sides and both ends of the detour bridge unless otherwise directed by the Engineer.
      b. Ensure that the barrier extends at least 40 ft. (12 m) from the bridge ends unless the plans show otherwise.

C. Remove the Detour Bridge
   After the permanent construction is open to traffic, remove the detour bridge according to Section 540.
   Material salvaged from the detour bridge remains the property of the Contractor. Consider the salvage value when compiling the bid.

541.3.06 Quality Acceptance
General Provisions 101 through 150.

541.3.07 Contractor Warranty and Maintenance

A. Maintain the Detour Bridge
   Except as otherwise provided in Subsection 104.05.D, Detours Outside Right-of-Way, maintain the detour bridge so it can safely carry the design loading at all times. Furnish labor and material to maintain the bridge.
   If the Engineer determines that the detour bridge endangers public safety, promptly repair the bridge. If the bridge is not repaired immediately, the Engineer will proceed according to Subsection 105.15, Failure to Maintain Roadway or Structures.
Section 541 — Detour Bridges

541.4 Measurement
This work will not be measured separately for payment.

541.4.01 Limits
General Provisions 101 through 150.

541.5 Payment
This work will be paid for at the Contract Price per detour bridge complete in place, maintained, and removed.

Payment will be made under:

| Item No. 541 | Detour bridge (requires width, length, and sta. no.) | Per lump sum |

541.5.01 Adjustments
After the detour bridge is completed, the Engineer will include 80 percent of the Contract Price for the detour bridge in the next statement.

After the detour bridge is satisfactorily removed, the Engineer will include the remaining 20 percent in the next statement.
Section 542 — Contractor Proposed Alternate to Reinforced Concrete Deck Girder

Section 542—Contractor Proposed Alternate to Reinforced Concrete Deck Girder

542.1 General Description
This specification covers design requirements for superstructures proposed by the Contractor as alternates to cast-in-place reinforced concrete deck girder structures.

This work is limited to construction using precast reinforced or precast prestressed concrete stems, including AASHTO Type I beams.

For areas not specifically covered in this specification, refer to the applicable portions of the project specifications, Standard and Supplemental Specifications of the Department, and Part I of the AASHTO Specifications for Highway Bridges with interim and Guide Specifications.

542.1.01 Definitions
General Provisions 101 through 150.

542.1.02 Related References
A. Standard Specifications
   Section 105—Control of Work

B. Referenced Documents
   AASHTO Specifications
   AASHTO Specifications for Highway Bridges, including interim and Guide Specifications

542.1.03 Submittals
A. Department’s Responsibilities
   The Department will quickly review submittals to avoid delaying the Contractor’s scheme.
   The Department will judge the completeness, accuracy, and structural acceptability of submittals.

B. Contractor’s Bid Price
   Include the following in the bid price:
   - Costs for complying with this specification
   - Costs for completing and revising the Department plans

C. Submittals
   The Contractor may bid based on using precast reinforced or precast prestressed concrete stems. When bidding is based on an alternate design, submit a Contractor-proposed alternate.

1. Follow Submittal Guidelines
   Follow these guidelines for submittals:
   a. Submit the Plan on reproducible mylar sepias.
   b. Submit design notes, except for computer printouts, on A4 paper, neatly bound, indexed, and stamped by the Design Engineer.
   c. Allow the Department 60 days from the date it receives the submission to review the construction plan.
   d. Do not begin bridge construction until the construction plans are reviewed and approved.
   e. Ensure that the Plans and notes indicate they have been checked by the Department’s Bridge and Structural Design section.
Section 542 — Contractor Proposed Alternate to Reinforced Concrete Deck Girder

2. Submit the Contractor-Proposed Alternate

Even when submitting an alternate, assume responsibility for the plans and working drawings required by Subsection 105.02, Plans and Working Drawings.

Submit alternate construction Plans and design notes that are prepared and stamped by the Design Engineer. The alternate plans submitted shall include, but not be limited to, the items below. Indicate the information using the same format used on the Department plans.

a. General Plan and Elevation Sheet

Show the following on this sheet for each Contractor-proposed alternate structure bid:

- Span lengths
- Pier locations
- Minimum horizontal clearances from the pier face to the edge of the roadway
- Minimum vertical clearances from the bottom of the lowest portion of the superstructure to the roadway surface (outside edge of shoulder to outside edge of shoulder)
- The 28-day concrete strength for the superstructure and substructure
- Yield and working strengths of the reinforcing steel proposed for the superstructure and the substructure
- Design Specifications and interim specifications used during the design of the structure
- Design live loading, impact factor, and the future wearing surface loading.

b. Details of the Proposed Structure

On projects that involve widening existing structures, eliminate the tie strips shown on the Department Plans. Include in the proposal for the project the cost savings from eliminating the tie strips. Include the following items in the structure details:

- Each cross section at the midspan, end bent, and intermediate bent showing reinforcing steel size, spacing, and location
- Concrete dimensions relative to computing the structural properties of the members
- The dimensions of fillets
- The spacing and size of the web stirrups and longitudinal reinforcing, shown in a longitudinal view of the stem
- Design notes indicating how the spacings and sizes of reinforcing bars were obtained

c. Details of the Size and Type of Tendons for Prestressed Alternate

Include on the drawings the size and type of tendons for prestressed alternate, the horizontal location, and the vertical profile. Also include the following:

- Location of the hold-down point for the tendons
- Initial prestress force and strength of concrete when the tendons are released
- Method of retaining the depressed tendons in place
- Calculations for determining the tendon elongation required to produce the specified pre-tensioning force
- Calculations for determining the casting length
- Detensioning schedule

d. Dead Load Deflections from the Slab, Stem, Coping, and Barrier

d. Camber for the Stems

Include in the camber the effects of vertical curvature.
542.2 Materials
General Provisions 101 through 150.

542.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

542.3 Construction Requirements

542.3.01 Personnel
General Provisions 101 through 150.

542.3.02 Equipment
General Provisions 101 through 150.

542.3.03 Preparation
General Provisions 101 through 150.

542.3.04 Fabrication
General Provisions 101 through 150.

542.3.05 Construction

A. Design and Construct Team
Contractor-proposed alternates are considered a design and construct proposal. The design and construct team shall consist of a Contractor and a Design Engineer.

1. Contractor
The Contractor is responsible for engineering design, drawing, detailing, plan preparation, printing, and other Work necessary to modify the Department Plans for the proposed scheme.

2. Design Engineer
The Design Engineer must be registered as a Professional Engineer in the State of Georgia.
The Design Engineer is responsible for the following:
- Remain a part of the team and be available to discuss the project with the Department at any time during the project.
- Keep a record of project-related communications with the Department, including copies of correspondence and transcripts of conversations.
- Provide copies of the communication record to the Department and the Contractor.

B. Criteria for Contractor-Proposed Alternates
Contractor-proposed alternates shall be subject to the following criteria:

1. Comply with the traffic handling and sequence of operation schemes found on the plans and specifications.

2. Do not change the following items from the Department plans:
   - Horizontal and vertical alignments
   - Beginning and ending bridge stations
   - Minimum horizontal clearance
   - Span lengths

3. If necessary, reduce vertical clearances from those indicated on the plans by following the restrictions below and submitting mathematical computations indicating a check of revised vertical clearance.
Section 542 — Contractor Proposed Alternate to Reinforced Concrete Deck Girder

4. Construct the bridge superstructure using either a precast reinforced or precast prestressed concrete stem that meet the following criteria:
   a. The section depth, measured from the top of the top slab to the bottom of the stem may deviate from the plans if the vertical clearance requirement in of Subsection 542.3.05.B.3 Criteria for Contractor-Proposed Alternates, is satisfied.
      The stem depth shall be constant throughout the length of each structure unless indicated otherwise on the plans.
   b. The stem and deck thicknesses may vary from the plans; however, the center-to-center stem spacing shall not vary.
   c. Give particular attention to skewed structures. The plans shall clearly indicate all dapouts and skewed end dimensions.
   d. Precast stems shall be fabricated at a site approved by the Department.
   e. Precast stems shall be designed for construction without using falsework.

5. Meet the following design criteria for alternate plans:
   a. The bearing area and edge distance requirements follow AASHTO specifications.
   b. The substructure remains as designed on the Department plans except for the following adjustments:
      • Elevations that accommodate a deeper superstructure
      • Cap widths that provide adequate bearing area
      The Department will not allow adjustments in substructure quantities resulting from adjusting the elevations or cap widths.
   c. The design complies with applicable requirements of the following:
      • Current AASHTO Specifications for highway bridges, including interim and guide specifications
      • This specification
      If this specification and the AASHTO Specifications conflict, this specification shall apply.
   d. The structure meets the AASHTO live-loading requirement indicated on the Department plans.
   e. The design dead load of the structure considers the following:
      • Weight of the structure
      • Weight of the future wearing surface
      • Construction loads
   f. Precast prestressed concrete stems meets the following requirements:
      • Initial tension (before losses from creep and shrinkage) shall not exceed 200 psi (1.38 MPa) or 3√f’c
      • Final tension (after losses) shall not exceed 3√f’c
   g. Concrete is normal weight and has a minimum concrete cylinder compression strength at 28 days of at least that indicated on the plans.
      For design purposes, do not consider 28-day concrete strength above 3,000 psi (20 MPa) for cast-in-place deck construction.
h. The deck has drain openings the same shape, size, and location as those shown on the plans.

i. The barrier curbs are not considered effective in resisting longitudinal stresses and are constructed as shown on the plans.

j. Reinforcing steel in the superstructure having a vertical clearance of 4 in. (100 mm) or less, as measured from the top of the top slab to the top of the reinforcing bar, is epoxy coated if the plans specify epoxy-coated bars.

Barrier curb reinforcing steel is epoxy coated as shown on the Department plans.

k. The minimum cover for reinforcing steel is as shown on the plans.

l. The effective flange depth is altered as follows:

   1) When calculating design section properties, deduct 1/4 in. (6 mm) from the flange depth. However, when calculating the dead load moment, shear, and reaction, include the 1/4 in. (6 mm).

   2) Where stay-in-place PSC deck panels are used, deduct 1 in. (25 mm) from the effective flange depth when calculating design section properties. However, when calculating the dead load moment, shear, and reaction, include the 1 in. (25 mm).

m. Bearing pads or bearing assemblies are placed normal to beams.

   Place bearing pads or bearing assemblies no closer than 1-1/2 in. (40 mm) to the end of the beams and 3 in. (75 mm) to the edge of the cap.

n. Sole plates are beveled.

o. Bent tops are not sloped for bearing purposes.

p. Neoprene bearing pads used with a precast beam alternate have 3/16-in. (5 mm) sealing ribs on the top and bottom of each neoprene pad.

q. The following dead loads are added to the non-composite loads for metal stay-in-place forms:

<table>
<thead>
<tr>
<th>Main Slab Reinforcement Normal to Beams</th>
<th>9.25 lbs./ft.² (45 kg/m²)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Main Slab Reinforcement Skewed to Beams</td>
<td>16.00 lbs./ft.² (78 kg/m²)</td>
</tr>
</tbody>
</table>

**542.06 Quality Acceptance**

General Provisions 101 through 150.

**542.07 Contractor Warranty and Maintenance**

Ensure the following:

- The design meets the Specification requirements for final design loads.
- Calculations and construction engineering ensure that adjustments during construction account for deflections.
- Proper line, grade, structural capacity, and stresses in the substructure and the superstructure are retained during construction.

**542.4 Measurement**

Material or work required to construct the Contractor-proposed concrete superstructures are not measured for payment.

Payment for the superstructure will be full compensation for furnishing the labor, materials, equipment, tools, and incidentals necessary to complete the work, including the following:

- Concrete
- Reinforcing steel
- Expansion joint material
Section 542 — Contractor Proposed Alternate to Reinforced Concrete Deck Girder

- Waterproofing
- Bearing pads
- Barrier concrete
- Design
- Redesign
- Plan preparation
- Shop drawings
- Concrete finish
- Other superstructure elements necessary for constructing the bridge

542.4.01 Limits

A. Additional Compensation

No additional compensation will be made for the following:

- Additional material, equipment, or other items the Department requires after its review of the Contractor’s alternate for project specification conformance
- Changes or deviations from the Contractor’s plan, as approved by the Department
- Additional material, equipment, or other costs needed because of changes in the Contractor’s plan

542.5 Payment

A. Preparation and Review Time

Charge the time required for preparation of construction plans and design notes to the allowable Contract time.

B. Superstructure

Work performed and materials furnished in place as required by this Specification will be paid for at the Contract Price bid for Lump Superstr Conc, CL, Br No. and Lump Superstr Reinf Steel, Br No.

C. Superstructure—Bridge Complete

Work performed and materials furnished in place as required by this specification will be paid for at the Contract Price bid for Lump Construction of Bridge Complete to Bottom of Cap—Alt 4.

542.5.01 Adjustments

A. Partial Payment

The Department will determine a schedule for partial payments for the lump superstructure items.
Section 543 — Bridge Complete

543.1 General Description
This work consists of constructing the bridge complete as shown in the contract. The work includes furnishing and placing all bridge components from the bottom of the cap to the top of the superstructure.

543.1.01 Definitions
General Provisions 101 through 150.

543.1.02 Related References
A. Standard Specifications
   Section 211 — Bridge Excavation and Backfill
   Section 500 — Concrete Structures
   Section 511 — Reinforcement Steel
   Sections 500 to 542

B. Referenced Documents
   AASHTO Specifications

543.1.03 Submittals
A. Alternative Designs
   The Contractor may submit for approval an alternative design for the portion of the bridge between the top of the superstructure and the bottom of the cap. The alternative design shall meet the following criteria:
   • The design conforms to current AASHTO specifications, including the latest Interim Specifications.
   • The design live load is HS20-44, including impact.
   Submit the design to the Bridge Engineer for review and approval. Do not begin Work or order materials until the Bridge Engineer approves the plans in writing.
   Include the following in the alternative design:
   • Three copies of the plans bearing a Professional Engineer’s Stamp of Approval.
   • The Engineer may require additional copies of the plans.
   • Two copies of complete design notes for the elements of the structure that are a part of the alternate design.
   • Bridge Plans developed and published by industry organizations, Federal Highway Administration, and other States may be acceptable without design notes. However, the Bridge Engineer will judge the acceptability of the design notes and the plans.
   If the Bridge Engineer does not accept the design, construct the bridge according to the Contract Plans.

543.2 Materials
Use materials that meet the requirements of the applicable Materials sections of the specifications. Material references are listed in the specification sections pertaining to the item of work.

543.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.
543.3 Construction Requirements

543.3.01 Personnel
General Provisions 101 through 150.

543.3.02 Equipment
General Provisions 101 through 150.

543.3.03 Preparation
General Provisions 101 through 150.

543.3.04 Fabrication
General Provisions 101 through 150.

543.3.05 Construction
A. Bridge Construction
Construct bridges under this specification according to the drawings.

B. Order Lengths for Prestressed Concrete Pile
The prestressed concrete pile order lengths shown on the plans are the estimated pile lengths.

On bridges with more than four bents, the estimated pile lengths shown on the plans apply to the first four bents constructed. The Engineer will adjust the pile order lengths for the remaining bents based on the pile driving for the first four bents constructed.

Instead of using Plan lengths or lengths determined by the Engineer, the Contractor may determine order lengths by furnishing and driving a test pile in a permanent pile location. There will be no additional compensation for this test pile.

543.3.06 Quality Acceptance
General Provisions 101 through 150.

543.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

543.4 Measurement
Bridge construction complete to the bottom of the substructure caps will be measured for payment based on a lump sum basis for the bridge complete, accepted in place.

543.4.01 Limits
A. Lump Sum Inclusions and Exclusions
The lump sum includes payment for superstructure elements and substructure caps.

The lump sum does not include the cost of piling portions embedded in the substructure caps as shown on the plans.

B. Concrete Bent Measurement
Where foundation conditions require the use of a concrete bent instead of a trestle pile bent, concrete and reinforcement steel below the bottom of the substructure cap will be measured and paid for according to Section 500, Section 511, and Section 211.
Section 543 — Bridge Complete

543.5 Payment
This work will be paid for at the Contract Unit Price bid. Payment will be full compensation for furnishing all materials and completing the Item according to these specifications.

Payment will be made under:

| Item No. 543-1100 | Construction of bridge complete to bottom of cap | Per lump sum |

543.5.01 Adjustments
Statements for partial payment include:

<table>
<thead>
<tr>
<th>Item</th>
<th>Payment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Caps, each</td>
<td>20% of Item 543 divided by number of caps</td>
</tr>
<tr>
<td>Superstructure, per span</td>
<td>80% of Item 543 divided by number of spans</td>
</tr>
</tbody>
</table>
544.1 General Description
This work includes furnishing deck drainage systems according to plan details.

544.1.01 Definitions
General Provisions 101 through 150.

544.1.02 Related References
A. Standard Specifications
   Section 645—Repair of Galvanized Coatings
   Section 870—Paint
B. Referenced Documents
   General Provisions 101 through 150.

544.1.03 Submittals
Submit complete detail Shop Drawings for the deck drain system to the Engineer for approval.
If the deck drain system is for a railway, the Engineer will submit the Shop Drawings to the Chief Engineer of the railway company for approval.
In either case, obtain approval from the Engineer prior to fabrication or installation.

544.2 Materials
Use materials that meet plan requirements. Use commercial-grade steel hardware (clips, brackets, bars, etc.) unless otherwise noted on the plans. Use galvanizing repair compound that meets the requirements of Section 870.

544.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

544.3 Construction Requirements
544.3.01 Personnel
General Provisions 101 through 150.

544.3.02 Equipment
General Provisions 101 through 150.

544.3.03 Preparation
General Provisions 101 through 150.

544.3.04 Fabrication
General Provisions 101 through 150.

544.3.05 Construction
Repair damaged galvanized areas according to Section 645.
Install deck drain systems according to the plans.
544.3.06 Quality Acceptance
General Provisions 101 through 150.

544.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

544.4 Measurement
This work is not measured separately for payment.

544.4.01 Limits
General Provisions 101 through 150.

544.5 Payment
This work will be paid for at the Contract Price for deck drain system complete in place.
Payment will be made under:

| Item No. 544 | Deck drain system—bridge no.____ | Per lump sum |

544.5.01 Adjustments
General Provisions 101 through 150.
Section 547—Pile Encasement

547.1 General Description
This Item includes furnishing all labor, materials, equipment, and services necessary to clean and encase steel piles as indicated on the plans. Complete all work according to this specification and to the Engineer’s satisfaction.

547.1.01 Definitions
General Provisions 101 through 150.

547.1.02 Related References
A. Standard Specifications
   Section 500—Concrete Structures
   Section 514—Epoxy Coated Steel Reinforcement
   Section 801—Fine Aggregate

B. Referenced Documents
   ASTM 2262
   ASTM C 939
   ASTM D 737
   ASTM D 1682

547.1.03 Submittals
When substituting equal products or systems for one of the two encasement procedures noted in this specification, obtain approval from the Engineer before use. Submit complete data, including:

- Company name and address
- Description of the product or system previously used on similar projects and how they were used
- List of products and their application
- Length of time the products have been in use (at least three years)
- Length of time the applicator has been in business

547.2 Materials
A. Fabric for Pile Jacket
For encasement systems, use pile jacket fabric that conforms to the following requirements:

<table>
<thead>
<tr>
<th>Requirements for Pile Jacket Material</th>
</tr>
</thead>
<tbody>
<tr>
<td>Warp</td>
</tr>
<tr>
<td>21 ends per in. (25 mm) 1260 denier</td>
</tr>
<tr>
<td>Fill</td>
</tr>
<tr>
<td>Nylon 66 fill -- 20 picks per inch (25 mm) 1840 denier</td>
</tr>
<tr>
<td>Approximate Weight</td>
</tr>
<tr>
<td>Dupont Cordura -- 9 oz per sq. yd (305 g/m²)</td>
</tr>
<tr>
<td>Tensile Strength</td>
</tr>
<tr>
<td>(ASTM D 1682 grab method at 1 in./min. (25.4 mm/min.) in excess of 400 lbs./in. (70 N per mm) in both warp and fill directions</td>
</tr>
<tr>
<td>Tearing Strength</td>
</tr>
<tr>
<td>(Tongue method ASTM 2262)—100 lbs. (445 N)</td>
</tr>
<tr>
<td>Air Permeability</td>
</tr>
<tr>
<td>(ASTM D 737) in excess of 100 ft. (30 m) per min.</td>
</tr>
</tbody>
</table>
Section 547 — Pile Encasement

B. Mortar for Pile Encasement Procedure 2

Maintain mortar at a uniform consistency to avoid pumping problems. When using concrete sand, keep mortar consistency in the 12-second to 15-second range through the 3/4 in. (19 mm) orifice of a standard flow cone, as described in ASTM C 939. When using mason’s sand, keep consistency in the 30- to 35- second range through a 1/2 in. (13 mm) orifice.

1. Admixtures

When recommended by the manufacturer, use admixtures such as grout super plasticizer, water-reducing agent, or air-entraining agent to improve pumpability or to retard setting time. The Department recommends that a pozzolanic admixture be substituted for up to 30 percent of the cement.

2. Mortar mix for Pile Encasement Procedure 2

Use mortar mix for pile encasement that conforms to the following proportions:

<table>
<thead>
<tr>
<th>Component</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cement</td>
<td>1,130 lbs./yd.³ (670 kg/m³)</td>
</tr>
<tr>
<td>Sand, Concrete, or Masonry</td>
<td>2,000 lbs./yd.³ (1187 kg/m³)</td>
</tr>
<tr>
<td>Water</td>
<td>565 lbs./yd.³ (335 kg/m³)</td>
</tr>
<tr>
<td>Water/Cement Ratio</td>
<td>0.50</td>
</tr>
</tbody>
</table>

C. Epoxy-Coated Steel Reinforcement

Use epoxy-coated steel reinforcement that conforms to Subsection 514.2, Materials.

D. Class A Concrete Deposited in Water

Use concrete with a 10 percent increase in cement factor. Ensure that concrete is air entrained according to Section 500, with a maximum slump of 8 in. (200 mm).

547.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

547.3 Construction Requirements

General Provisions 101 through 150.

547.3.01 Personnel

General Provisions 101 through 150.

547.3.02 Equipment

General Provisions 101 through 150.

547.3.03 Preparation

A. Cleaning

Sandblast piles on existing structures to be encased to remove loose dirt, rust, scale, and other deleterious material from the surface. Rinse thoroughly with clean water. Do not sandblast piles to be used on new construction. Clean new piles with a wire brush to free them of rust or other loose material.

547.3.04 Fabrication

General Provisions 101 through 150.
547.3.05 Construction

A. Encasement

To perform encasement, follow the details of Figure 1 (Figure 1 metric) and one of the following procedures:

**FIGURE 1**

- COST OF #3 TIES AND #4 BARS TO BE INCLUDED IN PRICE BID FOR PILE ENCASEMENT. #3 TIES AND #4 BARS SHALL BE EPOXY COATED.
- **SLOPE TOP OF ENCASEMENT AS INDICATED TO ENSURE POSITIVE DRAINAGE.**
- 4 #4 BARS (1 IN EACH CORNER)
- #3 TIES AT 1'-0"
- **TOP OF ENCASEMENT ELEV. (AS SHOWN ON PLANS)**
- ENCASEMENT MAY CONFORM TO THE DETAILS OF EITHER DETAIL "A" OR DETAIL "B".
- STIRRUPS FOR ENCASEMENT ON EXISTING BRIDGES MAY BE LAPPED.
3. Procedure 1

Form the pile encasement with class “A” concrete deposited in water and epoxy-coated steel reinforcement. Place the concrete according to Subsection 500.2.01.E, *Concrete Handling and Placing*, where site construction conditions allow. The Department will not require cofferdams. Concrete may be deposited in water.

4. Procedure 2

Form the pile encasement with a Fabriform Pile Jacket System or an approved equal. Pump mortar into the fabric jacket using two tremie hoses extending to the bottom of the jacket. Withdraw these hoses during pumping so that the lower end remains 1 to 2 ft. (300 to 600 mm) under the rising mortar surface. Pump mortar at a rate to provide a rise of approximately 6 in. (150 mm) per minute.

B. Installation

After cleaning the pile, place steel reinforcement as shown in Figure 1 (Figure 1 metric). Place spacers, tremie hoses, and fabric jacket or forms according to the specifications or the manufacturer-recommended methods. Fill the encasement with concrete or mortar.

547.3.06 Quality Acceptance

A. Limits of Encasement

Ensure that the pile encasement extends from 2 ft. (600 mm) below the existing streambed to the top elevation for pile encasement, as shown on the plans.
547.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

547.4 Measurement
Pile encasement is measured by the linear foot (meter) for each pile size indicated.

547.4.01 Limits
General Provisions 101 through 150.

547.5 Payment
Pile encasements will be paid for at the Contract Price per linear foot (meter) for the pile size indicated, complete in place as specified.

This payment will be full compensation for furnishing all materials, tools, labor, equipment, and other items necessary to complete the Work.

Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 547</th>
<th>Pile encasement, ___in.(mm) pile</th>
<th>Per linear foot (meter)</th>
</tr>
</thead>
</table>

547.5.01 Adjustments
General Provisions 101 through 150.
Section 550—Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

550.1 General Description
This work includes furnishing and installing the following:

- Storm drain pipe
- Side drain pipe
- Pipe-arch culverts
- Elliptical pipe
- Flared end sections
- Safety end sections
- Tapered pipe inlets

Install structures according to the Specifications and the details shown on the Plans, or as directed by the Engineer.

550.1.01 Definitions
Side Drain – All driveway pipes (commercial, non-commercial, residential, utility, farm, logging, and mining).
Storm Drain Pipe – All pipe used in the highway drainage system that receives surface water through inlets and conveys the water through conduits to a pipe outlet.
Thermoplastic Pipe – High Density Polyethylene (HDPE), Polypropylene (PP) and Polyvinyl Chloride (PVC).

General Provisions 101 through 150.

</tbody>
</table>
Use any of the following types of pipe:

**Rigid Pipe Types**
- Reinforced concrete
- Nonreinforced concrete
- Ductile Iron

**Flexible Pipe Types**
- Corrugated steel or Aluminum
- Smooth-lined corrugated high density polyethylene (HDPE)
- Polyvinyl Chloride (PVC) Profile Wall Drain Pipe
- Polyvinyl Chloride (PVC) Corrugated Smooth Interior Drain Pipe
- Precoated, Galvanized Steel Culvert Pipe (Polymer)
- Smooth Lined Corrugated Polypropylene (PP) Pipe

Use the type of pipe designated on the Plans, or acceptable alternate types when applicable. For a listing of acceptable alternate pipe types see the GDOT Approved Material Selections List in Chapter 7—Storm Drain Design of the Department's Manual on Drainage Design for Highways. This document summarizes general applications for pipe.

For concrete, corrugated steel and aluminum pipes see Ga. Std. 1030D for minimum thicknesses, minimum cover, maximum fill, allowable pipe diameters and trench construction detail.

For thermoplastic pipes see Ga. Std. 1030P for minimum cover, maximum fill, allowable pipe diameters and trench construction details.

**A. Thermoplastic Pipe Project Restrictions**
Thermoplastic pipe is restricted to the following project conditions:

1. Storm Drain
   - Travel Bearing: ADT less than 15,000
   - Non-Travel Bearing: Non-Interstate

2. Side Drain
   - Allowed on all projects

**550.2.01 Delivery, Storage, and Handling**
General Provisions 101 through 150.

**550.3 Construction Requirements**

**550.3.01 Personnel**
General Provisions 101 through 150.

**550.3.02 Equipment**
General Provisions 101 through 150.
Section 550 — Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

550.3.03 Preparation and Backfill

Before installing pipe, shape the foundation material as shown on the Plans.

Prepare structure excavations, foundation and backfill according to Section 207. Except, use the following foundation and backfill material requirements for thermoplastic pipe installations:

1. For storm drain applications (cross and longitudinal) use graded aggregate material meeting Section 815.
   a. 20 ft. (6.1 m) maximum fill height for High Density (HDPE) Polyethylene Culvert Pipe.
   b. 25 ft. (7.6 m) maximum fill height for Polyvinyl Chloride (PVC) and Polypropylene (PP) Pipe.

2. For side drain applications (driveway) use backfill material based on fill height.
   a. Fill heights up to 10 ft (3 m), use normal backfill material meeting the following soil classes per Subsection 810.2.01.
      • High Density (HDPE) Polyethylene Culvert Pipe use Class II B2 soil or better.
      • Polyvinyl Chloride (PVC) and Polypropylene (PP) Pipe use Class II B3 soil or better.
      • If the required soil Class is not available use graded aggregate material meeting Section 815.
   b. Fill heights above 10 ft. (3 m), use graded aggregate material meeting Section 815.

550.3.04 Fabrication

General Provisions 101 through 150.

550.3.05 Construction

A. Drainage

Provide necessary temporary drainage. Periodically remove any debris or silt constricting the pipe flow to maintain drainage throughout the life of the Contract.

B. Damage

Protect the structure by providing sufficient depth and width of compacted backfill before allowing construction over a culvert. Repair damage or displacement from traffic or erosion occurring after installing and backfilling at no additional cost to the Department.

C. Installation

Check vertical and horizontal alignment of the pipe culvert or pipe barrel by sighting along the crown, invert and sides of the pipe, and by checking for sagging, faulting and invert heaving. Repair any issues involving incorrect horizontal and/or vertical alignment before backfilling pipe.

1. Concrete Pipe

Install Concrete Pipe according to ASTM C 1479 and as per plans. Lay sections in a prepared trench with the socket ends pointing upstream. Join section using rubber gasket installed according to Subsection 848.2.01 and the manufacturer’s recommendations.

2. Ductile Iron Pipe

Lay pipe sections in a prepared trench, with bells pointing upstream. Construct joints according to Subsection 841.2.02.A.

3. Corrugated Metal

Lay pipe sections in a prepared trench, with outside laps of circumferential joints pointing upstream and longitudinal joints at the sides. Join the sections with coupling bands, fastened by two or more bolts. Before backfilling the structure:
   a. Repair areas of damaged coatings and exposed base metal according to applicable AASHTO Standard Specification specified in Section 844.
4. Thermoplastic Pipe
   Install smooth-lined corrugated HDPE, PVC, and smooth-lined polypropylene pipe according to ASTM D 2321 and as per plans using backfill requirements in Subsection 550.3.03. Use fitting and couplings that comply with the joint performance criteria of AASHTO Standard Specifications for Highway Bridges, Division II. Ensure all joints are “silt tight” as stated in the AASHTO bridge specifications.

5. Specials (Wyes, Tees, and Bends)
   Install wyes, tees, and bends as shown on the Plans or as directed.

6. Tapered Pipe Inlets
   Locate and install tapered pipe inlet end sections as shown on the Plans or as directed.

7. Elongation
   Elongate metal pipe as shown on the Plans. Order the elongation of the vertical axis of the pipe to be done in the shop.
   Ensure the manufacturer ships metal pipe with wire ties in the pipe ends. Remove wire-ties immediately after completing the fill.

8. Flared End Sections
   Use flared end sections on the inlet, outlet, or on both ends of storm drain pipe, according to Plan details.

550.3.06 Quality Acceptance

The Engineer will visually inspect all pipe for alignment, deflection, cracking, joint separation, sagging, or other exterior damage.

The Department may elect to conduct Quality Assurance verifications of any pipe inspections. These verifications will be performed by Department personnel.

The Department will require video inspection on projects that have more than 500 linear feet of storm drain pipe and on routes with an AADT greater than 3,000 vehicles. Conduct video inspection in accordance with the requirements of this Specification and GDT 136 on 20% of all storm drain pipe and 10% of all side drain pipe installations. The Engineer will randomly select installations to be tested.

Unless the Engineer directs otherwise, schedule the video inspections for the selected locations no sooner than 30 days after completing pipe installations to be tested.

A. Post Installation Inspection

Before post installation inspection, dewater installed pipe (if necessary) and provide the Engineer with a post installation inspection schedule. Notify the Engineer at least seven days in advance of beginning inspection.
Perform post installation inspections once compacted backfill has reached a depth of 8 feet or after completion of the pipe installation and final cover, which includes the embankment and all non-asphalt bases and/or subgrades. Notify the Engineer if distresses or locations of improper installation are discovered. When camera testing shows distresses or improper installation in the installed pipe, the Engineer may require additional sections to be tested or may require corrective action.

Video and laser profiling and measurement technology must be certified by the company performing the work to meet the requirements of GDT 136. Inspection contractor personnel completing remote inspections shall be NASSCO – PACP Certified Technicians. Testing performed by a company failing to meet these requirements will result in non-payment of the pipeline video inspection and non-certification of the pipe tested.

For video recorded, laser profiled pipe indicating deflection is in excess of Specification requirements, the Contractor may elect to further test the pipe with the use of a mandrel. Ensure mandrel meets requirements of GDT 136 and the Engineer has approved before use.

Mandrel or manual post installation inspection allowed for pipe diameters greater than 48 inches.
B. Requirements for Rigid Pipe – Concrete

1. Joints: Note differential movement, cracks, spalling, improper gasket placement, movement or settlement of pipe sections, and leakage in the inspection report. Repair or replace pipe sections to the satisfaction of the Engineer where joint separation is greater than 1 inch (25 mm). Repair or replace pipe sections where soil migration through the joint is occurring.

2. Longitudinal and Transverse Cracks: Cracks with a width less than 0.01 inch (0.25 mm) are considered hairline and minor and only need to be noted in the inspection report, no corrective action is necessary. When cracks exceed the cracking and installation thresholds indicated in the Rigid Pipe Remediation Table in Section 550.5.01.B, regardless of position in the wall of the pipe, measure the width, length, and locations of the cracks and diameter of the pipe, both horizontally and vertically, use remediation methods in accordance with recommendations of the pipe manufacturer and submit to the Engineer for review and approval an evaluation utilizing a Professional Engineer registered in the State of Georgia that takes into consideration structural integrity, environmental conditions, and the design service life of the pipe. Based on the evaluation, the Department may allow the pipe to remain in place if the cracking is remediated according to an approved remediation plan submitted in writing to the Engineer. Provide 10 business days for the Department to review the evaluation. When the pipe shows cracking 0.01 inch (0.25 mm) or greater and extending for a length of 12 inches (300mm), remediate or replace as directed by the Engineer. When the camera/video cracking results are called into question, the Department may require manual inspection measurements.

C. Requirements for Flexible Pipe – Thermoplastic, Corrugated Metal

1. Joints: Remediate pipe showing evidence of crushing at the joints. Note differential movement, improper joint sealing, movement or settlement of pipe sections, and leakage in the inspection report. Remediate joint separation of greater than 1 inch (25 mm) per manufacturer's recommendation. Repair or replace pipe sections where soil migration through the joint is occurring.

2. Cracks: Remediate cracks or splits in the interior wall of the pipe. Use remediation methods in accordance with recommendations of the pipe manufacturer and accepted and authorized by the Engineer.

3. Buckling, bulging, and racking: Note in the inspection report flat spots or dents at the crown, sides or flowline of the pipe due to racking. Note areas of wall buckling and bulging in the inspection report. The Engineer will determine if corrective action is necessary.

4. Deflection: If flexible pipes exceed the deflection and installation thresholds indicated in the Flexible Pipe Deduction Table in Section 550.5.01.C, provide the Department with an evaluation of each location conducted by a Professional Engineer registered in the State of Georgia addressing the severity of the deflection, structural integrity, environmental conditions, and design service life. Based on the evaluation, the Department may allow the pipe to remain in place at a reduced unit price as shown in the Flexible Pipe Deduction Table. Provide 10 business days for the Department to review the evaluation. When the pipe shows deflection 10 percent or greater, remove and replace. When the laser deflection results are problematic, the Department may require mandrel or manual testing.

5. Coating on Corrugated Metal: Note areas of the pipe where the original coating has been scratched, scoured or peeled.

550.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.
Section 550 — Storm Drain Pipe, Pipe-Arch Culverts, and Side Drain Pipe

550.4 Measurement

A. Excavation and Backfill
   Foundation backfill materials Types I, II and III are measured according to Subsection 207.4, Measurement.
   Normal backfill is not measured separately.
   No measurement will be made for graded aggregate used for structural backfill of thermoplastic pipe.

B. Flat Bottom and Circular Pipe (All Types)
   The overall length of pipe installed, excluding tapered inlets, is measured in linear feet (meters), along the central axis of the diameter of the pipe. Wyes, tees, and bends are included in this measurement.

C. Pipe-Arches
   The overall length of pipe-arch installed is measured in linear feet (meters), along the bottom center line of the pipe.

D. Multiple Installations
   In multiple installations, each single line of culvert structure is measured separately.

E. Tapered Pipe Inlets
   Tapered pipe inlet sections are measured as a unit; do not include them in the overall length of the pipe.

F. Flared-End Sections
   Flared-end sections are measured separately by the unit and not included in the overall pipe length.

G. Smooth-Flow Pipe
   Smooth-flow pipe is measured by the linear foot (meter) along the pipe invert.

H. Elliptical Pipe
   Elliptical pipe is measured in linear feet (meters) along the bottom center line of the pipe.

I. Video Inspection
   Video Inspection is measured by the linear feet of quantity of pipe inspected. When inspection above the quantity specified in the Contract is performed due to the possibility of additional distresses or non-compliance noted by the Department and the pipe is found to be in compliance, the Department will measure this quantity as Extra Work as per Specification 104.04. However, if additional distresses are found, the additional linear feet of video inspection will not be measured for payment.

J. Deduction for Pipe Deflection
   Quantity of deflected pipe will be determined using the pipe inspection summarization report in accordance with GDT 136. Deductions will be made for pipe sections that do not meet the requirements of this specification in accordance with the table in sub-section 550.5.01. The section length is determined by the length of the pipe between joints where the failure occurred.

550.4.01 Limits
   Excavation and normal backfill are not measured for payment.

550.5 Payment

A. Backfill
   Foundation backfill material Type II and III will be paid for according to Section 207.
   Foundation backfill material Type I will be paid for according to Section 205 or Section 206.
   Graded aggregate used for structural backfill of thermoplastic pipe will not be paid for separately, payment will be included in the overall price bid for pipe.
B. Pipe Installations

Pipe installations complete in place and accepted will be paid for at the Contract Price for each item. This payment is full compensation for excavating, furnishing, and hauling materials; installing, cutting pipe where necessary; repairing or replacing damaged sections; making necessary connections; strutting, elongating, providing temporary drainage; joining an extension to an existing structure where required; and removing, disposing of, or using excavated material as directed by the Engineer.

1. Smooth Flow Pipe
   The quantity of each diameter and steel thickness of smooth flow pipe as measured will be paid for at the Contract Unit Price per linear foot (meter) bid for the various sizes. Payment is full compensation for furnishing labor, materials, tools, O-ring mechanical joints, equipment, and incidentals to complete this Item, including removing and disposing excavation material.

2. Flared-End Sections
   Flared-end sections, measured as specified above, will be paid for at the Contract Unit Price for each section of the specified size.

   Payment will also include sawing, removing, and replacing existing pavement removed to install a new drainage structure.

   Payment for this item is made as follows:

   One hundred percent of the Contract Price bid per linear foot (meter) is paid when the pipe is installed per the specifications including the required material documentation. The Contract Price is paid before post installation inspection.

C. Video Inspection

Include the cost of Video Inspection in the bid submitted for this pay item. Video Inspection will be paid for up to the maximum number of linear feet included in the contract. Testing performed by a company failing to meet the requirements of GDT 136 will result in non-payment of the pipeline video inspection and non-certification of the pipe tested.

D. Temporary Drainage

Temporary Drainage items will be paid for at 75% of contract price for each item when installed. The final 25% will be paid when the temporary drainage item is removed or filled with flowable fill as specified in the plans.
payments will be made under:

   ASTM D 1622
   APHA 426 D

551.1.03 Submittals
General Provisions 101 through 150.

551.2 Materials
A. Cans
   Place cans of smooth or corrugated steel pipe over piling. Use cans thick enough to prevent buckling while placing and compacting earth-stabilized embankment. Coat both inside and outside of the cans with either of the following:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>2P Coating</td>

</tr>
</tbody>
</table>

B. Backfilling Cans
   Use aggregate for the backfilling of cans according to Section 801 or Section 806.
C. Corrosion Inhibitor (Grease)

Use grease that conforms to the following requirements.

<table>
<thead>
<tr>
<th>Requirement</th>
<th>ASTM Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Drop point 350 °F (175 °C) minimum</td>
<td>ASTM D 1241</td>

<tr>
<td>Nitrates, 10 PPM maximum</td>
<td>ASTM D 992</td>
</tr>
<tr>
<td>Sulfides, 10 PPM maximum</td>
<td>APHA 426 D</td>
</tr>
</tbody>
</table>

D. Polyurethane Foam

Use foam approved for commercial use in Georgia that meets the following requirements:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>ASTM Standard</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum density 1.5 lbs./ft.³ (24 kg/m³)</td>
<td>ASTM D 1622</td>
</tr>
<tr>
<td>Compressive strength perpendicular 16 psi (110 kPa) @ 6 percent</td>
<td>ASTM D 1621</td>
</tr>
</tbody>
</table>

E. Polypropylene Fluted Sheets

Use plastic cardboard ultra-violet stabilized sheets that are at least 48 in. (1.2 m) long. Score or grease sheets to fold around piling and into H-pile web. When adding sections, use at least a 3 in. (75 mm) (shingle style) overlap.

F. Duct Tape

Use duct tape to patch and secure plastic cardboard and polyurethane. Keep duct tape from grease or pile. Use duct tape in sandy backfill to seal overlaps and prevent sand infiltration.

551.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

551.3 Construction Requirements

551.3.01 Personnel

General Provisions 101 through 150.

551.3.02 Equipment

General Provisions 101 through 150.

551.3.03 Preparation

General Provisions 101 through 150.

551.3.04 Fabrication

General Provisions 101 through 150.

551.3.05 Construction

When the plans require, protect end bent piles from negative skin friction by using one of the following methods.
Section 551 — Pile Protection in Earth Walls

A. **Method A**

   After driving the end bent piles and before installing the earth reinforcing elements:
   
   1. Place a cylindrical can over each pile to prevent the earth wall backfill material from contacting the pile. Use a can large enough in diameter to give a 1 in. (25 mm) minimum clearance from the pile to the inside of the can.
   
   2. Place a spacer between the pile and the can to prevent the can from contacting the pile during wall backfilling. Extend the cans from the bottom of the earth-stabilized backfill to the bottom of the bridge end bent cap.
   
   3. After positioning the cans, seal them at the top while backfilling to keep rubbish or aggregate out of the can. Keep the cans sealed until fill settlement time has expired.
   
   4. When the wall backfill has reached the bottom of the cap and fill settlement time has expired, fill the cans with aggregate.

B. **Method B**

   Cover the piles with the following amounts of corrosion-inhibiting grease as follows:
   
   - Steel piling = 1/16 in. (2 mm) minimum
   - Concrete piling = 1/4 in. (6 mm) minimum

   1. Apply grease only after driving the piles. Treat only the pile portion that will be in contact with the wall backfill.
   
   2. In addition to the grease, install a urethane or polypropylene sleeve to protect the grease coating from the backfill.
   
   3. Use spray-on or preformed sleeves. Replace portions of the sleeve damaged or removed by construction activities during backfill.

551.3.06 **Quality Acceptance**

General Provisions 101 through 150.

551.3.07 **Contractor Warranty and Maintenance**

General Provisions 101 through 150.

551.4 **Measurement**

No separate measurement for payment will be made of the materials and labor required to conform with this specification.

551.4.01 **Limits**

General Provisions 101 through 150.

551.5 **Payment**

No separate payment will be made for pile protection. Include all costs incurred in complying with this specification in the price bid for the piling.

551.5.01 **Adjustments**

General Provisions 101 through 150.
Section 555—Tunnel Liner

555.1 General Description
This work includes:

- Driving a tunnel
- Furnishing and installing steel plates for tunnel liner
- Furnishing and erecting brick portals to close each end of the tunnel, when required
- Pressure grouting

Construct to Plan line, grade, and dimensions, according to the applicable specifications.

555.1.01 Definitions
General Provisions 101 through 150.

555.1.02 Related References
A. Standard Specifications
   Section 608—Brick Masonry

555.1.03 Submittals
A. Special Permit Application
Before working with explosives, apply to the Department for a special permit. This permit will be in addition to a tunneling permit not involving explosives.

Special permits will be issued when the proposed operational procedures outlined in the permit form are submitted and approved.

B. Design Data
For Projects not under Contract to the Department but are being performed under permit, the owner shall submit complete design data including working or Shop Drawings for approval before receiving the permit. Include the following applicable design data:

- Design data as required by AASHTO LRFD Road Tunnel Design and Construction Guide Specification
- Subsoil surveys, including the elevation of the water table and the classification and relative density of the soils from the ground line to 3 ft. (1 m) below the tunnel liner
- Rock coring data, including rock type and core recovery, where required
- Water control plans, where required
Section 555 — Tunnel Liner

C. Repair Plan

If tunneling damages the roadway, submit a roadway repair plan for approval.

555.2 Materials

Ensure that materials meet the following requirements:

<table>
<thead>
<tr>
<th>Material</th>
<th>Specification Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Liner Plates</td>
<td>ASTM: A 569/A 569M</td>

</tr>
<tr>
<td>Brick for Portal</td>
<td>608</td>
</tr>
<tr>
<td></td>
<td>834.2.01</td>
</tr>
</tbody>
</table>

A. Liner Plates

Construct the completed liner with a series of steel liner plates assembled with staggered longitudinal joints and fabricated to fit the tunnel cross section.

1. Characteristics

   Use hot-dipped galvanized, bituminous-coated steel of the size, thickness, and sectional modulus specified. Use plates made of hot-rolled, cold-formed steel that conform to ASTM A 569/A 569 M. Use plates with the following mechanical properties before cold forming:
   - Tensile strength = 42,000 psi (290 MPa)
   - Yield strength = 28,000 psi (190 MPa)
   - Elongation, 2 in. (50 mm) = 30 percent

2. Grout Intrusion Nipples

   Provide grout intrusion nipples 2 in. (50 mm) or larger in diameter in the top plates at intervals 10 ft (3 m) or less. This will permit grouting while the tunnel liner is erected. For larger tunnels, or where conditions make more grout openings advisable, install additional plates with nipples at the top quarter points and/or on each side between the top openings. Stagger these additional openings but keep the distance between them 10 ft. (3 m) or less in any one line.

3. Flanged Joints

   Form plates to provide circumferential flanged joints. Use longitudinal joints that are flanged or offset lap seam type.
   - Punch plates for bolting on both longitudinal and circumferential seams or joints.
   - Space bolts in circumferential flanges according to the manufacturer’s standard spacing. Space bolts a multiple of the plate length so that plates with the same curvature are interchangeable and will permit staggering of longitudinal seams.

4. Longitudinal Seams

   For lapped longitudinal seams, ensure that bolt size and spacing is according to the manufacturer’s standard, but meets the longitudinal seam strength requirements of Section 12 of the AASHTO LRFD Bridge Design Specifications. Galvanizing Bituminous Coating and Bolts shall be in compliance with applicable information in Section 844.
B. Grout

Use grout that consists of:

- One-part Portland cement
- Two parts masonry lime
- Four parts mortar sand
- Two percent of an approved admixture, (i.e., Bentonite, Septamine Stearex, or Hydrocide Liquid)
- A retardant, where required

Use enough mixing water to produce a workable mixture of grout capable of being pumped into the voids created by tunneling.

C. Brick

Brick for portal shall conform to Section 608 and Subsection 834.2.03.

555.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

555.3 Construction Requirements

555.3.01 Personnel
General Provisions 101 through 150.

555.3.02 Equipment

A. Pumping Equipment

Provide pumping equipment for grouting operations. Use equipment with enough pump horsepower and grouting line pressure to completely fill voids without buckling or shifting the liner plates or damaging the roadway.

B. Water Control

When water control is required, operate well points or other drainage systems in the vicinity of the tunnel construction limits.

555.3.03 Preparation
General Provisions 101 through 150.

555.3.04 Fabrication
General Provisions 101 through 150.

555.3.05 Construction

Excavate the tunnel using any of the following procedures:

- Full face
- Heading and bench
- Multiple drift

Do not use a full or partial shield, a tunneling machine, or other equipment that exerts a force on the liner plates to propel, steer, or stabilize the equipment.

Prevent the overpassing roadway or railway section from settling when constructing tunnels by using:

- Poling plates
- Brest boards
- Shields
- Soil solidification
- A combination of these methods
A. Installation of Liner Plates

Use the same type of liner plates for the full length of the tunnel. Flanged and lapped seam methods of construction are acceptable.

1. General
   Install self-supporting steel liner plates according to the manufacturer’s recommendations. Do not leave more than 5 ft. (1.5 m) of tunnel unlined while tunneling. Do not leave more than 1 ft. (300 mm) of tunnel unlined at the end of the day’s operation.

2. Sealing
   Before grouting tunnel liner segments, seal that segment sufficiently between the liner plates and the surrounding soil to retain the grouting pressure. Place the seals in these locations:
   - At the tunnel entrance
   - Between grout intrusion nipples
   - Within 1 ft. (300 mm) of the end of the tunnel

3. Pressure Grouting
   Pressure grout voids in the area outside the plates every 10 ft. (3 m) at the end of the work shift. Grout more frequently if soil conditions dictate.

4. Repair
   Repair damaged spelter coating according to Section 645. Replace plates with damaged spelter or bituminous coatings at no additional cost to the Department if the Engineer determines they cannot be repaired.

B. Safety

Schedule the Work to avoid interfering with or endangering traffic flow on the highway or railway. Follow required safety measures specified in the Manual on Uniform Traffic Control Devices.

1. Begin tunneling at one end of a pit that has been sheeted and shored as necessary. Comply with Section 615. Perform work below the level of the roadbed.

2. Complete tunneling at one location before beginning work at another.

3. If the Engineer determines that tunneling is endangering overpassing roadway or the traveling public, stop tunneling until making the necessary corrections.

4. Provide a well-braced, temporary bulkhead against the face of the excavation when work stops while the heading is within 20 ft. (6 m) of railroad tracks or highway pavement.

5. If distress occurs to roadway due to tunneling, the Contractor shall submit for approval a plan to repair the roadway.

C. Portals

Close tunnel portals at each end using a three-course mortared brick wall according to Plan details. Erect one of the three courses inside the liner.

555.3.06 Quality Acceptance

Ensure that the tunnel has a diameter essentially the same as the outside diameter of the liner plates.

555.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.
Section 555 — Tunnel Liner

555.4 Measurement
Tunnel liner installed according to the approved design and these Specifications is measured by the linear foot (meter) complete in place. The liner is measured between the ends of the liner along the invert.

555.4.01 Limits
Portals are not measured for separate payment.

555.5 Payment
This Work, measured as specified above, will be paid for at the Contract Unit Price bid per linear foot (meter) of liner for each diameter and plate thickness. The specified thickness is used for either a two-flange plate or a four-flange plate.

This payment will be full compensation for:

- Furnishing materials, labor, tools, and equipment
- Removing and satisfactorily disposing of all excavated materials
- Force grouting
- Providing tunnel portals, where required
- Restoring and cleaning, including regrassing, as required
- Installing liner

Payment will be made under:

<table>

555.5.01 Adjustments
General Provisions 101 through 150.
Section 560—Structural Plate Pipe, Pipe-Arch and Arch Culverts

560.1 General Description
This work includes furnishing and installing structural plate pipe, pipe-arch, and arch culverts. Use the type of structural plate structure shown on the plans.
Install structures according to the specifications and to plan details, or as directed by the Engineer.

560.1.01 Definitions
General Provisions 101 through 150.

560.1.02 Related References
A. Standard Specifications

</tr>
</tbody>
</table>

560.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

560.3 Construction Requirements

560.3.01 Personnel
General Provisions 101 through 150.
Section 560 — Structural Plate Pipe, Pipe-Arch and Arch Culverts

560.3.02 Equipment
General Provisions 101 through 150.

560.3.03 Preparation
Prepare structure excavation and foundation according to Section 207.
Before installing structural plate pipe, pipe-arch, or arch culverts, shape their foundation material as shown on the plans.

560.3.04 Fabrication
General Provisions 101 through 150.

560.3.05 Construction
A. Drainage
Provide necessary temporary drainage.
Immediately remove debris or silt that constricts the flow through a structural plate pipe, pipe-arch, or arch culvert to maintain drainage throughout the life of the Contract.

B. Protection and Repair
Before allowing traffic over a culvert, provide compacted backfill of a depth and width to protect the structure. Repair and correct damage or displacement from traffic, erosion, or negligence at no additional cost to the Department.

C. Installation
Erect structural plate pipe-arches and arches in the sequence recommended by the manufacturer.
1. Bolts
   Tighten the bolts only after erecting the whole structure. Set bolts using drift pins or bars to line up the holes. Tighten bolts with torque wrenches to at least 150 ft.-lbf. (200 N·m), but not more than 200 ft.-lbf. (270 N·m) of torque.
2. Repair
   If there are damaged spots in the galvanized coating of the pipe, pipe-arch, or culvert where the base metal is exposed, repair according to Section 645.
   If there are damaged spots in the bituminous coating of the pipe, pipe-arch, or arch culvert where the base metal is exposed, repair by recoating with asphalt before backfilling the structure.
3. Elongation
   Elongate structural plate pipe as shown on the Plans. Have the vertical axis of the pipe elongated in the shop. Ensure that when erection is complete, the elongated axis is in a vertical position.

560.3.06 Quality Acceptance
Clean all structures before final acceptance of the work.

560.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

560.4 Measurement
A. Excavation and Backfill
   Backfill materials Types II and III are measured according to Subsection 207.4, Measurement.
B. Circular Pipe (All Types)

The overall length of circular pipe in place and accepted is measured in linear feet (meters) along the central axis of the pipe diameter.

C. Pipe-Arches

The overall length of pipe-arch in place and accepted is measured in linear feet (meters) along the bottom center line of the pipe-arch.

D. Multiple Installations

In multiple installations, each single line of culvert structure is measured separately.

E. Arch Culverts

Arch culverts of the dimensions and materials shown on the Plans, complete in place, are measured as a unit that includes necessary foundations, walls, and wings.

560.4.01 Limits

Excavation and normal backfill are not measured for payment.

560.5 Payment

A. Backfill

Backfill will be paid for according to Section 207.

B. Structural Plate Pipe, Pipe-Arch, and Arch Culvert

Structural plate pipe and pipe-arch installations, complete in place and accepted, will be paid for at the Contract Price per linear foot (meter). Arch culvert installations, complete in place and accepted, will be paid for per Lump Sum. This payment will be full compensation for the Item, including:

- Excavating
- Furnishing and hauling materials
- Installing
- Cutting pipe where necessary
- Repairing or replacing damaged sections
- Making connections, strutting and elongating
- Providing temporary drainage
- Joining an extension to an existing structure, where required

Payment will also be full compensation for removing, disposing, or using excavated materials as directed by the Engineer.

Payment will be made under:

</tbody>
</table>

560.5.01 Adjustments

Excavation will not be paid for separately, but all of the other provisions of Section 205 and Section 208 shall govern.
561.1 General Description
This work includes furnishing and inserting helically corrugated metal pipe, smooth-lined corrugated polyethylene pipe, high density polyethylene profile wall pipe, and high-density polyethylene solid wall pipe or a polyvinyl chloride pipe inside an existing metal pipe and pressure grouting the space between the two pipes.

561.1.01 Definitions

</tbody>
</table>

*Use Georgia Standard 1030D to determine the metal thickness of the insert pipe.

**For this Work, use agricultural lime that has 90 percent minimum passing the No. 30 (600 µm) sieve and 30 percent minimum passing the No. 200 (75 µm) sieve.

A. High Density Polyethylene (HDPE) Profile Wall Pipe

Use pipe liner that consists of a HDPE profile wall pipe that conforms to the requirements of ASTM F 894. Polyethylene material shall have polyethylene pipe liners material designation of PE 3408 and shall have a material cell classification per ASTM D 3350 of 334433C or higher.

Join HDPE profile wall pipe liner by thermal fusion (extrusion welding) per manufacturer specifications or provide a positive mechanical joint that meets the requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation.

B. High Density Polyethylene (HDPE) Solid Wall Pipe

Pipe liner shall consist of a HDPE solid wall pipe that conforms to the requirements of ASTM F 714 with an SDR of 32.5. Polyethylene material shall have polyethylene pipe liners material designation of PE 3408 and shall have a material cell classification per ASTM D 3350 of 345464C.

Join HDPE solid wall pipe liner by butt fusion per ASTM F 2620 and the manufacturer specifications or provide a positive mechanical joint that meets the requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation.

C. Polyvinyl Chloride (PVC) Pipe

Pipe liner shall consist of PVC corrugated pipe with a smooth interior that conforms to the requirements of ASTM F 949. PVC pipe shall have a minimum pipe stiffness of 46 psi (317 kPa) when tested according to ASTM D 2412. Use pipe made of PVC compound with a cell classification per ASTM D 1784 of 1245B.

Join the PVC pipe liner with a PVC coupling that uses elastomeric sealing gaskets. The assembled joint shall meet the performance requirements of ASTM D 3212. The joint shall be able to be pulled or pushed into the host pipe without joint separation. Ensure that elastomeric seals meet the requirements of ASTM F 477.

D. Grout Mixtures

Mix water with the dry ingredients to produce a grout with an efflux time from the flow cone of at least 16 seconds and no more than 22 seconds when tested according to GDT 84.

Add cement, cement and limestone dust, or cement and fine aggregate to the batch proportions to produce the required consistency.
Table of Grout Mixtures

561.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

561.3 Construction Requirements

561.3.01 Personnel
General Provisions 101 through 150.

561.3.02 Equipment
A. Batching
   Use weight hoppers and scales for each dry material or calibrated volumetric batch hopper. Calibrate volumetric batch hoppers in increments equivalent to one 94 lb. (42.6 kg) bag of cement.
B. Mixing
   Use a watertight batch-type mixer capable of blending the various materials into a homogenous mixture.
C. Grout Pumping
   Use a positive-displacement, piston-type pump or a screw-type worm pump equipped with the following:
   - Discharge line with a positive cut-off valve at the nozzle end and a by-pass return line to recirculate the grout back into a holding tank or mixer
   - A nozzle or device at the end of the discharge line that will remain secure in the 1 in. (25 mm) grout pipe and free of leaks
D. Pulling
   Provide equipment capable of pulling the new helically corrugated metal pipe.

561.3.03 Preparation
General Provisions 101 through 150.

561.3.04 Fabrication
General Provisions 101 through 150.

561.3.05 Construction
A. Grout Mixtures
   Use the Table of Grout Mixtures in Subsection 561.2.D, Grout Mixtures.
Section 561 — Renovating Existing Pipe

B. Installation

Install pipe liner according to the manufacturer’s guidelines and as specified in the plans, with the following requirements:

1. Clean and inspect the existing pipe before pulling or pushing the new pipe through.
2. Use a nose cone on all on all pipe liners. The nose cone shall have enough strength to withstand pulling or pushing of the new pipe liner. Weld or bolt the nose cone to the end of the liner. Use a nose cone that includes a ring for attaching the pulling cable.
3. After pulling or pushing the new pipe through the old one, plug the space between the pipes at both ends with concrete or mortar. Insert a 1 in. (25 mm) grout pipe with threaded ends on the outside into the tops of the plugs at both ends of the pipes, and screw on a threaded cap.
4. After the pipe plugs have been in place long enough to develop strength to withstand pressure grouting, remove the grout pipe caps. Connect the grout pump to the downstream grout pipe and pump grout into the void until it flows freely from the upstream grout pipe.
5. After pumping is complete, replace the grout pipe caps.

561.3.06 Quality Acceptance
General Provisions 101 through 150.

561.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

561.4 Measurement
Renovating existing pipe is measured by the linear foot (meter) of the specified diameter of new pipe installed.

561.4.01 Limits
General Provisions 101 through 150.

561.5 Payment
Renovating existing pipe will be paid for at the Contract Unit Price bid per each diameter and metal thickness of new pipe. This payment will be full compensation for completing all work described in this Section, including cleaning and restoring damaged areas.

Payment will be made under:

| Item No. 561 | Renovating existing pipe____ in. (mm) diameter | Per linear foot (meter) |

561.5.01 Adjustments
General Provisions 101 through 150.
Section 570—Minor Drainage Structures for Detours

570.1 General Description
This work includes selecting, constructing, and maintaining minor structures used on detours for cross drains or side drains. Remove these structures when the detour is no longer needed.

This Item covers only the use of minor structures. When the plans call for constructing, maintaining, and removing a detour bridge, apply Section 541.

570.1.01 Definitions
General Provisions 101 through 150.

570.1.02 Related References
A. Standard Specifications
Section 541 — Detour Bridges

B. Referenced Documents
AASHTO HS-15

570.1.03 Submittals
If using a bridge-type structure instead of one or more pipes, present plans of the proposed structure to the Engineer for approval before beginning construction.

570.2 Materials
All selected materials are subject to the following requirements:

A. Bridge-Type Structure
Ensure that each bridge-type structure roadway width is at least 2 ft. (600 mm) greater than the approach pavement width or 24 ft. (7.2 m), whichever is greater. Ensure that load capacity is equivalent to AASHTO HS-15. Provide suitable hub guards and handrails.

B. Pipe Culvert
Use pipe culverts long enough to accommodate the detour grade and cross section shown on the plans.

570.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

570.3 Construction Requirements
570.3.01 Personnel
General Provisions 101 through 150.

570.3.02 Equipment
General Provisions 101 through 150.

570.3.03 Preparation
General Provisions 101 through 150.
570.3.04 Fabrication
General Provisions 101 through 150.

570.3.05 Construction
Have the Engineer approve selected construction methods.

Use structures that have adequate openings and are suitable for the purpose intended. Unless otherwise modified by a special provision, provide for an uninterrupted flow of traffic over the existing highway or the completed detour, as the case may be. Assume all risks involved in the design, construction, maintenance, and removal of each structure, including any damage from any cause.

570.3.06 Quality Acceptance
General Provisions 101 through 150.

570.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

570.4 Measurement
The entire structure at the location specified is measured for payment. Multiple lines of pipe used instead of a bridge-type structure or a single larger diameter pipe is considered one structure.

570.4.01 Limits
General Provisions 101 through 150.

570.5 Payment
This Item will be paid for at the Lump Sum price bid for each structure. This price includes the materials, labor, equipment, and small tools necessary to construct, maintain, and remove the structure and to dispose of the materials. Upon removal, materials become the property of the Contractor.

Sixty percent of the Lump Sum price will be paid when the structure is complete in place. The remaining 40 percent will be paid when the maintenance period is complete, the structure removed, and the materials disposed of.

Payment will be made under:

| Item No. 570 | Construct, maintain, and remove detour drainage structure no. | Per lump sum |

570.5.01 Adjustments
General Provisions 101 through 150.
Section 572—Slope Underdrains

572.1 General Description
This Work consists of the construction of slope underdrains, including placement of Geogrid reinforcement, Geocomposite wall drains, plastic filter fabric and other materials in slope excavations or fills where encountering high groundwater. Perform this Work in accordance with the Specifications and details, lines and grades shown on the Plans, or as directed by the Engineer.

572.1.01 Definitions
General Provisions 101 through 150.

Use approved geocomposite wall drain listed on QPL 47.
See QPL 28 for acceptable woven fabrics that meet the requirements of this Specification.
572.3 Construction Requirements

572.3.01 Personnel
General Provisions 101 through 150.

572.3.02 Equipment
General Provisions 101 through 150.

572.3.03 Preparation
General Provisions 101 through 150.

572.3.04 Fabrication
General Provisions 101 through 150.

572.3.05 Construction

Arrange the work schedule so that the slope underdrain installations will coincide with other operations on the Project in a manner that will prevent damage to completed work or may cause and/or allow soil contamination of materials.

A. Excavation
Excavate in accordance with the details and elevations shown on the Plans or to an additional depth as directed by the Engineer to intercept the water-bearing strata encountered during construction. Begin the excavations with the topmost bench and proceed to the bottom of the slope. Excavate as necessary to provide continuous slope underdrain coverage from the top of the water-bearing strata to the bottom of the slope. When encountering unstable conditions in the bottom of the excavation, remove unstable material as directed by the Engineer and replace with approved granular material and compact so as to provide a stable foundation for the excavation and placement of pipes.

B. Placement of Geocomposite Wall Drains
Place the Geocomposite wall drains the full height and width of the vertical bench cuts and secure the drains with metal staples or wooden stakes. Do not allow any horizontal joints or splices to remain in the drains. Abut adjoining drain strips to make vertical joints between drain strips.

C. Placement of Plastic Filter Fabric
Place plastic filter fabric of sufficient length to cover the drainage aggregate at the bottom of the bench excavation adjacent to the geocomposite wall drain. Overlap the fabric with a minimum of 3 feet (914 mm) of material. Sewing of the fabric will not be required. The fabric may be cut at the locations of the solid underdrain pipe to allow for wrapping around the drainage aggregate.

D. Placement of Pipe and Aggregate
Place perforated pipe continuous with the bench excavation adjacent to the Geocomposite wall drain in accordance with the details shown on the Plans. Place solid pipe at 200-foot (61-meter) intervals with a minimum of 2 solid pipes at each bench excavation, joined to perforated pipe with “T” connections. Connect all joints securely. Place drainage aggregate to a level of 6 inches (152 mm) above the pipes without disturbing the pipe alignment. Wrap the plastic filter fabric over the drainage aggregate prior to backfilling with soil.

E. Backfilling and Placement of Geogrid Reinforcement
Place soil to be used as backfill material with the same lift and compaction requirements as normal embankment construction. Do not disturb the pipe alignment. Place layers of Type B geogrid reinforcement 4 feet (1.22 m) long beginning at a level 2 feet (600 mm) above the bottom of each bench, and at 1-foot (300 mm) intervals thereafter as each bench excavation is backfilled.

F. Markers
Mark each outlet end of the drainage pipe in accordance with Plan details.
Section 572 — Slope Underdrains

G. Protection from Contamination

Protect all materials from contamination by foreign matter. In the event that the drainage aggregates, plastic filter fabric or Geocomposite wall drains become contaminated, remove the contaminated portion and replace with clean material at no additional cost to the Department. Placement of soil backfill over the fabric is incidental to the Work and is not considered to be contamination.

H. Type B Concrete Flume

After the slope is backfilled, construct a Type B concrete flume at each solid drain location as indicated on the Plans. Extend each flume from the topmost solid drain pipe to the bottom of the slope.

572.4 Measurement

Slope underdrains will be measured for payment by the linear foot (meter) of accepted perforated underdrain in place at each bench excavation. No separate measurement will be made for bench excavation, drainage aggregate, Geocomposite wall drain, solid drain pipe, connections, geogrid, plastic filter fabric, or backfill required by the Plan Details. Additional depth bench excavation required beyond the limits of the Plan details and directed by the Engineer will be measured according to Subsection 205.4 of the Specifications. No separate measurement will be made for disposing of any unsuitable material encountered. Replacement material will not be measured separately. When the contract includes Item 210-Grading Complete, additional depth bench excavation required beyond the limits of the Plan details, and as directed by the Engineer, will be measured according to Subsection 210.4.C. of the Specifications. No separate measurement will be made for backfilling the additional depth bench excavation.

572.5 Payment

Slope underdrains will be paid for at the Contract Price per linear foot (meter), complete and in place. Payment is full compensation for excavation, furnishing all materials, including drainage aggregate, Geocomposite wall drain, solid drain pipe, perforated drain pipe, connections, geogrid and plastic filter fabric, backfill, placing all materials and for all labor, equipment, tools and incidentals necessary to perform the Work. Payment for concrete flumes will be according to the Plans. Additional depth bench excavation required beyond the limits of the Plan details, and as directed by the Engineer, will be paid for at the Contract Price per cubic yard for Unclassified Excavation. When the contract includes Item 210-Grading Complete, additional depth bench excavation will be paid for according to Subsection 210.5.C, Undercut Excavation.

Payment will be made under:

</table>

573.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

573.3 Construction Requirements

573.3.01 Personnel
General Provisions 101 through 150.

573.3.02 Equipment
General Provisions 101 through 150.
573.03 Preparation
General Provisions 101 through 150.

573.04 Fabrication
General Provisions 101 through 150.

573.05 Construction
Schedule the work so that underdrain installations coincide with other operations on the project to prevent conflict, damage, or infiltration of materials.

A. Excavation
To intercept water-bearing strata, excavate according to the details and elevation shown on the plans, or to an increased depth if the Engineer directs.

When the material in the bottom of the trench is unstable, remove unstable material, add approved granular material, and compact to provide a stable foundation for the pipe.

B. Laying Pipe
Lay pipe according to plan details with the perforations on the underside of the pipe, unless otherwise directed by the Engineer.

1. Lay bell and spigot and tongue and groove pipe with the bell or grooved end upstream and the bells embedded in the foundation material.
2. Firmly connect the joints.
3. Connect pipe and butt joints securely, using the appropriate size and type of band or coupling.
4. Install the following miscellaneous items as indicated on the plans or otherwise specified:
   - Pipe screens
   - Caps
   - Plugs
   - Ells
   - Wyes
   - Tees
   - Markers

C. Backfilling
After laying the pipe, place drainage aggregate in 6 in. (150 mm) layers. Compact each layer thoroughly until reaching the total plan depth. Do not disturb pipe alignment.

D. Marking
Mark each outlet end of the drainage system according to plan details.

E. Protecting from Contamination
Protect the filter material from contamination by foreign matter.

1. Particular attention must be given to the top surface of the filter blanket when it will be covered by an aggregate drainage course. Soil infiltration from placing soil courses over the filter material is incidental to the Work and is not considered contamination.
2. If aggregates become contaminated, remove the contaminated portion and replace it with clean filter material before placing succeeding layers of filter blanket or placing aggregate drainage course.

573.06 Quality Acceptance
General Provisions 101 through 150.
573.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

573.4 Measurement
The quantity of underdrain pipe with or without drainage aggregate, complete in place and accepted, is measured in linear feet (meters) along each line or lateral, from center to center of junctions and fittings.

573.4.01 Limits
When the trench is required to be undercut, the depth measurement for determining the underdrain pipe payment will be from the bottom of the required undercut to the final elevation established for the top of the trench.

573.5 Payment
Each size of underdrain pipe will be paid for at the Contract Price per linear foot (meter) as follows:

A. Underdrain Pipe Only
   Payment for pipe under this Item will include:
   • Ground preparation
   • Excavation
   • Backfilling
   • Disposal of surplus material
   • All appurtenances required to complete the Item including screens, tees, wyes, ells, and markers

B. Underdrain Pipe Including Drainage Aggregate
   Payment for pipe under this Item will include specified drainage aggregate and all items listed under Subsection 573.5.A above.

   Underdrain pipe including drainage aggregate to depths greater than 6 ft. (1.8 m) below the final elevation established for the top of the trench will have an adjusted Unit Price. This price will be computed by increasing the Contract Unit Price by a percentage based on the extra depth as follows:

<table>
<thead>
<tr>
<th>Depth Range</th>
<th>Adjustment</th>
</tr>
</thead>
<tbody>
<tr>
<td>From over 6 ft. (1.8 m) to and including 8 ft. (2.4 m)</td>
<td>At contract price plus 20 percent</td>
</tr>
<tr>
<td>Over 8 ft. (2.4 m) deep</td>
<td>By supplemental agreement or force account</td>
</tr>
</tbody>
</table>

C. Contaminated Aggregate
   Removal and replacement of contaminated aggregate will not be paid for separately but will be included in the Bid Price for underdrain pipe.

   Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 573</th>
<th>Description</th>

574.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.
Section 574 — Edgedrains

574.3 Construction Requirements

574.3.01 Personnel

General Provisions 101 through 150.

574.3.02 Equipment

General Provisions 101 through 150.

574.3.03 Preparation

Before placing edgedrains, pressure grout and cure pavement slabs in the immediate area. Do not begin work until the Engineer determines that pavement slabs are stable.

574.3.04 Fabrication

General Provisions 101 through 150.

574.3.05 Construction

Complete any opened trenches, including the asphalt cap, each working day. Install edgedrains with other operations on the Project to prevent conflict, damage, or improper infiltration of other materials.

A. Excavating

Excavate according to the details and elevations shown on the plans or as directed by the Engineer.

B. Placing Filter Fabric

Place filter fabric according to plan details.

If the drainage aggregate or the filter fabric become contaminated or the filter fabric is damaged during the backfilling operation, remove the contaminated or damaged materials and replace them at no additional cost to the Department.

C. Laying Pipe

Lay pipe according to the plan details, with perforations on the underside of the pipe, unless otherwise directed by the Engineer.

1. Lay bell and spigot and tongue and groove pipe with the bell or grooved end upstream and the bells embedded in the foundation material.

2. Firmly connect the joints.

3. Connect butt joint pipes securely using the appropriate size and type of band or coupling.

4. Install the following miscellaneous Items according to the plans or as otherwise specified:
   - Pipe screens
   - Caps
   - Plugs
   - Covers
   - Ells
   - Wyes
   - Tees
   - Markers

D. Backfilling

After laying the pipe, place the additional backfill material in 6 in. (150 mm) layers.
1. Before compacting, establish the target density as 1.18 times the average of 5 dry-density determinations made on the material in the trench. Space the 5 determinations over at least 500 ft. (150 m) and determine them using the 6-in. (150 mm) direct transmission density mode according to GDT 59.

2. Thoroughly compact each layer to 100 percent of the target density and complete to the depth shown on the Plans, details, or as directed by the Engineer.

3. Do not disturb the pipe alignment or damage the filter fabric.

4. Place a compacted asphaltic concrete cap on the trench as shown in the Plan details or as directed by the Engineer.

E. Marking
Mark each outlet end of the drainage system according to plan details.

F. Protecting from Contamination
Protect the backfill material from contamination by foreign matter.
If aggregates become contaminated, remove the contaminated portion and replace it with clean material before placing succeeding layers.

574.3.06 Quality Acceptance
General Provisions 101 through 150.

574.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

574.4 Measurement
The quantity of edgedrain pipe, including backfill material and filter fabric, complete in place and accepted is measured in linear feet (meters) along each line or lateral, from center to center of junctions and fittings.

574.4.01 Limits
General Provisions 101 through 150.

574.5 Payment
Each size of edgedrain pipe will be paid for at the Contract Price per linear foot (meter).
Payment for pipe under this Item includes:

- Preparation
- Excavation
- Backfilling
- Specified backfill materials and filter fabric
- Disposal of surplus material
- Screens, tees, wyes, and ells
- The asphaltic concrete cap over the trench

Payment will be made under:

| Item No. 574 | Edgedrain pipe, including backfill material and filter fabric ___ in (mm) | Per linear foot (meter) |

574.5.01 Adjustments
General Provisions 101 through 150.
576.1 General Description
This work includes furnishing and installing slope drains made of corrugated steel pipe, corrugated aluminum pipe, or corrugated smooth-lined polyethylene pipe where shown on the plans.

576.1.01 Definitions
General Provisions 101 through 150.

576.1.02 Related References
A. Standard Specifications

Section 845—Smooth Lined Corrugated Polyethylene (PE) Culvert Pipe

B. Referenced Documents
General Provisions 101 through 150.

576.1.03 Submittals
General Provisions 101 through 150.

576.2 Materials
Ensure that materials meet the requirements of the following specifications:

<table>
<thead>
<tr>
<th>Material</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Corrugated Aluminum Alloy Slope Drain Pipe</td>
<td>840.2.02</td>
</tr>
<tr>
<td>Corrugated Steel Culvert Pipe</td>
<td>844.2.01</td>
</tr>
<tr>
<td>Corrugated Smooth Lined PE Pipe</td>
<td>845.2.01</td>
</tr>
</tbody>
</table>

Ensure that the nominal thickness of the metal for slope drain pipe conforms to the minimum thickness or gauge specified in the design tables, unless otherwise shown on the plans.

576.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

576.3 Construction Requirements

576.3.01 Personnel
General Provisions 101 through 150.

576.3.02 Equipment
General Provisions 101 through 150.

576.3.03 Preparation
Before placing the pipe, compact the foundation until firm and stable.
Section 576 — Slope Drain Pipe

576.3.04 Fabrication
General Provisions 101 through 150.

576.3.05 Construction
Place slope drain pipe in an open trench, excavated to the line and grade shown on the plans or as directed.
Lay pipe sections that have circumferential joints with the outside laps of the circumferential joints uphill.
After installing the pipe:
1. Immediately backfill the trench with excavated materials or other approved material.
2. Place backfill in layers 8 in. (200 mm) thick or less.
3. Compact each layer until firm and stable.

576.3.06 Quality Acceptance
General Provisions 101 through 150.

576.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

576.4 Measurement
Slope drain pipe is measured by the actual number of linear feet (meters) of the size installed and accepted.

576.4.01 Limits
General Provisions 101 through 150.

576.5 Payment
Accepted slope drain will be paid for at the Contract Price per linear foot (meter) for the size specified. This price includes full compensation for labor and incidentals necessary to complete the Item.
Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 576</th>
<th>Slope drain pipe ___ in. (mm)</th>
<th>Per linear foot (meter)</th>
</tr>
</thead>
</table>

576.5.01 Adjustments
General Provisions 101 through 150.
Section 577 — Metal Drain Inlets

577.1 General Description
This work includes installing metal drain inlets according to the specifications and plan details.

On Projects where the grading and paving are let simultaneously, the item will be designated as *Metal Drain Inlets — Complete Assembly*. For this type of construction, complete the Work in two stages. Perform Stage 1 Construction immediately after completing an embankment. Perform Stage 2 Construction progressively as the paved shoulders are completed.

On grading Projects where no paving is involved, limit the installations to Stage 1 Construction.

On paving Projects where the grading has been completed and metal drain inlets are in place under Stage 1 Construction, complete each assembly as specified under Stage 2 Construction.

577.1.01 Definitions
General Provisions 101 through 150.

577.1.02 Related References

</tr>
</tbody>
</table>

For asphalctic concrete spillways, use the mixture for asphalctic concrete curb.
577.3 Construction Requirements

577.3.01 Personnel
General Provisions 101 through 150.

577.3.02 Equipment
General Provisions 101 through 150.

577.3.03 Preparation
General Provisions 101 through 150.

577.3.04 Fabrication
Fabricate metal inlets as integral units to the shape and dimensions shown on the plans. The end section and reducer shall not be corrugated or perforated.

577.3.05 Construction
Install metal inlet drainage assemblies at locations shown on the plans or where directed by the Engineer. Locate inlets to avoid future installations such as guard rail posts and lighting standards.

A. Repair
Repair damaged galvanized coating according to Section 645.

B. Stage Construction
On combination grading and paving projects, install metal drain inlet assemblies in two construction stages as follows:

1. Stage 1 Construction
   As soon as the initial grading of an embankment is completed:
   a. Install metal drain inlets where shown on the plans or as directed by the Engineer. Each installation includes:
      - Metal inlet
      - Necessary slope drain pipe
      - Concrete aprons or rip rap as required by the Engineer, to control erosion at the outlet end
   b. To direct the water to the inlets, crown the roadbed and construct a roll of embankment material at the shoulder line. Protect and maintain this drainage system to prevent leakage, erosion, and scouring. Keep gutters, pipes, and inlets open.

2. Stage 2 Construction
   Complete this second stage operation immediately after paving shoulders to provide a complete drainage installation and prevent erosion of the embankment slopes. As soon as a section of paved shoulder is completed:
   a. Remove each adjacent inlet from its position placed under Stage 1 Construction and place it in its final position as shown on the Plans.
   b. Field cut a section of slope drain pipe to the required length to connect the existing slope drain pipe to the metal inlet in its new position.
   c. Thoroughly compact the embankment material around the inlet, including the subgrade under the asphaltic concrete spillway. Finish to a smooth, firm surface.
Section 577 — Metal Drain Inlets

d. Place the asphaltic concrete mixture for the spillway on the prepared subgrade within the temperature limits set by the Engineer. Thoroughly compact by rolling. Use a hand-operated roller weighing 300 lbs. (135 kg) or more or a small power roller satisfactory to the Engineer. When areas cannot be reached with rollers, compact them with vibratory tampers or hand tampers approved by the Engineer.

e. After compaction, ensure that the surface and texture is smooth, even, and dense. Shape and complete the shoulders and slopes to conform to the required finished section.

f. As soon as each drainage assembly is completed, place the asphaltic curb at the edge of the paved shoulder and connect it to the inlet as shown on the plans.

3. Metal Drain Inlet
Complete assembly construction of each metal drain inlet shall include both Stage 1 Construction and the Stage 2 Construction specified above.

577.3.06 Quality Acceptance
General Provisions 101 through 150.

577.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

577.4 Measurement

Each of the three different types of metal drain inlet installations is measured separately for payment, complete in place and accepted. In each instance, the 2 ft. (600 mm) section of corrugated pipe (which is an integral part of each Unit) is included in the measurement.

Measurement of each Metal Drain Inlet—Complete Assembly and each Metal Drain Inlet—Stage 2 Construction includes the asphaltic concrete spillway and the portion of asphaltic concrete curb included, within the limits of each inlet assembly, as shown on the Plans.

Measurement of each Metal Drain Inlet—Stage 1 Construction includes the integral drain unit and rip rap, earth roll, or other incidental construction necessary to direct water into the Inlet.

Other items of construction required in the work and eligible for payment such as slope drain pipe, asphaltic concrete curb, rip rap, and concrete aprons are measured for payment according to the applicable specification for such items.

577.4.01 Limits
General Provisions 101 through 150.

577.5 Payment

Each of the three types of metal drain inlet installation, measured for payment as described above, will be paid for at the Contract Unit Price per each.

Payment of each Metal Drain Inlet—Complete Assembly will include both the First Stage and Second Stage Construction outlined above.

When First Stage Construction is completed and the installation is satisfactory to the Engineer, 50 percent of the bid price for each such Unit will be included for payment on the next statement.

When the Second Stage Construction is completed and the installation is satisfactory to the Engineer, the remaining 50 percent of the Bid Price for each Unit will be included for payment on the next statement.

All other Items needed to complete the installation and that are eligible for payment will be paid for according to the applicable specification for such items.
Section 577 — Metal Drain Inlets

   A 709 Grade 50 (A 709M Grade 345)
   AASHTO LRFD Bridge Design Specifications
   AASHTO LRFD Bridge Construction Specifications

581.1.03 Submittals
Provide the following reports to the Project Engineer and the Office of Materials and Testing:

- Certified test reports
- Materials certificates
- Certificate of Compliance to conform with the requirements in this Specification
- Shop drawings
- Certification
Section 581 — Pot Bearings

A. Shop Drawings
Submit to the Engineer shop drawings and calculations for pot bearings for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper. The submission shall be prepared and stamped by the Design Engineer who shall be registered as a Professional Engineer in the State of Georgia.

Include the following on the drawings:

- Bearing plan and elevation
- Complete details and sections that show the materials incorporated into the bearing
- ASTM or other material designations
- Vertical and horizontal load capacity
- Rotation and translation capacity
- Compression stress on sliding surfaces and elastomeric surfaces at maximum and minimum design loads
- Complete design calculations
- Complete erection and installation procedure

B. Certification
Have the pot bearing manufacturer furnish the following to the Project Engineer and the Office of Materials and Testing:

- Certified test reports
- Material certificates
- Certificate of compliance to conform with these Specifications for each bearing furnished

581.2 Materials
Ensure that materials meet the requirements of the following Specifications:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expanded Mortar</td>
<td>506</td>
</tr>
<tr>

<td>852.2.02</td>
</tr>
<tr>
<td>Elastomeric Bearing Pads</td>
<td>885</td>
</tr>
<tr>
<td>Bearing Plates with PTFE Surfaces</td>
<td>887</td>
</tr>
</tbody>
</table>

A. Metals
Use the stainless-steel sliding surfaces indicated below:

- Stainless Clad Steel Plate: Minimum eight percent stainless steel conforming to the requirements of ASTM A 264 (both Shear Strength and Bond Strength tests in 8.13 and 8.14 of ASTM A 264 are required). Use stainless steel cladding that meets Type 304. Use backing steel (base metal) that meets ASTM Designation A 709 Grade 50W (A 709M, Grade 345 W).
- Stainless Steel Plate Welded to A Steel Backup Plate: Use at least 16 gage (1.6 mm) thickness of the stainless steel plate that meets ASTM 240 Type 304. Use steel backing plate that meets ASTM Designation A 709 Grade 50W (A 709M Grade 345W) unless otherwise indicated on the Plans. Use qualified welders to weld the stainless-steel plate to the steel backing. Furnish welding procedures and welder qualification documents to the Department for review and approval prior to fabrication. Weld entirely around the perimeter of the stainless-steel plate.
Section 581 — Pot Bearings

- Solid Stainless-Steel Plate: Mill-finish the stainless-steel sliding surfaces to a maximum surface roughness of 20 micro-inches (0.50 µm), RMS, according to the requirements of ANSI Standard B 46.1. Remove and replace, at no additional cost to the Department, bearing plates whose stainless-steel sliding surfaces have been scratched or damaged.

B. Structural Steel

Use structural steel for the masonry plates and the components of the bearings that meet the requirements of these ASTM Specifications:

- ASTM A 709, Grade 36 (ASTM A 709M, Grade 250)
- A 709, Grade 50 (A 709M, Grade 345)

Machine the base pot from a solid steel plate.

C. Anchor Bolts

Use anchor bolts, including nuts and washers, that meet the requirements of Subsection 852.2.02.

D. Elastomeric Material

Ensure that the elastomeric material used as the confined medium within the pot is 100 percent virgin chloroprene (“Neoprene”) that meets the requirements of Section 885. Ensure that the elastomer is a minimum Grade 2 and has a durometer hardness of 50 ± 5.

Ensure that the sealing rings for containing the elastomer in the pot bearings are as specified by the pot bearing manufacturer, and meet the following requirements:

- Made of brass or stainless steel
- Withstands and transmitting all imposed loading
- Allows free movement of the piston
- Contains the elastomer within the pot under the maximum static and dynamic loading
- Prevents contamination of the elastomer with foreign matter

E. Expanded Mortar

Set anchor bolts in preformed or drilled holes using expanded mortar that meets the requirements of Section 506.

F. Paint

Paint exposed steel of each bearing assembly other than stainless steel according to System VI of Section 535. Take care to keep Polytetrafluroethylene (PTFE) or sliding surfaces free of paint.

G. Design and Applicable Codes

Design, fabricate, and erect pot bearings according to these Specifications and the applicable requirements of the following Standard Codes and Specifications.

- Section 501, including supplements
- AASHTO LRFD Bridge Design Specifications
- AASHTO LRFD Bridge Construction Specification

Additional design parameters with which the pot bearing manufacturer must comply:

1. Bearing on Concrete: Maximum bearing pressure is as indicated in AASHTO.
2. Elastomeric Disc: Design compressive strength is 3,500 psi (25 MPa).
   a. Stainless Steel Sliding Surface: Accurate, flat surface with Brinell hardness of 125 minimum.
      1) Stainless steel sliding surface to completely cover PTFE surface in all operating positions of the bearing.
      2) Position the stainless-steel sliding surface so that the sliding movement causes the dirt and dust accumulation to fall from the surface of the stainless steel.
   b. PTFE Sliding Surface: Do not use holes of slots in the PTFE sliding surface.
c. Static Coefficient of Friction: Under a load of 3,500 psi (25 MPa), do not exceed 4 percent for unfilled PTFE nor 8 percent of filled PTFE surfaces.
d. Rotation: 0.015 radians.
e. Piston-Cylinder Clearance: Limit clearance to 0.30 in (7.6 mm). Use a brass or stainless steel sealing ring to prevent extrusion of the elastomeric material.

H. Substituted Bearings

Pot bearings with a design similar to that shown on the Plans may be used provided the bearings to be substituted are approved by the State Bridge Engineer and comply with the following:

1. Equal or better load carrying and moment capacity.
2. All control dimensions are maintained, and bearings fit within the limits of detailed masonry plate.
3. Use filled or unfilled (recessed) PTFE.
4. Piston-cylinder clearance is limited to 0.030 in. (0.76 mm) and a brass or stainless steel sealing ring shall be used to prevent extrusion of the elastomeric material.
5. Elastomeric material is used as a confined medium within the pot.
6. The elastomeric disc is lubricated by a means acceptable to the Engineer.
7. Do not use aluminum or aluminum alloy.
8. Equal or better than the pot bearings shown on the Plans in all structural respects and meets all design requirements.

581.2.01 Delivery, Storage, and Handling

A. Assembling and Marking

Have each pot bearing assembled at the plant, marked for identification, and delivered to the construction site as a complete unit.

Each bearing shall be marked with permanent match-marks to indicate the normal position of the bearing.

B. Transportation, Storage, and Handling During Construction

Follow these guidelines to transport, store, and handle pot bearings during construction:

1. Protect each pot bearing from dust and moisture.
2. Store the PTFE surface in the shade to avoid the damaging effects of ultraviolet rays.
3. Protect the pot bearings from damage during construction and prevent contamination of the various components of the pot bearings.

Ensure that the Fabricator also follows the above requirements.

During transportation and storage, cover the bearings with moisture-proof and dust-proof covers.
581.3 Construction Requirements

581.3.01 Personnel

A. Skilled Representative

Have the bearing manufacturer provide a skilled representative who is certified by the manufacturer to be experienced in similar installations.

The representative shall:

• Give aid and instruction during the pot bearing installation.
• Be present during the initial bearing installation.
• Be present during welding of the pots to the masonry plates, if not performed in the manufacturer’s shop.
• Remain on the job until the bearing installation proceeds without trouble and until the workmen are experienced with the work for each installation as determined by the Engineer.

Arrange to have the manufacturer’s skilled representative present whenever requested by the Engineer.

581.3.02 Equipment

General Provisions 101 through 150.

581.3.03 Preparation

General Provisions 101 through 150.

581.3.04 Fabrication

A. Polytetrafluoroethylene (PTFE)

Ensure that the PTFE, including its connection to its backup material, conforms with the requirements of Section 887, except as modified in this Specification.

Have the PTFE sliding surface bonded under factory-controlled conditions, or mechanically connect it to a rigid backup material that can resist bending stresses of the sliding surfaces.

As an alternate, PTFE material of twice the thickness specified above may be recessed for half its thickness in the backup material. Ensure that it is at least 1/8 in (3 mm) thick.

1. When shown on the Plans, weld the pot to the masonry plate before installing the elastomer.
   If welding procedures established and approved by the Engineer restrict the temperature of the bond area to no greater than 300 °F (150 °C), welding to steel plates with a bonded PTFE surface is permitted.
   Use temperature-indicating wax pencils or other suitable means to determine the temperature.

2. After fabricating the backup material, plane it before bonding the stainless steel or PTFE to a true plane surface.

3. Have the PTFE sheets bonded at the bearing manufacturer’s factory under controlled conditions according to the approved adhesive system manufacturer’s written instructions.

4. When epoxy bonding PTFE sheets, ensure that the side of the PTFE sheet to be bonded to the metal is factory treated by the sodium naphthalene or sodium ammonia process.

5. After the bonding operation, ensure that the PTFE surface is smooth, flat, and bubble free. Polish the filled PTFE surfaces.

6. Positively locate the elements of the bearing in the bearing manufacturing and assembling.

7. If using bearing other than those detailed on the Plans, obtain approval before constructing the substructure upon which the bearings will be installed.

8. Have each bearing assembled at the manufacturer’s plant, marked for identification, and delivered to the construction site as a complete unit.

Ensure that the bearings have permanent match-marks to indicate the normal position of the bearing.
581.3.05 Construction

A.  Erection

Place bearings at their proper locations before erecting the superstructure supported by the bearings.

1.  Install Pier Tops

Install pier tops horizontal at the correct elevation with a plus or minus tolerance of zero. Do not install the masonry plates until the Engineer accepts the pier tops.

2.  Install the Anchor Bolts

Cast anchor bolts in the concrete or set them in preformed holes, unless otherwise shown on the Plans. If setting them in preformed holes, fill the preformed holes in the concrete substructure with expanded mortar.

   a.  Insert the anchor bolts to the prescribed depth.

   b.  Place additional mortar as required in the annular space around the anchor bolts until the mortar is well packed and flush with the top surface of the concrete.

   c.  Wipe clean the exposed surfaces of the anchor bolts and substructure. Do not allow a load on mortar that has not been in place at least 7 days.

3.  Install Masonry Plates

Set the masonry plates to the proper elevation on the previously finished concrete pads.

4.  Install the Bearings

   a.  Place the bearing at the predetermined locations when erecting the superstructure.

   b.  Remove the temporary restraints as directed by the bearing manufacturer.

   c.  Adjust the bearings as follows:

      •  Adjust the expansion bearings from the normal position at 60 °F (15 °C) to allow for the ambient temperature during erection or casting.

      •  Adjust the pot bearings to allow them to move when dead loads are applied. Ensure that the bearing is properly positioned and parallel (free from rotation) after applying the dead load.

      •  Adjust the bearings horizontally on the masonry plate to properly fit the superstructure members being erected.

   d.  After adjustments and approval by the Engineer, weld the bearings to the masonry plate.

581.3.06 Quality Acceptance

Instruct the manufacturer to furnish facilities to test and inspect the completed bearings in the plant or at an independent test facility. An approved testing laboratory or the manufacturer supervised by an approved independent expert shall perform the testing.

Follow these testing guidelines:

•  Instruct the manufacturer to allow the Engineer and Inspectors access to the plant and test facilities.

•  Furnish certified test reports, materials certificates, and a certificate of compliance to conform with the requirements in the specifications.

•  Perform testing according to Section 887 and this Specification. The Department reserves the right to sample and test the material and pot bearing assemblies as shown in Section 106.

•  Test complete bearing assemblies or a specially manufactured pot bearing prototype that has a capacity of 400 kips (181 000 kg).

Successfully tested full-size bearings that meet the requirements of this subsection and have no damaged components, finishes, or surfaces may be used in construction. Provide prototype pot bearings, if used, at no additional expense to the Department.

Specific Items tested are as follows:

A.  Coefficient of Friction

Perform tests to determine the static coefficient of friction of the first movement under a load of 3,500 psi (25 MPa) on a piston area applied continuously for 12 hours before testing. Determine under a load of 2,000 psi (14 MPa) on a piston area the following:
Section 581 — Pot Bearings

1. The static coefficient of friction value shall not exceed 10 percent for filled PTFE surfaces and 6 percent for unfilled PTFE surfaces.

2. The first movement static and dynamic coefficient of friction at a sliding speed of less than 1 in. per min. (0.4 mm per sec). Values shall not exceed 10 percent for filled PTFE surfaces and 6 percent for unfilled PTFE surfaces.

3. The static and dynamic coefficient of friction is determined after the bearing is subjected to 100 design movements at a speed of less than 1 ft. per min. (5 mm per sec). Values shall not exceed those indicated in step 2 above. Signs of bond failure or other defects are cause for pot bearing rejection.

B. Proof Loading

Perform, under maximum design loads, proof loading and compression deflection tests on a full-size pot bearing.

C. Cold Flow

Subject an approved sample of filled PTFE or unfilled PTFE to a static pressure of 3,500 psi (25 MPa) for at least 24 hours. Ensure that the PTFE material is bonded or mechanically connected to its backup material in the same way as the pot bearing.

Apparent cold flow of the PTFE material is cause for pot bearing rejection.

581.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

581.4 Measurement
Pot bearing assemblies are measured by Lump Sum for each bridge. Determine the actual quantities required before submitting the bid.

581.4.01 Limits
General Provisions 101 through 150.

581.5 Payment
The work in this Specification will be paid for on a Lump Sum basis.

Payment is full compensation for:

- Furnishing materials and equipment including structural steel components of the bearings, masonry plates, top plates, sole plates, PTFE, elastomers, anchor bolts, and welding
- Designing the pot bearing
- Performing tests
- Furnishing prototype bearings and test samples
- Performing Work as described and specified in this Specification or the Plans
- Providing incidentals to complete the work

Payment will be made under:

| Item No. 581 | Pot bearings, bridge No.___ | Per lump sum |

581.5.01 Adjustments

Section 600—Controlled Low Strength Flowable Fill

600.1 General Description
This work consists of furnishing and placing ready-mixed or volumetric mixed Flowable Fill as an alternate to compacted soil as approved by the Engineer. Applications for this material include beddings, encasements, and closures for tanks and pipe, and general backfill for trenches and abutments.

600.3.03 Preparation
A. Mix Design

Flowable fill can be batched by ready-mix or volumetrically mixed on site.

Ready-mixed flowable fill is a mixture of Portland cement, fly ash, fine aggregate, air entraining admixture, and water. Ready-mixed flowable fill contains a low cement content for reduced strength development.

Volumetric mixed flowable fill is a mixture of Class C fly ash or Portland cement, Class F fly ash, and water mixed on site.

1. Submit mix designs for flowable fill to the Engineer for approval by the Office of Materials and Research. The following table lists mix design proportion ranges for excavatable and non-excavatable flowable fill:

</tbody>
</table>

*Amounts singly or in combination to make the mix yield one cubic yard (meter).

**Mix designs shall produce a consistency that will result in a flowable self-leveling product at time of placement.

***The requirements for percent air, compressive strength, and unit weight are for laboratory designs only and are not intended for jobsite acceptance requirements.
600.3.04 Fabrication
   A. Ready-Mixed
      Ensure ready-mixed flowable fill is manufactured at plants that qualify as approved sources according to the Standard Operating Procedure for Quality Assurance for Ready-Mix Concrete Plants in Georgia (SOP-10). Mix and deliver according to Subsection 500.2.01 of the specifications or other methods approved by the Engineer. Revolution counter requirements are waived.

   B. Volumetric Mixed
      Ensure volumetric mixed flowable fill is manufactured through the use of volumetric mixers according to Subsection 500.3.02 of the specifications or other methods approved by the Engineer.

600.3.05 Construction
   When using as backfill for pipe, where flotation or misalignment may occur, assure correct alignment of the pipe by using straps, soil anchors, or other approved means of restraint.

   Protect flowable fill from freezing for 36 hours after placement.

600.3.06 Quality Acceptance
   A. Jobsite Acceptance
      Acceptance of flowable fill is based on documentation as outlined in Subsection 500.1.03 of the specifications and a minimum temperature of flowable fill at the point of delivery of 50 °F (10 °C).

600.3.07 Contractor Warranty and Maintenance
   General Provisions 101 through 150.

600.4 Measurement
   Flowable fill will be measured for payment in cubic yards (meters) in place and accepted when shown as a pay item in the Contract. When flowable fill is not shown as a pay item, include the cost of the work in the bid price for the appropriate item.

600.4.01 Limits
   General Provisions 101 through 150.

600.5 Payment
   When shown as a pay item in the contract, flowable fill complete, in place and accepted will be paid for per cubic yard (meter).

   Payment will be made under:

   | Item No. 600 | Flowable fill | Per cubic yard (meter) |

600.5.01 Adjustments
   General Provisions 101 through 150.
601.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 602—Doublewal™ Precast Wall

602.1 General Description

This work includes the materials, manufacture, construction, measurement, and payment for Doublewal™ precast walls. The scope of work of the wall erection includes:

- Grading for wall construction
- Compacting the wall foundation (including areas underlying the footings and the precast modules)
- Dewatering (general and local) to execute the work properly
- Constructing footings
- Erecting precast concrete modules and caps
- Placing and compacting soils within the Doublewal™ modules
- Excavating and replacing unsuitable materials
- Constructing berms

Ensure that the architectural treatment of the modules is according to the plan details.

602.1.01 Definitions

Doublewal™—Doublewal™ is a trademark.

A. Shop Drawings

Submit Shop Drawings with each job to the Department for review and approval. The Shop Drawings shall be approved by the Department before beginning to fabricate the wall elements. Indicate on the Shop Drawings:

- General notes for constructing the wall
- Dimensions for the modules
- Fabrication tolerances
- Material requirements
- Reinforcing steel
- Module size markings that will agree with the wall designations on the construction plans
- Project construction number, Prime Contractor, and wall designation in the title block in the lower right corner of the sheet
- Summary of quantities that indicate the cubic yards (meters) of concrete and pounds (kilograms) of reinforcing steel in each module and unit of parapet and footing

602.2 Materials

A. Reinforcing Steel

Ensure that reinforcing steel conforms to Section 853.

B. Concrete

For precast modules and caps, use Class AAA concrete according to Section 500.

For footings, traffic barriers, and precast parapets use Class A cast-in-place concrete according to Section 500.

C. Joint Treatment

Follow these joint treatment requirements:

1. Cover the joints with plastic filter fabric between the modules on the back side of the front face of the wall and on the inside of the back of the wall. Use fabric that meets the requirements of Subsection 881.2.05. In floodplains, use only woven fabric 3 ft. (1 m) above and entirely below the 100-year flood elevations.

2. For bearing pads between the modules, use rubber pads that have a durometer hardness of 80+5. See Figure 1 (Figure 1 metric).

3. Place preformed cork that conforms to ASTM D 1752, Type II, adjacent to the key of transition modules as recommended by the Doublewal™ Corporation.

4. Ensure that the minimum width and lap of plastic filter fabric sheets are as follows:

<table>
<thead>
<tr>
<th>Joint Type</th>
<th>Minimum Width/Lap</th>
</tr>
</thead>
<tbody>
<tr>
<td>Vertical joints</td>
<td>12 in. (300 mm)</td>
</tr>
<tr>
<td>Horizontal joints</td>
<td>12 in. (300 mm)</td>
</tr>
<tr>
<td>Laps in fabric</td>
<td>44 in. (1.1 m)</td>
</tr>
</tbody>
</table>
D. Backfill
Use modular backfill materials within the rectangular cells of the Doublewal™ precast wall that meet the following requirements:

- Are free from organic or otherwise harmful material
- Conform to the following gradation limits:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 in. (100 mm)</td>
<td>100</td>
</tr>
<tr>
<td>2 in. (50 mm)</td>
<td>80 to 100</td>
</tr>
<tr>
<td>No. 10 (2.00 mm)</td>
<td>20 to 90</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>0 to 12</td>
</tr>
</tbody>
</table>

E. Drainage
Ensure that underdrain pipe meets the requirements of Subsection 573.2, *Materials*.
Ensure that filter fabric meets the requirements of Section 881.2.05.
Ensure that stone conforms to Subsection 806.2.01.
NOTE: Front face and rear face of modules shall be reinforced sufficiently to prevent cracking which might result from unequal distribution of bearing pressures. The reinforcing for the modules shall be as shown on the plans.

* 3/8 in thick x 5 in wide x L long rubber bearing pad
** 3/8 in thick x 5 in wide x L long rubber bearing pad to be used where module width transitions
*** 3/8 in thick x 5 in wide x L long rubber bearing pad

For length of bearing pad see shop drawings. Thickness may vary ± 1/8 in to account for leveling adjustments.
Section 602 — Doublewal™ Precast Wall

NOTE: Front face and rear face of modules shall be reinforced sufficiently to prevent cracking which might result from unequal distribution of bearing pressures. The reinforcing for the modules shall be as shown on the plans.

---

For length of bearing pad see shop drawings. Thickness may vary ± 3 mm to account for leveling adjustments.
Section 602 — Doublewal™ Precast Wall

F. Certification
Joint filler acceptance furnished for the work is based on Subsection 106.05, Materials Certification.

G. Bearing Pads
Use resilient, weather-resistant elastomer bearing pads. Use fiber reinforcement with rayon, nylon, and fiberglass or combinations of these fibers. The physical properties of the material are as follows:

- **Dimensions.** Ensure that dimensions are as detailed on the Plans. Various thicknesses may be required for leveling purposes.
- **Compression Modulus.** Ensure 1,200 psi (8 MPa) compression at less than 50 percent of the ultimate compressive strain. Determine compression on a 0.5 in. (13 mm) specimen.
- **Shear Modulus.** Ensure 500 psi (3.5 MPa) in direct shear while compressed and 1,200 psi (8 MPa) at 50 percent ultimate shear strain uncompressed. Determine shear on a 0.5 in. (13 mm) specimen.
- **Tensile Strength.** Ensure at least 400 psi (3 MPa) tested in transverse and longitudinal directions.
- **Property Retention.** Ensure heat aging at ASTM D 573 at 158 °F (70 °C) for 72 hours. Ensure change in tensile strength does not exceed 25 percent. Ensure change in elongation does not exceed 25 percent. Ensure no creep failure when stressed to the above maximum requirements for long periods.

Have the above properties certified according to Subsection 106.05, Materials Certification.

602.2.01 Delivery, Storage, and Handling
Safely handle, store, and ship modules and prevent damage to the module.

602.3 Construction Requirements

602.3.01 Personnel
The Contractor shall have Doublewal™, or its licensee, provide an Erection Supervisor who is thoroughly familiar with the Doublewal™ erection technique to assist the Contractor in erecting the Doublewal™ and verify that the Doublewal™ is erected properly.

602.3.02 Equipment
General Provisions 101 through 150.

602.3.03 Preparation
Make arrangements to obtain precast concrete modules and caps, joint materials, and the expertise to construct the Doublewal™ precast wall.

602.3.04 Fabrication

A. Reinforcing Steel
Have the reinforcing steel for precast modules and other components shop fabricated according to the requirements of the Doublewal™ Corporation.

B. Precast Concrete

1. Casting
   Perform casting according to the requirements of the Doublewal™ Corporation.
   a. Place the concrete in each unit without significant interruption.
   b. Consolidate the concrete by using an approved internal vibrator and external vibrators that are securely attached to the steel form.

2. Curing
   Cure the units as specified in Subsection 865.2.01.B.10 and long enough for the concrete to develop the specified compressive strength.
3. Removing the Forms
   Keep the forms in place until they can be removed without damaging the unit.

4. Concrete Finish and Tolerances
   Cast concrete surfaces for the front face against steel forms or architectural form liners if noted on the Plans.
   Ensure that the units are manufactured within the following tolerances:
   a. Keep all dimensions within 3/16 in. (5 mm).
   b. Keep deviation from the square measured on the diagonal to 5/16 in. (8 mm).
   c. Finish the bearing surfaces (top of the module’s front panel and back panel) to within 1/8 in (3 mm) when measuring with a 8 ft. (2.4 m) straightedge.
   d. Meet exposed surface tolerances as follows:
      1) **Smooth Finish.** Correct variations greater than 0.1 in. (2.5 mm) when tested with a 5 ft. (1.5 m) straightedge before moving the panel from the casting yard.
      2) **Other Finish Types.** Ensure that other finish types conform to approved samples displayed by the manufacturer.

5. Compressive Strength
   Perform compression tests to determine the minimum strength requirements on cylinders.
   a. Make at least three cylinders to determine when the units may be put into service from each day’s production.
   b. Cure the cylinders according to GDT 35.D.B.6.
   c. Ensure that the shipping strength is equal to the required 28-day strength.
   d. Make an additional 2 cylinders to determine 28-day strength for each day’s production or for each 50 yd³ (40 m³) of concrete placed, whichever amount of concrete is less.
      Cure according to GDT 35.D.B.6.
   e. Ensure that the 28-day compressive strength is at least 5,000 psi (35 MPa).
   f. Perform compressive strength tests according to AASHTO T 22.
      If the cylinder tests are questionable, take cores from modules at the manufacturer’s option and expense and use them to determine the 28-day strength.

6. Testing and Inspection
   Determine the acceptability of the precast units at the casting yard by performing compression tests and visually inspecting them during and after casting. Ensure the units conform with the specifications and drawings.
   The precast units are acceptable, regardless of curing age, when compression test results show that the strength will conform to 28-day specifications and all other requirements.
   Instruct the manufacturer to furnish the facilities and assistance to perform sampling and testing rapidly and satisfactorily.

7. Marking
   Mark each unit according to the requirements of the Office of Materials.

8. Repairs at the Plant
   Before shipment, concrete technical service personnel from the OMR and/or the plant’s certified personnel shall examine the surfaces of precast units for approval.
   The Engineer will inspect the surfaces at the job site. Patch honeycombing and other defects in the wall surfaces to the Engineer’s satisfaction.
9. Rejection

Units will be rejected if they do not meet the requirements in Subsection 602.3.04.B.4, Concrete Finish and Tolerances, Subsection 602.3.04.B.5, Compressive Strength, and any of the above paragraphs.

Units that are cracked or damaged, or do not meet tolerance requirements in this specification will not be allowed on the job site.

602.3.05 Construction

A. Foundation Bed

Excavate and compact the foundation bed for the Doublewal™ precast wall as required in this specification. Obtain the Engineer’s approval before beginning the erection.

B. Foundation

Cast the footings in place to the dimensions and details shown on the project plans. Construct the footings with or without forms. Strictly follow the top of footing elevations shown on the plans.

Before erecting the wall, compact the foundation area to at least 95 percent of maximum laboratory dry density specified in Subsection 208.3.05.B.2.c.

C. Wall Erection

Install the precast concrete module units according to the manufacturer’s recommendations as shown on the approved shop drawings.

1. Set the bottom course of units to true line and grade. Grade the foundation for the wall level with a width equal to the width of the lower course unit.

2. Remove and replace foundation soils that cannot sustain the required compaction as provided in this specification.

3. When placing the modules on the footing, do not vary from level the horizontal levelness from one module to another (measured on the top of the module’s front face and back face), by more than 1/8 in. (3 mm). Measure with a 10 ft. (3 m) straightedge and level.

4. Maintain this tolerance when placing additional layers of modules on the existing layer.

5. If leveling is required, use various thickness of bearing pads to level the module. Place these pads on the beam bearing pads. Do not allow the total thickness of the rubber bearing pads to exceed 0.75 in. (20 mm).

6. Interlock the modular units above the first course with lower courses. Stagger vertical joints with each successive course.

7. Ensure that the vertical joint opening on the front face of the wall does not exceed 0.75 in. (20 mm). Install joint treatment in the horizontal joints of both faces as in Subsection 602.2.C, Joint Treatment.

8. Ensure that the tolerances and alignment are according to the Department’s Specifications for concrete structures.

   - Vertical tolerances (plumbness) and horizontal alignment tolerances shall not exceed 3/8 in. (10 mm) when measured along a 8 ft. (2.4 m) straightedge.
   - Overall wall vertical tolerance (plumbness from top to bottom) shall not exceed 0.5 in. per 8 ft. (5 mm/m) of wall height, except for battered wall designs. In this case, the variation of the battered plane from the theoretical shall not exceed 0.5 in. per 8 ft. (5 mm/m) of wall.
   - The footing surface shall not vary from level more than 1/8 in. per 10 ft. (1 mm/m).

9. If repairs at the job site are necessary, have experienced personnel use methods and materials recommended by the manufacturer.

Perform patching only when the repaired area will conform to the balance of the work in appearance, strength, and durability. Repair to the Engineer’s satisfaction.
Section 602 — Doublewal™ Precast Wall

D. Modular Backfill Materials

Backfill each successive course of modular units.

1. Fill the rectangular cells of the Doublewal™ precast walls directly below the edge of the travelway with modular backfill material in two lifts or layers.
   a. Compact each layer to 95 percent of the maximum laboratory dry density.
   b. Fill the cells beyond step a above in one lift or layer and compact to 90 percent of the maximum laboratory dry density.

2. Place modular backfill material and embankment around the outside of the wall according to Section 208.

3. When erecting a wall, backfill behind the wall immediately after erecting successive courses of units. Do not allow the modular backfill material and the top of the last erected course to differ in elevation by more than 6 ft. (1.8 m).

4. Place the underdrain, if required, according to the plans and specifications. Include underdrain costs in the modular backfill material cost.

5. Ensure that the modular backfill material at bridge structures and extending for 100 ft. (30 m) from the lateral limits of the bridge, contains fines to fill the voids in the aggregate. Compact the aggregate material to at least 95 percent of the maximum laboratory dry density.

6. Place the modular backfill material in two lifts.

E. Storm Drains

Cast the appropriate storm drainage into wall modules at the elevation and locations indicated on drainage profiles. Construct the catch basin and place the storm drain in coordination with construction of the Doublewal™ precast wall.

F. Dewatering

Furnish, install, operate, and maintain dewatering systems as necessary to:

- Keep the site dry and workable
- Grade and compact the wall foundation
- Erect and backfill the wall

Ensure that these systems include equipment and materials and are continued as long as necessary. Include dewatering costs in the price bid for modular backfill material.

602.3.06 Quality Acceptance
General Provisions 101 through 150.

602.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

602.4 Measurement

When a Doublewal™ precast wall is built to plan dimensions, the plan quantities will be the pay quantities. When the Engineer changes the Plan dimensions during construction or when original Plans are in error, the revised plan quantities will be the pay quantities.

A. Excavation and Shoring

Excavation, including removing unstable material and shoring to construct a Doublewal™ precast wall will not be measured and paid for separately.
B. **Modules**

The area of modules, complete in place and accepted, are designated for payment by the surface area per square foot (meter) of the front face of each module width. The front face of the wall is the face exposed to view.

C. **Modular Backfill Material**

The modular backfill material used in the modules is designated for payment by the cubic yard (meter), complete in place.

Modular backfill material that extends beyond the width and height of modules is incidental. The cost will be included in the price bid for Contract Items.

Increases in foundation excavation from undercut ordered by the Engineer that requires modular backfill material to provide stability will be measured and paid for at the Contract Unit Price per cubic yard (meter) of modular backfill material.

Backfilling undercut areas with materials of grades at or lower than common excavation soils will not be measured or paid for separately.

D. **Concrete Footing**

The concrete footings will be measured for payment by the cubic yard (meter). This measurement includes steps and reinforcing steel indicated on the plans.

E. **Precast Barriers and Parapets**

The following Units, complete in place and accepted, will be designated on the Plans and measured and paid for at the Contract Unit Price bid per yard (meter) for each type Unit.

- Precast parapet A
- Precast parapet B
- Cast-in-place coping
- Cast-in-place traffic barrier A
- Cast-in-place traffic barrier B
- Precast traffic barrier B

This measurement also includes cast-in-place concrete and reinforcing steel to install the precast units as shown on the plans.

Use precast parapet B and cast-in-place traffic barrier B, or use precast traffic barrier B, whenever noise walls, light standards, or other appurtenances are mounted on top of the traffic barrier or parapet. Use precast parapet A and cast-in-place traffic barrier A or use precast traffic barrier B when no appurtenance is used on top of the parapet or traffic barrier.

**602.4.01 Limits**

General Provisions 101 through 150.
602.5 Payment

When the wall is built to Plan dimensions, the plan quantities will be the pay quantities. When plan dimensions are revised as directed by the Engineer, the wall will be paid for using the revised plan quantities. Payment is full compensation for fabricating, transporting, and erecting materials according to the plans and specifications.

No separate measurement or payment will be made for tools, supervision, labor, coatings, joint materials (including but not limited to cork, rubber pads, and filter fabric), site preparation, or other incidentals to perform the work.

The following items, when shown on the Plans, will be paid for according to the applicable sections of the project specifications:

- Concrete side barrier
- Sound barriers
- Light standards
- V gutters
- Guard rail
- Fencing
- Handrail

Sleeves for chain link fencing and anchor bolts for light standards and noise barriers, when installed on the wall shall be included in the price bid for wall items.

Modifications to accommodate drainage systems are incidental and shall be included in the price bid for wall items.

Payment will be made under:

602.5.01 Adjustments

General Provisions 101 through 150.
Section 603—Rip Rap

603.1 General Description
This work includes placing protective coverings of sand-cement bag rip rap or stone rip rap.
When required, this work includes placing crushed stone filter material or plastic filter fabric beneath stone rip rap on:
- Fill slopes
- Cut slopes
- End rolls
- Shoulders
- Ditches
- Stream banks
- Channel banks
- Other locations

*Except that up to 10% is allowed to pass the No. 4 (4.75 mm) sieve.

A. Bags for Sand-Cement Bag Rip Rap
Use cotton, burlap, or fiber reinforced paper bags that can contain the sand-cement mixture without leaking during handling and placing. Do not use bags that previously held sugar or other material that will adversely affect the sand-cement mixture.
Ensure that the capacity is at least 0.75 ft.³ (0.02 m³) but not greater than 2 ft.³ (0.5 m³).

B. Stone Dumped Rip Rap
Stone dumped rip rap is designated on the Plans as Type 1 or Type 3 as defined in Subsection 805.2.01.

603.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

603.3 Construction Requirements

603.3.01 Personnel
General Provisions 101 through 150.

603.3.02 Equipment
General Provisions 101 through 150.

603.3.03 Preparation
General Provisions 101 through 150.

603.3.04 Fabrication
General Provisions 101 through 150.

603.3.05 Construction
Construct this Work according to the following requirements:
A. Preparing the Foundations

Prepare the ground surface where the rip rap will be placed to conform with the correct lines and grades before beginning the placement.

1. When filling depressions, compact the new material with hand or mechanical tampers.
   Dispose of excess material by spreading it neatly within the right-of-way as an incidental part of the work.
2. Unless otherwise shown or provided below, begin placing the rip rap in a toe ditch constructed in original ground around the toe of the fill or the cut slope.
   Ensure that the toe ditch is 2 ft. (600 mm) deep in original ground and the side next to the fill or cut has the same slope.
3. After placing the rip rap, backfill the toe ditch and spread the excess dirt neatly within the right-of-way as an incidental part of the work.
4. When beginning rip rap in water or below normal water level, substitute an apron of rip rap for the toe ditch.
   Ensure that the width and thickness of this apron is as shown on the plans or determined by the Engineer.

B. Placing Stone Rip Rap

Place rip rap to the limits shown on the Plans or as directed by the Engineer. Place and classify rip rap as follows:

1. Stone Plain Rip Rap
   Dump and handle stone plain rip rap into place to form a compact layer to the design thickness.
   Ensure that the thickness tolerance for the course is plus 12 in. (300 mm) with no under-tolerance. If the plans do not show a thickness, place stone rip rap to at least 12 in. (300 mm) thick, but no greater than 2 ft. (600 mm) thick.

2. Stone Dumped Rip Rap
   Dump stone dumped rip rap into place to form a uniform surface as thick as specified in the Plans.
   a. Ensure that the thickness tolerance for the course is minus 6 in. (150 mm) and plus 12 in. (300 mm). If the plans or proposal do not specify a thickness, place the course to at least 2 ft. (600 mm) thick.
   b. Recycled concrete that meets the requirements of Subsection 805.2.01 may be used instead of stone when shown on the plans or approved by the Engineer.
      Use recycled concrete only when materials do not contain steel after processing.
      **NOTE: Do not use recycled concrete in aesthetically sensitive areas.**

3. Stone Grouted Rip Rap
   Place stone grouted rip rap according to specifications for stone plain rip rap and these guidelines:
   a. Prevent earth from filling the spaces between the stones.
   b. After placing the stone, fill the spaces between them with 1:3 grout composed of Portland cement and sand mixed thoroughly with enough water to make a thick, creamy consistency.
   c. Place the grout beginning at the toe. Finish it by sweeping with a stiff bristle broom.
   d. After grouting, cover the rip rap and keep it wet for 5 days, or cover and keep wet for 24 hours and then coat with white pigmented membrane curing compound.
C. Placing Filter

Place woven plastic filter fabric under all rip rap. Follow these requirements for placing the filter fabric:

1. Prepare the surface to receive the fabric until it is smooth and free from obstructions, depressions, and debris.
2. Place the fabric with the long dimension running up the slope. Minimize the number of overlaps.
3. Place the strips to provide a width of at least 1 ft. (300 mm) of overlap for each joint.
4. Anchor the filter fabric in place with securing pins of the type recommended by the fabric manufacturer. Place the pins on or within 3 in. (75 mm) of the centerline of the overlap.
5. Place the fabric so that the upstream strip will overlap the downstream strip.
6. Loosely place the fabric to prevent stretching and tearing during stone placement. Do not drop the stones more than 3 ft. (1 m) during construction.
7. Always protect the fabric during construction from clogging due to clay, silts, chemicals, or other contaminants.
8. Remove contaminated fabric or fabric damaged during installation or rip rap placement. Replace with uncontaminated or undamaged fabric at no expense to the Department.

D. Placing Sand-Cement Bag Rip Rap

Place rip rap to the limits shown on the plans or as directed by the Engineer.

1. Proportioning Materials
   a. Mix sand and Portland cement at the maximum ratio of 5:1 by weight.
   b. Obtain a minimum compressive strength of 500 psi (3 MPa) in 7 days.
   c. For sand-cement bag rip rap, use enough water to make up the optimum moisture content of the aggregate and cement as determined by AASHTO T 134.
   d. When sand-cement rip rap is to be prebagged, mix the sand cement dry. After placing each course, wet the bags until the bags are wet enough for proper cement hydration.

2. Placement
   a. Place the bagged rip rap by hand with the tied ends facing the same direction. Produce close, broken joints.
   b. Place header courses when directed by the Engineer or required by the plans.
   c. After placing the bags, ram or pack them against one another to produce the required thickness and form a consolidated mass.
   d. Do not allow the top of each bag to vary more than 3 in. (75 mm) above or below the required plane.

E. Placing Stone Blanket Protection

Ensure that the stone blanket protection meets the materials Specifications for stone filter blanket as specified in Subsection 603.2, Materials, except stone size No. 357 will be allowed instead of size No. 467.

Place stone blanket protection to the limits shown on the plans, or as directed by the Engineer.

Uniformly place this material to the thickness shown on the plans and to a thickness tolerance of 0.5 in. (± 15 mm).

Do not use stone blanket protection on slopes steeper than two horizontal to one vertical or in areas highly susceptible to erosion. Do not use plastic filter fabrics with stone blanket protection.

603.3.06 Quality Acceptance

General Provisions 101 through 150.

603.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.
603.4 Measurement
This work is measured for payment in square yards (meters) of accepted material of the specified thickness. Area measurements are made parallel to the surface on which the material is placed. Plastic filter fabric will be measured as the area of rip rap placed and accepted. No separate measurement will be made for fabric overlap joints, seams, or vertical sections at toe of slopes. No separate measurement is made for grout or cushioning sand.

Plan dimensions are figured by the use of filled bags 12 by 18 by 6 in. (300 by 450 by 150 mm) thick.

When filled bags are less than plan dimensions or are of varying lengths or width, plan square yards (meters) will be used to determine pay quantities, if overall dimensions are equal to or greater than those shown on the plans.

603.4.01 Limits
General Provisions 101 through 150.

603.5 Payment
This work will be paid for at the Contract Price per square yard (meter) of material complete in place.

Payment will be made under:

607.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

607.3 Construction Requirements

607.3.01 Personnel
General Provisions 101 through 150.

607.3.02 Equipment
General Provisions 101 through 150.

607.3.03 Preparation
General Provisions 101 through 150.

607.3.04 Fabrication
General Provisions 101 through 150.
607.3.05 Construction

Construct rubble masonry as follows:

A. Shaping the Stone

Roughly square the stones on joints, beds, and faces. At angles and ends of walls, use selected stone roughly squared and pitched to line. If specified, finish the corners or angles in exterior surfaces with a chisel draft.

Before laying the stone in the wall, shape and dress it so that it will not loosen after it is placed. No dressing or hammering which will loosen the stone will be permitted after it is placed.

B. Laying the Stone

1. Decrease the stone thickness from the bottom to the top of wall.
2. Ensure that the headers in the heart of the wall are the same size as shown in the face and extend at least 12 in. (300 mm) into the core or backing.
3. Ensure that headers in walls 2 ft. (600 mm) or less in thickness extend entirely through the wall. The headers shall occupy at least 20 percent of the face of the wall.
4. Lay the masonry to line and in roughly leveled courses. Ensure that the bottom of the foundation is large, selected stones.
5. Lay the courses with leaning beds parallel to the natural bed of the material.
6. Regularly diminish the thicknesses of the courses, if varied, from the bottom to the top of the wall. Keep a surplus supply of stones at the site to select from.
7. When mortar masonry is specified:
   a. Clean each stone and saturate it with water before setting it. Clean and moisten the bed that will receive it.
   b. Bed the stones in freshly made mortar with full joints. Carefully settle the stones in place before the mortar sets.
   c. Do not permit spalls in the beds. Ensure that the joints and beds have an average thickness of not more than 1 in. (25 mm).
   d. Ensure that the vertical joints in each course break with the adjoining courses at least 6 in. (150 mm).
   e. Do not place vertical joints directly above or below a header joint.
      If a stone is moved or if the joint is broken after the mortar has set, take the stone up and thoroughly clean the mortar from the bed and joints. Reset the stone in fresh mortar.
      Do not lay the masonry in freezing weather or when the stone contains frost, except by permission and subject to required conditions.

   NOTE: Do not lay the masonry in freezing weather or when the stone contains frost, except with permission.

   f. Whenever possible, properly point the face joints before the mortar sets. If joints cannot be pointed, rake them out to a depth of 1 in. (25 mm) before the mortar sets.
      Do not smear the stone face surfaces with the mortar forced out of the joints or the mortar used in pointing.

   g. Thoroughly wet the joints pointed after the stone is laid with clean water and fill with mortar.

   h. Drive the mortar into the joints and finish with an approved pointing tool.

   i. Keep the wall wet while pointing. In hot or dry weather, protect the pointed masonry from the sun and keep it wet for at least three days after the pointing is finished.

   NOTE: Do not perform pointing in freezing weather or when the stone contains frost.
j. After the pointing is completed and the mortar is set, thoroughly clean the walls and leave them in a neat condition.

8. Dry Rubble Masonry
   When laying dry rubble:
   a. Take care that each stone takes a firm bearing no less than in three separate points upon the underlying course.
   b. Ensure that face joints are no greater than 1 in. (25 mm) wide.
   c. Chink the open front and rear joints with spalls fitted to take firm bearing upon the top and bottom surfaces throughout the length of the stone.
   d. Fill the interstices in the heart of the wall with spalls. When specified, thoroughly slush the open joint on the rear surfaces with mortar to prevent water from seeping through the joints.

C. Weep Holes
   Provide adequate drainage for retaining walls with weep holes as shown on the plans or required by the Engineer.
   When backfilling at weep holes, build chimneys and French drains extending through the parts of the fill to be drained. The cost of chimneys, weep holes, and French drains is included in the Contract Price for rubble masonry.

D. Copings
   Use copings, bridge seats, and back walls made from the materials shown on the Plans. If not otherwise specified, they shall be Class A concrete.
   Make concrete copings in sections at least 12 in. (300 mm) thick and from 5 to 10 ft. (1.5 to 3 m) long, extending the full width of the wall. Cast the sections in place or precast and set them in place in free mortar beds.

607.3.06 Quality Acceptance
   General Provisions 101 through 150.

607.3.07 Contractor Warranty and Maintenance
   General Provisions 101 through 150.

607.4 Measurement
   This work is measured in cubic yards (meters) of accepted masonry. The dimensions shown on the plans shall be used except for changes made by the Engineer.
   Excavation for rubble masonry is not measured for separate payment.

607.4.01 Limits
   General Provisions 101 through 150.

607.5 Payment
   This work will be paid for at the Contract Price per cubic yard (meter) for mortar rubble masonry or dry rubble masonry complete in place.
   Payment will be made under:

608.3.04 Fabrication
General Provisions 101 through 150.
Section 608 — Brick Masonry

608.3.05 Construction

A. Brick Selection
   Select brick for exposed surfaces, corners, etc. from brick approved as to color and uniformity.

B. Laying Brick
   Follow these guidelines when laying brick:
   1. Saturate the brick with water before laying it.
   2. Lay the brick using the shove-joint method to bond it thoroughly into the mortar.
   3. Arrange headers and stretchers to bond the mass thoroughly.
   4. For straight masonry walls using stretcher courses, ensure that at least 1 course in 7 is a header course.
   5. Finish joints properly as the Work progresses. Create joints at least 0.25 in. (5 mm) but no more than 0.5 in. (15 mm) thick.

   **NOTE:** Do not use spalls or bats except to shape around irregular openings or to use at corners.

C. Observing Weather Limitations
   Do not lay brick in freezing weather or when the bricks contain frost, except with permission from the Engineer and when required.
   In hot and dry weather, protect the masonry and keep it wet for at least 48 hours after laying the brick.

D. Backfilling
   Do not place backfill against the masonry until it is at least 7 days old. During cold weather, the restricted period may be longer as directed.

608.3.06 Quality Acceptance
   All brick masonry shall present an even, uniform, neat, and workmanlike appearance.

608.3.07 Contractor Warranty and Maintenance
   General Provisions 101 through 150.

608.4 Measurement
   This work is measured for payment by one of the two methods specified below. The unit of measurement is stated in the Contract. Separate payment is not made for brick masonry used in catch basins, inlets, manholes, and similar items, which are measured and paid for per each.
   Excavation and backfill for this work are not measured for payment except as specified in Section 207. Mortar is not paid for separately, and the cost is included in the Contract Price for brick masonry.

A. Measurement by Cubic Meter
   When brick masonry is measured by the cubic yard (meter), the volume measured is the brick and mortar placed within the lines indicated on the Plans and typical cross sections or as directed by the Engineer.

B. Measurement by Number of Bricks
   When brick masonry is measured by the brick, the unit of measurement is each thousand (M) bricks and fraction placed within the lines indicated on the Plans and typical cross sections or as directed by the Engineer.

608.4.01 Limits
   General Provisions 101 through 150.
608.5 Payment
This work will be paid for at the Contract Price per cubic yard (meter) or per thousand (M) bricks for brick masonry complete in place.

Payment will be made under:

609.3.03 Preparation
General Provisions 101 through 150.

609.3.04 Fabrication
General Provisions 101 through 150.

609.3.05 Construction
The Engineer will determine which slabs to remove and replace and whether to use full or partial slab replacement.
A. Partial Slab Replacements

The Engineer will determine the limits of removal. Remove and replace at least 6 ft. (1.8 m) of slab measured longitudinally and 12 ft. (3.6 m) measured transversely.

Any slab removal beyond the limits determined by the Engineer will be at no additional cost to the Department for removal and replacement.

1. Saw the slab full depth longitudinally along the center-line joint and shoulder joint and transversely along the area marked for removal, including transverse joints where applicable.
   a. If approved by the Engineer, omit the shoulder joint cut if doing so does not damage the shoulder.
   b. If necessary and if approved by the Engineer, make additional cuts within the removal area to remove the damaged slab more easily.

2. Thoroughly remove saw slurry and other contaminants from the over-cutting beyond limits of the removal area. Repair by filling the overcuts with Type II epoxy adhesive that meets the requirements of Section 886. Clean and fill the overcuts as soon as possible, but no later than when the joints are sealed.

3. Remove the damaged slabs by lifting. Do not fragment the slabs for removal unless approved by the Engineer.

4. Drill holes in each slab section to accommodate the expanding type lift anchors. Remove sections nearest the centerline joint first to minimize damage to the shoulder.

**NOTE: During removal, avoid damaging the pavement base, shoulder, or sides that will not be removed.**

5. Repair the damaged shoulder area to the Engineer’s satisfaction at the Contractor’s expense.

6. If the adjacent concrete pavement is damaged during removal, enlarge the removal area to include the damaged sections of adjacent concrete.
   All applicable rules regarding the minimum size of remaining slab will apply as shown on the plans.
   Remove and replace additional slab lengths damaged from removing the initial slab at the Contractor’s expense.

7. Remove loose underlying base material to produce a sound, well-compacted base.

8. Thoroughly tamp the material loosened in the removal process to the Engineer’s satisfaction before replacing the slab.

9. Dispose of the slabs and underlying base material removed during this work.

10. Obtain the disposal site and necessary permits and agreements.

609.3.06 Quality Acceptance
General Provisions 101 through 150.

609.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

609.4 Measurement
Slabs and portions of slabs removed are measured by the square yard (meter) using the average squared dimensions. Removing underlying base material and cleaning and repairing overcuts is not measured for payment.

609.4.01 Limits
General Provisions 101 through 150.

609.5 Payment
Slabs and portions of slabs, measured as specified in Subsection 609.4, Measurement above, will be paid for at the Contract Unit Price bid. Payment is full compensation for sawing, cleaning, repairing over-cutting, and removing and disposing of the concrete and any underlying base material.
Section 609 — Removal of Portland Cement Concrete Roadway Slabs

Payment will be made under:

<table>

<th>Item No. 609</th>
<th>Remove roadway slab</th>
<th>Per square yard (meter)</th>
</tr>
</thead>
</table>

609.5.01 Adjustments

General Provisions 101 through 150.
Section 610—Removal of Miscellaneous Roadway Items

610.1 General Description
This work includes removing, salvaging, or disposing of items listed in the proposal as Pay Items to be removed, and backfilling the excavations made during removal.
Remove structures not separately listed as Pay Items in the Contract as specified in Sections 201, 202, or 205.

610.1.01 Definitions
General Provisions 101 through 150.

610.1.02 Related References
A. Standard Specifications
   Section 201—Clearing and Grubbing Right-of-Way
   Section 202—Random Clearing and Grubbing
   Section 205—Roadway Excavation
   Section 208—Embankments
   Section 540—Removal of Existing Bridge
   Section 611—Relaying, Reconstructing, or Adjusting to Grade of Miscellaneous Roadway Structures
B. Referenced Documents
   General Provisions 101 through 150.

610.1.03 Submittals
General Provisions 101 through 150.

610.2 Materials
610.2.01 Delivery, Storage, and Handling
A. Materials Retained by the Department
   Unless removed under Sections 201, 202, or 205, or unless otherwise provided for in the plans or proposal, carefully remove materials with a salvage value.
   1. Neatly stack or stockpile the materials along the right-of-way near the removal point and above high water.
   2. Store highway signs standing on edge and protected from the elements.
   3. Replace materials damaged, defaced, or destroyed by removing them carelessly at no cost to the Department.
   4. Notify the Engineer when the materials have been stockpiled and are ready to be transported.
   5. Keep materials secure and replace (at the Contractor’s expense) materials lost, stolen, or missing within a maximum of 10 days after the Engineer has been notified that the materials are ready to be transported.
B. **Materials Reused in the Work**

Maintain structures, portions of structures, and other materials to be salvaged and reused in reconstruction work.

Assume responsibility for the material until Project Final Acceptance.

Repair or replace materials lost or stolen before reuse at the Contractor’s expense.

Spread suitable surplus excavation material on the slopes of the roadway embankments. Otherwise, dispose of the waste materials off the right-of-way at the Contractor’s expense.

C. **Bridge Components**

Dispose of bridge components according to Section 540. Replace or repair at the Contractor’s expense structures, portions of structures, or materials to be salvaged, retained, or used in the reconstructed work but that were carelessly damaged or destroyed by the Contractor.

### 610.3 Construction Requirements

#### 610.3.01 Personnel

General Provisions 101 through 150.

#### 610.3.02 Equipment

General Provisions 101 through 150.

#### 610.3.03 Preparation

If removing a structure may endanger a new construction, finish that part of the work before beginning the new construction.

#### 610.3.04 Fabrication

General Provisions 101 through 150.

#### 610.3.05 Construction

A. **Protection of Remaining Structures**

Do not use explosives, equipment, or devices that may endanger structures, facilities, or other property to remain in place. If parts of structures are to remain in place, protect them from damage during construction. Protect and preserve the salvage value of materials to be salvaged.

B. **Extent of Removal**

Separate and remove existing structures, with their attached parts and connections, as shown on the plans or designated to be removed.

1. When a part of an existing structure is to remain in place, ensure that the part to be removed extends to a construction joint or is cut off to the lines shown on the Plans, leaving reasonably smooth faces.
2. Remove walls and other masonry construction to the bottoms of the foundations unless otherwise specified.
3. Remove walls and their foundations within the roadbed area to an elevation at least 3 ft. (900 mm) below the top of the finished subgrade, unless otherwise specified.
4. See Subsection 201.3.05.C.1.c, *Abandoned Obstructions*, for guidelines for rigid surfaces.

C. **Railway Tracks**

Removing railway tracks includes removing rails, ties, switches, towers, concrete structures, sign posts, and other related railway structures. Leave ballast in place, unless otherwise specified.
D. Inlets, Catch Basins, Manholes, and Culverts
   1. Remove gratings, traps, and other metal castings of inlets, catch basins, and manholes without damaging them. Reuse them on new structures or salvage them, whichever the Engineer directs.
   2. Remove old culverts down to the ground level or to the adjacent water level, unless otherwise shown on plans.
   3. Remove the bottom slabs of inlets, catch basins, manholes, and culverts. If the Engineer permits them to remain in place, break them up so that water will readily pass through them.

E. Removing Pipe
   Uncover the pipe to remove it without damage. Exercise care in removing the pipe. Replace pipe sections damaged by negligence at the Contractor’s expense.
   After removing the pipe, clean it and neatly stack it at points directed by the Engineer along the line of the work. Unless otherwise specified, the pipe is the property of the Department.

F. Septic Tanks
   When encountering septic tanks, completely remove the contents of each tank.
   1. Remove and dispose of the tank’s contents as required by the State Department of Health and local health authorities.
   2. Before backfilling the remaining portion of the septic tank, drill holes in the bottom of the tank or break it up as the Engineer directs, to permit drainage.

G. Backfilling
   Backfill trenches and other excavations dug for removing miscellaneous structures.
   1. Use approved materials in the backfill.
   2. Compact the backfill in layers no more than 6 in. (150 mm) thick and with the proper moisture content. Use pneumatic tampers or other approved equipment.
   3. Under the roadway, ensure that the degree of compaction conforms to Section 208. Elsewhere, compact the backfill equal to the soil surrounding it.

H. Structures to Remain
   Preserve unharmed the miscellaneous structures, including fences, buildings, pipe lines, pole lines, water and sewer lines, and other improvements that owners or the Department will retain or that others will remove.

I. Culverts to be Extended
   Where concrete culverts are to be extended, remove a minimum amount of concrete in parapets, wing walls, and wing wall footings to clear the new construction. Make the joint or connection as shown on the plans or as directed by the Engineer.

J. Fences
   When removing fences, do not allow livestock to escape. If fences are to be reset according to Section 611, protect the spelter coating of fence fabric, steel fence posts, and braces.
   The Engineer will require that reusable posts removed be clean and free of concrete. If desired, furnish new posts instead of cleaning the old ones at no additional cost to the Department.

K. Raised Edge Curb
   Remove raised edge curb to a reasonably true line at the elevation of normal finished pavement.
   If the average of the plus and minus deviations approximate the original normal edge of pavement, a tolerance of approximately 1 in. (25 mm) above or below this elevation will be accepted.
   Do not shatter pavement that will be retained.
Section 610 — Removal of Miscellaneous Roadway Items

L. Highway Signs
   Remove the entire sign from the supports and remove the supports from the concrete foundation.

M. Lighting Standards and Appurtenances
   Disassemble the lighting standard and separate each component part including the transformer base. Cut the underground duct before removing these items.

N. Removal of Existing Building Structures
   Demolish, remove, and dispose of all building structures within the right of way and easement areas including concrete slabs, footings, foundations, etc. as shown on the plans. Grade all disturbed ground to a reasonably smooth and pleasing appearance, free from loose boulders and other debris that would interfere with the use of power mowers. Grass all disturbed areas.

   Prior to demolition or removal:
   1. Inspect all building structures for the presence of asbestos. The inspection shall be done by an EPA Asbestos Hazard Emergency Response Act (AHERA) accredited inspector whose certification is current.
   2. Provide a copy of all inspection reports including the inspector’s credentials to the Engineer.
   3. Provide written notice of intent to demolish to the Georgia Environmental Protection Division (EPD) of the Georgia Department of Natural Resources in accordance with EPD regulations with a copy to the engineer. This notice is required even if there is no asbestos present.

   If there is asbestos present, its removal shall be done by a contractor licensed with the EPD in accordance with the Rules of Georgia Department of Natural Resource Environmental Protection Division chapter 391-3-14-04. All asbestos removal and disposal shall be done in accordance with EPD regulations. All asbestos removal shall be considered as Extra Work and payment will be made in accordance with Subsection 109.05.

610.3.06 Quality Acceptance
    General Provisions 101 through 150.

610.3.07 Contractor Warranty and Maintenance
    General Provisions 101 through 150.

610.4 Measurement
    Removing miscellaneous roadway items is measured to determine the Unit or Units of each type specified in the Proposal and on the Plans. Only when listed as a Pay Item in the Contract will a removed item be measured for separate payment.

610.4.01 Limits
    General Provisions 101 through 150.

610.5 Payment
    Removing miscellaneous roadway items will be paid for at the Contract Unit Price. Payment is full compensation for removing and disposing of the structures according to these specifications.

    Payment will be made under:

    | Item No. 610 | Remove_____ | Per unit shown in Proposal |

610.5.01 Adjustments
    General Provisions 101 through 150.
Section 611—Relaying, Reconstructing, or Adjusting to Grade of Miscellaneous Roadway Structures

611.1 General Description
This work includes relaying, reconstructing, resetting, adjusting to grade, capping minor structures, resetting guard rail, or adjusting other miscellaneous roadway structures as specified in the proposal or on the plans.

611.1.01 Definitions
General Provisions 101 through 150.

611.1.02 Related References
A. Standard Specifications
   Section 610—Removal of Miscellaneous Roadway Items
   Section 641—Guard Rail
   Section 668—Miscellaneous Drainage Structures
   Section 854—Castings and Forgings

B. Referenced Documents
   General Provisions 101 through 150.

611.1.03 Submittals
General Provisions 101 through 150.

611.2 Materials
Most materials for the work in this specification are salvaged from the removal of existing structures. The Engineer will determine the suitability of the salvaged material for use.

Use other materials to complete the structure, such as mortar, sand-cement grout, sand for sand cushion, bituminous filler, brick, and other materials that meet the requirements of the applicable specifications for such materials for use in new structures of the same character and type.

611.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

611.3 Construction Requirements

611.3.01 Personnel
General Provisions 101 through 150.

611.3.02 Equipment
General Provisions 101 through 150.

611.3.03 Preparation
General Provisions 101 through 150.

611.3.04 Fabrication
General Provisions 101 through 150.
611.3.05 Construction

A. Miscellaneous Roadway Items

Follow these procedures to construct miscellaneous roadway items:

1. Remove existing structures to be rebuilt according to Section 610.
2. Clean the material salvaged for use in the rebuilt structure and stockpile it in convenient places. Protect it from damage until it is used.
3. Dispose of the portions of structures not suitable for reuse as provided in Section 610. Replace them with suitable new material.
4. Relay or rebuild the structures according to the Specifications for new structures of the same type.
5. Adjust to the required grade miscellaneous structures specified in the proposal or on the plans by raising or lowering the upper portion of the fixture, including sleeve extensions, adjustable manhole rings, gaskets, mastic, mortar, masonry, and other material.
6. Furnish materials such as mortar, sand-cement grout, sand cushion, bituminous filler, brick, castings, and other materials to excavate, trench, prepare earth foundation, backfill, and other work necessary to complete the item.

B. Capping an Existing Structure

When capping an existing structure requires removing adjacent existing pavement, sidewalk, curb, gutter, or other improvement not otherwise affected by the work, follow these guidelines:

1. Remove the improvements to expose only the portion of the structure to be modified.
2. Replace the removed improvements to the Engineer's satisfaction without additional compensation.
3. Remove enough existing masonry to lower the top elevation to a point not less than the thickness of the cap plus 3 ft. (1 m) below subgrade elevation, unless otherwise indicated.
4. Cap the remaining portion of the structure with a fitted reinforced concrete cover constructed to the general details shown on the plans.

Grates, rings, plates, covers, hoods, or other castings or fittings removed while capping and not re-used become the property of the Department unless otherwise indicated on the plans.

C. Resetting Guard Rail

When resetting the guard rail is specified in the Proposal:

1. Reset guard rail removed according to Section 610 where the plan indicates and to the required post spacing.
2. Furnish materials, including additional hardware, offset blocks, and posts.
3. Replace posts that do not conform to the plans.
4. Follow the applicable provisions of Section 641.

D. Raising Manholes

When raising manholes:

1. Adjustments may be made by using adjustable extension rings that do not require removing the existing manhole frame.
2. Ensure that the extension device locks to the existing frame and permits height and diameter adjustment. The adjustable extension ring to be used shall have the Engineer's prior approval.
3. Choose an extension ring compatible with the existing casting and cover. Ensure that the adjustment range conforms to the finished pavement surface.
Section 611 — Relaying, Reconstructing, or Adjusting to Grade of Miscellaneous Roadway Structures

a. Use an adjustable extension ring made of materials that meet the requirements of Subsection 854.2.01 or are manufactured from ASTM A 36/A 36M steel and approved by the Office of Materials and Research.
b. Ensure that the extension ring and cover are machine ground to reduce contact irregularity. Ensure that the grates are rattle proof.
c. Obtain the Engineer’s approval for the type of adjustable extension ring used.

E. Replacing Fences
Replace fences removed under Section 610 in kind, using the removed materials as far as possible. Unless the Plans provide for new fence at the particular location, include new materials required in the Bid Price for resetting fence.

611.3.06 Quality Acceptance
General Provisions 101 through 150.

611.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

611.4 Measurement
Relaying, reconstructing, or adjusting to grade, capping minor structures, resetting guard rail, or adjusting other miscellaneous roadway structures is measured to determine the unit or units of each type completed and accepted.

Manhole tops to be raised or lowered 2 ft. (600 mm) or less are considered “Adjust to Grade.”

Manhole tops to be raised between 2 ft. (600 mm) and 6 ft. (1.8 m), or tops to be lowered more than 2 ft. (600 mm), are considered “Reconstruct Manhole” and are paid as shown in Subsection 611.5, Payment.

Remove manholes to be raised more than 6 ft (1.8 m) as clearing and grubbing and construct a new manhole in its place according to Section 668.

611.4.01 Limits
General Provisions 101 through 150.

611.5 Payment
Relaying, reconstructing, resetting, adjusting to grade, capping minor structures, resetting guard rail, or adjusting other miscellaneous roadway structures will be paid for at the Contract Unit price. Payment is full compensation for relaying, resetting, reconstructing, or adjusting to grade the structures as specified in this Specification.

Excavation and backfill necessary for capping is considered incidental to the Item and is not paid for separately.

Tapping a new pipeline into an existing structure is not considered reconstruction of the existing structure.

Payment will be made under:

611.5.01 Adjustments
General Provisions 101 through 150.
Section 612—Construct, Maintain, and Remove Median Crossover

612.1 General Description
This item includes constructing, maintaining, and removing median crossovers according to the plans.

612.1.01 Definitions
General Provisions 101 through 150.

612.1.02 Related References
A. Standard Specifications
   Section 700—Grassing
B. Related Documents
   General Provisions 101 through 150.

612.1.03 Submittals
General Provisions 101 through 150.

612.2 Materials
Furnish materials that meet the following requirements:

A. Drainage
   Use temporary drainage structures, if required, as shown on the plans or as directed by the Engineer. Use structures satisfactory for the required use. They do not have to be new.

B. Other Materials
   Ensure that other materials meet the applicable requirements of the specifications.

612.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

612.3 Construction Requirements

612.3.01 Personnel
General Provisions 101 through 150.

612.3.02 Equipment
General Provisions 101 through 150.

612.3.03 Preparation
General Provisions 101 through 150.

612.3.04 Fabrication
General Provisions 101 through 150.
612.3.05 Construction

A. Constructing the Crossover

Construct the crossover according to the details shown on the plans and these guidelines:

1. Place the materials to construct each crossover according to the applicable specifications and as directed by the Engineer.
2. Place and remove barricades and warning signs as directed by the Engineer.
3. When the Engineer determines that the crossover has served its purpose, remove and dispose of the materials, including temporary drainage structures used in its construction.
4. Reshape the area where the crossover was removed to comply with the appropriate typical section and grass the reshaped area.
5. Grass according to Section 700. Substitute loose sod if the Engineer approves.

612.3.06 Quality Acceptance

General Provisions 101 through 150.

612.3.07 Contractor Warranty and Maintenance

Maintenance includes, but is not limited to, filling washes as they occur and repairing defects in the pavement as directed by the Engineer.

612.4 Measurement

Median crossovers, constructed, maintained, and removed are measured by the individual unit.

612.4.01 Limits

General Provisions 101 through 150.

612.5 Payment

Crossovers measured as shown above will be paid for at the Unit Price for each crossover constructed, maintained, and removed. Payment is full compensation for:

- Earthwork, materials, pavement, drainage structures, signs, and barricades used and reused as directed on the plans.
- Removal and disposal of materials when the crossover is no longer needed
- Grassing or re-grassing of the disturbed areas

The first monthly statement following satisfactory construction will pay 75 percent of the Unit Price bid. The remaining 25 percent will be paid upon removal and restoration of the site.

Payment will be made under:

| Item No. 612 | Construct, maintain, and remove median crossover, station _____ | Per each |

612.5.01 Adjustments

General Provisions 101 through 150.
Section 613—Docks

613.1 General Description
This work includes constructing docks according to plan details and locations, maintaining the docks, and/or removing the docks as specified by the Engineer.

613.1.01 Definitions
General Provisions 101 through 150.

613.1.02 Related References
A. Standard Specifications
Section 863—Preservative Treatment of Timber Products
B. Referenced Documents
General Provisions 101 through 150.

613.1.03 Submittals
When the Proposal includes constructing docks, submit to the Engineer for approval three prints or a reproducible drawing showing the proposed construction details for each dock.

The Engineer will check the design and request changes to ensure the design conforms with the specifications and the intended purpose.

After making the required changes, resubmit the drawings to the Engineer for final approval. Do not begin work on the dock until the drawings receive the Engineer's final approval.

613.2 Materials
Ensure that dock timber (except timber used for handrails) is creosote-treated according to Section 863.

Piles for docks may be untreated, but they must be peeled and have a minimum 8 in. (200 mm) butt diameter. Use piles of a wood species that will withstand driving and will support the load required by the Engineer.

Nails and hardware do not need to be galvanized. Materials used to construct these expendable items will not be pre-inspected, sampled, or tested.

Replace, repair, or strengthen defective, worn, deteriorated, corroded, or unsatisfactory material according to Subsection 613.3.07.A, Dock Maintenance.

613.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

613.3 Construction Requirements

613.3.01 Personnel
General Provisions 101 through 150.

613.3.02 Equipment
General Provisions 101 through 150.

613.3.03 Preparation
General Provisions 101 through 150.
613.3.04 Fabrication
General Provisions 101 through 150.

613.3.05 Construction
Ensure that the dock is suitable for its intended purpose. Select construction methods approved by the Engineer.
Drive piling deep enough to provide a safe dock under weather and construction conditions peculiar to the project area.

613.3.06 Quality Acceptance
General Provisions 101 through 150.

613.3.07 Contractor Warranty and Maintenance
A. Dock Maintenance
Maintain the docks to the satisfaction of the Engineer. Follow these guidelines:

1. Immediately replace, repair, or strengthen defective, unduly worn, corroded, deteriorated, or otherwise unsatisfactory material at the Engineer’s request.

   **NOTE:** If repairs are not made promptly, the Engineer may make the repairs and have the costs deducted from the monies due the Contractor.

2. If the dock will not be removed as part of the Work, maintain it as directed by the Engineer to keep it in serviceable condition for future use before moving off the Project or relinquishing it to a subsequent Contractor.

3. When the dock was constructed for use on a previous project or Contract, assume responsibility for the dock and promptly restore and maintain it in a safe and satisfactory condition as directed by the Engineer. Maintain the dock for the duration of the Contract as directed by the Engineer.

B. Dock Removal
When the dock is no longer needed the Engineer will direct in writing to remove it. The salvaged material becomes the Contractor’s property.

613.4 Measurement
This work is not measured separately for payment.

613.4.01 Limits
General Provisions 101 through 150.

613.5 Payment
This item will be paid for according to the Plans, Proposal, and the following:

A. Construct, Maintain, and Remove Dock
After the dock is constructed satisfactorily, 50 percent of the Lump Sum price bid will be included in the next monthly statement.

If the dock maintenance is satisfactory, monthly increments of 35 percent of the Lump Sum price bid will be paid based on the percent complete of the Contract. When the dock is no longer required and has been removed, the remaining 15 percent of the Lump Sum price bid will be included in the next monthly statement.

Each dock, complete in place and accepted, suitably maintained until no longer needed, and satisfactorily removed, will be paid for at the Lump Sum price bid, which is full compensation for the Item.
B. **Construct and Maintain Dock**

After the dock is constructed satisfactorily, 60 percent of the Lump Sum price bid will be paid. If the dock maintenance remains satisfactory, the remaining 40 percent of the Lump Sum price bid will be paid in monthly increments based on the percent complete of the Contract.

C. **Maintain and Remove Dock**

When the dock was constructed for use on a previous Project or Contract as defined in Subsection 613.3.07.A.3, the Contractor who satisfactorily maintains and removes the dock will be paid 50 percent of the Lump Sum price bid in monthly increments based on the percent complete of the Contract.

When the dock is removed, the remaining 50 percent of the Lump Sum price bid will be paid on the next monthly statement.

D. **Maintain Docks**

When the Contractor assumes satisfactory maintenance of the dock as provided in Subsection 613.3.07.A, the Lump Sum price bid will be paid in monthly increments based on the percent complete of the Contract.

Payment will be made under:

   Section 847—Miscellaneous Pipe

B. Referenced Documents
   General Provisions 101 through 150.

615.1.03 Submittals
A. Handling Method
   Furnish for the Engineer’s approval, a plan showing the proposed method of handling, including:
   • Design for the jacking head, jacking support, or back stop
   • Arrangement and position of jacks, pipe guides, etc., complete as assembled

B. Welding Procedure
   Before welding steel pipe or ductile iron pipe as casing and carrier, submit to the State Materials and Research Engineer a written welding procedure. Include joint details, preheat temperature, and electrodes to be used. Do not use welded steel pipe as a sanitary sewer carrier.

615.2 Materials
Use pipe types and sizes that conform to the plans and the following:

General Provisions 101 through 150.

615.3.05 Construction
Dispose of the excavated material from the following jacking or boring operations or use it as directed by the Engineer at no additional cost to the Department.

A. Jacking
Follow these requirements when jacking:

1. Excavate suitable pits or trenches for the jacking operation and for placing the end joints of pipe, when required. Securely sheet and brace the pits or trenches to prevent caving, where necessary.

2. When installing pipe under railroads, highways, streets, or other facilities by jacking or boring, perform construction and prevent:
   - Interfering with the facility operation
   - Weakening the roadbed or structure

3. To force the pipe through the roadbed, use a jack with a head constructed to apply uniform pressure around the ring of the pipe.

4. Set the pipe to be jacked on guides, braced together to properly support the pipe section and to direct it to the proper line and grade.

5. Excavate the roadbed as follows:
   a. Excavate roadbed material just ahead of the pipe.
   b. Remove the excavated material through the pipe.
   c. Ensure that the excavation diameter conforms to the outside diameter and circumference of the pipe as closely as possible.

6. Force the pipe through the roadbed into the excavated space.

7. Use an approved mix to pressure grout voids that develop during installation and that the Engineer determines are detrimental to the work.

8. Ensure that the excavation does not extend beyond the pipe more than 2 ft. (600 mm). Decrease the distance at the Engineer's direction or if the character of the excavated material allows.

9. Jack the pipe from the low or downstream end. The line and grade from the pipe's final position established by the Engineer may vary no more than two percent in lateral alignment and one percent in vertical grade. Ensure that the final grade of the flow line is in the direction indicated on the plans.

10. Use a cutting edge around the head end. Extend it a short distance beyond the pipe end with inside angles or lugs to keep the cutting edge from slipping back into the pipe.

11. Once the pipe jacking has begun, proceed with the operation without interruption to prevent the pipe from becoming firmly set in the embankment.
12. Remove and replace pipe damaged in jacking operations at no additional expense to the Department.
13. After completing the jacking, immediately backfill the excavated pits or trenches.

B. Boring
Proceed with the boring from a pit provided for boring equipment and workmen. Complete these steps:
1. Excavate for pits and shoring installation as outlined above.
2. Locate the pit at the Engineer’s approval.
3. Bore the holes mechanically using a pilot hole approximately 2 in. (50 mm) in diameter that is bored the entire length of the installation.
   a. Check the pilot hole for line and grade on the opposite end of the bore from the work pit.
   b. Use the pilot hole to serve as the center line of the larger diameter hole to be bored.
4. Place excavated material near the top of the working pit and dispose of it as required. Use water or other fluids with the boring operation to lubricate the cuttings. Do not perform jetting.
5. In unconsolidated soil formations, use a gel-forming colloidal drilling fluid with at least 10 percent of high grade carefully processed bentonite to consolidate excavated material, seal the walls of the hole, and lubricate subsequent removal of material and immediate pipe installation.
6. Ensure that the diameter of the excavation conforms to the outside diameter of the pipe as closely as possible.
7. See Subsection 615.3.05.A, Jacking, for the allowable variation from line and grade.
8. Use an approved mix to pressure grout voids that develop during the installation operation and that the Engineer determines are detrimental to the Work.

615.3.06 Quality Acceptance
General Provisions 101 through 150.

615.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

615.4 Measurement
Pipe installed by jacking or boring is measured by the linear foot (meter) of pipe complete in place. Measurement is made between the ends of the pipe along the control axis as installed.

615.4.01 Limits
General Provisions 101 through 150.

615.5 Payment
Work performed and materials furnished as prescribed by this item and measured as provided above will be paid for at the Contract Price per linear foot (meter) for jacking and boring of the pipe type, size, and class specified. Payment is full compensation for furnishing the pipe and the incidentals to complete the Item.

Excavation will not be paid for separately but will conform to Section 205 and Section 208.

Payment will be made under:

| Item No. 615 | Jack or bore pipe (type), (class), (size) | Per linear foot (meter) |

615.5.01 Adjustments
General Provisions 101 through 150.
616.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 617—Permanent Anchored Walls

617.1 General Description
This work includes furnishing materials, labor, tools, equipment, and other incidental items to design, detail, and construct an anchored wall. This specification applies to any Contractor-proposed alternate design of Department-furnished plans.

617.1.01 Definitions
Anchor—Synonymous with the terms tie-back or tie-down.
The term Anchored Wall includes the following items:
- Anchors
- Soldier piles
- Lagging
- Facing
- Drainage

617.1.02 Related References
A. Standard Specifications
   Section 500—Concrete Structures
   Section 511—Reinforcement Steel
   Section 853—Reinforcement and Tensioning Steel
B. Referenced Documents
   General Provisions 101 through 150.

617.1.03 Submittals
A. Proof of Ability
   Submit the following proof of ability (or ability of the Subcontractor) when requested by the Department to design or construct anchored walls:
   - Evidence of successfully completing at least 5 Projects similar in concept and scope to the proposed wall.
   - Resumes of foremen, anchor testing personnel, and drilling operators to be employed on this Project. Show the type, length, and number of ground anchors each has installed or tested within the past 5 years.
   - Evidence of experience in anchor testing. Persons performing anchor testing must prove experience by performing sample tests supervised by the Engineer.
   The Department is the sole judge of the qualifications of the foreman, drilling operator, and testing personnel. Do not begin wall construction until the Engineer has approved proof of ability.
B. Design Criteria for Alternate Design
   If the Department receives more than 2 submittals of the plans and calculations for review, the Contractor will be assessed $60 per hour of engineering time for reviews in excess of the 2 submittals.
C. Construction Drawings and Design Notes
   If a Contractor-proposed alternate anchored wall is a part of the low bid, submit construction drawings and design notes within 28 days of the date of award of the Contract. The Design Engineer shall prepare and stamp the submission.
Include design notes and reproducible drawings in the submission concerning the following:

- Details, dimensions, and schedules of reinforcing steel, including dowels or studs for attaching the facing to the tied back wall
- Details of the anchors and soldier piling, including spacing and size of piles and spacing and angle of anchor installation
- Detailed plans for anchor proof and performance testing that show loading and measuring devices used and procedures followed

D. Wall Final Plans and Calculations

Submit final wall plans and calculations to the Department for review and approval before beginning construction on the wall the time required for plan and calculation preparation and review will be charged to the allowable Contract time. The Department has 30 days for plan and calculation review per Item after receiving the structure calculations and drawings.

New submittals from the Contractor showing corrections from the Department's review or changes to ease construction or to correct field errors have a 30-day review. The Department is the sole judge of information adequacy.

The Department’s review and acceptance of the final plans and construction methods does not relieve the Contractor from successfully completing the work. Time extensions are not granted for Contractor delays from untimely submissions and insufficient information.

E. Admixture Literature

Before using an admixture, submit to the Engineer the manufacturer’s literature. Indicate the admixture type and the manufacturer’s recommendations for mixing the admixtures with grout.

F. Structural Steel

Submit to the Engineer the mill test reports for each heat or lot of prestressing material used to fabricate tendons.

617.2 Materials

A. Concrete

Use concrete that conforms to Section 500.

B. Reinforcing Steel

Use reinforcing steel that conforms to Section 511.

C. Structural Steel

Use structural steel as follows:

1. Use prestressing bars made of continuously threaded full-length steel that conforms to ASTM Designation A 722, Type II. Do not use couplers.
   
   Ensure material requirements, coating application, and epoxy coating sampling and testing conform to Section 514.

2. Use full-length prestressing strands and wires according to Section 853.

D. Cement Grout

Produce cement grout using Portland cement that conforms to AASHTO M 85, Type I, II, or III, and potable water. Use cement that is fresh and free of lumps and hydration.

Follow these restrictions if using admixtures:

1. Do not use admixtures with chemicals that may harm the prestressing steel or cement.

2. Do not use expansive additives that cause air bubbles in the grout.
Section 617 — Permanent Anchored Walls

3. If approved by the Engineer, use admixtures that will impart low water content, flowability, and minimum bleeding in the cement grout.

E. Plastic

For corrosion protection, use polypropylene plastic that conforms to designation grade II 26500D as per ASTM D-2146. Ensure that the environmental stress crack resistance of the material prevents failures at 1,000 hours when tested by ASTM D-1693.

F. Corrosion Inhibitor

Use corrosion inhibitor (grease) that conforms to the following test requirements:

- Drop point 300 °F (149 °C) minimum by ASTM D-566
- Flash point 300 °F (149 °C) minimum by ASTM D-92
- Water content 0.1 percent maximum by ASTM D-95
- Rust grade 7 or better after 720 hours, aggressive conditions: rust grade 7 or better after 1,000 hours by ASTM B-117 and ASTM D-610

Water-soluble ions must follow these requirements:

1. Oil separation—0.5 percent by weight maximum at 160 °F (71 °C) by FIMS791B, Method 321.2
2. Soak test—5 percent salt fog at 100 °F (38 °C) 5 mils (0.13 mm) (Q panel type S). (Immerse panels in 50 percent salt solution and expose to 5 percent salt fog—no emulsification after 720 hours—by ASTM B-117 modified.)

617.2.01 Delivery, Storage, and Handling

A. Protection Systems

Protect prestressed rock and soil anchors against corrosion by properly storing, fabricating, and handling the tendon components before inserting them into the borehole.

Avoid prolonged exposure of the tendon components to the elements and avoid mechanical or physical damage that reduces or impairs the component's ability to resist adverse conditions during service.

Tendon components will be rejected for heavy corrosion or pitting, but not for a light coating of rust.

Use the protection systems as follows:

1. Prestressing Steel

   a. Encase the prestressing steel in a corrugated plastic tube.

   b. Use cement grout to fill the voids between the tube and the prestressing steel and the tube and the soil. Fill the cement grout between the soil and the tube to at least 1/2 in. (13 mm) thick and extend the entire length of the tendon.

   c. Provide centralizers spaced a maximum of 5 ft. (1.5 m) center-to-center throughout the bond length. Do not use wood or material harmful to the tendon steel or corrugated plastic tubing as centralizers.

   d. Provide a smooth piece of plastic sheath to encapsulate the entire free length. Do not splice the sheath. Ensure that the sheath is at least 0.05 in. (1.27 mm) thick.
Section 617 — Permanent Anchored Walls

e. Place a grease film, compounded to lubricate and inhibit corrosion, between the sheath and the prestressing steel in the entire free length. Ensure that the plastic sheath is seamless, hot melt extruded polypropylene shrunk tightly onto the grease.

Ensure that the sheath has a coefficient of friction with the steel of less than 0.05 and a wall thickness of at least 0.05 in. (1.27 mm).

f. Ensure that the sheath exerts a positive pressure on the grease. Ensure that the grease film is at least 0.01 in. (0.25 mm) thick. Minimize the void space between the sheath and the steel by filling visible void spaces with grease and sealing the bottom to keep the grout out.

2. Area Underneath Anchorage

Protect the area immediately behind the stressing anchorage.

a. Weld a pipe sleeve to the bearing plate and seal the pipe sleeve to the anchor sheath at the other end of the sleeve.

b. Clean the pipe sleeve to remove dirt, rust, or other harmful material before inserting the tendon into the pipe sleeve.

c. If a seal is not provided at the lower end of the pipe sleeve, during installation and grouting fill the lower end of the pipe sleeve with grout.

Keep the pipe sleeve free of harmful material until the upper portion of the pipe sleeve and anchor head is filled with grout.

d. After stressing the anchors, fill the void inside the sleeve and anchor head with anti-bleed expansion grout.

3. Anchorage

Encase the anchorage system head at each lift into a corrosion protective system before proceeding to the next lift. Install the protective system for each lift within 30 days after installing the anchors for that lift.

Ensure that the anchorage system has a cover of at least 3 in. (75 mm) once the wall face is placed.

617.3 Construction Requirements

617.3.01 Personnel

A. Contractor Qualifications

The Contractor and Subcontractor shall be experienced in designing or constructing permanently anchored walls. Provide at least one Registered Professional Engineer licensed to perform work in the State of Georgia and a supervising Engineer for the Project with at least 5 years of experience in constructing permanently anchored walls.

Furnish verification of these qualifications to the Engineer before beginning operations.

B. Design Engineer

The Design Engineer shall:

- Be registered as a Professional Engineer in the State of Georgia
- Have considerable knowledge and experience designing and constructing anchored walls
- Be available at any time during the Contract to discuss the design of the walls with the Department

C. Registered Professional Engineer

Retain the services of a second registered Professional Engineer licensed to perform work in the state of Georgia and prequalified by the Department. The Engineer shall operate independently from the Professional Engineer of Subsection 617.3.01.A, Contractor Qualifications.

This Engineer will independently check the design calculations and Plan details for the permanent anchored walls before submitting them to the Department for review.
Section 617 — Permanent Anchored Walls

617.3.02 Equipment

A. Anchorage and Hardware

Use anchorage and hardware suitable for the type of anchor tendon used. Ensure that anchorage and hardware are capable of the following:

- Developing 95 percent of the guaranteed specified minimum ultimate tensile strength of the tendon, when tested in the unbonded state and without failure of the tendon
- Holding a load of prestressing steel that produces a stress of at least 95 percent of the guaranteed specified minimum ultimate tensile strength of the prestressing steel, without exceeding the anticipated set and without causing anchorage or prestressing steel failure
- Lifting-off, detensioning, or retensioning a tendon before secondary grouting to fill voids at the top of the pipe sleeve

B. Anchor Nut and Plate for Bars

Use anchor nuts and plates for bars that have complementary spherical shapes at the contact areas.

617.3.03 Preparation

Before beginning the work, survey the condition of the adjoining properties. Keep records and photograph settlement or cracking of adjacent structures that may become the subject of possible damage claims. Deliver the report to the Department before beginning work at the site.

Obtain a Foundation Investigation Report from the Geotechnical Engineering Bureau of the Department to assist in evaluating existing conditions for design and construction.

617.3.04 Fabrication

A. Tendons

Fabricate the tendons according to the approved details.

1. Keep the tendons free of dirt, rust, or other harmful substances.
2. Use a plastic sheath that is a single piece without splices.
3. Install the sheath at the fabrication shop, not in the field.
4. Before installation, handle and store the tendons so as to avoid corrosion and physical damage.
   Tendons will be rejected for damage such as abrasions, cuts, nicks, welds, weld splatters, or heavy corrosion and pitting.
   Replace the tendons at the Contractor’s expense for material replacements or time delays.
5. Repair damaged coatings in the field at the Engineer’s approval.

617.3.05 Construction

A. Design Criteria for Alternate Design

The design criteria for a proposed alternate or design include:

1. Design rock anchors and soil anchors according to this specification.
2. Assume responsibility for lagging. Design the lagging with sound engineering principles.
3. Use reinforced concrete facing according to the latest AASHTO Standard Specifications for Highway Bridges, including interims.
   Ensure that the facing structural thickness is at least 12 in. (300 mm). Perform architectural facing treatment as shown on the Department drawings.
4. Ensure that the concrete strength for a proposed alternate is at least 3,000 psi (20 MPa) 28-day strength.
   Extend the facing 2 ft. (600 mm) below the gutterline or, if applicable, the ground line adjacent to the wall unless otherwise indicated on the plans.
5. Design soldier piles for shear, bending, and axial stresses according to the latest AASHTO design criteria. Use steel or concrete soldier piles with a steel yield strength at least 36,000 psi (248 MPa). Ensure that the concrete has a 28-day strength of at least 3,000 psi (20 MPa).

6. Design and install permanent drainage systems behind the wall. Connect drainage systems to the nearest drop inlet using pipe or free drainage through traffic barriers or other obstructions. Ensure that holes through traffic barriers or facing are no higher than 3 in. (75 mm) above the gutterline or ground line.

7. Have the wall design account for live load, dead load, and wind load from traffic barriers, lights, overhead signs, or other appendage on top or adjacent to the wall. Figure 1, Figure 2, and Figure 3 indicate loading conditions for soldier piles, lagging, and anchors at critical stages of construction.

\[ \begin{align*}
\gamma a k_p^{*} & \\
\gamma a k_\alpha^{*} & \\
\gamma (H+a) k_\alpha^{*} & \\
\gamma (H+a) k_p^{*} & \\
\gamma b k_\alpha^{*} & \\
\gamma (H+b) k_p^{*} & \\
\end{align*} \]

* Design pressure diagram shall include the effect of surcharge loading.
* NOTE: The above diagrams apply for cohesionless soils. For cohesive soils the effect of cohesion may be considered.

Where lagging is in place, active earth pressure acts over the entire wall surface. Below lagging, active earth pressure acts only on the soldier pile width and passive earth pressure is generated as follows:

A) In sands and saprolitic soils (with blow counts of 10 or greater) passive pressure is generated over 3 times the soldier pile width.
B) In clays, non-saprolitic silts, and saprolitic soils (with blow counts of 10 or less) passive pressure is generated over the width of the soldier pile.

Vertical component of anchor force must be resisted by embedded length of soldier piles below assumed excavation.

\[ \gamma \text{ is the soil unit weight in pounds per cubic foot.} \]

**FIGURE 1**
Load Case II
Intermediate Excavations for Subsequent Anchor Installations

* See “NOTE” Figure 1.
+ Design pressure diagram shall include the effect of surcharge loading.

$K_a = \text{Coefficient of active earth pressure}$
$K_p = \text{Coefficient of passive earth pressure}$
$g = \text{Soil density}$

FIGURE 2
8. Ensure that the wall is compatible with horizontal and vertical criteria indicated on the Department plans.

9. Include the following on the design criteria for rock anchors:
   a. Determine the tendon size to ensure that the anchor design load is no greater than 53 percent of the guaranteed ultimate tensile strength of the tendon.
   b. Ensure that the free stressing length is no less than 15 ft. (4.5 m).
   c. Estimate the bond length using the following equation:
      \[ L_b = \frac{P}{(3.1416) (d)(t_w)} \]
      where
      \( L_b \) = Bond length (not less than 10 ft. [3 m])
      \( P \) = Design load for the anchor
      \( d \) = Diameter of the drill hole
      \( t_w \) = Bond stress in the interface between the rock and grout
      When determining the bond stress, consider the critical nature of the anchor application, rock property variations, and installation procedures.
10. Include the following in the design criteria for soil anchors:
   a. Analyze the anchor structure system to ensure a well-anchored structure.
   b. Analyze the overall earth mass stability and the assumed failure plane to ensure that the anchor bond length is started at least 5 ft. (1.5 m) beyond the failure plane. Consider the following in the analysis:
      - Type of foundation, nearness, and susceptibility to movement of adjacent buildings (see Figure 4).
      - Interaction of anchor groups when the anchor center-to-center spacing is less than or equal to 6 times the bulb diameter
   c. Determine the tendon size so that the anchor design load does not exceed 53 percent of the guaranteed ultimate tensile strength of the tendon.
   d. Ensure that the free stressing length is at least 15 ft. (4.5 m).
   e. Use the existing theoretical and empirical methods only to predict anchor capacity for preliminary design estimates. Verify the final anchor capacity by field testing each anchor.

11. Retain a second registered Professional Engineer to operate independently from the Design Engineer Professional Engineer of Subsection 617.3.01.B.
    Have this Engineer independently check the design calculations and Plan details of the permanent anchored walls before submitting them to the Department for review.
Section 617 — Permanent Anchored Walls

B. Ground Movements and Load Transfer Instruments

The Department may install devices to monitor ground movements and load transfers during and after construction. The Department will schedule installation to minimize interference with the Contractor’s operations. Cooperate with the instrumentation installers. Anticipate delays of two to four hours per instrumented anchor.

Although the Instrumentation Specialist maintains the instruments, assume responsibility for damage to the instruments, connections, or readouts from operations. Replace and install damaged equipment at the Department’s approval and at the Contractor’s expense.

C. Rock Anchors

1. When required on the Plan or by the Engineer, use a prestressed rock anchor made of high-strength steel tendon fitted with a stressing anchorage at one end and a way to transfer force to the grout and rock on the other end.

2. Insert the rock anchor tendon into a prepared hole of suitable length and diameter, fixed to the rock, and stressed to a specified force. The basic components of a prestressed rock anchor are as listed below:
   a. Prestressing steel may be single or multiple wires, strands, or bars. The rock anchor length is composed of these two parts:
      • Bond length (socket)—the portion of the anchor that transmits the force to the surrounding rock
      • Free length (stressing length)—the portion of the anchor free to elongate elastically during stressing
   b. The stressing anchorage is the device that permits the stressing and anchoring of the prestressing steel under load.
   c. The fixed anchorage is a mechanism opposite the stressing anchorage on the tendon that transfers the induced force to the surrounding grout or rock. Deformed bars and strand tendons do not have fixed anchorages since the anchor load is transferred to the grout by bond.
   d. Provide grout, vent pipes, and miscellaneous appurtenances to inject the anchor grout. Pump grout through the drill casing or rods.

D. Rock Anchor Installation

Install the rock anchors as follows:

1. Before installation, visit the site to observe existing conditions that may affect the work or design, if applicable, and to review the geotechnical data available for the project.

2. Drive or drill the holes for the anchors by core drilling, rotary drilling, auger drilling, or percussion drilling. If using water in the drilling operation, dispose of the water to minimize wall erosion.
   Repair water erosion damage to the site at no cost to the Department.

3. If the hole will not stand open, install casing to maintain a clean and open hole. Ensure that the hole diameter is at least 3 in (75 mm) if no pressure grouting is used.
   Pressure grouting is grouting with a pressure greater than 60 psi (415 kPa).

4. Ensure that the drill bit diameter is not less than 1/8 in. (3 mm) smaller than the specified hole diameter.

5. Start anchor holes within an angle tolerance of 1 to 3 degrees from the inclination specified on the approved design Plans. Do not allow holes to deviate from a straight line by more than 1 to 2 in. (25 to 50 mm) in 10 ft. (3 m).
   Do not allow holes to extend outside the Right-of-Way limits. Thoroughly clean holes of rock dust, rock chips, grease, or other material before inserting the tendon.

6. Install the tendon in the casing or in a hole drilled for the anchor. Ensure that the tendon’s corrosion protection is not damaged during handling or installation.
Section 617 — Permanent Anchored Walls

7. Install the tendon in the bond length, to achieve at least 0.5 in. (13 mm) of grout cover.
   Degrease the bond length of strands or wires before installing by using Acetone, MEK, or MIBK. Do not leave residue on the tendon. Use other substances only after the Department’s approval. Include the costs of cleaning tendons in the price bid for Contract Items.

8. If using multi-element tendons without a fixed anchorage at the lower end, adequately space the tendon elements to achieve proper grout coverage.

**NOTE:** Do not use anchors to ground electric equipment and do not subject anchor tendons to sharp bends.

9. Provide centralizers spaced a maximum of 5 ft. (1.5 m) center to center throughout the bond length. Do not use wood spacers or other material harmful to the tendon steel or sheathing.

10. Inject the grout at the lowest point of the anchor and place over the entire anchor length.
   a. Ensure that the grouting equipment can continuously mix and produce lump-free grout.
      Equip the grout pump nozzle with a grout pressure gauge capable of measuring pressure of at least 150 psi, (10 kPa) or twice the actual pressure used.
   b. Base the material proportions used in the grout on grout tests made before beginning the grouting. Or, select the proportions based on prior documented experience with similar materials and equipment under comparable field conditions.
   c. Use the minimum water content necessary for proper placement and do not exceed a water-cement ratio of 0.45. Do not leave grout in the mixer longer than 45 minutes.
      Only fill voids at the top of the free length with grout after final lock-off.

11. After grouting, do not disturb the tendon until the grout has reached a cube strength of 3,500 psi (25 MPa). Keep the mouth of the hole clean after grouting. Record the following data in a Project field book during the grouting operation:
   - Type of mixer
   - Water-cement ratio
   - Type of additives
   - Grout pressure
   - Type cement
   - Test sample strengths (before stressing)
   - Volume of grout placed in bond and free lengths

12. If using pressure grouting, choose whether to perform a water tightness test. However, if injecting grout with a pressure of 60 psi (415 kPa) or less, always perform a water tightness test.

   Perform the test as follows:
   a. Fill the entire hole in the rock with water and subject it to a pressure of 5 psi (35 kPa) in excess of the hydrostatic head as measured at the top of the hole.
   b. If after 10 minutes the leakage rate from the hole exceeds 0.001 gal per inch diameter per foot of depth per minute (12 mL per 25 mm diameter per meter of depth per minute), consolidate grout, re-drill, and retest the hole. If the second water tightness test fails, repeat the entire process.
   c. During the tests, observe holes adjacent to the hole being tested for water tightness to detect and seal inter-hole connections.
   d. If finding artesian or flowing water in the drilled hole, maintain the pressure on the consolidation grout until the grout has initially set.
E. Cutting of Tendon Protrusions
After the Engineer accepts an anchor, the portion of the anchored tendon protruding over the anchor may be cut if it is not required for use in retesting. Cut the tendon according to the tendon manufacturer’s recommendations as approved by the Engineer. Do not damage the tendon anchor.

F. Redesign
If the anchors fail during performance tests or proof tests, modify the design or construction tests and procedures. The design is subject to Department review. These modifications may include:

- Reducing the anchor design load by increasing the number of anchors
- Increasing the grout pressure
- Requiring post-grouting or increasing the bond length

Modify the design or construction procedures, install the redesigned anchors in the wall, and test as previously defined at no cost to the Department.

Anchors that fail the performance or proof tests may be incorporated in the wall. Propose a reduced design load and retest as noted above. The Department will determine acceptance of such anchors.

G. Soil Anchors
A prestressed soil anchor is a high-strength steel tendon fitted with a stressing anchor at one end and an anchor device that transfers force to the soil on the other end. These anchors are used in clay, silt, sand, or gravel and are inserted in a prepared hole that is drilled or driven into the ground.

The following are the two soil anchors considered for use:

- Friction type—rely on friction between the drilled borehole walls
- Anchor grout—rely on an enlarged pressure-grouted bulb or an underreamed bulb to provide resistance to pull-out

Test the soil anchors after placing the anchor grout and after the curing period. The basic components of the soil anchor are identical to the rock anchor as described previously.

For installation, see Subsection 617.3.05.D, Rock Anchor Installation, except water tightness tests are not required.

Test and stress soil anchors according to 617.3.06.A, Anchor Testing and Stressing except that 15% of the anchors remaining after the initial testing shall be performance tested.

H. Cutting of Tendon Protrusions
See Subsection 617.3.05.E, Cutting of Tendon Protrusions.

I. Redesign
See Subsection 617.3.05.F, Redesign.

617.3.06 Quality Acceptance

A. Anchor Testing and Stressing
Perform testing and stressing according to this subsection.

Test each anchor to ensure that the maximum test load does not exceed 80 percent of the guaranteed ultimate tensile strength of the tendon.

Performance test the first 2 anchors installed of each design load capacity and 5 to 10 percent of the remaining anchors (the Engineer will choose the locations). Proof test the remaining anchors.

1. Performance test by incrementally loading and unloading the anchor according to the following schedule.

</tbody>
</table>

2. Record the tendon movement at each increment to the nearest 0.001 in. (0.025 mm) referring to an independent fixed reference point.
3. Monitor the jack load with the production gauge and load cell calibrated as a set.
4. Adjust to a transfer load of 1.0P. Actual lock-off loads may be somewhat higher to account for seating losses.
5. To prevent misalignment of testing equipment, maintain an Alignment Load (AL) of at least 0.05P.
6. Hold the load at each increment long enough to obtain the movement reading.
Submit the loading and unloading rates (tons [megagrams] per minute) for approval. Each load must be applied in less than 30 seconds after starting the jack pump.

7. Perform the creep test by holding the 1.50P load for 50 minutes while maintaining the load constant. Record the anchor movement (total movement) referenced to a fixed point at 30 seconds, 1, 2, 3, 4, 5, 6, 10, 15, 20, 25, 30, 40, and 50 minutes.

Begin the observation time when the jack begins to load the anchor from 1.25P to the test load.

8. If performance tests indicate that the loaded substrata is sensitive to creep, maintain the load for an additional 250 minutes and record the movements at 60, 75, 90, 100, 120, 150, 180, 210, 240, 270, and 300 minutes.

9. Have the Engineer review the performance tests to determine if the anchor is acceptable. An anchor is acceptable if:
   - The total movement obtained exceeds 80 percent of the theoretical elastic elongation of the free length and is less than the theoretical elastic elongation of the total of the free length plus 50 percent of the bond length.
   - The creep movement does not exceed 0.08 in. (2.00 mm) during 5- to 50-minute time increments regardless of tendon length and load.
   - If held for an additional 250 minutes, creep movement does not exceed 0.08 in (2.00 mm) from the 30-minute to the 300-minute time increment regardless of tendon length and load.

10. Perform proof tests as follows:
    a. Incrementally load the anchor according to the following schedule:
       - AL
       - 0.25P
       - 0.50P
       - 0.75P
       - 1.00P
       - 1.25P
       - 1.50P (Test conditions—hold for at least 10 minutes)
    b. At each increment, record the movement of the tendon to the nearest 0.001 in. (0.025 mm) referring to an independent fixed reference point.
    c. Monitor the jack load with a production gauge that was calibrated with the load cell used for the performance test.
       If required by the Engineer, monitor the jack load with the production gauge and load cell that were calibrated as a set.
    d. Adjust to a transfer load of 1.0P. Actual lock-off load may be somewhat higher to account for seating losses.
    e. To prevent misalignment of testing equipment, maintain an alignment load (AL) of at least 0.05P.
    f. Perform the creep test by holding the 1.50P load for 10 minutes while maintaining the load constant.
       Record the anchor movement (total movement) referenced to a fixed point at 30 seconds and 1, 2, 3, 4, 5, 6, and 10 minutes.
       Begin the observation time when the jack begins to load the anchor from 1.25P to the test load.
    g. If the movement between the 1-minute and 10-minute readings exceed 0.040 in. (1.00 mm), maintain the load for an additional 40 minutes. Record the movements at 15, 20, 25, 30, 40, and 50 minutes.
Section 617 — Permanent Anchored Walls

h. Have the Engineer review the proof tests to determine if the anchor is acceptable. An anchor is acceptable if:
   • The total movement obtained exceeds 80 percent of the theoretical elastic elongation of the free length and is less than the theoretical elastic elongation of the total of the free length plus 50 percent of the bond length.
   • The creep movement does not exceed 0.04 in. (1.00 mm) during the 1-minute to 10-minute increment regardless of tendon length and load.
   • If held for an additional 40 minutes, creep movement does not exceed 0.08 in. (2.00 mm) during the 5- to 50-minute increment regardless of tendon length and load.

11. Use the following test equipment:
   a. Use a dial gauge that can measure elongation to the nearest 0.001 in. (0.025 mm).
   b. Use a production gauge with an accuracy of at least 0.5 to 1 percent of full scale with gradation no greater than 100 psi (690 kPa). Ensure that it has a non-parallax dial.
   c. Use test gauges with an accuracy of at least 0.25 of 1 percent of full scale with gradations no greater than 50 psi (345 kPa). Ensure that they have a non-parallax dial.
   d. Use a load cell with a resolution of at least 1/10 of 1 percent constructed to eliminate inaccuracy with uneven loading.
   e. Ensure that the jack, gauges, and load cell are calibrated as a set and independently.
      Check the pressure gauge and load cell calibration every week (or when erratic results are found) against a test gauge that is kept onsite for this purpose. Have the Department’s Inspector witness these calibration checks. Perform installation, testing, and stressing in the Department Inspector’s presence.

12. Perform lift-off tests when using anchors. Make a lift-off reading after transferring the load to the end anchorage and before removing the jack.
   a. Determine the load within 5 percent of 1.00P. If the lift-off load is less than 0.95P, reset the end anchorage and make another lift-off reading.
   b. Perform additional lift-off tests 7 days after the load was locked-off in the anchor.
      After performing 5 additional lift-off tests, perform lift-off tests randomly. The total number of tests will be performed on no more than 10 percent of the remaining anchors.

617.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

617.4 Measurement
Permanently Anchored Walls are not measured separately for payment.

617.4.01 Limits
In cases where additional wall area is required due to unforeseen foundation conditions or other reasons as approved by the Engineer, or, if the wall area is decreased, measurements based on plan dimensions will be used to adjust the Lump Sum Price Bid referenced under Payment.
Section 617 — Permanent Anchored Walls

617.5 Payment
Payment for this work is made per Lump Sum. Payment includes costs for concrete, reinforcing steel, excavation, backfill, lagging, piles, anchors, labor, design, and other materials and equipment. Payment also includes grouting, drilling holes, post-tensioning, performing and evaluating tests, and submitting records of tests, tools, and other items to complete the work.

Payment will be made under:

| Item 617 | Permanent anchored wall, wall no.___ | Per lump sum |

617.5.01 Adjustments
Additional wall area required because of unforeseen foundation conditions or other reasons that are approved by the Engineer, will be paid for by increasing the Lump Sum Price Bid. The increase in wall area will be multiplied by an adjustment price of $45 per square foot ($485 per square meter).

If the wall area is decreased, the Lump Sum Price Bid is adjusted proportionally to the decrease in wall area. The adjustment price is the Lump Sum Price Bid divided by the original plan area of the wall.

No additional compensation will be made for additional material, equipment, design, or other items to comply with the project specifications as a result of the Department’s review of an alternate design. If based on a redesigned wall, the bid price includes costs to comply with the requirements of this specification.

No additional compensation will be made for subsequent changes or deviations from the approved plan for additional material, labor, or equipment that may be required to comply with the acceptance criteria of this specification.
618.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 619—Permanent Anchored Slurry Diaphragm Wall

619.1 General Description

Specifications for this work will be included elsewhere in the Contract.
Section 620—Temporary Barrier

620.1 General Description
This work provides for Method 1 and Method 2 temporary barrier systems.

620.1.01 Definitions
Method 1- Method of furnishing, placing, maintaining, moving, and reusing where required, and removing temporary barrier of the length and at the locations shown on the Plans. Method 1 barrier is not suitable on bridges where the distance from the centerline of the barrier to the free edge of the bridge deck is less than 6 ft.- 0 in. (1.8 m) measured normal to the barrier.

Method 2- Method of furnishing, placing, maintaining, moving, and reusing where required, and removing manufactured barrier of the length, and at the locations shown on the Plans. Method 2 barrier is to be used on bridges and bridge approaches where the distance from the centerline of the barrier to the free edge of the bridge deck is less than 6 ft.- 0 in. (1.8 m) measured normal to the barrier.

620.1.02 Related References

B. Referenced Documents
   General Provisions 101 through 150
   National Cooperative Highway Research Program (NCHRP) Report 350
   Manual for Assessing Safety Hardware (MASH)
   Report No. TRP-03-386-19 – MASH TL-3 Evaluation of Concrete and Asphalt Tied-Down Anchorage for Portable Concrete Barrier

620.1.03 Submittals
Method 1 - For temporary barrier produced on or before December 31, 2019, submit certification from the manufacturer that the proposed barrier and its interconnecting hardware replicate an NCHRP-350 or MASH “Test Level 3” approved barrier, documented in an eligibility letter from FHWA or certification that the barrier meets the requirements of Ga. Std. 4961. Submit all certification documents to the engineer prior to delivery of the barrier to the project.

For temporary barrier produced after December 31, 2019, submit certification from the manufacturer that the proposed barrier and its interconnecting hardware replicate a MASH 2016 “Test Level 3” approved barrier, documented in an eligibility letter from FHWA. Submit all certification documents to the engineer prior to delivery of the barrier to the project.

Method 2 - For temporary barrier produced on or before December 31, 2019, submit certification from the manufacturer that the proposed barrier and its interconnecting hardware replicate an NCHRP-350 or MASH “Test Level 3” approved barrier, documented in an eligibility letter from FHWA and that the barrier does not deflect more than 1 ft. – 0 in. (300mm) under NCHRP-350 or MASH test conditions. Attach the eligibility letter stating that the proposed barrier is in compliance with NCHRP-350 or MASH “Test Level 3” and that the barrier meets the deflection criteria to the certification. Submit all certification documents to the engineer prior to delivery of the barrier to the project.
Section 620 — Temporary Barrier

For temporary barrier produced after December 31, 2019, submit certification from the manufacturer that the proposed barrier and its interconnecting hardware replicate a MASH 2016 “Test Level 3” approved barrier, documented in an eligibility letter from FHWA and that the barrier does not deflect more than 1'- 0" (300mm) under MASH 2016 test conditions or certification that the proposed barrier, its interconnecting hardware, and anchoring system replicate the Midwest F-Shape (22.5"x32"x12.5") and Technical Report TRP-03-386-19 (for deck depths less than 8 in., anchor bolt must extend through deck with washer and nut on underside of deck). For barrier other than the Midwest F-Shape, attach the eligibility letter stating that the proposed barrier is in compliance with MASH 2016 “Test Level 3” and that the barrier meets the deflection criteria to the certification. Submit all certification documents to the engineer prior to delivery of the barrier to the project.

620.2 Materials

A. Method 1
   Supply a temporary barrier.
   Ensure that materials are in accordance with the manufacturer’s recommendations, specifications, and details or that the materials meet the requirements of the Standard Specifications and Ga. Std. 4961.

B. Method 2
   Supply a temporary barrier.
   Ensure that materials used in the barrier are in accordance with the manufacturer's recommendations, Specifications, and details.

620.2.01 Delivery, Storage, and Handling

General
Deliver, store, and handle barrier in accordance with the manufacturer’s recommendations.
Repair damage to the barrier and its connections in accordance with the manufacturer’s recommendations at no additional cost to the Department prior to acceptance for use by the Department.

620.3 Construction Requirements

620.3.01 Personnel
General Provisions 101 through 150.

620.3.02 Equipment
General Provisions 101 through 150.

620.3.03 Preparation
General Provisions 101 through 150

620.3.04 Fabrication

A. Method 1
   Perform barrier fabrication as detailed on Ga. Std. 4961 or in accordance with the manufacturer’s recommendations.

B. Method 2
   Perform barrier fabrication in accordance with the manufacturer’s recommendations.
Section 620 — Temporary Barrier

620.3.05 Construction

A. General

Handle and transport units to prevent damage and/or as recommended by the manufacturer. When required, use units at one or more sites on the same project.

Ensure that the units are complete and in acceptable condition and located where designated on the plans or directed by the Engineer before acceptance by the Department.

Use the Plan quantity of barrier effectively to complete the work within the Contract time. If scheduling the work requires additional barrier, furnish it at no additional expense to the Department.

Use only one section shape, length, and connection type in a single run of interconnected barrier.

Interconnect all barrier sections within each single run of barrier.

B. Method 2

Rigidly attach the barrier to the bridge deck and extend it off the bridge a transition distance indicated in the Standard Plans.

Use non-shrink grout to fill all holes remaining in permanent bridge decks after barrier is removed.

620.3.06 Quality Assurance

General Provisions 101 through 150.

620.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

620.4 Measurement

This work will be measured per unit (per linear foot (meter)) of accepted barrier delivered and used. The quantity shall be computed by multiplying the number of units by the length of each unit as per Standard 4961 or approved alternate, subject to the maximum amount specified in Subsection 620.3.05.

620.4.01 Limits

General Provisions 101 through 150.

620.5 Payment

This work is paid for at the Contract Price per linear foot (meter) of temporary barrier Method 1 or barrier Method 2 as designated complete in place. Payment includes fabrication, use, moving, reuse, and removal of the units.

No separate payment will be made for moving and/or reusing units during the work or for using additional units beyond the plan quantity to facilitate the construction schedule.

No separate payment will be made for filling holes used to bolt Method 2 barrier to bridge decks.

The first 75 percent of the Contract Unit Price bid will be paid on the first monthly estimate following initial delivery, installation, and acceptance.

The remaining 25 percent will be paid when the project is complete or when the material is no longer needed and removed from the Project, whichever applies.

Payment will be made under:

620.5.01 Adjustments

General Provisions 101 through 150.
621.1 General Description
This work includes constructing Portland Cement concrete barriers according to these specifications and in conformance with the lines, grades, type and typical sections shown on the plans, or established by the Engineer. This specification may require barriers suitable for medians or side installation on both roadways and bridges.

621.1.01 Definitions

621.1.03 Submittals
General Provisions 101 through 150.

621.2 Materials
Use materials that meet the requirements of the following specifications:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Portland Cement Concrete, Class AA</td>
<td>500</td>
</tr>
<tr>
<td>Steel Bars for Concrete Reinforcement</td>
<td>853.2.01</td>
</tr>
<tr>
<td>Joint Fillers and Sealers</td>
<td>833</td>
</tr>
</tbody>
</table>

Ensure that barrier walls and parapets on bridges are Class “AA” concrete unless otherwise specified on the plans.

621.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.
621.3 Construction Requirements

621.3.01 Personnel
General Provisions 101 through 150.

621.3.02 Equipment
General Provisions 101 through 150.

621.3.03 Preparation

A. Subgrade Preparation
Follow these guidelines for preparing the subgrade:

1. Finish the subgrade to the required lines, grade, and cross section shown on the plans or directed by the Engineer.
2. Compact the subgrade to 100 percent of the maximum laboratory density for the depth shown on the plans.
3. Determine the maximum laboratory dry density from representative samples of the material being compacted using GDT 7, GDT 24a, GDT 24b, or GDT 67, whichever is applicable.
4. Use GDT 20, GDT 21, or GDT 59 to determine the in-place density of the compacted subgrade.

B. Base Preparation
Follow these requirements for preparing the base:

1. Place the base as shown on the plans and compact it to 100 percent of the maximum laboratory dry density.
2. Use GDT 49 to determine the maximum laboratory dry density from representative samples of the material being compacted. Use GDT 21 or GDT 59 to test in-place density of the base.

621.3.04 Fabrication
General Provisions 101 through 150.

621.3.05 Construction

A. Formed or Slip Formed Barrier
Ensure that the barriers are Class AA concrete as defined in Section 500 (or as specified in plans) and are constructed according to plan details.

1. Place the concrete using conventional forms or an approved self-propelled extrusion machine. When using forms, give the barrier a Type III finish, and cured according to Section 500.
2. Construct joints of the type and at the locations specified on the plans.
   a. When emergencies interrupt placement, the Engineer will decide whether to allow a construction joint and will direct where and how to construct the joint.
   b. Joints may be sawed or formed as specified in the plans. If the joint is sawed within 24 hours of placement, immediately remove the following material:
      - Material that may damage the adjacent concrete by blocking the sawed joint
      - Material that may prevent later operation or cleaning after the sawing operation is complete
   c. Saw the joints through the footing.
3. The outside vertical face of the side barrier or parapet may be battered as directed by the Engineer. Radii, as approved by the Engineer, may be used at intersecting surfaces of the barrier.

Make approved requested changes at no cost to the Department.
Section 621 — Concrete Barrier

B. Slip-Formed Barriers
When placing barriers using slip-form methods, follow these requirements:

1. To place barriers, use extrusion machines designed to place concrete barrier or parapet without using forms. Extrusion machines may be either crawler or rubber tired.
2. Conform the barrier or parapet to the established shape, line, grade, and dimensions shown on the plans.
3. Obtain the proper density and cross section by forcing an approved concrete mix through a mold of the proper cross section.
4. Ensure that the extrusion machine consolidates the freshly placed concrete in one complete pass and that internal vibrators can consolidate the concrete along the faces of the forms and adjacent to joints.
   Perform this work to minimize hand finishing and to produce a dense and homogenous barrier free from voids and honeycomb.

C. Finish
Use a steel trowel to repair or correct the concrete surface. Do not over finish the surface. Keep hand finishing to a minimum.
Correct the exposed surfaces that are not satisfactory to the Engineer in color, texture, smoothness, or patching.

D. Curing
Cure as specified in Subsection 500.3.05.Z, Cure Concrete, and as follows if an approved membrane-forming curing compound is used.

1. Use a Type 1, Class B curing compound.
2. Uniformly spray the concrete surface with curing compound immediately after obtaining the surface finish.
   Applying protective surface treatment to the barrier or parapet surfaces is not required.

621.3.06 Quality Acceptance
General Provisions 101 through 150.

621.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

621.4 Measurement
The barrier is measured for payment in linear feet (meters) of each accepted type shown on the plans. The barrier is measured along the top of the various types.
Side barriers are measured for payment in linear feet (meters) of each accepted type shown on the plans. The barrier is measured along the top of the various types.
Barriers on bridges are measured separately for payment, as defined in Subsection 500.4.01.C.
Barriers placed on approach slabs are measured for payment as defined in Section 433.

621.4.01 Limits
General Provisions 101 through 150.

621.5 Payment
This work, measured as specified above, will be paid for at the Contract Unit Price per linear foot (meter) for each barrier type. Payment is full compensation for providing materials, forms, and equipment; preparing subgrade and base; and providing labor, incidentals, and direction to complete the work.
Section 621 — Concrete Barrier

621.5.01 Adjustments

General Provisions 101 through 150.
Section 622—Global Stability of Retaining Walls on Construction

622.1 General Description
This work consists of performing the global stability analyses of applicable retaining walls after final construction plans, shop drawings and design notes have been developed, reviewed and approved. Perform this work before the wall is constructed. This work shall be performed by a Professional Engineer licensed in the state of Georgia who is experienced in this type of work.

622.2 Applicable Wall Types
This specification applies to the following wall types:
1. Rigid/Cantilever Retaining Walls
2. Gravity Walls
3. Mechanically Stabilized Embankment Retaining Walls
4. Mechanically Stabilized Embankment Retaining Wall – Contractor Design
5. Soldier Pile Walls with or without Anchors
6. Soil Nail Walls
Note: GDOT Standard Walls are excluded from the requirements of this special provision.

622.3 Criteria for Global Stability Requirement
Perform global stability analyses on construction for Walls that meet any of the following criteria:
1. Wall Height is 15 ft. or greater.
2. Wall is being constructed on a slope.
3. Wall will have a slope, structure (including structures attached directly to the top of the wall such as sound walls), or traffic loading above it.
4. Wall footing is being constructed on weak underlying soils with the following conditions:
   - Soils within 10 ft. of the bottom of footing are single digit blow count soils based on SPT tests.
   - Groundwater is within 5 ft. of the bottom of the wall.

622.4 Requirements
Develop the shop drawings for the wall and submit the drawings to the Department for review and approval prior to performing field global stability analyses.
Use the subsurface investigation data from the approved Wall Foundation Investigation (WFI) report for global stability analyses. Any additional borings performed on construction may be used for global stability analyses.
For MSE Walls, use the properties of the backfill material as well as the strap lengths shown on the shop drawings for global stability analyses, even if they differ from that which was specified on the approved WFI.
Model the wall in the global stability analysis program using the exact wall configuration to be built on construction.
Identify all critical sections of the Wall such as the tallest sections, sections on slopes, sections with a slope, structure or traffic loading above the wall, and sections on the weakest soils, and analyze these sections for global stability.
All global runs shall meet the requirements of AASHTO LRFD Specifications, Seventh Edition, 2014 – Section 11.6.2.3. For walls that do not meet the requirements, provide recommendations to mitigate the problem, and submit global stability analyses that incorporate the recommended solution(s). All global runs that incorporate the solutions shall
Section 622 — Global Stability of Retaining Walls on Construction

meet the AASHTO LRFD requirements. Prior to implementing a solution on construction, receive approval from the Geotechnical Bureau.

Submit a global stability analyses report with analyses and recommendations (if warranted) to the Office of Materials and Testing's Geotechnical Bureau for review and approval before wall construction commences. Allow seven (7) calendar days for review and approval.

Provide global stability analyses and recommendations (if warranted) using the services of a Professional Engineer licensed in the state of Georgia who is experienced in this type work.

622.5 Payment

No separate payment will be made for performing global stability analyses or any associated tasks deemed necessary such as additional investigation or report preparation. Include the cost of this work in the contract bid price for the retaining wall.
Section 623—Pneumatically Applied Concrete

623.1 General Description
This item includes manufacturing and pneumatically placing concrete at locations and to the dimensions shown on the plans. Follow the requirements of Section 441 and Section 500 for this work.

623.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

623.3 Construction Requirements

623.3.01 Personnel
Have qualified machine, nozzle, and re-bound operators prepare and apply pneumatically applied concrete under the supervision of qualified superintendents.
Furnish documentation of personnel qualifications upon request.

623.3.02 Equipment
Use equipment in good operating condition to work on the Project. Have all necessary equipment on the project prior to beginning application.

623.3.03 Preparation
A. Earth Foundation
Prepare earth foundations for application as follows:
1. Thoroughly compact and finish the area upon which the pneumatically applied concrete will be placed to the lines and grades shown on the plans.
2. Ensure that the foundation contains enough moisture to provide maximum density and to avoid absorbing water from the concrete. Ensure that the foundation does not contain free surface water.

B. Bonding Foundation
When bonding pneumatically applied concrete to a previously placed structure, ensure that the surface is rough and clean.
1. Remove unsound or deteriorated concrete, loose particles, dust, and dirt.
2. Thoroughly clean steel members by sand blasting loose rust, scale, or other deleterious material that would prevent or lessen the bond between concrete and steel.
3. Keep the bonding surface wet for at least one hour before applying the concrete. Remove any free water immediately before placing.

623.3.04 Fabrication
General Provisions 101 through 150.

623.3.05 Construction
A. Earth Foundation
1. Use gauging wires to establish finish grade lines, surface planes, and the plan thickness.
2. Place joints, side forms, shooting strips, weep holes, and reinforcement according to plan details.

B. Bonding Foundation
1. Reinforce and form concrete according to plan details.
2. When sloping, vertical, or overhanging work surfaces require successive layers or thicknesses, allow enough time between application of layers to permit an initial but not a final set.
   When the initial set is developing, clean the surface to remove laitance and to ensure bonding.
Section 623 — Pneumatically Applied Concrete

C. Placing Reinforcement

Place reinforcement, if required, as shown on the plans.

1. When dowels or anchor bolts are specified, securely fasten the reinforcing steel to them.
2. Lap the welded wire fabric at least 4 in. (100 mm) and firmly tie the full area of mesh or fabric in position with wire ties.
3. Place welded wire fabric around the top of slab-carrying beams and girders before pouring the slab and extend at least 5 in. (125 mm) below the slab. Locate the fabric to properly lap the web reinforcement.
4. Place the reinforcement at least 0.5 in. (15 mm) from the surface on which the concrete is to be placed. Ensure that there is at least 0.75 in. (20 mm) from the outside surface of the reinforcing to the finished surface of the concrete.

D. Composition

Use pneumatically applied concrete composed of one-part Portland cement to three parts fine aggregate by volume. Thoroughly mix the dry ingredients before placing them into the applicator hopper. The Contractor may submit mix design proportions for approval from an approved producer (QPL 10) who has the capability of producing transit-mixed concrete.

1. Substitute a maximum of 30 percent by volume of No. 9 stone for an equivalent amount of fine aggregate when approved by the Engineer.
2. Discard material not used within one hour after combining cement and aggregates. Do not remix or temper the material.

E. Transporting and Placing

When premixing the materials and transporting them to the job site, follow the applicable requirements of Section 500 and these guidelines:

1. Do not place pneumatically applied concrete under these conditions:
   • The ambient temperature is below 40 °F (4 °C).
   • The subgrade is frozen.
   • Wind velocity prevents homogenous and uniform application.
2. Place the approved mix by pneumatic pressure through a machine with the proper amount of water for hydration applied at the mixing nozzle.
3. Maintain water pressure in the delivery pipe approximately 20 psi (140 kPa) above the air pressure in the machine.
4. Maintain a constant pressure of at least 45 psi (310 kPa) in the placing machine when the applicator hose length is 100 ft. (30 m) or less.
   Increase the pressure at least 5 psi (35 kPa) for each additional 50 ft. (15 m) of hose length or fraction thereof, or for each 25 ft. (7.5 m) vertically that the nozzle is above the machine.
5. When placing concrete on slopes pneumatically, limit the height to 8 ft. (2.5 m) lifts measured along the slope.
6. Direct the applicator nozzle to minimize rebound. Maintain the nozzle velocity at a constant level and rate determined by the job conditions.

F. Finishing

After placing the concrete to the required depth and before the initial set, screed the surface and check it with a 10 ft. (3 m) straightedge. Immediately correct irregularities in excess of 0.25 in. in 10 ft. (6 mm in 3 m).

Remove and replace loose areas of pneumatically applied concrete at the Contractor’s expense. Before application, protect the adjacent areas not to be covered and clean after application if necessary.

G. Curing

Cure pneumatically applied concrete according to the applicable requirements of Subsection 500.3.05.Z.1, General Curing — Supplying Additional Moisture.
Section 623 — Pneumatically Applied Concrete

H. Joints

Construct joints at locations indicated on the Plans and as specified in Section 441.

Slope construction joints to a clean edge of approximately 45 degrees. Before resuming the placing, clean and moisten the joint.

623.3.06 Quality Acceptance
General Provisions 101 through 150.

623.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

623.4 Measurement

Pneumatically applied concrete placed on slopes or plane areas are measured for payment by the square yard (meter) of accepted surface areas constructed to the neat lines indicated on the plans or as directed.

Where pneumatically applied concrete is used for patching, grouting, plastering, or build-ups, it is measured by the ton (megagram) of cement actually used.

623.4.01 Limits
General Provisions 101 through 150.

623.5 Payment

Pneumatically applied concrete will be paid for at the Contract Price per square yard (meter) of paving or per ton (megagram) of cement as specified, complete in place. No separate payment will be made for reinforcing steel, joint-filling materials, clean-up, or disposal of rebound.

Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 623</th>
<th>Pneumatically applied concrete</th>
<th>Per square yard (meter)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item No. 623</td>
<td>Pneumatically applied concrete</td>
<td>Per ton (megagram) of cement</td>
</tr>
</tbody>
</table>

623.5.01 Adjustments
General Provisions 101 through 150.
624.1 General Description
This work includes furnishing and installing a noise barrier wall, single and double steel doors and concrete pads according to this Specification and conforming to the locations, dimensions, lines, grades, and material type shown on the Plans.

Types of noise wall material include the following:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Concrete masonry units</td>
</tr>
<tr>
<td>B</td>
<td>Interlocking steel panels</td>
</tr>
<tr>
<td>C</td>
<td>Precast concrete panels</td>
</tr>
<tr>
<td>D</td>
<td>Treated timber panels</td>
</tr>
<tr>
<td>F</td>
<td>Glass reinforced thermoset composite structural panels</td>
</tr>
<tr>
<td>G</td>
<td>Precast autoclaved aerated concrete (PAAC) panels</td>
</tr>
<tr>
<td>H</td>
<td>Absorptive panels</td>
</tr>
<tr>
<td>I</td>
<td>Reflective panels</td>
</tr>
</tbody>
</table>

If a material type is not specified elsewhere in the Contract, then the noise barrier walls shall be constructed using precast concrete panels. Interlocking steel panels shall be used where a lighter weight material is necessary such as on bridges and retaining walls. A decision to use a noise barrier wall material other than precast concrete panels or interlocking steel panels, as noted above, will require written approval from the GDOT Chief Engineer.

624.1.03 Submittals

Submit to the Engineer shop drawings for noise barrier walls and steel doors for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper.

A. Noise Barrier Wall

1. Submit sketches and other data, that either verifies the wall will fit the final field conditions or indicates where revisions are necessary, to the Engineer for review and approval. Submit this information prior to the creation of noise barrier wall shop drawings.

2. Prepare Shop Drawings for each Noise Barrier wall. Show all details necessary for field erection.

The minimum requirements are:

- Complete elevation view showing the top and bottom elevations, the required wall envelope, the roadway grade, top of side barrier, top and bottom of footing of side barrier and ground line at the wall.
- Diameter and depth of caissons at each post
- Post size
- Transitions between ground mounted and structure mounted noise barriers
- Complete plan view with dimensions, stations and offset
Section 624 — Noise Barriers

B. Steel Doors

Prepare Shop Drawings for a Single Steel Door and a set of Double Steel Doors.

Show all details necessary for general construction, configurations, jointing methods, reinforcement, and anchorage meeting the following requirements:

- Double steel exterior fire doors – 96 in. (2,438 mm) height by 36 in. (914 mm) width with latch bolt throws with two adjoined concrete pads – 18 ft. (5.49 m) length by 4 ft. (1.22 m) width by 6 in. (152 mm) depth concrete pad and 10 ft. (3.05 m) length by 4 ft. (1.22 m) width by 6 in. (152 mm) depth concrete pad
- Single steel exterior door – 84 in. (2,134 mm) height by 36 in. (914 mm) width with latch bolt throws with two adjoined concrete pads – 10 ft. (3.05 m) length by 4 ft. (1.22 m) width by 6 in. (152 mm) depth concrete pad and 4 ft. (1.22 m) length by 4 ft. (1.22 m) width by 6 in. (152 mm) depth concrete pad
- Latch bolt throws - 38 in. (965 mm) to centerline of door knobs from top of finished concrete pad.

624.2 Materials

Ensure other materials not listed herein meet the requirements of the appropriate Specification to which they pertain.

Noise barriers shall meet the requirements of the following Specification, unless specified otherwise on the Plans or in the Special Provisions. For a list of approved noise barriers, see QPL 90.

624.2.01 Wind Loading

Noise barrier panels shall be designed to the following wind speeds using a 700 Mean Recurrence Interval (MRI) for the listed counties:

- 140 mph (Coastal 2): Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
- 130 mph (Coastal 1): Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnall, Wayne
- 120 mph (Piedmont 2): Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady, Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
- 115 mph (Piedmont 1): For all counties not listed above

The wind speeds and associated counties listed above result in the following minimum design wind pressures:

<table>

624.2.02 Noise Reduction

Noise barrier panels shall meet or exceeds the following criteria related to noise reduction:

- Type A, B, D, F, G and I barriers must achieve a minimum weighted sound transmission loss of 20 dBA. The transmission or loss results must be based on the generalized truck spectrum when tested according to ASTM E 90.
- Type H barriers must achieve a minimum noise reduction coefficient (NRC) of 0.8 and a minimum sound transmission class (STC) of 30 when tested according to ASTM C423.
624.2.03 Component Materials

A. Type A - Concrete Masonry
   1. Concrete Blocks shall be Class A Hollow Load Bearing Concrete Masonry Units, ASTM C90
   2. Mortar shall conform to Section 834 of these Specifications
   3. Design and erection shall conform with the requirements of the AASHTO LRFD Bridge Construction Specifications, Section 15.

B. Type B - Interlocking Steel
   1. Interlocking Steel Panels
      Use cold formed configured steel panels that meet the following requirements:
      a. Use steel sheet conforming to ASTM A 653/653M or ASTM A 792/792M Structural Steel (SS) Grade 50 Class 2 with a minimum thickness of 0.029 inches (0.74 mm)
      b. Has a male-female rib that provides a friction interlock connection with adjacent panels or is joined adequately according to the manufacturer’s specifications
      c. Provides sufficient friction interlock connection strength to support its own weight without using fasteners when connected to another panel and held in a vertical or horizontal position
      d. Use a panel size and shape shown on the Plans or an alternate approved by the Engineer.
      e. Coat (galvanize) the panels with either a G90 (Z275) weight of zinc according to ASTM A 653/653M or an AZ50 (AZM150) weight of 55% aluminum-zinc alloy according to ASTM A 792/792M.
   2. Protective Color Coating
      Use one of the following coatings:
      a. System A—The coating is polyvinylidene fluoride (70 percent resin, minimum enamel, PVF2).
         1) Apply the coating system (including primer) at a total minimum film thickness of 1 mil (0.03 mm) per coated side.
         2) Cure the polyvinylidene fluoride film to at least 0.8 mil (0.02 mm) film thickness.
      b. System B—The coating is polyvinyl fluoride plastic film (PVF1) and has a thickness of at least 1.5 mils (0.04 mm) coated on both sides.
         1) Have the coating applied at the factory to thoroughly cleaned and pretreated galvanized steel according to ASTM D 6386.
         2) Laminate the coating to the galvanized steel using heat and adhesive to form a uniform and durable coating pigmented to obtain optimum color performance.
         3) Use a color from the Federal Standard Color Number indicated on the Plans. Ensure that caulking is color pigmented to match the wall color specified.
   3. Posts
      Use posts that meet the following requirements:
      a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250
      b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M
      c. Coating that weighs at least 2 ounces/ft.² (610 g/m²) on all sides
      d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.
Section 624 — Noise Barriers

4. Steel Flashing and Caps
   Use flashing and caps for steel walls of the same material and color coating as the panels. Fasten steel
   flashing and caps with self-tapping screws. Ensure that A-1 screws are Class #410 Stainless Steel and
   conform to Federal Specification QQ-S-763-C, or are cadmium coated according to ASTM B 766.

5. Fasteners
   Attach panels to posts using a powder-actuated fastening system. Ensure fasteners are stainless steel or hot-
   dip galvanized as per ASTM A 153 Class C or have a mechanically deposited zinc coating as per ASTM B 695
   Class 50.

C. Type C- Precast Concrete
   1. Panels
      Use precast concrete panels meeting the following requirements:

      | Class AA Concrete or Self-Consolidating Concrete (SCC) | Section 500 |
      | Reinforcing                                              | AASHTO M 31/M 31M and M 32/M 32M |

      If SCC is used the following shall be met: wet/cement ratio 0.40 min 3500 psi Spread Slump 24” ± 2”, Air Entrainment – min 3.5% to max 6.5%

   2. Posts
      Use posts that meet the following requirements:
      a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250
      b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M
      c. Coating that weighs at least 2 ounces/ft.² (610 g/m²) on all sides
      d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

   3. Anchor bolts, nuts, washers and base plates
      a. Use anchor bolts, nuts and washers meeting the requirements of Subsection 852.2, or ASTM F1554 Grade 36 (F1554M), A563 (A563M) and F436 (F436M), except use rolled threads meeting 8 UN/8 UNR thread profile according to ANSI B1.1. Use bolts with Class 2A threads, and nuts with class 2B threads. Galvanize all components in accordance with ASTM A 123/A123M or A153/A 153M, whichever is applicable.
      b. Use galvanized base plates conforming to ASTM A709 Grade 36.

   4. Elastomeric Bearing Pads
      Use elastomeric bearing pads that conform to Section 885.

D. Type D- Treated Timber
   1. Use treated timber panels meeting the following requirements:

      | Noise Barrier Walls                          | See QPL 90 |
      | Class A Concrete                             | Section 500 |
      | Lumber and Timber                            | Section 860 |
      | Preservative Treatment of Timber Products    | Section 863 |
E. Type F- Glass Reinforced Thermoset Composite

1. Structural Plank: Use continuous glass fiber reinforced structural planks meeting the following requirements:
   a. Constructed of a durable, UV resistant, flame retardant, thermosetting composite material
   b. Resistant to degradation from ozone, hydrocarbons, and freeze/thaw cycling
   c. Matches the Federal Standard Color Number indicated on the Plans
   d. Meets the following minimum mechanical properties:

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>MINIMUM VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flexural Modulus</td>
<td>2,200,000 psi (15200 MPa)</td>

</tr>
</tbody>
</table>

2. Filler: Use either hollow structural planks or planks filled with a recycled tire rubber compound comprised of sorted and graded ground tire rubber (0.25 ± 0.025 inch (6.4 ± 0.6 mm)).

3. Flashing and Caps: Use flashing and caps of the same material and color as the panels.

4. Caulking: Use color pigmented caulking matching the wall color specified.

5. Posts
   Use posts that meet the following requirements:
   a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250
   b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M
   c. Coating that weighs at least 2 ounces/ft.² (610 g/m²) on all sides
   d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

5. Anchor bolts, nuts, washers and base plates
   a. Use anchor bolts, nuts and washers meeting the requirements of Subsection 852.2, or ASTM F1554 Grade 36 (F1554M), A563 (A563M) and F436 (F436M), except use rolled threads meeting 8 UN/8 UNR thread profile according to ANSI B1.1. Use bolts with Class 2A threads, and nuts with class 2B threads. Galvanize all components in accordance with ASTM A 123/A123M or A153/A 153M, whichever is applicable.
   b. Use galvanized base plates conforming to ASTM A709 Grade 36.
Section 624 — Noise Barriers

F. Type G—Precast Autoclaved Aerated Concrete (PAAC)

1. Precast Autoclaved Aerated Concrete Wall Units: Use PAAC wall units cast from a mixture of Portland cement, fine aggregate, water, gypsum, lime, and an expansion agent. After setting, and before hardening, the PAAC is machine cut to the required size, then steam-cured under pressure in an autoclave. Use PAAC that meets the following physical requirements:
   a. Has a minimum average compressive strength of 725 psi (5000 kPa) when three specimens are tested in accordance with ASTM C 1693, with no single specimen having a compressive strength of less than 580 psi (4000 kPa).
   b. Has a maximum shrinkage of 0.02% when tested in accordance with ASTM C 1693
   c. Has a dry bulk density between 34 lb./ft.³ (544 kg/m³) and 41 lb./ft.³ (656 kg/m³) when tested in accordance with ASTM C 1693

2. Reinforcing: Use reinforcing conforming to AASHTO M31/M 31M or M32/M 32M.

3. Posts
   Use posts that meet the following requirements:
   a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250
   b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M
   c. Coating that weighs at least 2 ounces/ft.² (610 g/m²) on all sides
   d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

4. Welds: Use welds as shown on the Plans.

5. Coatings: Use only approved coating systems on all exposed surfaces, including steel supports. Use the same topcoat color on both the PAAC panels and the steel supports. Submit independent laboratory test results for 1500 hours of accelerated weathering in accordance with ASTM G 154. Submit results that show ratings of at least 9 in the following categories: color change, chalking, checking, cracking, blistering, flaking and rusting. Submit a certification stating that the PAAC topcoat is graffiti resistant.

6. Anchor bolts, nuts, washers and base plates
   a. Use anchor bolts, nuts and washers meeting the requirements of Subsection 852.2, or ASTM F1554 Grade 36 (F1554M), A563 (A563M) and F436 (F436M), except use rolled threads meeting 8 UN/8 UNR thread profile according to ANSI B1.1. Use bolts with Class 2A threads, and nuts with class 2B threads. Galvanize all components in accordance with ASTM A 123/A123M or A153/A 153M, whichever is applicable.
   b. Use galvanized base plates conforming to ASTM A709 Grade 36.

G. Type H—Absorptive

1. Noise Absorptive Panels
   a. Constructed of a durable lightweight, UV resistant, flame retardant material. Provide manufacturer certified wind load test report.
   b. Resistant to degradation from ozone, hydrocarbons, and freeze/thaw cycling.
   c. Matches the Federal Standard Color Number 16360(T-ROCK GREEN) or equivalent.
   d. Free draining to prevent moisture buildup and possible corrosion.
Section 624 — Noise Barriers

2. Posts

Use posts that meet the following requirements:

a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250

b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M

c. Coating that weighs at least 2 ounces/ft² (610 g/m²) on all sides

d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

3. Anchor bolts, nuts, washers and base plates

a. Use anchor bolts, nuts and washers meeting the requirements of Subsection 852.2, or ASTM F1554 Grade 36 (F1554M), A563 (A563M) and F436 (F436M), except use rolled threads meeting 8 UN/8 UNR thread profile according to ANSI B1.1. Use bolts with Class 2A threads, and nuts with class 2B threads. Galvanize all components in accordance with ASTM A123/A123M or A 153/A 153M, whichever is applicable.

b. Use galvanized base plates conforming to ASTM A709 Grade 36.

4. Other Materials

a. Use materials meeting the requirements of the appropriate Section in the Specifications to which they pertain.

H. Type I- Reflective

1. Noise Reflective Panels

a. Constructed of a durable lightweight, UV resistant, flame retardant material. Provide manufacturer certified wind load test report.

b. Resistant to degradation from ozone, hydrocarbons, and freeze/thaw cycling.

c. Matches the Federal Standard Color Number 16360 (T-ROCK GREEN) or equivalent.

d. Free draining to prevent moisture buildup and possible corrosion.

2. Post

Use posts that meet the following requirements:

a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250

b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M

c. Coating that weighs at least 2 ounces/ft² (610 g/m²) on all sides

d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

3. Anchor bolts, nuts, washers and base plates

a. Use anchor bolts, nuts and washers meeting the requirements of Subsection 852.2, or ASTM F1554 Grade 36 (F1554M), A563 (A563M) and F436 (F436M), except use rolled threads meeting 8 UN/8 UNR thread profile according to ANSI B1.1. Use bolts with Class 2A threads, and nuts with class 2B threads. Galvanize all components in accordance with ASTM A123/A123M or A153/A 153M, whichever is applicable.

b. Use galvanized base plates conforming to ASTM A709 Grade 36.
I. **Single and Double Steel Doors**

Ensure materials meet the following:

1. **Hot Rolled Steel Sheets and Strip:** Commercial quality carbon steel, pickled and oiled, complying with ASTM A-569 and ASTM A-568.
   a. **Cold-Rolled Sheets:** Commercial quality carbon steel, complying with ATM A-366 and ASTM A-568.
   b. **Galvanized Steel Sheets:** Zinc-coated or Zinc-Iron alloy-coated carbon steel sheets of commercial quality, complying with ASTM A526, with ASTM A653, G-60 zinc coating, mill phosphatized. Use for all exterior units.
   c. **Supports and Anchors:** Fabricate of not less than 18 gauge galvanized sheet steel.
   d. **Inserts, Bolts and Fasteners:** Manufacturer’s custom units, except hot-dip galvanized items to be built into exterior walls, complying with ASTM A-153, Class C or D as applicable.

2. **Protective Color Coating**

Use one of the following coatings:

a. **System A**—The coating is polyvinylidene fluoride (70 percent resin, minimum enamel, PVF2).
   1) Apply the coating system (including primer) at a total minimum film thickness of 1 mil (0.03 mm) per coated side.
   2) Cure the polyvinylidene fluoride film to at least 0.8 mil (0.02 mm) film thickness.

b. **System B**—The coating is polyvinyl fluoride plastic film (PVF1) and has a thickness of at least 1.5 mils (0.04 mm) coated on both sides.
   1) Have the coating applied at the factory to thoroughly cleaned and pretreated galvanized steel according to ASTM D 6386.
   2) Laminate the coating to the galvanized steel using heat and adhesive to form a uniform and durable coating pigmented to obtain optimum color performance.
   3) Use a color from the Federal Standard Color Number indicated on the Plans.

### 624.2.04 Delivery, Storage, and Handling

General Provisions 101 through 150.

### 624.3 Construction Requirements

#### 624.3.01 Construction

Perform the following work according to the Specifications:

A. **Clearing and Grubbing**

   When necessary, clear and grub according to Section 201 as applicable.

B. **Excavation, Borrow, Embankment**

   Perform excavation, borrow, and embankment according to Section 205, Section 206, Section 208, or Section 210. The scope and dimensions of the work are shown on the Plans.

C. **Grassing**

   Perform grassing according to Section 700, as specified on the Plans.

D. **Vine, Shrub, and Tree Planting**

   Plant vine, shrub, and trees according to Section 702 as specified on the Plans.

E. **Miscellaneous Construction Items**

   When items are shown on the Plans but are not covered in this Specification, the Plans and Standard Specifications to which they pertain govern the work.
Section 624 — Noise Barriers

F. Walls, Single and Double Steel Doors

Follow these requirements to construct each type of wall:

1. Type A Wall
   When using hollow load bearing concrete masonry units (concrete block) to construct the walls, work according to the notes, details, and dimensions on the Plans, including footings, reinforcement, and plaster coat when required.

2. Type B Wall
   a. Install steel noise barrier walls according to the manufacturer’s recommendations and Plan details.
   b. Repair cut, scratched, or marred surfaces according to the manufacturer’s recommendations.

3. Type C Wall
   When using precast concrete panels:
   a. Cast panels at a precast concrete plant listed on QPL 9 or at a precast facility approved by the Engineer.
   b. Have the Engineer determine panel acceptability from the compressive strength of cylinders made and cured the same as the panels and from inspection during manufacture.
      Have the panel manufacturer furnish facilities and assistance to sample and test quickly and satisfactorily.
   c. Cast the panels on a steel surface with steel side forms.
   d. Place concrete in each panel without interruption. Consolidate the concrete using vibrators supplemented by hand tamping and rodding to force the concrete into the corners of the forms to eliminate stone pockets, cleavage planes, and air bubbles.
   e. Architectural finish required. Use the Ashlar Stone finish unless another architectural finish is specified. Provide a similar architectural finish to the opposite side of the barrier unless noted otherwise in the plans. Provide the same or similar finish on extensions of existing noise walls or additions of new noise walls along a corridor with existing noise walls.
   f. Cure the panels as specified in Subsection 500.3.05.Z.1, General Curing—Supplying Additional Moisture, (wet cure) long enough for the concrete to develop the specified compressive strength.
      1) Ensure that the curing period is at least 72 hours under normal summer temperature conditions.
         In colder weather extend the curing period, as directed by the Engineer
      2) Protect the panels from freezing from the time the concrete is placed until curing is complete.
      3) Instead of the wet cure method, steam cure the panels as specified in Subsection 865.2.01.B.2.g.(2) if desired.
   g. Mark each panel with the date cast and the Inspector’s approval stamp.

   **NOTE:** Even with the Inspector’s acceptance at the precast yard, panels can still be rejected at the erection point if they are damaged.

   h. Erect the panels according to Plan details and dimensions. Place bearing pads as shown in the Plans, and tighten the restraining bolts. Do not stack more than two bearing pads at the panel support. Do not use concrete blocks at the panel supports to make up for grade difference on top of foundation.
   i. After erection is complete and before Final Acceptance of the Project, clean the noise barrier to remove dirt or stains.
4. Type D Wall
   Install in accordance with manufacturer’s recommendations and plan details. Do not install walls with burns, discolorations, cracks, or other objectionable marks that would adversely affect the performance of the system.

5. Type F Wall
   Install in accordance with manufacturer’s recommendations and Plan details. Do not install walls with burns, discolorations, cracks, or other objectionable marks that would adversely affect the performance of the system.

6. Type G Wall
   a. Cast the PAAC panels in a precast facility approved by the Engineer.
   b. Have the Engineer determine panel acceptability from the compressive strength of cylinders made and cured the same as the panels and from inspection during manufacture. Have the panel manufacturer furnish facilities and assistance to sample and test quickly and satisfactorily.
   c. Cast the panels on a steel surface with steel side forms. When an architectural finish is specified for one side of the barrier, provide a similar finish to the opposite side unless noted otherwise in the plans.
   d. Place concrete in each panel without interruption. Consolidate the concrete using vibrators supplemented by hand tamping and rodding to force the concrete into the corners of the forms to eliminate stone pockets, cleavage planes, and air bubbles.
   e. After machine cutting to the required size, cure the PAAC units by high-pressure steam autoclaving so that the units meet the physical requirements of Subsection 624.2.03.F.1.
   f. Mark each panel with the date cast and the Inspector’s approval stamp.

   **NOTE**: Even with the Inspector’s acceptance at the precast yard, panels can still be ejected at the erection point if they are damaged.

   g. Erect the panels according to Plan details and dimensions.
   h. After erection is complete and before Final Acceptance of the Project, clean the noise barrier to remove dirt or stains.
   i. Use coatings that are approved by the Laboratory.
      1) PAAC panels. Apply the coating with a sponge-textured roller in accordance with the manufacturer’s recommendations. Cover all exposed galvanized steel surfaces for protection from splattering. Apply the coating at a minimum thickness of 60 dry mils (1.5 mm). Apply the coating only when the ambient temperature is greater than 40 °F (4 °C) and rising. Do not apply any coating during rainfall or when rainfall is forecast overnight.
      2) Galvanized Steel Supports. Apply a corrosion resistant coating by brush, roller, or airless spray in accordance with the manufacturer’s recommendations. Protect the adjacent PAAC surfaces from overspray. Apply the coating at a minimum thickness of 2 dry mils (0.05 mm). Use a color that matches the PAAC final topcoat color. Apply the coating only when the ambient temperature and relative humidity fall within the limits stated by the manufacturer.

7. Type H Wall
   Install in accordance with manufacturer’s recommendations and Plan details. Do not install walls with burns, discolorations, cracks, or other objectionable marks that would adversely affect the performance of the system. Ensure to install panels with the absorptive portion facing the highway side.

8. Type I Wall
   Install in accordance with manufacturer’s recommendations and Plan details. Do not install walls with burns, discolorations, cracks, or other objectionable marks that would adversely affect the performance of the system. Ensure to install panels with the reflective portion facing the highway side.
9. All Walls

Before beginning earthwork on the Project, stake the noise barriers in the field and establish the final ground line elevations at the noise barrier walls.

After wall stake out data has been reviewed and approved by the Engineer per subsection 624.1.03, furnish these elevations to the supplier who will develop the shop plans per subsection 624.1.03.A.

a. Protect the final ground elevations established in the field for the duration of the Project. Do not adjust them without the Engineer’s approval.

b. Install noise barriers according to the Plans and Shop Drawings approved by the Engineer.

c. Secure joints and connections to be structurally sound with no visible openings for sound transmission. Ensure that vibration from metal barriers is not a secondary source of noise transmission.

d. Repair marred, chipped, scratched, or spalled barrier areas according to the manufacturer’s recommendations and as directed by the Engineer at the Contractor’s expense.

e. To substitute welded for fixed-bolt connections or vice versa on metal barriers and doors, meet these conditions:
   1) Submit load calculations for the specific connection to be modified.
   2) Use a safety factor of at least 3.0.

f. Place trench backfill for noise barrier construction according to Section 207. Use select material to backfill.

   If the Engineer believes the trench is too narrow for compaction, backfill the trench excavation with concrete grout to the Engineer’s satisfaction. No additional compensation will be made for the concrete grout.

g. Dispose of excess excavation to the Engineer’s satisfaction.

h. Keep right-of-way fence scheduled to be salvaged in place until the noise barrier is constructed, or as long as the Engineer deems practical.

i. After erecting the noise barrier, leave the disturbed area in a finished condition at the Engineer’s direction and plant grass or sod.

j. Payment for establishing grass is described in Subsection 624.4.C, “Grassing.”

k. Ensure noise barrier meets these tolerances:
   1) Vertical alignment for barriers and posts is:
      - 0.5 in. (15 mm) for noise barrier heights to 10 ft. (3 m)
      - 1 in. (25 mm) for noise barrier heights to 20 ft. (6 m)
      - 1.5 in. (40 mm) for noise barrier heights to 30 ft. (9 m)
   2) Horizontal alignment for noise barriers is close to that shown on roadway Plans.
   3) Post spacings are within 0.5 in (15 mm) of their intended location.

l. For noise barriers built on top of earth berms, construct the berms of earthwork fill material and compact to 95% of the maximum density as determined by GDT 7, GDT 24a, GDT 24b, or GDT 67, as applicable. Determine in-place density according to GDT 20, GDT 21, or GDT 59, as applicable.

m. Tolerance for Type C and G Panels
   1) Manufacture Type C and G panels within the dimensional tolerances for Flat Wall Panels listed in SOP-3, Standard Operating procedures for Precast/Prestressed Concrete.
   2) The Department may reject noise wall panels based on excessive deviations.
   3) For textured finished, surface defects greater than 5/16 in. (8 mm) in 5 ft. (1.5 m) will be rejected.
10. Single and Double Steel Doors  
   a. Install single and double steel doors according to the manufacturer’s recommendations, the Plans, and Shop Drawings approved by the Engineer.  
   b. Furnish the elevations and locations to the supplier who will develop the Shop Plans, including a complete elevation view of each single and double steel door set indicating the locations and the concrete pad top elevation.

6. Graffiti-Proof Coating  
This work includes providing graffiti-proof coating on both faces of concrete and masonry noise barriers, and single and double steel doors from the ground line to the top of the wall.

1. Materials. Use materials as noted on QPL 42.  
2. Delivery and Storage. Ensure that the materials are delivered in manufacturer’s original containers with labels intact.  
   Store the materials out of the weather, in a single location, and as specified by the manufacturer.

3. Job Conditions. Protect the coating from the weather and work conditions as follows:  
   a. Apply the graffiti-proof coating in weather recommended by the manufacturer.  
   b. Mask, cover, or otherwise protect finished adjacent surfaces from damage that work in this Section could cause.  
   c. Protect finished coatings from staining, marring, and damages from other trades.

4. Quality Criteria. Use materials that are products of one manufacturer.  
   Use application equipment recommended or approved by the coating manufacturer for use on this Project. Use equipment in good operating condition.

5. Application. Ensure that the moisture content of surfaces to receive coating are within the limits recommended by the coating manufacturer.  
   a. Apply coating after applying a Type III finish of concrete, or after thoroughly cleaning the concrete block.  
   b. Apply coating at rate of 1 gal per 250 to 300 ft.² (1 L per 6 to 7 m²). Apply three coats using a low-pressure spray.  
   c. Begin the coating application at the uppermost surfaces and work down.  
   d. Remove loose particles, dirt, grease, oil, and other foreign materials following application.

624.3.02 Quality Acceptance  
The panels are subject to rejection if they fail to meet the requirements specified above. The following defects are also cause for rejection:  
1. Defects from imperfect mixing and casting  
2. Honeycombed or open texture  
3. Exposed reinforcement  
4. Failure to meet the required 3,500 psi (25 MPa) compressive strength at 28 days
Section 624 — Noise Barriers

624.4 Measurement

A. Clearing and Grubbing
Clearing and grubbing will not be measured separately for payment.

B. Excavation, Borrow, and Embankment
Excavation, borrow, and embankment will not be measured for payment unless an earthwork pay item is included in the contract.
The scope and dimensions of the work are as shown on the Plans.

C. Grassing
Grassing is not measured separately for payment unless shown on the Plans as a payment item.

D. Vine, Shrub, and Tree Planting
Vine, shrub, and tree planting shown on the Plans is measured according to Section 702.

E. Items Not Covered in This Specification
Items shown on the Plans but not covered in this Specification are measured for payment according to the applicable portions of the Specifications.

F. Walls
1. Type A Wall
Concrete masonry wall constructed of concrete masonry units (blocks), complete in place, is measured in square feet (meters) of area from end to end and from top of footing to top of wall, including solid top block or solid cap block.

2. Type B Wall
Steel wall is measured in square feet (meters) of wall surface installed before backfilling complete in place according to Subsection 109.01, Measurement and Quantities. There will be no separate measurement for posts, flashing, caps, concrete post embedment, or other incidental items required for construction.

3. Type C Wall
Precast concrete noise barriers are measured in square feet (meters) of wall surface before backfilling, including pile flanges, complete in place and accepted.
There will be no separate measurement pile, anchor bolts, plates, connections, neoprene bearing pads, connecting bolts, or other components of the noise barrier.

4. Type D Wall
Treated timber walls are measured in square feet (meters) of wall surface installed before backfilling.
No separate measurement is made for posts, caps, foundations, footings, hardware, timber treatment, pile, or over boards.

5. Type F Wall
Glass reinforced thermoset composite structural panel walls are measured in square feet (meters) of wall surface installed before backfilling complete in place in accordance with Section 109.
There will be no separate measurement for posts, top caps, bottom caps, side caps, flashing, strip seals, mounting brackets and hardware, concrete post embedment, or other incidental items required for construction.

6. Type G Wall
Precast Autoclaved Aerated Concrete walls are measured in square feet (meters) of wall surface installed before backfilling, complete in place and accepted.
There will be no separate measurement for steel supports or any other components of the noise barrier.
Section 624 — Noise Barriers

7. Type H Wall
Absorptive panel walls are measured in square feet (meters) of wall surface before backfilling complete in place and accepted. There will be no separate measurement for steel post or any other components of the noise barrier.

8. Type I Wall
Reflective panel walls are measured in square feet (meters) of wall surface before backfilling complete in place and accepted. There will be no separate measurement for steel post or any other components of the noise barrier.

624.5 Payment
The pay quantities will be the Wall Envelope quantities shown in the Plans unless the Engineer approves an adjusted wall envelope. In this case, the pay quantities will be the adjusted wall envelope quantities.

No additional compensation will be made for any additional material, equipment, design, or other items found necessary to comply with the project Specifications as a result of the Department’s review except for changes made necessary by the survey verification required by Subsection 624.1.03 and Subsection 624.3.01.F.9, or other changes approved by the Engineer.

Include in the unit bid prices all costs necessary to comply with the requirements of this specification. No payment will be made for wall area outside of the adjusted wall envelope.

A. Clearing and Grubbing
The cost of clearing and grubbing is included in the Lump Sum Clearing and Grubbing Item for the Project. When clearing and grubbing is not shown as a payment Item, the cost is included in the overall Contract Price for the work covered in this Specification.

B. Unclassified Excavation and Borrow
No separate payment will be made for Excavation, Borrow and Embankment unless shown on the Plans as a separate Pay Item.

C. Grassing
No separate payment will be made for Grassing unless shown on the Plans as a separate pay item.

D. Vine, Shrub, and Tree Planting
When the Plans state that this Item will be paid for, payment will be made under Section 702.

E. Items Not Covered by This Specification
Items shown on the Plans to be paid for but are not covered by this Specification will be paid for according to the applicable portions of the Specifications.

F. Walls
1. Type A Wall
   a. Concrete block walls will be paid for at the Contract Unit Price bid per square foot (meter). Payment includes but is not limited to: Concrete blocks of the thickness shown on the Plans for the wall and pilasters.
   b. Plaster coat when required
   c. Excavation for footings, concrete footings, and reinforcement when specified
   d. Incidental to complete the Item, including graffiti-proof coating

2. Type B Wall
Steel wall will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing and installing materials, providing post and post embedment, and providing labor, equipment, and incidentals to complete the Work.
3. Type C Wall
   Precast concrete noise barrier will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing materials, including piling and attachments and for erecting the noise barrier, including graffiti-proof coating.

4. Type D Wall
   Treated timber wall will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing materials including concrete and steel and for erecting the noise barrier.

5. Type F Wall
   Glass reinforced thermoset panel walls will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing and installing materials, including post and post embedment, and for labor, equipment, and incidentals to complete the Work.

6. Type G Wall
   Precast autoclaved aerated concrete noise barrier will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing materials, including steel supports, and for erecting the noise barrier, including graffiti-proof coating.

7. Type H Wall
   Absorptive wall will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing and installing materials, post and post embankment, labor, equipment, and incidentals to complete the Work.

8. Type I Wall
   Reflective wall will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full compensation for furnishing and installing materials, post and post embankment, labor, equipment, and incidentals to complete the Work.

Payment will be made under:

**624.5.01 Adjustments**

General Provisions 101 through 150.
625.1 General Description
This work includes furnishing and installing a visual barrier according to this specification and conforming to the locations, dimensions, lines, and grades shown on the plans.

Unless a specific type is required by the Contract documents, select one of the following barrier types.

625.1.3 Submittals

Submit Shop Drawings to the Engineer for review and approval.

Prepare Shop Drawings for each Visual Barrier.

Show all details necessary for field erection. The minimum requirements are:

- Complete elevation view showing the top and bottom elevations, the required wall envelope, the roadway grade and ground line at the barrier.
- Diameter and depth of caissons at each post
- Post size
- Complete plan view with dimensions, stations and offset

Have the manufacturer certify to the Department that a specimen of the proposed barrier meets or exceeds a minimum weighted Visual transmission loss of 20 dBA. Furnish test results for barrier material types (except Type C). The transmission or loss results must be based on the generalized truck spectrum when tested according to ASTM E 90.

625.2 Materials

Ensure that other materials not listed herein meet the requirements of the appropriate specification to which they pertain.

A. Type A

Concrete-Class A Hollow Load Bearing Concrete Masonry Units (Concrete Block) ASTM C 90, Grade N-I or N-II

Mortar

B. Type B

1. Interlocking Steel Panels

   Use cold formed configured steel panels that meet these requirements:

   a. Use steel sheet conforming to ASTM A 653/653M or ASTM A 792/792M Structural Steel (SS) Grade 50 Class 2 with a minimum thickness of 0.029 in. (0.74 mm)

   b. Has a male-female rib that provides a friction interlock connection with adjacent panels or is joined adequately according to the manufacturer’s specifications

   c. Provides sufficient friction interlock connection strength to support its own weight without using fasteners when connected to another panel and held in a vertical or horizontal position

   d. Use a panel size and shape shown on the Plans or an alternate approved by the Engineer.
e. Coat (galvanize) the panels with either a G90 (Z275) weight of zinc according to ASTM A 653/653M or an AZ50 (AZM150) weight of 55% aluminum-zinc alloy according to ASTM A 792/792M.

2. Protective Color Coating
   Use one of the following coatings:
   a. System A—The coating is polyvinylidene fluoride (70 percent resin, minimum enamel, PVF2).
      1) Apply the coating system (including primer) at a total minimum film thickness of 1 mil (0.03 mm) per coated side.
      2) Cure the polyvinylidene fluoride film to at least 0.8 mil (0.02 mm) film thickness.
   b. System B—The coating is polyvinyl fluoride plastic film (PVF1) and has a thickness of at least 1.5 mils (0.04 mm) coated on both sides.
      1) Have the coating applied at the factory to thoroughly cleaned and pretreated galvanized steel according to ASTM D 2092, Method F.
      2) Laminate the coating to the galvanized steel using heat and adhesive to form a uniform and durable coating pigmented to obtain optimum color performance.
      3) Use a color from the Federal Standard Color Number indicated on the plans. Ensure that caulking is color pigmented to match the barrier color specified.

3. Post
   Use post for steel barriers with these features:
   a. Hot rolled shape conforming to AASHTO M 270/M 270M GR 36/GR 250.
   b. Hot-dip galvanized by an approved galvanizer as listed on QPL-53 and in accordance with AASHTO M 111/M 111M.
   c. Coating that weighs at least 2 oz/ft² (610 g/m²) on all sides.
   d. Each post requires pre-inspection by the Office of Materials & Testing as evidenced by a GDT stamp affixed near one end of each post.

4. Steel Flashing and Caps
   Use flashing and caps for steel barriers that are the same material and color coating as the panels. Fasten steel flashing and caps with self-tapping screws. Ensure that A-1 screws are Class #410 Stainless Steel and conform to Federal Specification QQ-S-763-C, or are cadmium coated according to ASTM B 766.

5. Fasteners
   Attach panels to posts using a powder-actuated fastening system. Fasteners shall be stainless steel or shall be hot-dip galvanized as per ASTM A 153 Class C or shall have a mechanically deposited zinc coating as per ASTM B 695 Class 50.

C. Type C
   1. Use precast concrete panels that meet these requirements:

<table>
<thead>
<tr>
<th>Class AA Concrete or SCC Concrete</th>
<th>Section 500</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reinforcing</td>
<td>AASHTO M 31/M 31M and M 32/M 32M</td>
</tr>

<td>Section 520 and AASHTO M 111/M 111M</td>
</tr>
<tr>
<td>Elastomeric Bearing Pads</td>
<td>Section 885</td>
</tr>
</tbody>
</table>

   If SCC is used the following shall be met: wet/cement ratio 0.40 min 3500 psi Spread Slump 24” ± 2”, Air Entrainment – min 3.5% to max 6.5%

   2. Use piling, bolts, and fittings that are hot-dip galvanized when the barrier rests on another concrete structure.
D. Type D

Use treated timber panels that meet these requirements:

<table>

E. Type F

1. Structural Plank: Use continuous glass fiber reinforced structural planks meeting the following requirements:
   a. Constructed of a durable, UV resistant, flame retardant, thermosetting composite material
   b. Resistant to degradation from ozone, hydrocarbons, and freeze/thaw cycling
   c. Matches the Federal Standard Color Number indicated on the plans
   d. Meets the following minimum mechanical properties:

<td>1.86</td>
<td>ASTM D 792</td>
</tr>
</tbody>
</table>

1. Filler: Use either hollow structural planks or planks filled with a recycled tire rubber compound comprised of sorted and graded ground tire rubber (0.25 ± 0.025 inch (6.4 ± 0.6 mm)).
2. Flashing and Caps: Use flashing and caps of the same material and color as the panels.
3. Caulking: Use color pigmented caulking matching the barrier color specified.
4. Posts: Use posts fabricated from hot rolled shapes conforming to AASTHO M 270/M 270M, GR 36/ GR 250, and hot dip galvanized in accordance with AASHTO M 111/M 111M, except coating weight shall be a minimum of 2.0 oz/ft.² (600 g/m²) on all sides.
5. Other Materials: Use materials meeting the requirements of the appropriate Section in the specifications to which they pertain.
Section 625 — Visual Barriers

F. Type G

1. Precast Autoclaved Aerated Concrete (PAAC) Panel Units: Use PAAC panel units cast from a mixture of Portland cement, fine aggregate, water, gypsum, lime, and an expansion agent. After setting, and before hardening, the PAAC is machine cut to the required size, then steam-cured under pressure in an autoclave. Use PAAC that meets the following physical requirements:
   a. Has a minimum average compressive strength of 725 psi (5000 kPa) when three specimens are tested in accordance with ASTM C 1693, with no single specimen having a compressive strength of less than 580 psi (4000 kPa).
   b. Has a maximum shrinkage of 0.02% when tested in accordance with ASTM C 1693
   c. Has a dry bulk density between 34 lb./ft.³ (544 kg/m³) and 41 lb./ft.³ (656 kg/m³) when tested in accordance with ASTM C 1693

2. Reinforcing: Use reinforcing conforming to AASHTO M 31/M 31M or M32/M 32M.

3. Galvanized Steel Support: Use supports as shown on the plans.

4. Welds: Use welds as shown on the plans.

5. Coatings: Use only approved coating systems on all exposed surfaces, including steel supports. Use the same topcoat color on both the PAAC panels and the steel supports. Submit independent laboratory test results for 1500 hours of accelerated weathering in accordance with ASTM G 154. Submit results that show ratings of at least 9 in the following categories: color change, chalking, checking, cracking, blistering, flaking and rusting. Submit a certification stating that the PAAC topcoat is graffiti resistant.

G. Single and Double Steel Doors

1. Ensure materials meet the following:
   c. Galvanized Steel Sheets: Zinc-coated or Zinc-Iron alloy-coated carbon steel sheets of commercial quality, Complying with ASTM A526, with ASTM A653, G-60 zinc coating, mill phosphatized. Use for all exterior units.
   d. Supports and Anchors: Fabricate of not less than 18 gauge galvanized sheet steel.
   e. Inserts, Bolts and Fasteners: Manufacturer’s custom units, except hot-dip galvanized items to be built into exterior barriers, complying with ASTM A-153, Class C or D as applicable.

2. Protective Color Coating
   Use one of the following coatings:
   a. System A—The coating is polyvinylidene fluoride (70 percent resin, minimum enamel, PVF2).
      1) Apply the coating system (including primer) at a total minimum film thickness of 1 mil (0.03 mm) per coated side.
      2) Cure the polyvinylidene fluoride film to at least 0.8 mil (0.02 mm) film thickness.
   b. System B—The coating is polyvinyl fluoride plastic film (PVF1) and has a thickness of at least 1.5 mils (0.04 mm) coated on both sides.
      1) Have the coating applied at the factory to thoroughly cleaned and pretreated galvanized steel according to ASTM D 2092, Method F.
      2) Laminate the coating to the galvanized steel using heat and adhesive to form a uniform and durable coating pigmented to obtain optimum color performance.
      3) Use a color from the Federal Standard Color Number indicated on the plans.
Section 625 — Visual Barriers

625.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

625.3 Construction Requirements

625.3.1 Personnel
General Provisions 101 through 150.

625.3.2 Equipment
General Provisions 101 through 150.

625.3.3 Preparation
General Provisions 101 through 150.

625.3.4 Fabrication
General Provisions 101 through 150.

625.3.5 Construction
Perform the following work according to the specifications:

A. Clearing and Grubbing
   When necessary, clear and grub according to Section 201 as applicable.

B. Excavation, Borrow, Embankment
   Perform excavation, borrow, and embankment according to Section 205,
   Section 206, Section 208, or Section 210. The scope and dimensions of the work are shown on the plans.

C. Grassing
   Perform grassing according to Section 700, as specified on the plans.

D. Vine, Shrub, and Tree Planting
   Plant vine, shrub, and trees according to Section 702 as specified on the plans.

E. Miscellaneous Construction Items
   When items are shown on the plans but are not covered in this specification, the plans and Standard
   specifications govern the work.

F. Barrier
   Follow these requirements to construct each type of barrier:

   1. Type B Barrier
      Install steel visual barrier according to the manufacturer’s recommendations and plan details. Repair cut,
      scratched, or marred surfaces according to the manufacturer’s recommendations.

   2. Type C Barrier
      When using precast concrete panels:
      a. Cast them in a precasting facility approved by the Engineer.
      b. Have the Engineer determine panel acceptability from the compressive strength of cylinders made and
         cured the same as the panels, and from inspection during manufacture.
      c. Have the panel manufacturer furnish facilities and assistance to sample and test quickly and satisfactorily.
      d. Cast the panels on a steel surface with steel side forms.
e. Place concrete in each panel without interruption. Consolidate the concrete using vibrators supplemented by hand tamping and rodding to force the concrete into the corners of the forms to eliminate stone pockets, cleavage planes, and air bubbles.

f. Give the panels a Type III—Rubbed Finish on the upper surface (as cast) according to Subsection 500.3.05.AB, “Finish Concrete.” When an architectural finish is specified for one side of the barrier, provide a similar finish to the opposite side unless noted otherwise in the plans.

g. Cure the panels as specified in Subsection 500.3.05.Z.1, General Curing—Supplying Additional Moisture, (wet cure) long enough for the concrete to develop the specified compressive strength.

   1) Ensure that the curing period is at least 72 hours under normal summer temperature conditions. In colder weather extend the curing period, as directed by the Engineer.

   2) Protect the panels from freezing from the time the concrete is placed until curing is complete.

   3) Instead of the wet cure method, steam cure the panels as specified in Subsection 865.2.01.B.2.g.(2) if desired.

i. Mark each panel with the date cast and the Inspector’s approval stamp.

**NOTE: Even with the Inspector’s acceptance at the precast yard, panels can still be rejected at the erection point if they are damaged.**

j. Erect the panels according to Plan details and dimensions.

   Place bearing pads as shown in the plans and tighten the restraining bolts.

k. After erection is complete and before Final Acceptance of the project, clean the Visual barrier to remove dirt or stains.

l. The contractor shall construct the Visual barriers with an ashlar stone finish except in specific locations identified in the plans. In these areas, the concrete panels will be constructed with special form liners based on the attached renderings.

3. Type D Barrier

   The Plans shall designate the correct type of D barrier (Type D.1 or Type D.2.).

   a. Type D.1 Barrier

      Construct this barrier of tongue and groove panels placed in a horizontal configuration supported by vertical posts set on concrete piers. Follow the plan details for information on sizes, timber treatment, and erection.

   b. Type D.2 Barrier

      Construct this barrier of double wood panels staggered to provide a 1/2-width overlap. The supports are posts set in a concrete footing. Follow the plans for full details of materials and erection, sizes, and timber treatment.

4. Type F Barrier

   Install in accordance with manufacturer’s recommendations and plan details. Do not install barriers with burns, discolorations, cracks, or other objectionable marks that would adversely affect the performance of the system.

5. Type G Barrier

   a. Cast the PAAC panels in a pre-casting facility approved by the Engineer.

   b. Have the Engineer determine panel acceptability from the compressive strength of cylinders made and cured the same as the panels, and from inspection during manufacture.

   c. Have the panel manufacturer furnish facilities and assistance to sample and test quickly and satisfactorily.
**Section 625 — Visual Barriers**

**d.** Cast the panels on a steel surface with steel side forms. When an architectural finish is specified for one side of the barrier, provide a similar finish to the opposite side unless noted otherwise in the plans.

**e.** Place concrete in each panel without interruption. Consolidate the concrete using vibrators supplemented by hand tamping and rodding to force the concrete into the corners of the forms to eliminate stone pockets, cleavage planes, and air bubbles.

**f.** After machine cutting to the required size, cure the PAAC units by high-pressure steam autoclaving so that the units meet the physical requirements of Subsection 625.2.G.1.

**g.** Mark each panel with the date cast and the Inspector’s approval stamp.

**NOTE:** Even with the Inspector’s acceptance at the precast yard, panels can still be rejected at the erection point if they are damaged.

**h.** Erect the panels according to plan details and dimensions.

**i.** After erection is complete and before Final Acceptance of the Project, clean the Visual barrier to remove dirt or stains.

**j.** Use coatings that are approved by the Laboratory.

1) **PAAC panels.** Apply the coating with a sponge-textured roller in accordance with the manufacturer’s recommendations. Cover all exposed galvanized steel surfaces for protection from splattering. Apply the coating at a minimum thickness of 60 dry mils (1.5 mm). Apply the coating only when the ambient temperature is greater than 40°F (4°C) and rising. Do not apply any coating during rainfall or when rainfall is forecast overnight.

2) **Galvanized Steel Supports.** Apply a corrosion resistant coating by brush, roller, or airless spray in accordance with the manufacturer’s recommendations. Protect the adjacent PAAC surfaces from overspray. Apply the coating at a minimum thickness of 2 dry mils (0.5 mm). Use a color that matches the PAAC final topcoat color. Apply the coating only when the ambient temperature and relative humidity fall within the limits stated by the manufacturer.

**6. All Barrier**

Before beginning earthwork on the Project, stake the visual barriers in the field and establish the final ground line elevations at the barrier.

Furnish these elevations to the supplier who will develop the shop plans, including a complete elevation view of each barrier indicating top and bottom elevations and the roadway grade.

**a.** Protect the final ground elevations established in the field for the duration of the project. Do not adjust them without the Engineer’s approval.

**b.** Install Visual barriers according to the plans and Shop Drawings approved by the Engineer.

**c.** Secure joints and connections to be structurally sound with no visible openings. Ensure that vibration from metal barriers is not a secondary source of noise transmission.

**d.** Repair marred, chipped, scratched, or spalled barrier areas according to the manufacturer’s recommendations and as directed by the Engineer at the Contractor’s expense.

**e.** To substitute welded for fixed-bolt connections or vice versa on metal barriers, meet these conditions:

- Submit load calculations for the specific connection to be modified.
- Use a safety factor of at least 3.0.

**f.** Place trench backfill for Visual barrier construction according to Section 207. Use select material to backfill. If the Engineer believes the trench is too narrow for compaction, backfill the trench excavation with concrete grout to the Engineer’s satisfaction. No additional compensation will be made for the concrete grout.

**g.** Dispose of excess excavation to the Engineer’s satisfaction.
h. Keep right-of-way fence in place that is scheduled to be salvaged until the barrier is constructed, or as long as the Engineer deems practical.

i. After erecting the barrier, leave the disturbed area in a finished condition at the Engineer’s direction and plant grass or sod.

j. Ensure that the barrier meets these tolerances:
   1) Vertical alignment for barriers and posts is:
      a) 0.5 in. (15 mm) for barrier heights to 10 ft. (3 m)
      b) 1.0 in. (25 mm) for barrier heights to 20 ft. (6 m)
      c) 1.5 in. (40 mm) for barrier heights to 30 ft. (9 m)
   2) Horizontal alignment for barriers is close to that shown on roadway plans.
   3) Post spacings are within 0.5 in. (15 mm) of their intended location.

k. For Visual barriers built on top of earth berms, construct the berms of earthwork fill material and compact to 95% of the maximum density as determined by GDT 7, GDT 24a, GDT 24b or GDT 67, as applicable. Determine in-place density according to GDT 20, GDT 21, or GDT 59, as applicable.

G. Graffiti-Proof Coating

This work includes providing graffiti-proof coating on both faces of concrete and masonry barriers from the ground line to the top of the barrier.

1. Materials. Use materials as noted on QPL 42.

2. Delivery and Storage. Ensure that the materials are delivered in manufacturer’s original containers with labels intact. Store the materials out of the weather, in a single location, and as specified by the manufacturer.

3. Job Conditions. Protect the coating from the weather and work conditions as follows:
   a. Apply the graffiti-proof coating in weather recommended by the manufacturer.
   b. Mask, cover, or otherwise protect finished adjacent surfaces from damage that work in this section could cause.
   c. Protect finished coatings from staining, marring, and damages from other trades.

4. Quality Criteria. Use materials that are products of one manufacturer. Use application equipment recommended or approved by the coating manufacturer for use on this project. Use equipment in good operating condition.

5. Application. Ensure that the moisture content of surfaces to receive coating are within the limits recommended by the coating manufacturer.
   a. Apply coating after applying a Type III finish of concrete, or after thoroughly cleaning the concrete block.
   b. Apply coating at rate of 1 gal per 250 to 300 ft² (1 L per 6 to 7 m²). Apply three coats using a low-pressure spray.
   c. Begin the coating application at the uppermost surfaces and work down.
   d. Remove loose particles, dirt, grease, oil, and other foreign materials following application.

625.3.6 Quality Acceptance

The panels are subject to rejection if they fail to meet the requirements specified above. The following defects are also cause for rejection for Barrier Type C and G:

1. Defects from imperfect mixing and casting Honeycombed or open texture
2. Exposed reinforcement
3. Failure to meet the required 3,500 psi (25 MPa) compressive strength at 28 days
Section 625 — Visual Barriers

625.3.7 Contractor Warranty and Maintenance
General Provisions 101 through 150.

625.4 Measurement

A. Clearing and Grubbing
Clearing and grubbing will not be measured separately for payment.

B. Excavation, Borrow, and Embankment
Excavation, borrow, and embankment are measured according to Section 205, Section 206, Section 208, or Section 210, as applicable.
The scope and dimensions of the work are as shown on the plans.

C. Grassing
Grassing is not measured separately for payment unless shown on the Plans as a payment item. In this case, the work is measured according to the requirements of Section 700 for the type of grassing required.

D. Vine, Shrub, and Tree Planting
Vine, shrub, and tree planting shown on the Plans is measured according to Section 702.

E. Items Not Covered in this Specification
Items shown on the plans but not covered in this Specification are measured for payment according to the applicable portions of the specifications.

F. Barriers
1. Type B Barrier
   Steel barrier is measured in square feet (meters) of barrier surface installed before backfilling complete in place according to Subsection 109.01, Measurement and Quantities. Posts, flashing, caps, concrete post embedment, or other incidental items required for construction are not measured separately.

2. Type C Barrier
   Precast concrete Visual barriers are measured in square feet (meters) of barrier surface before backfilling, including pile flanges, complete in place and accepted.
   No separate measurement is made for pile, anchor bolts, plates, connections, neoprene bearing pads, connecting bolts, or other Visual barrier components.

3. Type D Barrier
   Treated timber barriers are measured in square feet (meters) of barrier surface installed before backfilling.
   No separate measurement is made for posts, caps, foundations, footings, hardware, timber treatment, pile, or cover boards.

4. Type F Barrier
   Glass reinforced thermoset composite structural panel barriers are measured in square feet (meters) of barrier surface installed before backfilling.
   No separate measurement is made for posts, top caps, bottom caps, side caps, flashing, strip seals, mounting brackets and hardware, concrete post embedment, or other incidental items required for construction.

5. Type G Barrier
   Precast autoclaved aerated concrete barriers are measured in square feet (meters) of barrier surface installed before backfilling.
   No separate measurement is made for steel supports or other incidental items required for construction.
6. All Barrier
   Only authorized changes required to adjust plan ground elevations and other authorized changes will be
   measured. Payment will be made based on plan quantity unless changes are authorized.

625.4.01 Limits
   General Provisions 101 through 150.

625.5 Payment
   A. Clearing and Grubbing
      The cost of clearing and grubbing is included in the Lump Sum Item for the project. When clearing and grubbing is not
      shown as a payment Item, the cost is included in the overall Contract Price for the work covered in this specification.
   B. Unclassified Excavation and Borrow
      Unclassified excavation and borrow will be paid for and included in the normal excavation and borrow for the
      Project unless shown on the plans as a separate payment Item for Visual barriers. In that case, payment will be
      made under Section 205, Section 206, Section 208, or Section 210, as applicable.
   C. Grassing
      Grassing will be paid for and is included in the normal grassing for the project according to Section 700 unless
      shown on the plans to be included in the price bid for Visual barriers.
   D. Items Not Covered by This Specification
      Items shown on the Plans to be paid for but are not covered by this specification will be paid for according to the
      applicable portions of the specifications.
   E. Barriers
      Unless a specific barrier type is specified in the Contract, identify in the proposal which barrier type will be used.
      1. Type B Barrier
         Steel barrier will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full
         compensation for furnishing and installing materials, providing post and post embedment, and providing
         labor, equipment, and incidentals to complete the Work.
      2. Type C Barrier
         Precast concrete Visual barrier will be paid for at the Contract Unit Price bid per square foot (meter). Payment
         is full compensation for furnishing materials, including piling and attachments and for erecting the Visual
         barrier, including graffiti-proof coating.
         No separate measurement is made for special barrier construction. Contract price shall include construction
         of the special barrier in the pay item below.
      3. Type D Barrier
         Treated timber barrier will be paid for at the Contract Unit Price bid per square foot (meter). Payment is full
         compensation for furnishing materials including concrete and steel and for erecting the Visual barrier.
      4. Type F Barrier
         Glass reinforced thermoset panel barriers will be paid for at the Contract Unit Price bid per square foot
         (meter). Payment is full compensation for furnishing and installing materials, including post and post
         embedment, and for erecting the Visual barrier.
      5. Type G Barrier
         Precast autoclaved aerated concrete Visual barrier will be paid for at the Contract Unit Price bid per square
         foot (meter). Payment is full compensation for furnishing materials, including steel supports, and for erecting
         the Visual barrier, including graffiti-proof coating.
         Additional barrier payment criteria:
Section 625 — Visual Barriers

Barriers will be paid at the plan quantity plus or minus any authorized changes, or adjustments due to ground line elevation varying from plan.
Payment will be made under:

| Item No. 625 | Visual Barrier | Per square foot (meter). |

625.5.01 Adjustments
General Provisions 101 through 150.
626.1 General Description
This specification covers the required materials, fabrication, construction, measurement, and payment for mechanically stabilized embankment retaining walls.

The scope of work of wall erection includes:

- Grading for wall construction
- Compacting the wall foundation
- General and local dewatering as necessary
- Constructing leveling pads
- Erecting precast panels
- Placing soil reinforcing devices
- Placing and compacting special embankment backfill within the reinforced volume
- Furnishing and placing precast or cast-in-place concrete coping and cast-in-place or precast traffic barrier on top of the wall if shown on the Plans

The wall foundation includes areas underlying the leveling pad and the reinforced volume. Ensure that items used to construct the mechanically stabilized embankment retaining walls but not mentioned in this specification conform to the applicable sections of the Standard Specifications.

Ensure that the architectural treatment of the precast panels is according to the plan details.

For patented mechanically stabilized embankment retaining walls, obtain panels, soil reinforcing devices, connecting devices, joint materials, attachments, and expertise to construct the walls.

626.1.01 Definitions
Wall foundation—the area underlying the leveling pad and the reinforced volume.

Standard Operating Procedure 3, Precast/Prestressed Concrete Bridge Members

1992 AASHTO Specifications for Highway Bridges, Section 18, Elastomeric Bearings

626.1.03 Submittals

General Provisions 101 through 150.

626.2 Materials

A. Soil Reinforcing Devices

1. Reinforcing and Tie Strips

   Use tie strips shop-fabricated of hot rolled steel that conform to the minimum requirements of ASTM A 570 Grade 50 (ASTM A 570M Grade 345). Hot roll reinforcing strips from bars to the required shape and dimensions. Their physical and mechanical properties shall conform to ASTM A 709 Grade 36 (ASTM A 709M Grade 250).

2. Soil Reinforcing Mesh

   Use soil reinforcing mesh shop-fabricated of cold drawn steel conforming to the minimum requirements of ASTM A 185.
Section 626 — Mechanically Stabilized Embankment Retaining Walls

3. Backfill Stabilizing Geogrid:
   Use Backfill Stabilizing Geogrid that conforms to the requirements of Section 809.

B. Connecting Devices

1. Fasteners
   Use high-strength bolts and nuts that are hexagonal cap screw and that conform to ASTM A 325(A 325M), galvanized. Ensure that they are of the diameter shown in the plans—1-1/2 in. (40 mm) long with 3/4 in. (20 mm) thread length.
   Use galvanized washers with galvanizing fastener elements conforming to ASTM A 153/A 153M.

2. Steel Strap Connectors
   Use materials that conform to the following standards:

<table>
<thead>
<tr>
<th>Material</th>
<th>Conforms to the Requirements of:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel strap connection bar and plate</td>
<td>ASTM A 709 Grade 36 steel (ASTM A 709 Grade 250)</td>
</tr>
<tr>
<td>Bolts</td>
<td>ASTM A 307 (ASTM A 307M)</td>
</tr>
<tr>
<td>Nuts</td>
<td>ASTM A 563</td>
</tr>
<tr>
<td>Washers</td>
<td>ASTM F 436 (ASTM F 436M)</td>
</tr>
<tr>
<td>Coatings for connecting devices</td>
<td>As specified in the Subsection below</td>
</tr>
</tbody>
</table>

3. Attachments
   a. Use clevis loops and mesh loops fabricated of cold drawn steel wire that conforms to ASTM A 82 and are welded according to ASTM A 185. Ensure that they develop a stress of at least 0.9 times the steel’s yield strength. Use loops galvanized according to ASTM A 153/A 153M, Class B 3, or ASTM A 123/A 123M.
   b. Use a connector bar that is fabricated of cold drawn steel wire that conforms to ASTM A 82 and is galvanized according to ASTM A 123/A123M.

4. Geogrid Connection Bar: Use a connection bar 1 in. (25 mm) by 0.2 in. (5 mm) thick by roll width plus 3 inches meeting the same physical and chemical properties as the backfill stabilizing geogrid.

C. Concrete

Use Class AA concrete for precast panels, except ensure that the 28-day strength is at least 4,000 psi (28 MPa). Except as indicated in the approved mix design, admixtures will not be allowed. Do not use admixtures containing chlorides.

Use Class A concrete for leveling pads, traffic barriers, and coping.
D. Joint Fillers

Treat joints between panels as listed in this Subsection.

In flood plains or other intermittently inundated areas, cover the different joint types as follows:

<table>
<thead>
<tr>
<th>Joint Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Joints between panels from an elevation 3 ft. (1 m) above the 100-year flood elevation to the bottom of the wall</td>
<td>Cover on the back side of the wall with a woven plastic filter fabric sheet.</td>
</tr>
<tr>
<td>Joints between panels from 3 ft. (1 m) above the 100-year high water elevation to the top of the wall</td>
<td>Cover on the back side of the wall with a woven or nonwoven plastic filter fabric sheet.</td>
</tr>
<tr>
<td>All other locations</td>
<td>Cover joints between panels with a woven or nonwoven plastic filter fabric sheet.</td>
</tr>
</tbody>
</table>

Place in horizontal joints between panels two 4 inch by 3 in. by ¾ in. (100 mm by 75 mm by 20 mm) ribbed bearing pads or elastomeric pads as specified on the plans. Use ribbed bearing pads made of SBR rubber with a durometer hardness of 80 plus or minus 10 as determined by ASTM D 2240.

Use elastomeric pads that are 100% virgin chloroprene (neoprene) and meet the requirements of the 1992 AASHTO Specifications for Highway Bridges, Section 18, Elastomeric Bearings. Caulk the openings on either side of and between the pads with 2 in. by 2 in. (50 mm by 50 mm) open-cell urethane foam strips or equal as approved by the Engineer in addition to any other joint treatment that is required. Caulk vertical joints with 2 in. by 2 in. (50 mm by 50 mm) open-cell urethane foam strips. Piece the urethane foam strips together with a minimum overlap of 4 in. (100 mm).

Use plastic filter fabric sheets with a minimum width as follows:

<table>
<thead>
<tr>
<th>For Vertical Joints</th>
<th>18 inches (450 mm) wide</th>
</tr>
</thead>
<tbody>
<tr>
<td>For Horizontal Joints</td>
<td>12 inches (300 mm) wide</td>
</tr>
</tbody>
</table>

Overlap the joint with the filter fabric by at least 4 in. (100 mm). When piecing together the filter fabric, overlap by at least 4 in. (100 mm). Glue the filter fabric to the panels using any adhesive on the Qualified Products List (QPL). Use any woven and nonwoven plastic filter fabric listed on the QPL for work in this Specification, subject to the above requirements.

E. MSE Wall Backfill Material

Use material in the MSE Wall Backfill volume that conforms to the requirements of Subsection 812.2.04. In addition, obtain approval for use of the material by the Office of Materials and Research.

F. Coatings for Steel Soil Reinforcing Devices

Apply coatings to the soil reinforcing devices as follows:

1. Galvanize the entire surface of reinforcing and tie strips, mesh, and connecting devices according to ASTM A 123/A 123M. Or galvanize it mechanically according to ASTM B 695, Class 110, unless otherwise specified on the plans. Also galvanize the surfaces created by punching holes for bolts.

2. Repair damage sustained by the connecting devices, bolts, or reinforcing devices during phases of fabrication, storage, or erection according to Section 645.

Repair by brush coating with an approved galvanizing repair compound as specified in Subsection 870.2.05.A.2 to the Engineer’s satisfaction at no increase in Contract cost.

3. Galvanize the parts of the connecting devices that are threaded according to ASTM A 153/A 153M, Class C.

Hot dip galvanize alignment pins.
4. When the Type 2P coating is required on the Plans:
   a. After manufacturer galvanizing is complete, shop-coat the entire surface for the length indicated on the Plans with a two-component coal tar epoxy system indicated in Subsection 535.3.03.D, Prepare Steel Piling, Swaybracing, and Concrete Piling Surfaces for Special Protective Coatings, for a Type 2P coating according to Subsection 870.2.05.A.1.
   b. Use Type 2P coating to field-coat galvanized nuts, bolts, and washers used to connect reinforcing and tie strips. Repair damage to the coating on connecting devices or reinforcing devices from shipping, storage, or erection to the Engineer’s satisfaction at no additional cost.
   c. Use Type 2P coating to field-coat the parts of the connecting devices exposed after installing the soil reinforcing devices.

5. Epoxy coat the entire surface according Section 514 and Section 867, when required on the plans.
   a. Do not galvanize the soil reinforcing devices if this coating method is used.
   b. Use Type 2P coating to field-coat galvanized nuts, bolts, and washers used to connect reinforcing and tie strips.
   c. Use Type 2P coating to field-coat the parts of the connecting devices exposed after installing the soil reinforcing devices.

6. Repair damage to the coating on the connecting devices or soil reinforcing devices from shipping, storage, or erection to the Engineer’s satisfaction at no additional cost.

G. Reinforcing Steel
Use reinforcing steel that conforms to the requirements of Section 511.

H. Welded Wire Fabric for Precast Panels
Use welded wire fabric that conforms to the requirements of ASTM A 82.

I. Certification
The Department will use certified test report as specified in Subsection 106.05, Materials Certification and perform routine tests as a basis for material acceptance furnished for the work.

J. Corrosion Inhibiting Material
For the corrosion inhibiting material, use a bituminous plastic cement material that conforms to the requirements of Section 848, AASHTO M 243 Trowel Grade Asphalt Mastic, or use an approved corrosion-inhibiting grease.

626.2.01 Delivery, Storage, and Handling
Handle, store, and ship panels to eliminate the danger of chipping, cracking, discoloring, fracturing, and excessive bending stresses.

Repair at the plant the panels damaged during handling or storage at the casting plant as directed by the Engineer. Panels damaged during handling, storing, or shipping may be rejected upon delivery at the Engineer’s discretion. Support panels in storage on firm blocking located immediately adjacent to embedded connecting devices to avoid bending the connecting devices. Repair the coating on ties or soil-reinforcing devices damaged during handling or placing to the Engineer’s satisfaction.

626.3 Construction Requirements

626.3.01 Personnel
A. Wall Crew Supervisor
   Ensure that the wall crew supervisor has previous satisfactory experience in erecting mechanically stabilized walls.
626.3.02 Equipment
General Provisions 101 through 150.

626.3.03 Preparation
A. Prepare the Foundation

Before beginning construction, prepare the foundation as follows:

1. Grade the foundation for the mechanically stabilized embankment retaining wall level to a width equal to or exceeding the width of the reinforced volume and leveling pad. Use the top of the leveling pad as the grade elevation.

2. Before beginning the wall and leveling pad construction, compact the foundation to at least 95 percent of maximum laboratory dry density as determined by GDT 7.

3. Where walls are used as a bridge abutment, compact the foundation material as follows:
   a. When a portion of the wall is a bridge abutment, ensure that portions of the wall within 100 ft. (30 m) of the lateral limits of the bridge have foundation material compacted to at least 100 percent of maximum laboratory dry density as determined by GDT 7.
   b. When walls are used solely as bridge abutments, compact the foundation material for the entire wall to at least 100 percent of maximum laboratory dry density as determined by GDT 7.

Place and compact the embankment beneath the wall according to Section 208.

4. If excavating below the leveling pad elevation, reconstruct the area as embankment.

5. Remove and replace foundation soils that are incapable of sustaining the required compaction as directed by the Office of Materials and Research.

6. At each panel foundation level, provide a non-reinforced concrete leveling pad as shown on the plans.
   a. Place leveling pads so they are level within 1/8 in (3 mm) per pad or per 10 ft. (3 m), whichever length is greater.
   b. Repair or replace leveling pads that do not meet this requirement as directed by the Engineer at the Contractor’s expense.
   c. If using bearing pads on the leveling pad on the initial row of panels, also use them on all the leveling pads of that wall.
   d. Fill the horizontal joint between the leveling pad and panels with 2 in. by 2 in. (50 mm by 50 mm) polyether foam strips and cover with filter cloth.
   e. Use neoprene strips 3/16 in. (5 mm) thick as necessary to level panels. Do not use more than 3/8 in. (10 mm) of neoprene strips.
   f. If more leveling is required, take other corrective action, such as replacing the leveling pad or replacing panels.

7. Embed the wall at least 5 ft (1.5 m) into an embankment, when shown on the plans. Construct the embankment before constructing the leveling pad and placing backfill for the wall.

For step details on leveling pads, see plans and construction details.

626.3.04 Fabrication
A. Soil-Reinforcing Devices

Have steel soil-reinforcing devices shop fabricated. Use shop fabricated steel mesh of cold drawn steel welded into the finished mesh fabric according to ASTM A 185.

Cut soil-reinforcing devices to lengths and tolerances shown on the Plans. Punch holes for bolts in the location shown. Ensure that soil-reinforcing devices are true to size and free of defects that may impair the strength or durability.
Section 626 — Mechanically Stabilized Embankment Retaining Walls

B. Connecting Devices

Use connecting devices of the dimensions shown on the Plans. Assemble connecting members and soil-reinforcing devices before galvanizing the connecting devices. Ensure that the connecting devices are true to size and are free of defects that may impair the strength or durability.

Tie strips may be partially bent to no more than a 1 in. (25 mm) radius before they are shipped to the precast yard. Perform final bending at the precast yard.

Do not allow connecting devices, reinforcing steel, or welded wire fabric used in the panels to contact each other.

C. Bolts and Nuts

Ensure that the nominal diameter is as defined in Subsection 626.2.B, Connecting Devices.

D. Precast Panels

Use precast panel materials as specified in Subsection 626.2, Materials. Before casting, set the following in place to the dimensions and tolerances shown on the drawings:

- Tie strips
- Mesh attachment straps
- Coil embeds
- Coil bolts
- Reinforcing steel
- Welded wire fabric
- Connecting pins
- Handling devices

Do not allow the metal connecting devices and reinforcing steel to contact each other when in their final position in the panel.

1. Testing and Inspection

Use precast concrete panels that are cast at a Class A or B plant that conforms to Standard Operating Procedure 3, Precast/Prestressed Concrete Bridge Members. See QPL 9 for a list of approved plants.

2. Casting

Cast the panels using steel forms.

a. Cast the front face of the panel (the face exposed to view when installed in the wall) against a steel form or architectural form liner. Float finish the back face.

b. Place the concrete in each panel without interruption and consolidate it using an approved vibrator. Supplement vibration with hand tamping as necessary to force the concrete into the corners of the forms and prevent the formation of stone pockets or cleavage planes from forming.

c. Use clear form oil from only one manufacturer throughout the casting operation.

3. Curing

Cure the panels as specified in Subsection 500.3.05.Z, Cure Concrete, or Subsection 865.2.01.B.10, Concrete Curing. Cure for at least 12 hours or until the concrete develops the specified compressive strength. The Engineer will reject panels that do not reach specified strength within 28 days.

4. Removing Forms

Keep forms in place until they can be removed without damaging the panel.
5. Concrete Finishing and Tolerances

Finish the concrete surface for the front face as designated on the Plans. Float-finish the rear face enough to eliminate open aggregate pockets and distortions greater than 1/4 in. (6 mm).

Only use panels manufactured within the following tolerances:

- All dimensions are within 3/16 in. (5 mm).
- Angular distortion in the panel’s height does not exceed 3/16 in. (5 mm) in 5 ft. (1.5 m).
- Diagonal tolerance from Plan dimensions is no more than 3/8 in. (10 mm).

For textured finishes, surface defects greater than 5/16 in. (8 mm) in 5 ft (1.5 m) will be rejected.

6. Determining Compressive Strength

Perform compression tests to determine the minimum strength requirements on cylinders.

a. Make at least three cylinders to determine when the units may be put into service from each day’s production and cure according to GDT 35.D.B.6.

Make two additional cylinders from each day’s production or from each 10 cubic yards of concrete placed, whichever is the lesser amount of concrete, to determine the 28-day strength.

b. Ensure that the shipping strength is equal to the required 28-day strength for each day’s production or for each 10 yd³ (7.5 m³) of concrete placed, whichever amount of concrete is less.

c. Cure according to GDT 35.D.B.6. Ensure that the 28-day compressive strength is at least 4,000 psi (28 MPa). Perform compressive strength tests according to AASHTO T 22.

7. Rejection

Panels will be rejected if they do not meet the requirements above. The following defects are also cause for rejection:

- Indications of imperfect molding that result in tolerances being exceeded
- Honeycombed or open texture concrete

8. Marking

Clearly and permanently mark on the rear face of each panel the date of manufacture, lot number, and type of panel.

E. Precast Coping and Precast Traffic Barrier

To construct the precast portion of the coping or precast traffic barrier, use materials that conform to Subsection 626.2.C, Concrete. Use the same procedures for pre-casting, testing, and inspection as those for pre-cast panels.

626.3.05 Construction

A. Wall Erection

Place precast panels so that their final position at the completion of the wall is vertical.

1. Adjust the batter to allow for the effect of backfill type, equipment, and construction method on panel movement.

2. In general, batter the panels 1/2 in. (10 mm) in 4 ft. (1 m) into the reinforced volume to allow the panel to move during backfill placement and compaction.

3. Place panels in successive horizontal lifts as backfill is placed.

   a. When placing backfill behind a panel, maintain the panel in a vertical position by placing clamps and temporary wooden wedges in the joints at the junction of two adjacent panels on the external side of the wall.

   b. Use external bracing for the initial lift. Keep the wedges in place until the fourth layer of panels is placed, then remove the bottom layer of wedges.

   c. Remove each succeeding layer of wedges when placing the succeeding panel layers.
d. When the wall is completed, remove the wedges. Do not use the wedges to level the panels on leveling pads.
e. Remove the wedges placed below the groundline on the front face of the wall before backfilling this area.

4. Alignment and tolerance are as follows:
a. Ensure that the horizontal and vertical joint openings between panels are uniform. Ensure that the opening is 7/8 in. ± 3/8 in. (22 mm ± 10 mm).
b. Ensure that the vertical tolerance (plumbness) and horizontal alignment tolerance as the wall is constructed does not exceed 3/4 in. (20 mm) when measured along a 10 ft. (3 m) straightedge.
c. Ensure that the overall vertical tolerance of the wall (plumbness from top to bottom) in its final position does not exceed 1/2 in. per 10 ft. (13 mm per 3 m) of wall height.
d. Place cast-in-place concrete on top of the wall panel to bring the precast coping elements on top of the wall to proper grade. See the plans or construction details.

Before placing special backfill material on a soil-reinforcing device, complete the connections to the panels.

B. Joint Fillers
Treat joints between the panels as follows:

1. In flood plains or other intermittently inundated areas, cover the joints as follows:
   • Use a woven plastic filter fabric sheet to cover the joint on the back side of the wall between panels from 3 ft. (1 m) above the 100-year flood elevation to the bottom of the wall.
   • Use a woven or nonwoven plastic filter fabric sheet to cover the joint on the back side of the wall between panels from 3 ft. (1 m) above the 100-year high-water elevation to the top of the wall.

2. At other locations, cover joints between panels with a woven or nonwoven plastic filter fabric sheet.

3. Ensure that horizontal joints between panels contain two 4 by 3 by ¾ in. (100 by 75 by 20 mm) ribbed bearing pads or elastomeric pads as specified on the Plans. Use ribbed bearing pads that are SBR rubber with a durometer hardness of 80 plus or minus 10 as required in ASTM D 2240.

4. Use elastomeric pads that are 100 percent virgin chloroprene (neoprene) meeting the requirements of the 1992 AASHTO Specifications for Highway Bridges, Section 18, Elastomeric Bearings.

5. Caulk the openings on either side of and between the pads with 2 by 2 in. (50 by 50 mm) open cell urethane foam strips, or equal as approved by the Engineer in addition to other required joint treatments.

6. Caulk vertical joints with 2 by 2 in. (50 by 50 mm) or open cell urethane foam strips. When piecing the urethane foam strips together, overlap them at least 4 in. (100 mm).

7. Ensure that the minimum width of the plastic filter fabric sheets are as follows:

<table>
<thead>
<tr>
<th>For vertical joints</th>
<th>18 in. (450 mm) wide</th>
</tr>
</thead>
<tbody>
<tr>
<td>For horizontal joints</td>
<td>12 in. (300 mm) wide</td>
</tr>
</tbody>
</table>

8. Overlap the filter fabric with the joint at least 4 in. (100 mm).
9. When piecing the filter fabric together, overlap at least 4 in. (100 mm).
10. Glue the filter fabric to the panels. Use an adhesive on QPL 58.

C. MSE Wall Backfill
Place backfill shortly after erecting each lift panel. Follow these guidelines:
Section 626 — Mechanically Stabilized Embankment Retaining Walls

1. Place backfill lift to a uniform thickness and place it from the back face of the wall to 1 ft. (300 mm) beyond the end of the soil-reinforcing devices.

2. At each soil-reinforcing device level, compact the backfill to the full length of reinforcing devices and slope it to drain away from the wall before placing and attaching the next layer of reinforcing devices.

3. Level the compacted backfill with the connecting device before connecting the reinforcing device.

4. Repair damaged soil reinforcing devices or panels before attaching and backfilling the reinforcing devices.

5. Place soil reinforcing devices at 90 degrees to the face of the wall, unless otherwise indicated on the plans or by the Engineer.

6. Ensure that the maximum lift thickness is 8 in. (200 mm) (loose) and closely follows panel erection. Decrease this lift thickness to obtain the specified density, if required.

7. Compact the embankment backfill material to at least 100 percent of maximum laboratory dry density as determined by GDT 7 or GDT 24a, GDT 24b Method A or B, for full depth of the material.

8. Compact the embankment backfill material without disturbing or displacing the reinforcing devices and panels.

9. Compact from the area nearest the wall face to the back of the reinforcing devices except for a strip 3 ft. (1 m) wide adjacent to the backside of the wall.

After compacting the remainder of the layer, compact this 3 ft. (1 m) strip with light mechanical tampers without causing the panels to move outward.

10. Whenever a compaction test fails on a special embankment backfill lift, do not place additional material over that area until the lift is re-compacted and obtains a passing compaction test.

11. Ensure that the stabilizing geogrid at any layer is held taut, by mechanical means, free of wrinkles, bends or undulations until the special backfill material has been placed and compacted above the restrained layer to the level of the next layer of stabilizing geogrid. Release the uppermost layer of stabilizing geogrid after the final layer of special backfill is placed and compacted.

D. Storm Drains

Provide precast panels that have the appropriate storm drain openings into panels at the elevation and locations indicated on drainage profiles.

Place catch basins so that pipes will enter perpendicular (plan view) to the panels or below the leveling pads as shown on the Plans. Coordinate the catch basin construction and the storm drain placement with the wall construction.

E. Dewatering

Furnish, install, operate, and maintain satisfactory dewatering systems to maintain the site in a dry and workable condition to permit grading, compacting the wall foundation, and erecting and backfilling the wall. Furnish dewatering system equipment and materials and continue the system as long as necessary.

F. Catch Basins and Longitudinal Pipes

When catch basins are located behind the wall and the Wall Plans do not indicate a specific construction method, use the method outlined in the construction details.

When longitudinal pipes are located behind the wall, follow this procedure if specific details are not shown on the Wall plans:

1. Bend the soil-reinforcing device around the pipe without damaging the device, its coating, or its attachment to the precast panel. See the construction details.

2. If the pipe is too close to the wall to bend the soil-reinforcing device without damaging it, the Engineer will investigate relocating the pipe. The Engineer will contact the design office that designed the drainage system or the office responsible for the pipe and will investigate the pipe relocation.
3. If the pipe cannot be relocated or if the pipe is too large for relocation to be feasible, use the back-up panel procedure indicated on the construction details. Use precast concrete or cast-in-place concrete for:
   - Drainage structures that are within the special embankment backfill
   - Drainage structures that are outside the special embankment backfill but that are within 5 ft. (1.5 m) of the front face of the wall

626.3.06 Quality Acceptance
General Provisions 101 through 150.

626.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

626.4 Measurement
When a mechanically stabilized embankment retaining wall is built to plan dimensions, the plan quantities are the pay quantities. When the Engineer changes plan dimensions during construction, or when original Plans are in error, the revised plan quantities are the pay quantities.

A. Excavation and Shoring
   Excavation, including removing unstable material and shoring for construction of the mechanically stabilized embankment retaining wall, will not be measured and paid for separately.

B. Precast Concrete Panels
   The panels complete in place and accepted are measured for payment by the square foot (meter). The area of drains through the wall are not deducted.

C. Soil Reinforcing Devices
   The reinforcing strips, backfill stabilizing mesh, or backfill stabilizing geogrid is measured for payment by the linear foot (meter) of strip, mesh or geogrid.

D. Backfill
   The special embankment backfill used in the mechanically stabilized embankment retaining wall volume is measured for payment by the cubic yard (meter) and as shown on the Plans. The limits of the mechanically stabilized embankment retaining wall volume are as follows:
   1. The width shall be the length of the reinforcing devices plus 12 in. (300 mm). Where reinforcing device length changes, the volume width change will occur midway between reinforcing device layers.
   2. The height shall extend from the top of the leveling pad to at least 6 in. (150 mm) or to a maximum of 3 ft. (1 m) above the uppermost reinforcing device layer. The uppermost reinforcing device layer may be attached to the wall, traffic barrier, or bridge cap.
   3. The length shall extend for the entire length of the wall.
   4. Backfill material required by construction procedures to extend beyond the mechanically stabilized embankment retaining wall volume is incidental and is included in the price bid for Contract items.
Section 626 — Mechanically Stabilized Embankment Retaining Walls

5. If the mechanically stabilized embankment retaining wall volume increases from undercut ordered by the Engineer and requires special embankment backfill to provide stability, as determined by the Engineer, this will be measured and paid for at the Contract Unit Price bid per cubic yard (meter) for special embankment backfill.

If undercuts are not provided for on the Plans and the Engineer determines that special embankment backfill is not appropriate, backfill with foundation material conforming to Subsection 812.2.02, “Foundation Backfill, Type II. Payment for foundation backfill material used in this application is at the Contract Price bid per cubic yard (meter) for special embankment backfill.

Backfill for undercut areas that do not require materials of grades higher than common excavation soils will not be measured or paid for separately.

E. Concrete Leveling Pads

Concrete leveling pads are measured for payment by the linear foot (meter). This includes steps shown on the plans.

F. Dewatering

No separate measurement or payment will be made for dewatering. Include the cost of dewatering in the price bid for special embankment backfill.

G. Units Mounted on the Mechanically Stabilized Embankment Retaining Wall

Units on the mechanically stabilized embankment retaining wall, complete in place and accepted, will be designated on the plans and paid for at the Contract Unit Price bid per linear foot (meter) for each of the following unit types:

- Cast-in-place coping A
- Cast-in-place coping B
- Precast coping
- Traffic barrier V
- Traffic barrier H

Use traffic barrier H and cast-in-place coping B whenever noise walls, light standards, or other appurtenances are mounted on top of the barrier or coping. Use traffic barrier V and cast-in-place coping A when no appurtenance is used on top of the barrier or coping. Cast all traffic barriers in place except traffic barrier H, which is precast when detailed as precast on the plans.

626.4.01 Limits

General Provisions 101 through 150.

626.5 Payment

When mechanically stabilized embankment retaining walls are built to plan dimensions, the plan quantity will be the pay quantity. When plan dimensions are revised at the Engineer’s direction, mechanically stabilized embankment retaining wall will be paid for using the revised plan quantities. Payment is full compensation for fabricating, transporting, and erecting material according to the plans and specifications.

Separate measurement or payment is not made for tools, superintendence, labor, fasteners, coatings, joint materials (including but not limited to SBR or elastomeric pads, polyether foam, and filter fabric), site preparation, filler concrete, or other incidentals for performing the work. Soil-reinforcing devices attached to the traffic barrier or coping are not measured separately for payment but are included in the price bid for traffic barrier or coping.

Concrete side barrier, noise walls, light standards, V-gutters, guard rail, fencing, and handrail, when shown on the plans, will be paid for according to the applicable sections of the project specifications. Anchor bolts for sleeves for mounting fencing and light standards or noise walls on the wall are included in the price bid for wall items.
Payment will be made under:

**626.5.01 Adjustments**

General Provisions 101 through 150.
Section 627 — Mechanically Stabilized Embankment Retaining Wall—Contractor Design

627.1 General Description
This Specification covers the required materials, design, fabrication, construction, measurement, and payment for Contractor designed Mechanically Stabilized Embankment (MSE) retaining walls.

The scope of work of wall erection includes:
- Grading for wall construction
- Compacting the wall foundation
- General and local dewatering as required
- Constructing leveling pads
- Erecting precast panels
- Placing soil reinforcing devices
- Placing and compacting special embankment backfill within the reinforced volume
- Providing downdrag protection for piles
- Furnishing and placing precast or cast-in-place concrete coping and precast or cast-in-place traffic barrier on the top of the wall if these items are shown in the Plans.

For patented mechanically stabilized embankment retaining walls, obtain panels, soil reinforcing devices, connecting devices, joint materials, attachments, and expertise to construct the walls.

627.1.01 Definitions
Wall foundation—the area underlying the leveling pad and the reinforced volume.

627.1.03 Submittals

Submit to the Engineer shop drawings and calculations for the wall system, coping, and any special details for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper. The submission shall be prepared and stamped by the Design Engineer who shall be registered as a Professional Engineer in the State of Georgia.

Include in the submission:

A. MSE Wall Backfill Information
   1. Copy of source approval letter from Office of Materials and Testing
   2. Dry Unit Weight, Optimum Moisture, and Angle of Internal Friction test results for MSE Backfill material
   3. Pull out resistance testing results for approved source material or equivalent, if $f'$ values greater than suggested in AASHTO LRFD Bridge Design Specifications are used in design
Section 627 — Mechanically Stabilized Embankment Retaining Wall—Contractor Design

B. Retaining Wall Design Calculations

1. Internal stability design calculations for each design column in the retaining wall envelope
   - Evaluate Pullout
   - Evaluate Tension in reinforcement and connections
   - Evaluate Tension in reinforcement and connections due to vehicular collision load

2. External stability design verification calculations using project specific MSE Backfill materials
   - Evaluate Sliding Stability
   - Evaluate Eccentricity
   - Evaluate Bearing Capacity

Consider the final construction configuration and loads on the wall when preparing calculations.

C. Traffic Barrier H and Coping B Design Calculations

See Section 627.3.03.B.4.c for barrier coping design requirements.

D. Construction Drawings that include:

1. Plan and Elevation view of proposed wall
2. Details of leveling pad, including steps
3. Details of backfill stabilizing devices, including dimensions, spacing, size, and material type.
4. Details of Coping A, Coping B, or Traffic Barrier H.
   Traffic Barriers H and Coping B may be precast, cast in place, or a combination thereof. In all cases the moment slab shall be cast in place. Align the joints through all elements of the Traffic Barrier H or Coping B sections and detail such that there is no reinforcement crossing the joints. Omit joints in the moment slab as required by design.
   Provide transition details to allow for guardrail connection when necessary.
5. Details, dimensions, and schedules of all reinforcing steel, including dowels and/or studs for attaching the facing to the backfill reinforcement.
6. Details of all precast panels that are not presented in the library of panels approved as part of QPL 107 certification process outlined in SOP 33.
7. All other details necessary for the completion of work, including but not limited to details related to piling, drainage elements, noise barriers, traffic structures, etc.

Ensure that Plans match GDOT plans in size, format, borders, title block, etc. Include the Project Identification Number (P.I.) in or directly above the title block.

Itemize the wall quantities as follows:

1. Wall Envelope Quantities in the Plans. These are the values presented in the contract plans.
2. Adjusted Wall Envelope Quantities. These values are based on the approved survey verification of the Wall Envelope.
3. Material Quantities. These values reflect contractors means and methods and are not for payment.

Wall Envelope Quantities are required in all cases.

The time required for preparation and review of plans and calculations will be charged to the allowable contract time. The final plans and calculations for a wall shall be approved prior to beginning construction on the wall.
Section 627 — Mechanically Stabilized Embankment Retaining Wall—Contractor Design

The Department will be allowed 45 days to review the plans and calculations and provide either approval or review comments to the contractor. The 45-day review time will begin when the Department has received all of the calculations and drawings concerning the structure. Each new submittal from the Contractor as a result of corrections resulting from the Department’s review or changes that are made by the contractor to expedite construction or to correct for field errors will have a 45-day review time.

The Department will be the sole judge of the adequacy of the information submitted. The review and acceptance of the final plans and methods of construction by the Department will not in any way relieve the Contractor of responsibility for the successful completion of the work. Contractor delays due to untimely submissions and insufficient information will not be considered as justification for time extensions.

627.2 Materials

Ensure that items used to construct the mechanically stabilized embankment retaining walls but not mentioned in this Specification conform to the applicable sections of the Standard Specifications.

A. Soil Reinforcing Devices

1. Reinforcing and Tie Strips
   Use tie strips shop-fabricated of hot rolled steel that conform to the minimum requirements of ASTM A 1011 Grade 50 (ASTM A 1011M Grade 345). Hot roll reinforcing strips from bars to the required shape and dimensions. Their physical and mechanical properties shall conform to ASTM A 709 Grade 36 (ASTM A 709M Grade 250).

2. Soil Reinforcing Mesh
   Use soil reinforcing mesh shop-fabricated of cold drawn steel conforming to the minimum requirements of ASTM A 1064/A 1064M.

3. Backfill Stabilizing Geogrid:
   Use Backfill Stabilizing Geogrid that conforms to the requirements of Section 809.

B. Connecting Devices

1. Fasteners
   Use high-strength bolts and nuts that are hexagonal cap screw and that conform to ASTM F3125, grade A325 (F3125M, A325), galvanized. Ensure that they are of the diameter shown in the Plans - 1-1/2 in. (40 mm) long with 3/4 in. (20 mm) thread length.
   Use galvanized washers with galvanizing fastener elements conforming to ASTM A 153/A 153M.

2. Steel Strap Connectors
   Use materials that conform to the following standards:

<table>
<thead>
<tr>
<th>Material</th>
<th>Conforms to the Requirements of:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel strap connection bar and plate</td>
<td>ASTM A 709 Grade 36 steel (ASTM A 709 Grade 250)</td>
</tr>
<tr>
<td>Bolts</td>
<td>ASTM A 307 (ASTM A 307M)</td>
</tr>
<tr>
<td>Nuts</td>
<td>ASTM A 563</td>
</tr>
<tr>
<td>Washers</td>
<td>ASTM F 436 (ASTM F 436M)</td>
</tr>
<tr>
<td>Coatings for connecting devices</td>
<td>As specified in the Subsection below</td>
</tr>
</tbody>
</table>

3. Attachments
   a. Use clevis loops and mesh loops fabricated of cold drawn steel wire that conforms to ASTM A 1064 and are welded according to ASTM A 1064/A 1064M. Ensure that they develop a stress of at least 0.9 times the steel’s yield strength. Use loops galvanized according to ASTM A 153/A 153M, Class B 3, or ASTM A 123/A 123M.
   b. Use a connector bar that is fabricated of cold drawn steel wire that conforms to ASTM A 1064 and is galvanized according to ASTM A 123/A123M.
4. Geogrid Connection Bar: Use a connection bar 1 inch (25 mm) by 0.2 inches (5 mm) thick by roll width plus 3 inches meeting the same physical and chemical properties as the backfill stabilizing geogrid.

C. Concrete

Use Class AA concrete for precast panels, Traffic Barrier H, and Coping B, except ensure that the 28-day strength is at least 4,000 psi (28 MPa). Except as indicated in the approved mix design, admixtures will not be allowed. Do not use admixtures containing chlorides.

Use Class A concrete for leveling pads and Coping A.

D. Joint Fillers

1. Bearing Pads

Ribbed bearing pads shall be made of SBR rubber with a durometer hardness of 80 plus or minus 10 as determined by ASTM D 2240.

Elastomeric pads shall be made of 100% virgin chloroprene (neoprene) and meet the requirements of the AASHTO LRFD Bridge Design Specifications, Section 14, Elastomeric Bearings.

2. Filter Fabric

In flood plains or other intermittently inundated areas, cover the different joint types as follows:

<table>
<thead>
<tr>
<th>Joint Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Joints between panels from an elevation 3 ft. (1 m) above the 100-year flood elevation to the bottom of the wall</td>
<td>Cover on the back side of the wall with a woven plastic filter fabric sheet.</td>
</tr>
<tr>
<td>Joints between panels from 3 ft. (1 m) above the 100-year flood elevation to the top of the wall</td>
<td>Cover on the back side of the wall with a woven or nonwoven plastic filter fabric sheet.</td>
</tr>
<tr>
<td>All other locations</td>
<td>Cover joints between panels with a woven or nonwoven plastic filter fabric sheet</td>
</tr>
</tbody>
</table>

Use woven and nonwoven plastic filter fabric listed on QPL 28 for work in this Specification, subject to the above requirements.

Use adhesive listed on QPL 58 for attaching filter fabric to panels.

E. MSE Wall Backfill Material

Use material in the MSE Wall Backfill volume that conforms to the requirements of Subsection 812.2.04. In addition, obtain approval for use of the material by the Office of Materials and Testing.

F. Coatings for Steel Soil Reinforcing Devices

Apply coatings to the soil reinforcing devices as follows:

1. Galvanize the entire surface of reinforcing and tie strips, mesh, and connecting devices according to ASTM A 123/A 123M. Or galvanize it mechanically according to ASTM B 695, Class 110, unless otherwise specified on the Plans. Also galvanize the surfaces created by punching holes for bolts.

2. Repair damage sustained by the connecting devices, bolts, or reinforcing devices during phases of fabrication, storage, or erection according to Section 645.

Repair by brush coating with an approved galvanizing repair compound as specified in Subsection 870.2.05.A.2 to the Engineer’s satisfaction at no increase in Contract cost.

3. Galvanize the parts of the connecting devices that are threaded according to ASTM A 153/A 153M, Class C. Hot dip galvanize alignment pins.
4. When the Type 2P coating is required on the Plans:
   a. After manufacturer galvanizing is complete, shop-coat the entire surface for the length indicated on the Plans with a two-component coal tar epoxy system indicated in Subsection 535.3.03.D, “Prepare Steel Piling, Swaybracing, and Concrete Piling Surfaces for Special Protective Coatings,” for a Type 2P coating according to Subsection 870.2.05.A.1.
   b. Use Type 2P coating to field-coat galvanized nuts, bolts, and washers used to connect reinforcing and tie strips. Repair damage to the coating on connecting devices or reinforcing devices from shipping, storage, or erection to the Engineer’s satisfaction at no additional cost.
   c. Use Type 2P coating to field-coat the parts of the connecting devices exposed after installing the soil reinforcing devices.

5. Epoxy coat the entire surface according to Section 514 and Section 867, when required on the Plans.
   a. Do not galvanize the soil reinforcing devices if this coating method is used.
   b. Use Type 2P coating to field-coat galvanized nuts, bolts, and washers used to connect reinforcing and tie strips.
   c. Use Type 2P coating to field-coat the parts of the connecting devices exposed after installing the soil reinforcing devices.

6. Repair damage to the coating on the connecting devices or soil reinforcing devices from shipping, storage, or erection to the Engineer’s satisfaction at no additional cost.

G. Reinforcing Steel
   Use reinforcing steel that conforms to the requirements of Section 511.

H. Welded Wire Fabric for Precast Panels
   Use welded wire fabric that conforms to the requirements of ASTM A 1064.

I. Certification
   The Department will use certified test report as specified in Subsection 106.05, Materials Certification and perform routine tests as a basis for material acceptance furnished for The Work.

J. Corrosion Inhibiting Material
   For the corrosion inhibiting material, use a bituminous plastic cement material that conforms to the requirements of Section 848, AASHTO M 243 Trowel Grade Asphalt Mastic, or use an approved corrosion-inhibiting grease.

627.2.01 Delivery, Storage, and Handling
   Handle, store, and ship panels to eliminate the danger of chipping, cracking, discoloring, fracturing, and excessive bending stresses.
   Repair at the plant the panels damaged during handling or storage at the casting plant as directed by the Engineer. Panels damaged during handling, storing, or shipping may be rejected upon delivery at the Engineer’s discretion.
   Support panels in storage on firm blocking located immediately adjacent to embedded connecting devices to avoid bending the connecting devices. Repair the coating on ties or soil-reinforcing devices damaged during handling or placing to the Engineer’s satisfaction.
627.3 Construction Requirements

627.3.01 Personnel
Meet the following personnel requirements:

A. Design

Use a Design Engineer with the following qualifications to design the wall and prepare and submit plans for approval:

- Is registered as a Professional Engineer in the State of Georgia.
- Has knowledge and experience with the design and construction of MSE walls.
- Is available at any time during the life of the Contract to discuss the design of the walls directly with the Department.

B. Construction

The Contractor or Subcontractor shall meet the following requirements:

- Be experienced in the construction of Mechanically Stabilized Embankment Walls.
- Include on staff, a supervising engineer for the Project with at least five years of experience in the construction of Mechanically Stabilized Embankment Walls.

Submit the following proof, whenever requested by the Department, of the ability to design and/or construct Mechanically Stabilized Embankment Walls.

- Evidence of the successful completion of at least five Projects similar in concept and scope to the proposed wall.
- Resumes of the supervising engineer and foremen to be employed on this Project showing the type and number of Mechanically Stabilized Embankment Walls each worked on within the past five (5) years.

The Department will be the sole judge of the acceptability of the qualifications of the design engineer, supervising engineer and foreman.

627.3.02 Equipment

General Provisions 101 through 150.

627.3.03 Preparation

A. General Requirements – Designing and Detailing

The Department’s plans will include a Wall Envelope. The Wall Envelope will show:

- The existing and proposed ground line,
- The maximum elevation of the top of the leveling pad
- The proposed top of coping or the proposed gutterline elevations where the barrier is attached to the wall
- The soil parameters for the wall design
- The location of any internal walls required
- The location of other appurtenances including but not limited to:
  -- Light standards
  -- Noise barriers
  -- Sign supports
- Other obstructions in the wall backfill including but not limited to:
  -- Drainage structures and pipes
  -- Bridge columns, caps, wingwalls
  -- Bridge piles
• Details of any proposed ditches at the top of the wall  
• Proposed pay quantities  

Ensure that the wall design is compatible with all horizontal and vertical criteria and backfill loading conditions.

Verify the wall location according to Subsection 149.1.03.E and Subsection 149.3.03.D before the final wall design is submitted. Include in the verification:

• The top and bottom of the wall envelope  
• Backfill design conditions  
• Depth of wall embedment  
• Location of drainage structures and other obstructions in the wall backfill  
• Other appurtenances located on the wall.

If any changes to the wall envelope are required by the field survey, submit plan sheets to the Engineer for approval showing the wall envelope as detailed in the plans with the required changes noted.

B. Wall Design

Use the following design criteria for a Contractor designed wall:

1. Provide an approved MSE wall system from QPL 107

2. Design the MSE Wall according to the current AASHTO LRFD Bridge Design Specifications, Section 11.10, except as modified by these specifications.

3. Design MSE wall portions within 100 ft of a bridge to a service life of 100 years. All other MSE walls, including the remainder of walls greater than 100 ft away from a bridge may be designed to a service life of 75 years.

4. Design the MSE wall to account for all live load, dead load and wind load from all traffic barrier, lights, overhead signs, noise barriers and other appurtenances located on top and adjacent to the wall. Design MSE walls to account for all external forces. Also, design abutment walls for all horizontal and vertical loads applied by the bridge. Use the following load definitions as minimums for design:

   a) Live Load Surcharge:
      • Apply a live load surcharge of 0.25 KSF for walls with a pressure surface located within H/2 of a traffic load
      • Apply a live load surcharge of 0.10 KSF for all other walls to account for construction activities

   b) Bridge Loads:
      Provide soil reinforcement devices for the back side of abutments supported on piling that is encased in the MSE backfill. Design these soil reinforcement devices to resist the lateral forces from the bridge. If the lateral forces are not specifically stated on the retaining wall plans, use a minimum factored load of 1.0 k/ft along the length of the abutment cap, applied at the bearing seat height. Include this lateral loading from the bridge in the external stability calculations for the wall.

   c) Rail Loads:
      Traffic Barrier H, Coping B, and walls that include them should be designed for vehicular impact as follows:
      Evaluate precast or cast in place concrete barrier coping for sliding and eccentricity. For this analysis assume a 15 kip load applied over a width of 5 ft at the top of the barrier and distributed in to a maximum length equal to the minimum joint spacing in the moment resisting slab. Apply this same 15 kip load when considering internal and external stability of the reinforced wall mass.
      Design the barrier portion of the coping to resist an 80 kip load applied over a width of 5 ft at the top of the barrier. Evaluate the barrier using the yield line analysis procedures presented in the AASHTO LRFD Bridge Design Specifications, Section A13.
      Detail the moment slab and connecting elements such that all sections will satisfy a design moment equal to the moment capacity at the base of the barrier about its horizontal axis. For this calculation, take the base of the barrier as the section at the finished grade on the traffic side of the barrier.
5. For MSE walls that are intersected by a box culvert, detail the soil reinforcement devices over the box culverts to a length equal to the soil reinforcement devices in the adjacent sections.

6. Assume responsibility for all temporary shoring that may be necessary for wall construction. Design the shoring using sound engineering principles.

7. Use permanent concrete wall facing panels that are at least 5 1/2 in (139 mm) thick.

8. Provide a minimum length of soil reinforcement of 10 feet (3 m) or seven-tenths (0.7) of the wall height, whichever is greater.

9. At any section of wall, detail all soil reinforcement devices the same, including length, cross section, and corrosive protection.

10. Positively connect all soil reinforcement devices to the precast panels.

11. Ensure that the special wall backfill extends a minimum of 12 in (300 mm) past the end of the soil reinforcement.

12. For MSE Walls at Bridge Ends:
   - Ensure that MSE wall backfill extends vertically to the bottom of the approach slab.
   - Ensure that the MSE wall backfill extends horizontally to the back limit of the MSE backfill for the wall below the approach slab or 12 inches (300 mm) beyond the end of the stabilizing devices attached to the bridge, whichever is greater.
   - Show details of attachments to be cast into the bridge end bent and backwall.
   - Do not make attachments to bridge endwalls that are integral to the bridge superstructure and are subject to movement due to superstructure expansion and contraction.

13. Use the Architectural treatment of facing panels as indicated on the Department’s drawings.

14. Provide internal walls to allow for future widening if shown on the wall plans. Ensure the internal walls have galvanized wire or concrete facing. Ensure as a minimum that the facing of the internal walls extend to the back limit of the MSE Wall Backfill for the permanent wall.

15. Ensure the maximum panel area does not exceed 35 square feet (3.25 square meters).

14. A Foundation Investigation Report may be available from the Geotechnical Engineering Bureau of the Department. The information contained in this report may be used by the Contractor to assist in evaluating existing conditions for design as well as construction. However, the accuracy of the information is not guaranteed and no requests for additional monies or time extensions will be considered as a result of the Contractor relying on the information in this report.

15. Ensure the following requirements are met:
   - The gutterline grade on the proposed top of wall submitted matches the gutter elevations required by the plans.
   - The top of coping is at or above the top of coping shown on the envelope.
   - The leveling pad is at or below the elevation shown on the wall envelope.
   - Any approved changes in Wall Envelope quantities due to the approved survey verification are noted in the contractor’s plans as Adjusted Wall Envelope Quantities.
   - All changes in quantities due to the proposed walls being outside the wall envelope (step locations, ending wall at full panel, etc.) are shown as Material Quantities.

16. Ensure the minimum embedment of the wall (top of leveling pad) is at least 2 feet (600 mm). If the soil slopes away from the bottom of the wall, lower the bottom of the wall to provide a minimum horizontal distance of 10 ft. (3 m) to the slope. [i.e. a 2:1 slope in front of the wall requires 5 ft. (1.5 m) of embedment; a 4:1 slope in front of the wall requires 2.5 ft. (750 mm) of embedment]

627.3.04 Fabrication

A. Soil-Reinforcing Devices

Have steel soil-reinforcing devices shop fabricated. Use shop fabricated steel mesh of cold drawn steel welded into the finished mesh fabric according to ASTM A 1064/A 1064M.

Cut soil-reinforcing devices to lengths and tolerances shown on the Plans. Punch holes for bolts in the location shown. Ensure that soil-reinforcing devices are true to size and free of defects that may impair the strength or durability.
B. Connecting Devices

Use connecting devices of the dimensions shown on the Plans. Assemble connecting members and soil-reinforcing devices before galvanizing the connecting devices. Ensure that the connecting devices are true to size and are free of defects that may impair the strength or durability.

Tie strips may be partially bent to no more than a 1 in. (25 mm) radius before they are shipped to the precast yard. Perform final bending at the precast yard.

Do not allow connecting devices, reinforcing steel, or welded wire fabric used in the panels to contact each other.

C. Bolts and Nuts

Use bolts and nuts that meet the requirements defined in Subsection 627.2.B, Connecting Devices.

D. Precast Panels

Use precast panel materials as specified in Subsection 627.2, Materials. Before casting, set the following in place to the dimensions and tolerances shown on the drawings:

- Tie strips
- Mesh attachment straps
- Coil embeds
- Coil bolts
- Reinforcing steel
- Welded wire fabric
- Connecting pins
- Handling devices

Do not allow the metal connecting devices and reinforcing steel to contact each other when in their final position in the panel.

1. Testing and Inspection
   
   Use precast concrete panels that are cast at a Class A or B plant that conforms to Standard Operating Procedure 3, Precast/Prestressed Concrete Bridge Members. See QPL 9 for a list of approved plants.

2. Casting
   
   Cast the panels using steel forms.
   a. Cast the front face of the panel (the face exposed to view when installed in the wall) against a steel form or architectural form liner. Float finish the back face.
   b. Place the concrete in each panel without interruption and consolidate it using an approved vibrator. Supplement vibration with hand tamping as necessary to force the concrete into the corners of the forms and prevent the formation of stone pockets or cleavage planes from forming.
   c. Use clear form oil from only one manufacturer throughout the casting operation.

3. Curing
   
   Cure the panels as specified in Subsection 500.3.05.Z, Cure Concrete, or Subsection 865.2.01.B.10, Concrete Curing. Cure for at least 12 hours or until the concrete develops the specified compressive strength. The Engineer will reject panels that do not reach specified strength within 28 days.

4. Removing Forms
   
   Keep forms in place until they can be removed without damaging the panel.
Section 627 — Mechanically Stabilized Embankment Retaining Wall—Contractor Design

5. Concrete Finishing and Tolerances

Finish the concrete surface for the front face as designated on the Plans. Float-finish the rear face enough to eliminate open aggregate pockets and distortions greater than 1/4 in. (6 mm).

Only use panels manufactured within the following tolerances:

- All dimensions are within 3/16 in. (5 mm).
- Angular distortion in the panel’s height does not exceed 3/16 in. (5 mm) in 5 ft. (1.5 m).
- Diagonal tolerance from Plan dimensions is no more than 3/8 in. (10 mm).

For textured finishes, surface defects greater than 5/16 in. (8 mm) in 5 ft (1.5 m) will be rejected.

6. Determining Compressive Strength

Perform compression tests to determine the minimum strength requirements on cylinders.

   a. Make at least three cylinders to determine when the units may be put into service from each day’s production and cure according to GDT 35.D.1.
   b. Make two additional cylinders from each day’s production or from each 10 cubic yards of concrete placed, whichever is the lesser amount of concrete, to determine the 28-day strength.
   c. Ensure that the shipping strength is equal to the required 28-day strength for each day’s production or for each 10 yd³ (7.5 m³) of concrete placed, whichever amount of concrete is less.
   d. Cure according to GDT 35.D.1. Ensure that the 28-day compressive strength is at least 4,000 psi (28 MPa). Perform compressive strength tests according to AASHTO T 22.

7. Rejection

Panels will be rejected if they do not meet the requirements above. The following defects are also cause for rejection:

   - Indications of imperfect molding that result in tolerances being exceeded
   - Honeycombed or open texture concrete

8. Marking

Clearly and permanently mark on the rear face of each panel the date of manufacture, lot number, and type of panel.

E. Precast Coping and Precast Traffic Barrier

To construct the precast portion of the coping or precast traffic barrier, use materials that conform to Subsection 627.2.C, Concrete. Use the same procedures for precasting, testing, and inspection as those for precast panels.

627.3.05 Construction

A. Wall Erection

Place precast panels so that their final position at the completion of the wall is vertical.

1. Adjust the batter to allow for the effect of backfill type, equipment, and construction method on panel movement.

2. In general, batter the panels 1/2 in. (10 mm) in 4 ft. (1 m) into the reinforced volume to allow the panel to move during backfill placement and compaction.

3. Place panels in successive horizontal lifts as backfill is placed.

   a. When placing backfill behind a panel, maintain the panel in a vertical position by placing clamps and temporary wooden wedges in the joints at the junction of two adjacent panels on the external side of the wall.
   b. Use external bracing for the initial lift. Keep the wedges in place until the fourth layer of panels is placed, then remove the bottom layer of wedges.
   c. Remove each succeeding layer of wedges when placing the succeeding panel layers.
   d. When the wall is completed, remove the wedges. Do not use the wedges to level the panels on leveling pads.
   e. Remove the wedges placed below the groundline on the front face of the wall before backfilling this area.
4. Alignment and tolerance are as follows:
   a. Ensure that the horizontal and vertical joint openings between panels are uniform. Ensure that the opening is 7/8 in. ± 3/8 in. (22 mm ± 10 mm).
   b. Ensure that the vertical tolerance (plumbness) and horizontal alignment tolerance as the wall is constructed does not exceed 3/4 in. (20 mm) when measured along a 10 ft. (3 m) straightedge.
   c. Ensure that the overall vertical tolerance of the wall (plumbness from top to bottom) in its final position does not exceed 1/2 in. per 10 ft. (13 mm per 3 m) of wall height.
   d. Place cast-in-place concrete on top of the wall panel as needed to bring the precast coping elements on top of the wall to proper grade. See the plans or construction details.

Before placing special backfill material on a soil-reinforcing device, complete the connections to the panels.

B. Joint Fillers

Treat joints between the panels as follows:

1. Bearing Pads
   Ensure that horizontal joints between panels contain two 4 by 3 by ¾ in (100 by 75 by 20 mm) ribbed bearing pads or elastomeric pads as specified on the Plans.

2. Filter Fabric
   Cover all horizontal and vertical joints with 12 in. (300 mm) wide plastic filter fabric sheet glued securely to the backside of precast concrete panels. Overlap the filter fabric with the joint at least 4 in. (100 mm). When piecing the filter fabric together, overlap at least 4 in. (100 mm).

In flood plains or other intermittently inundated areas, cover the joints as follows:
   • Use a woven plastic filter fabric sheet to cover the joint on the back side of the wall between panels from 3 ft. (1 m) above the 100-year flood elevation to the bottom of the wall.
   • Use a woven or nonwoven plastic filter fabric sheet to cover the joint on the back side of the wall between panels from 3 ft. (1 m) above the 100-year flood elevation to the top of the wall.

C. MSE Wall Backfill

Place backfill shortly after erecting each lift panel. Follow these guidelines:

1. Place backfill lift to a uniform thickness and place it from the back face of the wall to 1 ft. (300 mm) beyond the end of the soil-reinforcing devices.
2. At each soil-reinforcing device level, compact the backfill to the full length of reinforcing devices and slope it to drain away from the wall before placing and attaching the next layer of reinforcing devices.
3. Level the compacted backfill with the connecting device before connecting the reinforcing device.
4. Repair damaged soil reinforcing devices or panels before attaching and backfilling the reinforcing devices.
5. Place soil reinforcing devices at 90 degrees to the face of the wall, unless otherwise indicated on the Plans or by the Engineer.
6. Ensure that the maximum lift thickness is 8 in. (200 mm) (loose) and closely follows panel erection. Decrease this lift thickness to obtain the specified density, if required.
7. Compact the embankment backfill material to at least 100 percent of maximum laboratory dry density as determined by GDT 7 or GDT 24a, GDT 24b Method A or B, for full depth of the material.
8. Compact the embankment backfill material without disturbing or displacing the reinforcing devices and panels.
9. Compact from the area nearest the wall face to the back of the reinforcing devices except for a strip 3 ft. (1 m) wide adjacent to the backside of the wall.
   After compacting the remainder of the layer, compact this 3 ft. (1 m) strip with light mechanical tampers without causing the panels to move outward.
10. Whenever a compaction test fails on a special embankment backfill lift, do not place additional material over that area until the lift is re-compacted and obtains a passing compaction test.
11. Ensure that the stabilizing geogrid at any layer is held taut, by mechanical means, free of wrinkles, bends or undulations until the special backfill material has been placed and compacted above the restrained layer to the level of the next layer of stabilizing geogrid. Release the uppermost layer of stabilizing geogrid after the final layer of special backfill is placed and compacted.

D. Storm Drains

Provide precast panels that have the appropriate storm drain openings in panels at the elevation and locations indicated on drainage profiles.

Place catch basins so that pipes will enter perpendicular (plan view) to the panels or below the leveling pads as shown on the Plans. Coordinate the catch basin construction and the storm drain placement with the wall construction.

E. Dewatering

Furnish, install, operate, and maintain satisfactory dewatering systems to maintain the site in a dry and workable condition to permit grading, compacting the wall foundation, and erecting and backfilling the wall. Furnish dewatering system equipment and materials and continue the system as long as necessary.

F. Catch Basins and Longitudinal Pipes

When catch basins are located behind the wall and the Wall Plans do not indicate a specific construction method, use the method outlined in the construction details.

When longitudinal pipes are located behind the wall, follow this procedure if specific details are not shown on the Wall Plans:

1. Bend the soil-reinforcing device around the pipe without damaging the device, its coating, or its attachment to the precast panel. See the construction details.

2. If the pipe is too close to the wall to bend the soil-reinforcing device without damaging it, the Engineer will investigate relocating the pipe. The Engineer will contact the design office that designed the drainage system or the office responsible for the pipe and will investigate the pipe relocation.

3. If the pipe cannot be relocated or if the pipe is too large for relocation to be feasible, use the back-up panel procedure indicated on the construction details.

Use precast concrete or cast-in-place concrete for:

- Drainage structures that are within the special embankment backfill
- Drainage structures that are outside the special embankment backfill but that are within 5 ft. (1.5 m) of the front face of the wall

627.3.06 Quality Acceptance

General Provisions 101 through 150.

627.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

627.4 Measurement

A. Excavation and Shoring

Excavation, including any required removal of unstable material, and shoring necessary for construction of the MSE Wall will not be measured for payment.
B. **MSE Wall Face**

MSE wall face area, complete in place and accepted, will be measured by the square foot (meter) in vertical bands bounded by the limits of each specific height range pay item in the plans. The height will be measured from the maximum top of leveling pad elevation on the wall envelope to the top of Coping A, the top of sidewalk elevation for Coping B, or the proposed gutterline elevation for Traffic Barrier H. Dividing the wall area into segments such as this provides the opportunity for the contractor to bid graduated unit prices that consider backfill volumes and reinforcement lengths.

Any area of cast-in-place facing around drainage structures within the approved wall envelope will be measured as MSE Wall Face. “Dummy” panels will not be measured for payment.

No separate measurement will be made for internal wall facing.

No deduction in area will be made for pipe passing through the wall facing. The area of box culverts that interrupt the wall envelope will not be included in the wall area measured for payment.

C. **Backfill Stabilizing Devices**

The backfill stabilizing devices will not be measured separately.

D. **Backfill**

The MSE backfill material used in the MSE wall volume will not be measured separately except as noted below.

- The MSE Backfill required behind bridge endwalls or backwalls and above the top of coping will be measured as additional MSE wall backfill.
- Any additional MSE backfill required as a result of an undercut ordered by the Engineer and requiring the MSE backfill material to provide stability, as determined by the Engineer, will be measured and paid for as additional MSE wall backfill.

Backfill of undercut areas not requiring classes of soils higher than common excavation soils will not be measured separately.

Backfill material required by construction procedures to extend outside the MSE wall volume shall be considered incidental and will not be measured separately.

E. **Concrete Leveling Pads**

Concrete Leveling Pads will not be measured separately.

F. **Coping A, Coping B, and Traffic Barrier H, mounted atop the MSE Wall**

These units complete in place and accepted, will be designated on the Plans and measured per linear foot (meter) for each type unit.

The quantities of coping and barrier will be measured as horizontal lengths in linear feet (meters).

### 627.4.01 Limits

General Provisions 101 through 150.

### 627.5 Payment

The pay quantities will be the Wall Envelope quantities shown in the Plans unless the Engineer approves Adjusted Wall Envelope. In this case, the pay quantities will be the Adjusted Wall Envelope quantities.

No additional compensation will be made for any additional material, equipment, design, or other items found necessary to comply with the project Specifications as a result of the Department’s review except for changes made necessary by the survey verification required by Subsection 149.1.03.E and Subsection 149.3.03.D, or other changes approved by the Engineer.

Include in the unit bid prices all costs necessary to comply with the requirements of this specification. No payment will be made for wall area outside of the Adjusted Wall Envelope.
Section 627 — Mechanically Stabilized Embankment Retaining Wall—Contractor Design

A. Excavation and Shoring

Excavation, including removing unstable material and shoring for construction of the mechanically stabilized embankment retaining wall, will not be paid for separately.

B. MSE Wall Face

MSE Wall Face area will be paid for at the Contract Unit Price bid per square foot (meter) for each height range in the wall envelope. Payment is full compensation for furnishing materials, including bearing pads, filter fabric, and graffiti-proof coating.

Any area of cast-in-place facing around drainage structures within the approved wall envelope will be paid as wall face. Payment will include all costs for concrete, reinforcing steel in the cast-in-place areas. No additional payment will be made for any “dummy” panels required.

If the wall height changes to a height greater than the maximum height range included in the pay items, the area of wall with a height greater than the maximum will be paid at 120% of the bid price of the maximum height range pay item included in the plans.

No separate payment will be made for architectural treatment.

No separate payment will be made for internal wall facing, internal wall backfill stabilizing devices or additional MSE backfill necessitated by the internal wall.

C. Backfill Stabilizing Devices

The backfill stabilizing devices will not be paid for separately. Include this cost in the unit price bid for MSE wall face.

D. Backfill

The MSE backfill material used in the MSE wall volume will not be paid for separately except as noted below. When not paid for separately, include the cost in the unit price bid for MSE wall face.

Exceptions:

- The cost of MSE Backfill required behind bridge endwalls or backwalls and above the top coping will be paid for as Additional MSE Wall Backfill.
- Any additional MSE backfill required as a result of an undercut ordered by the Engineer and requiring the MSE backfill material to provide stability, as determined by the Engineer, will be paid as additional MSE wall backfill.

Backfill of undercut areas not requiring materials of grades higher than common excavation soils will not be paid for separately. Include the cost in the overall bid price submitted.

Any backfill material required by construction procedures to extend outside the MSE Wall volume is considered incidental. Include this cost in the price bid for contract items.

E. Concrete Leveling Pads

Concrete leveling pads, including steps shown in the Plans will not be paid for separately.

F. Coping A, Coping B, and Traffic Barrier H, mounted atop the MSE Wall

These units, complete in place and accepted, will be designated on the Plans and paid for at the Contract Unit Price bid per linear foot (meter) for each type unit.

G. Dewatering

No separate payment will be made for dewatering. Include the cost of dewatering in the price bid for special embankment backfill.
Payment will be made under:

### 627.5.01 Adjustments

General Provisions 101 through 150.
Section 628 — Permanent Soil Nailed Wall

628.1 General Description
Specifications for this work will be included elsewhere in the Contract.
629.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 630—Modular Block Retaining Wall System

630.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 631 — Dynamic Message Signs

631.1 General Description
Furnish, install, test, and provide warranty and training for Dynamic Message Signs (DMS) comprised of equipment and materials as specified herein and shown in the Contract documents.

631.1.01 Definitions, Acronyms, and Abbreviations

A. Definitions
1. DMS Type 1: a full color matrix, 3 lines by 21 characters, 18 in. character height, walk-in enclosure.
2. DMS Type 2: a full color matrix, 3 lines by 18 characters, 18 in. character height, walk-in enclosure.
3. DMS Type 3: a full color matrix, 3 lines by 15 characters, 18 in. character height, front access enclosure.
4. DMS Type 4: a full color matrix, 3 lines by 15 characters, 12 in. character height, front access enclosure.
5. DMS Type 5: a full color matrix, 1 line by 3 characters, 18 in. character height, front access enclosure.
6. DMS Type 6: a full color matrix, 1 line by 8 characters, 18 in. character height, embedded or front access.
7. DMS Type 7: a full color matrix, 1 line by 8 characters, 12 in. character height, embedded or front access.
8. Embedded DMS: a sign assembly that consists of a dynamic message panel that is embedded or inserted into an outer static sign panel.
10. Sign Border: the blank area (no pixels) between the outermost pixels and the outermost edge of the sign.

B. Acronyms and Abbreviations
Refer to Sections 101.01 and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

631.1.02 Related References

A. GDOT Standard Specifications
1. Section 638 – Structural Supports for Overhead Signs
2. Section 682 – Electrical Wire, Cable, and Conduit
3. Section 925 – Traffic Control Signal Equipment
4. Section 926 – Wireless Communications Equipment

B. Referenced Documents
1. Refer to Section 942.1.02.B for a list of standards and documents referenced in this section.

631.1.03 Submittals
Refer to Section 942.1.04 for submittal requirements. Requirements for DMS equipment, materials and components are specified herein.
631.2 Materials

631.2.01 DMS Requirements

A. General

1. Comply with ISO 9001 or Six Sigma quality manufacturing requirements.
2. Provide only equipment and materials that are new and of like kind and function provided by one manufacturer, using the same model, part number, revision, and firmware as shown and specified in the Contract documents.
3. Provide a DMS that is designed and tested to comply with the current version of NEMA TS 4 standards.

B. Display Matrix

1. Type and Layout
   a. Provide full-color LED display matrix capable of displaying continuous and uniform messages composed of any combination of alphanumeric text, punctuation symbols, and graphic images across multiple message frames.
   b. Provide display matrix that are full matrix.
   c. Provide display matrix that support both fixed and proportional spaced fonts.
2. Provide a modified Series D 2000 MUTCD typeface and fonts for DMS messaging.
3. Provide pixel pitch spacing of 0.787 in. (20 mm), nominal, from the center of one pixel to the center of adjacent pixels, both horizontally and vertically. A variation in the pixel pitch spacing of up to ±3% is acceptable.
4. Provide nominal character and inter-line pixel spacing as shown in Table 1. A variation of up to ±1 pixel is acceptable.
5. Provide the capability to clear any display and post any new display in a time period not exceeding 500 ms.
6. Provide a DMS that is capable of displaying standard text applications shown in Table 1.
7. Display Legibility
   a. LED Cone of Vision
      i. Provide LEDs with a minimum cone of vision of 30 degrees, with a half-power angle of 15 degrees measured from the longitudinal optical axis of the LED.
      ii. Provide LED cone of vision with a tolerance that does not exceed ±5 degrees.
      iii. Provide LED display face with color uniformity and consistency within the 30-degree cone of vision, with no visible inconsistent color shifts or intensity. Inconsistent color shifts or intensity will be cause for rejection.
   b. Provide LED display matrix that is clearly visible and legible from distances between 150 ft. (45.7 m) and 1,000 ft. (305 m) from the DMS front face under normal freeway operating conditions during daylight hours with direct sunlight on the face and behind the DMS.
   c. Provide LED display matrix that maintains a minimum of 12,000 candelas per square meter minimum (white) for full color displays when measured using a photometric meter through the DMS front face panel assembly. Do not utilize light enhancing lenses to achieve LED viewing angles.

i. Provide LEDs that have no less than 50% of the normalized intensity at 50 percent of their maximum viewing angles.

ii. Provide LEDs that are from one luminous intensity bin from which the dimmest LED does not emit less than 70 percent of the luminous intensity of the brightest LED when driven with identical currents.

C. LED Requirements

1. Provide DMS that groups discrete LEDs into pixels arranged in a full continuous matrix display with individual pixel addressability. Character-based matrix arrangements are not acceptable.

2. Provide LEDs that are from the same manufacturer and of the same part number, except for the variations in the part number for color and intensity.

3. Provide a minimum MTBF of 10 years as defined by NEMA TS 4 Section 6.2.2.

4. Mount LEDs secured in perpendicular alignment to the display panel along the 0-degree centerline of the LED.

5. Provide multiple individual red, green, and blue LEDs conforming to the following requirements:
   a. Provide red LEDs utilizing aluminum indium gallium phosphide semiconductor technology and emitting red light with a peak wavelength of 615 to 635 nm.
   b. Provide green LEDs utilizing indium gallium nitride semiconductor technology and emitting green light with a peak wavelength of 519 to 539 nm.
   c. Provide blue LEDs utilizing indium gallium nitride semiconductor technology and emitting blue light with a peak wavelength of 460 to 480 nm.

6. Provide LED display modules that meet the following minimum requirements:
   a. Provide LED display modules, LED pixel boards, and driver circuit boards that are identical and interchangeable throughout the LED pixel matrix.
   b. Provide individual LED display modules conforming to the following requirements:
      i. Provide printed circuit boards of laminated fiberglass material that comply with IPC-A-610 Class B.
      ii. Mount LED display modules such that LEDs emit light through the face panels, with the face panel not blocking any portion of the individual LED viewing cones in the pixel.
Section 631 — Dynamic Message Signs

iii. Provide quick-disconnect locking connector types for LED display module power and signal connections.

iv. Mount each LED display module to the rear of the display front face panel(s) using durable non-corrosive hardware.

v. Maintenance removal or the replacement of an individual LED module, or a pixel board or a driver circuit board from its LED module, shall not require soldering.

vi. Provide a minimum of one LED driver per display module unless otherwise approved by the Department.

vii. The failure of one display module driver shall not cause a failure of the other display module drivers.

viii. The maintenance removal or the failure of any LED module shall not affect the operation of any other LED module or sign component.

ix. Provide LED display module that consists of one printed circuit board with header connections constructed such that the LED module cannot be incorrectly connected upside down or in an otherwise incorrect position within the matrix.

x. The current flow through the LEDs shall not exceed manufacturers’ stated current for non-surface and surface mount components.

D. Redundancy

1. Provide the minimum number of LEDs per pixel as specified in the NEMA TS 4 standard.

2. Provide LED power supply redundancy in compliance with Section 631.2.01.H.6.

E. DMS Controller

1. Provide a DMS controller that meets the following message library and memory requirements:

   a. Provide controller with both permanent and changeable memory.

   b. Provide changeable memory in the form of NVRAM. This memory shall be formed by flash or battery-backed static RAM integrated circuits that retain the data in memory for a minimum of 30 calendar days following a power loss or failure. This memory shall be used to store messages and schedules.

2. Local User Interface

   a. Provide a graphical LCD and keypad interface for direct operation, configuration, and diagnostics of the DMS.

   b. Provide the capability to display test patterns on the sign, blank the current message, and perform other available canned tests (pixel, power supplies, etc.).

   c. Provide a sign controller that requires login credentials for access and supports multiple user configurable passwords.

3. Failure mode in the sign controller shall be in compliance with NEMA TS 4 and, in the event of a controller failure or loss of communications or power, any displayed message will be blanked and the sign face will remain blank when the controller communications or power is restored.

4. Provide DMS controller that indicates when a sign display power supply has failed and identifies the specific power supply that has failed.
F. Communications and Network Requirements

1. Equip the DMS controller assembly with a minimum of the following communications ports:
   a. Provide a minimum of one 10/100 Ethernet port for connectivity to the GDOT network.
   b. Provide a minimum of one 10/100 Ethernet port or serial port for technician local access.
   c. Provide a minimum of one SFP fiber-optic channel connection port for communication to the DMS housing electronics via SM or MM fiber. It is acceptable to provide a fiber optic media converter with power supply that is environmentally hardened along with patch cables and associated materials to connect fiber optic cabling to the appropriate port on the DMS controller.

2. Comply with NTCIP 1203 v02 or later.

3. Support authentication and restricted access to the built-in web server through usernames and passwords at a minimum of three different levels.

4. Provide a DMS that meets the following network configuration requirements:
   a. Provide secure access through the DMS controller local user interface and remotely through an SSH login or HTTP browser or web-based interface.
   b. Provide access to user-programmed features and settings, including but not limited to, configuration parameters, sign controller settings, sign status, and security functions.

G. Mechanical

1. Structural Frame
   a. Construct sign with 6061-T6 or 6063-T6 aluminum alloy extrusions.
   b. Provide a minimum of two lifting eyes attached directly to the DMS housing structural frame with strength to allow sign lifting and moving without damage to the sign.
   c. Provide a sealant to lifting eye intrusions to prevent water infiltration.

2. Sign Housing
   a. Construct with 5052-H32 aluminum alloy sheeting with a minimum thickness of 0.125 in. (3.17 mm).
   b. Provide structurally capable metal hex nuts and flat washers, which meet the manufacturer’s recommendations, located on each side of the sign housing (interior and exterior).
   c. Provide a sealant to lifting eye intrusions to prevent water infiltration.

3. Types 1 through 5 only: Provide sign border with yellow, retro-reflective, fluorescent self-adhesive tape on all four sides for display clarity and background contrast. Provide tape width of 2 in. (50 mm). Provide border tape material that meets the requirements of Section 647.

4. Provide bare-aluminum mill finish (without paint) for both exterior and interior surfaces, excluding the front face of the sign housing.
Section 631 — Dynamic Message Signs

5. Weight and Dimension
   a. Total weight, including internal and external components for walk-in signs, shall not exceed 3,400 lb.
      (1,542 kg) for signs up to 15 characters wide, and 4,100 lb. (1,859 kg) for signs greater than 15
      characters wide.
   b. Individually limit the maximum outside dimensions, excluding minor appurtenances, of the sign to
      the following.
      i. Width 31 ft. (9.45 m)
      ii. Height 10 ft. (3.05 m)
      iii. Depth 4.5 ft. (1.37 m)

6. The polycarbonate sheeting shall be attached to the inside of the aluminum face panel and contains UV
   inhibitors to prevent premature aging of the material and to protect the LED display matrix from the effects of
   UV light exposure.

7. Welding shall be performed and inspected in accordance with the requirements of AWS D1.2.

8. Use non-corrosive attachment hardware such as aluminum and stainless steel and provide corrosion
   protection between dissimilar metals, including sign mounting hardware and materials.

9. Provide a minimum of two (2) weep or drain holes at the bottom of the housing with replaceable screens to
   prevent entrance of insects and small animals.

10. Maintenance Features
    a. Controller Operation Access
        i. Provide software operational access to DMS operations from the DMS controller inside the field
           cabinet and from inside walk-in DMS housings through a remote auxiliary control panel or local
           Ethernet communication port in the sign housing.
        ii. The remote auxiliary control panel or an Ethernet interface located in the sign housing shall have the
            same capabilities as a laptop computer used for maintenance purposes connected to the local port of
            the DMS controller. It is acceptable to provide a hardened maintenance laptop computer left inside
            the walk-in DMS housing for maintenance purposes when working inside the walk-in housing.
    b. Provide internal DMS access for maintenance to provide unobstructed viewing, removal, and replacement
       of any non-structural component within the sign case and ground- or pole-mounted field cabinets.
    c. Provide replacement and serviceability capabilities as follows:
       i. Types 1 and 2 only: Provide display modules and panels that are replaceable from the inside rear of
          the display without the need for specialized tools.
       ii. Types 3 through 7 only: Provide display modules and panels from the outside of the enclosures
           without the need for specialized tools.
       iii. Provide display modules that are interchangeable between signs employing the same display
            technology and pixel pitch furnished by a DMS manufacturer.
       iv. Provide a design that upon replacement of panels and other internal components the sign remains
           weathertight as specified in NEMA TS 4 Section 3.1.1.
       v. Provide a design so that the removal of any combination of one or more display modules will not alter
           the structural strength of the sign display assembly or sign case or adversely affect the operation of
           the remaining functional modules.
Section 631 — Dynamic Message Signs

vi. Provide LED driver boards that are replaceable with simple hand tools and hot swappable within the sign housings.

11. Types 1 and 2 only: provide walk-in access door type sign that meets the following minimum requirements:
   a. Access Door Keys: Provide two No. 2 Corbin keys for each DMS provided. Alternative access methods are provided in Section 939.
   b. Access Door Braces: Provide hold-open braces and access door stops designed to withstand a minimum of 30 mph (48 kph) winds that allow the door to be held in the 180 (full), 90, 45, or 30-degree open positions without the use of tools.

12. Types 3 to 7 only: provide front access type sign that meets the following minimum requirements:
   a. Provide a design that allows for the access panels or hinged doors to be open and held open at an angle that permits the sign to be fully accessed and serviced by one technician from a bucket truck.
   b. Provide a design so that regular opening and closing of the access panels or hinged doors does not cause warping or misaligned fit/closure.
   c. Provide gaskets to provide a weathertight seal when the access panels or hinged doors are closed.

H. Electrical

1. Provide electrical power, signal, data, board-to-board, board-to-connector, and grounding connections that are non-corrosive, low loss, and vibration resistant that are compliant with NEMA TS 4 environmental requirements.

2. Provide AC electrical power to the DMS that meets the following minimum requirements:
   a. Provide a power load center or electrical panel with multiple separate thermomagnetic equipment circuit breakers and a two-pole main breaker.
   b. Size breakers in accordance with the NEC for the anticipated loads that will be experienced by equipment interior lighting, ventilation, and power receptacles located within the sign housing.

3. Electrically bond the DMS to the support structure at mounting bolt locations, consisting of an electrical bond wire or properly prepared electrical contact points.

4. Provide driver boards and electronic circuit boards installed in the sign housing that have been coated with an acrylic or urethane conformal coating for moisture-resistance.

5. Provide UL-listed auto-ranging regulated DC power supplies for the LED pixel display modules.

6. Provide a sign that meets the following DC power supply requirements:
   a. Provide power supplies that operate from 120 VAC power.
   b. Provide power supplies that provide N+1 redundancy or approved equivalent method. Provide power supplies that are rated so that if one supply fails the other(s) can operate the entire LED section under nominal load conditions.
   c. Provide power supplies that meet NEMA TS 4 temperature requirements.
   d. Provide power supplies with over-voltage protection devices that supplement the DMS assembly’s overvoltage, surge, and transient voltage protection devices.
   e. Provide power supplies with short circuit protection by turning the DC power off and resetting automatically after five seconds of AC power off.
Section 631 — Dynamic Message Signs

f. Protect power supplies by a minimum overload allowance of 125 percent and have an efficiency rating of at least 80 percent.

g. Provide power supplies that are UL listed and compliant with RoHS Directive 2011/65/EU.

h. Provide power supplies with a visible means of determining power status of individual supplies via the DMS controller and the supplies themselves.

i. Provide power supplies with indicators that identify whether the supplies are functioning properly and outputting power at the correct and calibrated levels.

7. Types 1 and 2 only: Provide a sign that meets the following ventilation system requirements:

   a. Provide thermostatically controlled fans meeting NEMA TS 4 ventilation requirements for walk-in housings.

   b. Provide multiple temperature sensors used to activate the system including an additional sensor located to accurately measure the ambient temperature outside the sign housing.

8. Provide a circuit breaker protected, shielded, LED lighting system on the interior of the walk-in sign housing activated by a two-hour timer switch located on the interior near the door.

9. Provide a circuit breaker to protect a minimum of one duplex 120 VAC GFI receptacles rated for 15A inside the sign housing for the use of maintenance personnel.

I. Field Cabinet: provide system components that are compatible with the field cabinet as shown in the Contract. The field cabinet is not included in the pay items defined in Section 631.5.

J. Mounting and Support Structure

   1. Provide DMS housing that is designed for the support structure and access platform (for walk-in sign types). The support structure and access platform (for walk-in sign types) are included in the pay items defined in Section 638.5.

   2. Provide DMS housing with the mounting and attachment hardware necessary to attach the sign assembly to the DMS support structure and the access platform (for walk-in sign types) to the sign structure.

   3. Provide DMS housing access door design that provides adequate access to the DMS housing, in coordination with the structure and access platform.

   4. Provide DMS housing that is designed to accommodate an access platform with safety rails extending from the supporting sign structure. Safety rails shall be installed flush with the sign housing and in compliance with OSHA safety requirements.

K. Cabling and Surge Protection

   1. Provide fiber optic cable in accordance with manufacturer requirements for communications between the sign controller inside the DMS field cabinet and the DMS enclosure communications and interface electronics. No communications interfaces with the DMS shall use non-fiber conductors.

   2. Terminate and secure the fiber strands with factory installed connectors on both ends of the cable.

   3. Provide power service cabling to the DMS enclosure and DMS field cabinet as specified and recommended by the DMS manufacturer and in accordance with the NEC.

   4. Use stranded copper electrical conductors that are sized as required by load and distance for connecting 120 VAC circuits between the DMS controller and the DMS housing equipment power distribution area.

   5. Provide a sign with surge protection that meets the following SPD requirements:
Section 631 — Dynamic Message Signs

a. DMS Housing: Protect incoming power within the DMS housing with surge protection as recommended by the DMS manufacturer and in compliance with UL 1449.

b. DMS Field Cabinet: Comply with the minimum SPD requirements in Section 939.2.06.B.6 and as recommended by the DMS manufacturer.

L. Environmental

1. Provide a DMS system that meets NEMA TS 4 environmental requirements and conditions.

2. Provide a DMS system that meets current NEMA TS 4 diagnostics requirements and has third-party testing certification from the DMS manufacturer.

M. DMS Spare Components

1. Deliver spare components to the Department’s maintenance facility.

2. Provide the following spare components:
   a. Two LED modules for every four DMS installed.
   b. Two LED driver cards for every four DMS installed, unless incorporated in the LED module.
   c. One DC power supplies (including surge protectors) for every four DMS installed.
   d. One complete fan assemblies (for sign housing), including thermostats, for every four DMS installed.
   e. One temperature sensor for every four DMS installed.
   f. One light sensor (photocell) for every four DMS installed.
   g. One DMS controller for every four DMS installed.

3. The spare components listed above shall be identical to those that are provided within each type of DMS assembly.

4. Package each spare component individually with a label attached to the package that includes a description of the item, date of manufacture, part number, and manufacturer or vendor of the item. A description of the item's function and installation or replacement (remove and install) procedures shall be included with each item on 8.5 in. (216 mm) by 11 in. (279 mm) sheets of paper. If multiple sheets are required, the sheets shall be stapled together in sequential order. The top sheet shall have the item name and vendor's name at the top of the sheet. The sheets shall be placed in the boxes with the item.
631.3 Construction
The construction and installation of the DMS equipment, materials, components, and assemblies as specified herein shall meet the requirements in this section and the DMS manufacturer’s installation requirements and recommendations.

631.3.01 Construction Requirements
A. General Construction

1. Use and Operations Prior to Final Acceptance
   a. The Department will approve or control any and all DMS messages at all times that a display is in potential public view. When potential public view of the DMS message exists, no message or graphical display of any kind or activation of any DMS display component is permitted without prior approval of the Department.
   b. At such time as the Department determines that any given DMS is ready for Department control, the Department will exercise complete and total control of that DMS display and all central and local communications with that local DMS controller. Do not interpret such DMS display control as acceptance of the Project in whole or in part, nor construe such action as a waiver by the Department of any provision of this section.
   c. Prior to any action, coordinate with the Department any remaining work or any testing or maintenance that may affect that DMS display.

2. Schedule of installation of signs meeting the following timing of work requirements:
   a. Refer to Sections 942.1.04 and 942.3.04 for the list of submittals and pre-installation tests required for approval prior to start of work.
   b. If the DMS is stored in an outdoor environment and subject to direct sunlight for more than a total of 72 hours, provide power to the DMS so that the DMS fans are active for the purpose of cooling the inside of the DMS housing.
   c. Do not lift and install the DMS housing and display until equipment, materials, and labor are available such that the DMS can be operated with messages from the local controller within 72 hours of installation on the overhead structure.
   d. Attach and secure mechanical hardware for initial attachment prior to the reopening of lanes to traffic. Attach hardware prior to the release of crane cables.
   e. Install and connect the DMS wiring and communications cables to the ground-mounted field cabinet and disconnect switch in the field cabinet only after attaching and securing the sign to the sign structure.

3. Maintain full responsibility for the sign housing mounting to the support structure and confirm the sign can be properly mounted on the sign support structure prior to installation.

4. For structural aspects and mounting attachments, use stainless steel nuts with nylon inserts for locking.

5. Install mounting hardware to the torque recommended by the overhead sign support manufacturer.

6. Utilize liquid-tight metal flexible conduit for installation of cables between the sign housing and sign structure. Secure conduit to the structure with strap intervals of 3 ft. (0.9 m) maximum spacing.

7. Install cabling between the DMS housing and DMS field cabinet unit in continuous, un-spliced cable lengths. Install cabling within the DMS in supported cable trays.

8. Upon completion of wiring and connections, bundle incoming cables and hold in place with nylon cable ties.
9. Provide AC and DC logic control circuits that are separately bundled or contain shielded wiring.

10. Coil cable slack (fiber optic and electrical service) neatly in the base of the DMS field cabinet such that the connections to the housing and power source will be possible without the need to add or splice any cables. All fiber optic cable installed shall not exceed the minimum bend radius as recommended by the cable manufacturer.

11. Install field cabinet equipment and wiring meeting the following requirements:
   a. Make connections to terminal boards or screw-type equipment terminals with insulated fork-tongue compression connectors only when using stranded cable.
   b. Make wiring to bulkhead connectors on equipment housings with MS bayonet-type connectors.
   c. Solder connector joints for use with extra-low voltage systems, with the joint metals preheated to the flow temperature of the solder or crimped using ratchet-type positive crimp tools and a double crimp (conductor and jacket) connector.
   d. Remove the outer jacket of data and communications cables to expose approximately 6 in. (150 mm) of the shielding or drain wire. Twist together and solder the shielding or drain wire for cables serving a similar function with a No. 10 AWG minimum insulated (green) ground lead connected to the field cabinet ground bus. Make the ground lead routing as short as possible. Cut the shield off and leave it isolated at the other end.
   e. Upon completion of wiring and connections, bundle incoming cables and hold in place with nylon cable ties.
   f. Coordinate with the Department to establish electrical utility service according to the NEC and as specified in Section 682.
      i. Verify with the local power service provider to ensure that the provided equipment is compatible with the installed equipment.
      ii. Contractor shall be responsible for paying for electrical service as required from the time of testing up to the issuance of the MAL by the Department at which time the service provider account shall be transferred to the Department.
   g. Comply with Section 682 for grounding and bonding requirements.
   h. Connect the front panel and chassis to the field cabinet ground bus from a single point only.
   i. Power the DMS controller from the power distribution assembly provided in the DMS field cabinet.
   j. Bond the shields of extra-low voltage cables to the ground bus inside the field cabinet. The shield inside the sign enclosure shall be unconnected and insulated.
   k. Route low voltage cables and extra-low voltage cables installed in the field cabinet on opposite sides of the field cabinet.
   l. Group similar extra-low voltage cables in the field cabinets, between common locations, together with cable ties.
   m. Install cables and connectors so that the manufacturer’s rated minimum bending radius and pulling tension are not exceeded.
   n. Prevent abrasions to the cable jacket during installation.

12. Adjust the light sensor(s) and calibrate the dimming system consistent with field conditions for each sign as a part of the installation process.
Section 631 — Dynamic Message Signs

B.  Spare Components and Materials

1.  Provide and test spare and support components and materials specified herein per the pre-installation procedures defined in Section 942.3.04.

2.  Deliver the spare components prior to issuance of the MAL by the Department.

631.3.02 Equipment Configuration and Integration Requirements
Refer to Section 942.3.03 for equipment configuration and integration requirements.

631.3.03 Testing Requirements
Refer to Section 942.3.04 for testing requirements.

631.3.04 Training Requirements
Refer to Section 942.3.05 for training requirements.

631.3.05 Warranty and Maintenance Support Services

A.  Warranty Requirements

1.  Provide a minimum warranty length of five years for DMS and associated components. If the manufacturer’s warranties for the components are for a longer period, those longer period warranties shall apply.

2.  Refer to Section 942.3.02 for general warranty requirements.

B.  Maintenance Support Services

Refer to Section 942.3.02 for maintenance support services requirements.

631.4 Measurement

The DMS system and training that are complete, in place, accepted, and of the kind, size, and type specified will be measured as follows:

A.  DMS System

The DMS system will be measured for payment by the number installed, complete, functional, tested, and accepted. Unless otherwise specified in the Contract, furnish, install, and test the following minimum items as part of a DMS system: DMS housing and internal electronics and components, auxiliary control panel or maintenance laptop computer, spare components, electrical panel, cabling and wiring, eyebolts, manufacturer software, power supplies, surge protection, grounding, mounting and attachment hardware, and work, equipment, and appurtenances to provide a fully functional DMS system. The price bid shall also include configuration software, and system documentation to be turned over to the Department, including shop drawings, operations and maintenance manuals, wiring diagrams, block diagrams, and other material necessary to document the operation of the applicable DMS system.

B.  DMS Components

Furnish and deliver the following components and materials:

1.  LED Module, Furnish Only: LED modules units will be measured for payment by the number actually furnished and accepted.

2.  LED Driver Card, Furnish Only: LED driver cards units will be measured for payment by the number actually furnished and accepted.

3.  DC Power Supply, Furnish Only: DC power supplies including surge protectors will be measured for payment by the number actually furnished and accepted.
Section 631 — Dynamic Message Signs

4. **Fan Assembly, Furnish Only**: Fan assemblies will be measured for payment by the number actually furnished and accepted.

5. **Temperature Sensor, Furnish Only**: Temperature sensors will be measured for payment by the number actually furnished and accepted.

6. **Light Sensor, Furnish Only**: Light sensors will be measured for payment by the number actually furnished and accepted.

7. **DMS Controller, Furnish Only**: DMS controllers will be measured for payment by the number actually furnished and accepted.

C. **Training**

Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the training.

631.5 **Payment**

**631.5.01 DMS System**

DMSs of the types specified in the Contract documents will be paid for at the Contract unit price. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary to complete the DMS system.

Payment Notes:

*Submittal*

Submittal requirements are included in Section 942.1.04 and will not be paid for separately. It will be considered incidental to the DMS pay item.

*Testing*

Testing is defined in Section 942.3.04 and will not be paid for separately. It will be considered incidental to the DMS pay item.

*DMS Field Cabinet*

New DMS field cabinets will be paid for separately under Section 939 pay items.

*DMS Support Structure and Access Platform*

DMS support structure and access platform will be paid for separately under Section 638 pay items.

*GDOT Central Software Integration*

GDOT Central Software integration is included in Section 942.3.03 and will be paid for separately under the Section 942.5 pay item.

Payment for the DMS system will be made under:

632.1 General Description
This work includes furnishing, maintaining, transporting, and using Portable Changeable Message Signs according to these specifications at locations shown on the plans, in the Special Provisions, or as directed by the Engineer.

632.1.01 Definitions
General Provisions 101 through 150.

632.1.02 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   MUTCD
   NCHRP 350
   QPL 82

632.1.03 Submittals
General Provisions 101 through 150.

632.2 Materials
General Provisions 101 through 150.

632.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

632.3 Construction Requirements
632.3.01 Personnel
General Provisions 101 through 150.

632.3.02 Equipment
Use Portable Changeable Message Sign (PCMS) meeting the requirements of MUTCD, Section 6F.55 Portable Changeable Message Signs and the following:
A. Completed a full evaluation cycle (1-year) by National Transportation Product Evaluation Program (NTPEP).
B. Passed NTPEP durability test.
C. Has a control system with a keyboard to allow programming of user defined messages.
D. Have primary and backup power sources.
E. Capable of adjusting its brightness from daylight to night time conditions.
F. Capable of displaying 3 lines of legend.
G. Has a minimum reliability from its primary power supply for a minimum of 14 days for solar units (5 days for diesel units). Gasoline powered units not allowed.
H. Message displayed on the sign is visible for 3000 ft. (915 m) and legible for not less than 650 ft. (198 m) during both daytime and nighttime operation.
I. Is a self-contained unit including a control system with keyboard, primary and backup power source, mounting and transporting equipment (trailer mounted with all applicable lights and hardware).
J. Bottom of message sign panel is capable of being raised a minimum of 7 ft. above the roadway.
K. Listed on QPL 82 as maintained by the Office of Materials and Research or have a letter of approval from the Office of Materials and Research before the sign is used on any portion of the worksite.

L. PCMS that remain the property of the Contractor may be either new or used provided the PCMS meets the requirements of this Subsection.

M. In addition to the alphanumeric combinations, the signs should include the capability to display directional arrow messages. A PCMS may be used as an arrow board display panel provided the PCMS meets the size and display requirement of a Type C panel as defined by the MUTCD, Section 6F.55 Portable Changeable Message Signs.

N. The PCMS has the following programmed as permanent messages:
   1. /KEEP/RIGHT/ /
   2. /KEEP/LEFT/ /
   3. /TWO WAY/ TRAFFIC/AHEAD/
   4. /ONE LANE/BRIDGE/AHEAD/
   5. /MERGING/TRAFFIC/AHEAD/
   6. /HEAVY/TRAFFIC/AHEAD/
   7. /BUMP/AHEAD/ /
   8. /PAINT/CREW/AHEAD/
   9. /LOOSE/GRAVEL/AHEAD/
  10. /SURVEY/PARTY/AHEAD/
  11. /ICY/BRIDGE/AHEAD/
  12. /ROUGH/ROAD/AHEAD/
  13. /DO/NOT/PASS/
  14. /LOW/SOFT/SHOULDER/ /
  15. /SHOULDER/DROPOFF/ /
  16. VEHICLES/CROSSING/ROADWAY/
  17. /DETOUR/AHEAD/ /
  18. /MERGE/RIGHT/AHEAD/
  19. /MERGE/LEFT/AHEAD/
  20. /TRAFFIC/ACCIDENT/AHEAD/
  21. /TRAFFIC/SLOWS/AHEAD/
  22. /ROAD/NARROWS/AHEAD/
  23. /LEFT/LANE/NARROWS/
  24. /RIGHT/LANE/NARROWS/
  25. /LANE/NARROWS/AHEAD/
  26. /LEFT/LANE/ /
  27. /RIGHT/LANE/ /
  28. /LEFT/SHOULDER/ /
  29. /RIGHT/SHOULDER/ /
  30. /CLOSED/AHEAD/ /

O. The PCMS is entirely mounted on a trailer that meets all of the requirements of the Georgia Vehicle Code. Additional trailer requirements:
   1. The trailer and the components of the sign is designed to allow one person to perform all transporting and operating functions without assistance.
Section 632—Portable Changeable Message Signs

2. The trailer is designed for unlimited on-highway travel at 70 mph (110 kph).
3. The trailer has a minimum of four outrigger type leveling jacks, one at each corner of the trailer deck.
4. The jacks are mounted to allow them to swivel into a locked position for secure storage during travel.
5. The trailer and all mounted equipment are structurally adequate for unlimited normal operation in wind velocities up to 80 mph (130 kph).

632.3.03 Preparation
General Provisions 101 through 150.

632.3.04 Fabrication
General Provisions 101 through 150.

632.3.05 Construction

A. Utilization Requirements

1. When set up as a Pay Item in the Contract, utilize PCMS whenever any condition(s) exists that would require extra emphasis in warning motorists of a situation or at any location as directed by the Engineer. Furnish PCMS and have them available on a continuous basis.

2. Use PCMS on Interstate, limited access and multi-lane divided highways when any of these conditions exist:
   a. Workers or equipment operating within 2 ft. (600 mm) of a travel lane without appropriate traffic control devices for positive barrier protection.
   b. Excavation or other construction creates drop-offs adjacent to the edge of a travel lane and channelization devices are placed within the travel lane that is adjacent to the drop-off.
   c. Material hauling in or out of a travel lane by hauling vehicles requires traffic to slow in the temporary traffic control zone.
   d. Traffic is delayed by pacing all lanes for short periods of time for placing bridge beams, overhead sign structures, blasting, etc.
   e. Any time that divided highway traffic is required to operate as two-way traffic condition and traffic is not separated by a positive barrier system.
   f. One mile in advance of lane closure, place PCMS on outside shoulder denoting appropriate lane closure one mile ahead.

3. Use PCMS on all other types of roadways according to the traffic control plan or as directed by the Engineer.

4. Locate the PCMS near the construction activity and display a message that is both concise and meaningful. Obtain the Engineer’s approval for messages used on the PCMS.

5. Include the location of the PCMS and any message to be displayed on the PCMS in the approved traffic control plan required in Section 150-Traffic Control.

6. For emergency situations, PCMS that are smaller in size and do not have all of the capabilities outlined in this Specification, may be used until a PCMS that meets these requirements can be located and placed in operation at the site.

   The Engineer will determine when conditions and situations are to be considered emergencies and will regulate the length of time that non-specification PCMS may be used.

   Provide the Engineer written notification when non-specification PCMS signs are in use on the work.

B. PCMS Phase Messages

1. Messages are displayed in preferably one phase but no more than two phases.
2. The first phase directs the motorist to take a specific action, such as MERGE/RIGHT, KEEP/RIGHT, OR REDUCE / SPEED.
3. The second phase, if necessary, is used to inform the motorist of road conditions such as LEFT/LANE/CLOSED; LANE/NARROWS/AHEAD; WATER/IN/ROAD; SHOULDER/DROP OFF; TRUCKS/IN AND/OUT.

4. Do not use messages such as USE/CAUTION; HAZARD/AHEAD; or DANGER which are confusing and give no guidance to the motorist. Also, do not use messages such as BUCKLE/UP or DRIVE/SAFELY which diminish the impact of important and relevant messages.

632.3.06 Quality Acceptance
General Provisions 101 through 150.

632.3.07 Contractor Warranty and Maintenance
Keep the units in good repair and neat and clean in appearance. If the unit fails, malfunctions, or is damaged, immediately repair the unit and furnish flaggers or other approved means to safely control the traffic until the units are back in service. Make repairs or replace the unit within 24 hours. Maintenance also includes periodically cleaning the units.

632.4 Measurement
Changeable message signs, complete with trailer and generating equipment, are measured by the unit.

632.4.01 Limits
General Provisions 101 through 150.

632.5 Payment
Changeable message signs, complete with appurtenances, will be paid for at the Contract Unit Price Per Each. Payment is full compensation for furnishing, using, and maintaining the signs for the duration of The Work. Each PCMS will be paid for only one time. The PCMS will remain the property of the Contractor.

Payment will be made under:

| Item No. 632 | Changeable message sign, portable, type3 | Per each |

632.5.01 Adjustments
General Provisions 101 through 150.
Section 633—Modification of Existing Signs

633.1 General Description
Specifications for this work will be included elsewhere in the Contract.
634.1 General Description
This work includes furnishing and erecting monuments, name plaques—special design, county line markers, and right-of-way markers.

634.1.01 Definitions
General Provisions 101 through 150.

634.1.02 Related References
A. Standard Specifications
   Section 500—Concrete Structures
B. Referenced Documents
   General Provisions 101 through 150.

634.1.03 Submittals
General Provisions 101 through 150.

634.2 Materials
Ensure that concrete is Class A or a mix approved by the Engineer that provides a cement factor of at least 5.85 CWT/yd³ (347 kg/m³) of concrete. Use a test specimen cut from a monument or marker using the proposed concrete design and manufacturing method to prove the concrete meets a compressive strength of at least 2,000 psi (14 MPa) at 7 days.
Ensure that concrete is reinforced, free of honeycomb, has uniform surfaces, and meets the applicable requirements of Section 500.
All other materials used will be those specified on the plans or in the proposal.

634.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

634.3 Construction Requirements
634.3.01 Personnel
General Provisions 101 through 150.

634.3.02 Equipment
General Provisions 101 through 150.

634.3.03 Preparation
General Provisions 101 through 150.

634.3.04 Fabrication
General Provisions 101 through 150.
Section 634 — Monuments and Road Markers

634.3.05 Construction
Set the monuments and road markers in the ground to the depth shown on the plans.
Use backfilling material of selected earth or gravel. Carefully tamp it in place so that the monument is stable and secure, when completed. Use a level to set it plumb in all directions.
Attach Name Plaques—Special Design to bridge end posts as shown on the plans.

634.3.06 Quality Acceptance
General Provisions 101 through 150.

634.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

634.4 Measurement
The quantity to be paid for under this Item is the actual number of monuments, name plaques—special designs, road markers, Right-of-Way markers, and county line markers placed, completed, and accepted.

634.4.01 Limits
General Provisions 101 through 150.

634.5 Payment
These Items will be paid for at the price bid for each, complete in place.
Payment will be made under:

635.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

635.3 Construction Requirements

635.3.01 Personnel
General Provisions 101 through 150.
Section 635 — Barricades

635.3.02 Equipment
General Provisions 101 through 150. Ensure that barricades meet the requirements of Section 3F.01 of the MUTCD.

635.3.03 Preparation
General Provisions 101 through 150.

635.3.04 Fabrication
General Provisions 101 through 150.

635.3.05 Construction
Use timber barricades to warn and alert drivers of the terminus of a road, street, or highway in a non-construction or non-maintenance area. Install timber barricades where called for on the Plans or directed by the Engineer.

Ensure that the barricade rails are marked with alternate red and white stripes sloping downward at an angle of 45 degrees in the direction traffic is to pass. If the traffic may turn right or left, have the stripes slope downward in both directions from the center of the barricade.

Make the entire red-and-white striped area of retro-reflectorized sheeting meeting Subsection 913.2.01. Other barricade components shall be white.

Ensure that the barricade has three rails as long as specified on the Plans.

Promptly clean, repair, or replace barricades that are damaged, defaced, or otherwise unfit at the Contractor’s expense.

635.3.06 Quality Acceptance
General Provisions 101 through 150.

635.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

635.4 Measurement
Barricades are measured for payment by the overall length of the barricade, complete in place and accepted.

635.4.01 Limits
General Provisions 101 through 150.

635.5 Payment
Barricades as measured above will be paid for at the Contract Unit Price per linear foot (meter) of barricade. Payment is full compensation for furnishing materials, erecting the barricades, and maintaining them until Final Acceptance.

Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 635</th>
<th>Barricades</th>
<th>Per linear foot (meter)</th>

636.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

636.3 Construction Requirements

636.3.01 Personnel
General Provisions 101 through 150.

636.3.02 Equipment
General Provisions 101 through 150.

636.3.03 Preparation
General Provisions 101 through 150.
636.3.04 Fabrication

General Provisions 101 through 150.

636.3.05 Construction

A. Finished Signs

Ensure that the finished signs are clear cut and that the lines of letters and details are true, regular, and free of waviness, unevenness, furry edges or lines, scaling, cracking, blistering, pitting, dents, or blemishes.

Only one type of demountable characters (letters, numerals, symbols, and borders) is permitted on special roadside signs on each project.

B. Erecting the Signs

1. Drive Type Posts

   Drive type posts may be driven in place or placed in prepared holes.
   
   a. Use driven posts only in firm and stable soil. If the soil is sandy or unstable, place each drive type post in a prepared dry hole of at least a 4 in. (100 mm) diameter.
   
   b. When placing posts in prepared holes:
      
      1) Backfill the holes with a mixture of damp, clean friable soil and 8 percent by volume Portland cement.
      
      2) Thoroughly tamp the mixture in place around the posts.
   
   c. Erect posts vertically as deep and at an angle to the roadway as shown on the Plans or as directed.
   
   d. Do not penetrate posts in the coastal plain region less than 4 ft. (1.2 m) or 3 ft. (1 m) for posts in the Piedmont and the Valley and Ridge Regions when no guard rail is present.

   When erecting signs behind a guard rail, penetrate at least 3 ft. (1 m) for posts 14 ft. (4.2 m) or less long, or 4 ft. (1.2 m) for posts over 14 ft. (4.2 m) long.

2. Single-Plate Signs

   Erect single-plate signs 9 ft.² (0.84 m²) or less on one drive-type post unless otherwise specified on the plans.
   
   Erect single-plate signs greater than 9 ft.² (0.84 m²) on two drive-type posts.

   Leave enough distance between the two posts to fit the mounting holes in the sign plate.

3. Steel Posts for Mast Arm Assemblies

   a. Erect steel posts for mast arm assemblies in a concrete foundation according to the plans. Erect at the place, height, and angle to the roadway specified.
   
   b. After curing the concrete foundation for at least 24 hours, securely fasten the specified signs into place on the mast arm.

4. Ground-Mounted Panel-Type Signs

   a. Erect the supporting members of ground-mounted panel-type signs where shown on the plans or as directed by the Engineer at the specified angle to the roadway.
   
   b. Securely fasten the panels into place.

5. Milepost Signs

   Erect milepost signs including posts as specified on the plans.

6. Delineator Posts

   Use delineator posts made of galvanized steel, aluminum, or an alloy that conforms to the requirements of Subsection 911.2.04.A.4 or 911.2.04.A.5.
   
   a. Erect the posts where shown on the plans.
   
   b. Mount reflectors for galvanized steel or aluminum posts on the flange side of the post.
   
   c. When signs are attached to supports, torque the bolts to at least 20 ft.-lbs. (27 N•m).
7. **Overhead Panel-Type Signs**
   Erect overhead panel type signs on sign supports where shown on the Plans or as directed by the Engineer.
   a. Ensure that the bottom of the sign is 18 in. (450 mm) above the top of the lighting fixture.
   b. Ensure that the sign has ample bracing for mounting the sign support so that each sign can withstand 1 in. (25 mm) of ice accumulated on the entire sign and wind pressures shown on the plans.
   c. Ensure that the top of each sign is three degrees off perpendicular from the bottom of the sign. Use the three-degree slant to lean the sign toward the approaching traffic.

C. **Foundations (for Special Roadside Signs)**
   Do not disturb the natural ground adjacent to a foundation more than necessary to construct the footing.
   1. Excavate for the footings to the lines and elevations shown on the Plans or established by the Engineer. Do not disturb or loosen the foundation below these elevations.
   2. Use forms of the necessary shape and dimensions to construct the footings to the lines and elevations shown on the plans.
   3. Cure the concrete foundations, constructed in conformance with Section 500 and the plan details, at least 7 days before erecting the sign.
   4. Ensure that the minimum lengths of steel H piling used in the foundations of ground-mounting signs are accepted and meet the plan penetration requirements. The Plan quantity of steel H piling is shown for estimating purposes only; determine and provide the necessary lengths of piles.
   5. Before driving the piles, furnish a list of proposed pile lengths to the Engineer.
      a. Use full-length piles or built-up piles with a maximum of two splices that are made in the presence of the Engineer.
      b. Furnish satisfactory identification for all piles or portions thereof.
   6. When rock prevents the penetration required on the plans, construct according to the notes and details shown on the plans.
   7. The minimum energy ratings required by Section 520 for pile hammers will be waived for constructing ground-mounted sign supports. Jetting is not permitted.
   8. Place required backfilling in layers no greater than 6 in. (150 mm) thick and thoroughly compact it to the approximate density of the undisturbed soil in the area.

D. **Sign Panels**
   Use extruded, panel-type aluminum. Ensure that the sign type used meets the requirements of Subsection 912.2.02.

E. **Legends and Borders**
   Place legends and borders according to Subsection 917.2.01, *Demountable Characters*, with Type XI reflective sheeting.

636.3.06 **Quality Acceptance**
   General Provisions 101 through 150.

636.3.07 **Contractor Warranty and Maintenance**
   General Provisions 101 through 150.
Section 636 — Highway Signs

636.4 Measurement

A. Type-1 or Type-2 Highway Signs

Type 1 or Type 2 highway signs with reflective sheeting of Type IX or XI as specified on the plans to be paid for are measured for payment by the actual number of square feet (meters) and fraction thereof of sign type and sheeting specified. The measurement includes providing the message and furnishing and placing signs complete and accepted. The plan quantity will be the pay quantity.

B. Extruded Aluminum Panels

Extruded aluminum panels to be paid for are the number of square feet (meters) or portion of square feet (meters) furnished, including legend components, border material, fittings, nuts, washers, clamps, molding, etc., furnished, erected, completed, and accepted.

C. Galvanized Steel Posts

Galvanized steel posts, types 7, 8, or 9 to be paid for are the actual number of linear feet (meters) and fraction thereof of the type specified, furnished, erected, completed, and accepted.

Galvanized steel to be paid for is the number of pounds (kilograms) furnished, erected, and accepted. Weights are computed from theoretical weights listed in the plans for each post size. Base plates, connections, anchors, stub post, etc., are not measured for payment but are considered incidental to the item.

D. Delineators

Delineators (reflectorized guide markers) to be paid for are the number of the type specified, including posts, rivets, and spacers, that are furnished, placed, and completed and accepted.

E. Mast Arm Assemblies

Mast arm assemblies to be paid for are the actual number furnished and erected, including concrete footing, sign, and post, completed and accepted.

F. Special Roadside Signs

Class A concrete for special roadside signs to be paid for are measured by the cubic yard (meter), neat measurement according to Section 500.5 Payment. No deductions are made for the volume of concrete displaced by steel piling, anchor bolts, or posts.

G. Portland Cement

Portland cement stabilized material used for backfilling holes is not measured for payment.

H. Steel H—Piling

Steel H—piling is measured for payment by the linear foot (meter) of accepted piling in place (signs), remaining in the completed work.

636.4.01 Limits

General Provisions 101 through 150.
Section 636 — Highway Signs

636.5 Payment

Highway signs, galvanized steel posts, I-beam posts, delineators, mast arm assemblies, Class A concrete, and piling for signs are paid for at the Contract Unit Price for the various items. Payment is full compensation for furnishing and erecting the Item complete in place according to this specification.

Separate payment will not be made for piling splices, the cost of cutting, or the cutoff portions. Pile cutoffs remain the Contractor’s property.

Piles eliminated due to authorized revisions will be paid for according to Subsection 109.06, Eliminated Items. These piles become Departmental property. Except for the above provision, no payment will be made for piles delivered to the project that are not used in the work.

Payment will be made under:

636.5.01 Adjustments

General Provisions 101 through 150.
Section 637 — Illuminated Sign System

637.1 General Description
This Specification describes the complete sign illumination system. Complete a secure installation according to the recommendations of the American Association of State Highway and Transportation Officials (AASHTO), the Illuminating Engineering Society, the standards of the National Electrical Code, and the applicable local ordinances.

For temporary overhead guide sign structures, except wire-supported signs, light the signs as soon as they are erected. Keep them lit during darkness until the temporary sign is no longer required.

The cost of temporary signs and electrical energy are included in the price bid for Section 150 when shown in the Proposal as a Pay Item. Otherwise, payment is as shown in Section 150. Ensure that illumination complies with Subsection 637.3.05.H, Externally Illuminated Signs.

637.1.01 Definitions
The terms “cable” and “wire” are used synonymously in this specification.

637.1.02 Related References

B. Referenced Documents
   NEC Section 370-18(c) in conjunction with NEC Section 250-42
   ANSI C 80.1
   EEI/NEMA publications

637.1.03 Submittals
Before purchasing materials or equipment, submit to the Engineer for approval a complete list of the products proposed for use. On the list, show the manufacturer’s name and catalog number of each item to ensure compliance with the requirements of these Specifications. Include in this submittal the calculations or computer printouts for sign illumination and uniformity values.

Submit voltage drop calculations for each circuit to verify that proper voltage is furnished to the sign luminaires. Provide alternate equipment or a sample board to be activated for in-service evaluation, when the Engineer requires.

637.2 Materials
A. General Requirements
   Have electrical material approved by the Underwriter’s Laboratory or other acceptable testing agency. Provide the fittings, devices, materials, and Work to install the complete functional system. Use methods that comply with local ordinances, rules, and regulations. See Section 636 and Section 638.
Section 637 — Illuminated Sign System

B. Power Supply and Wiring

Use cable and wire of sufficient size to safely carry the capacity intended and to prevent the voltage from dropping more than 5 percent from the service point to the farthest light.

1. Determine Cable and Wire Sizes

If the cable size is not specified on the plans, determine the safe size after studying the plans and specifications.

Wire and cable sizes as indicated below are for copper. Do not use aluminum wire unless otherwise noted on the plans.

Acceptable copper cable and wire sizes (commercial) are as follows:

<table>
<thead>
<tr>
<th>Size</th>
<th>Strands</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 2/0 AWG</td>
<td>19</td>
</tr>
<tr>
<td>No. 1/0 AWG</td>
<td>19</td>
</tr>
<tr>
<td>No. 2 AWG</td>
<td>7</td>
</tr>
<tr>
<td>No. 4 AWG</td>
<td>7</td>
</tr>
<tr>
<td>No. 6 AWG</td>
<td>7</td>
</tr>
</tbody>
</table>

Use smaller wire sizes (No. 10 AWG minimum) on the sign structure only if it is adequately protected with fuses inside the handhole of the structural support. Ensure that the fuse rating is the same as the ampere rating of the wire, such as 30 A for No. 10 AWG wire.

Do not reduce the wire size to a size that carries more than 80 percent of its rated amperage. If the number of luminaires on the sign structure is too many for No. 10 AWG wire, run two separate circuits from the base of the structural support to the luminaires. Fuse each of these separate circuits at the handhole of the sign structure.

2. Insulate Wire and Cable

The neutral/ground wire shall have white insulation or mark it with strips of white tape at each access point. On the cable installed underground, use 600 V, type RHH/RHW/USE, 75 °C insulation. On the cable installed on the sign structure and connected to the luminaires, use 600 V, type RHH, XHHW, or THHN, 90 °C insulation.

Install a waterproof boot, furnished by the fuse holder manufacturer, over each end of the fuse holder.

C. Power Control

When noted on the Plans, furnish and install a lighting contactor and a photoelectric control, complete with receptacle and accessories. Mount the photoelectric control near the top of the service pole so that it is exposed to the north sky. The control shall provide ON operation as shown in Subsection 637.2.I, Photoelectric Controls.

D. Grounding Rods

Use ground rods 5/8 in. (16 mm) in diameter (± 1/16 in. [± 1.6 mm]) and 8 ft. (2.4 m) long unless otherwise specified on the plans. Use ground rods that are galvanized steel. Ensure that the galvanization coating is at least 2 ounces/ft.² (610 g/m²) according to the requirements of ASTM A 153/A 153 M.
Section 637 — Illuminated Sign System

E. Conduit

Use conduit approved by the Underwriters’ Laboratories, Inc.

1. Rigid Steel Conduit

Use rigid steel conduit, including elbows and couplings, that conforms to American National Standards Institute Specification C 80.1.

a. Protect rigid steel conduit by a uniform metallic zinc coating on the exterior and interior surfaces.

b. Ensure that the conduit and coupling are galvanized at least 1.24 ounces/ft.² (380 g/m²) (total of both surfaces).

c. Determine the weight of the zinc coating according to ASTM A 90. If the Engineer elects, determine the thickness of the zinc coating by using a magnetic or electromagnetic thickness gage.

2. Nonmetallic Conduit

Unless otherwise noted, use Type II, schedule 40 (heavy wall) polyvinyl chloride (un-plasticized) nonmetallic conduit that conforms to Subsection 923.2.02.

3. Flexible Conduit

Ensure that the flexible conduit consists of a galvanized steel core and a polyvinyl chloride cover. Ensure that it contains a continuous copper ground and is liquid tight.

F. Circuit Breakers

Use quick-make and quick-break circuit breakers with a thermal magnetic molded case.

Use circuit breakers with the following characteristics:

- Over-the-center, toggle operating type with the handle positioned between ON and OFF to indicate automatic tripping
- Single handle and common trip multi-pole breakers
- Multi-pole breakers with a voltage rating 240 V or more from line to ground
- Bolt-on type with industrial rating and a minimum interrupting capacity of 10,000 RMS symmetrical amperes
- Lugs large enough to accommodate the cable used
- Lockable, weatherproof enclosure

G. Fuses and Fuse holders

Use fuses with the appropriate ampere rating and voltage rating for the operating voltage.

Use in-the-line and waterproof fuse holders.

H. Lightning Arresters

Use metal oxide varistor lightning arresters rated 650 V with the number of required poles unless otherwise specified. Provide a pole for each ungrounded leg of the service voltage.

I. Photoelectric Controls

Ensure that the photoelectric controls have a factory setting for turn-on at 1.5 foot-candles (16.1 lx) ambient light level.

Provide controls with a differential between turn-on and turn-off levels to prevent cycling at critical levels.

Use controls that meet these requirements:

- Operates on a supply voltage of 105 V to 130 V, 50/60 Hz, AC with an in-rush rating of 120 A at 120 V and a lamp load rating of 1,000 W for incandescent and 1,800 V amperes for mercury vapor and fluorescent
- Contains built-in surge and lightning protection
- Has a rated life at full load of at least 5,000 on-off operations
- Withstands an ambient temperature range of –65 °F to 158 °F (-54 °C to 70 °C) and is moisture proof
Section 637 — Illuminated Sign System

Provide single-pole, single-throw (SPST), normally closed (NC) relay contacts. Ensure that the dielectric strength is at least 5,000 V between a current carrying part and the metal mounting surface.

The housing shall be approximately 2.25 in. (57 mm) high with a base diameter of no more than 3.25 in. (83 mm).

The chassis shall be molded phenolic with three locking type blades and a neoprene gasket that conforms to EEI/NEMA publications. Mount the photoelectric control on an approved receptacle.

J. Lighting Control

Use lighting contactors specifically designed for use on tungsten and ballast (fluorescent and high-intensity discharge) lamp loads without derating. Use a contactor with these characteristics:

- The number of poles required to open each ungrounded conductor
- Lugs large enough to accommodate the cable used
- Lockable, weatherproof enclosure

K. Luminaires and Lamps

Use 400 W mercury luminaries with H 33-GL-400/DX lamps and a box-type configuration, unless otherwise specified. Mount on horizontal luminaire support channels.

Ensure that the luminaire contains:

- Integral regulator ballast and a prewired terminal board to connect the supply voltage
- Conduit openings on each side for through wiring
- Rain-tight housing made of aluminum with baked-on enamel finish
- Noncorrosive hardware
- Seals or gaskets at critical points to form a weathertight, breathing seal.
- Porcelain enclosed mogul socket, with spring loaded center contact and lamp grips, attached to ensure proper lamp positioning
- Lamp support on the end opposite from the socket to prevent the lamp from breaking from vibration
- Highly polished anodic-surfaced aluminum reflector and a removable, stippled, heat and shock tempered glass refractor
- Integral hinge system for the door that must be in a specified position to remove the door
- Detachable locking brace to hold the door open during maintenance
- Heavy-duty spring-loaded latch on the front of the luminaire that produces a watertight seal between the door and housing when closed

Ensure that the luminaire support framework is designed to withstand wind and 1 in. (25 mm) of ice accumulated on the entire framework as shown on the plans.

Ensure that lamps are 400 W deluxe white mercury vapor and have 24,000 hours rated life at 10 hours per start.

L. Ballasts

Use regulator-type ballast that provides rated lamp watts to the lamp through a range in primary voltage of plus or minus 10 percent.

Use high-power ballasts with a power factor of at least 0.90 and enough open circuit voltage to start lamps at a temperature as low as -20 °F (-29 °C). Enclose ballasts for external or cabinet mounting in an epoxy-encapsulated covering.

637.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.
Section 637 — Illuminated Sign System

637.3 Construction Requirements

637.3.01 Personnel

A. Contractor Requirements

The person performing this work must be on the Department list of approved electrical contractors or electrical subcontractors.

B. Qualified Electrician

A qualified electrician has a Class II license issued by the Georgia State Construction Industry Licensing Board, has completed an approved four-year apprenticeship training program, and is classified as a Journeyman Electrician. The qualified electrician shall show evidence of this classification to the Department Engineer in charge of the Construction. For further definition, see Subsection 755.1.01.

Always have a qualified electrician on the job site when pulling electrical wiring or making electrical connections.

637.3.02 Equipment

General Provisions 101 through 150.

637.3.03 Preparation

General Provisions 101 through 150.

637.3.04 Fabrication

A. Pull and Junction Boxes

Construct pull and junction boxes installed in the ground according to the design and dimensions, and at the locations shown on the plans. Use a type approved by the Engineer.

1. Construct concrete boxes of Class A concrete meeting the requirements of Section 500, including precast concrete boxes.

   Manufactured units are permitted when the Engineer determines that they are equal in design, quality, and structural strength.

2. Provide cast iron, steel, or reinforced concrete covers as shown on the plans for each pull or junction box.

3. Provide a drainage system for each ground-mounted box to keep water from accumulating inside the box.

4. Ground cast iron or steel covers used on electrical junction boxes or pull boxes as required by NEC Section 370-18(c) in conjunction with NEC Section 250-42.

5. Ensure that the pull and junction boxes mounted on bridges and the sign structure are waterproof, galvanized steel, stainless steel, or cast aluminum and conform to NEC requirements.

6. Seal conduit entrance holes in pull or junction boxes around the conduit to the Engineer’s satisfaction.

7. Blank off unused entrance holes and openings for conduit to be extended by other Contractors with suitable plugs of plastic, bituminous fiber, or other approved material to prevent foreign matter from entering.

637.3.05 Construction

A. Fees and Permits

Pay the fees and permits required by power companies or governmental agencies.

Notify the power company at least 30 days before the power source connection is needed.
Section 637 — Illuminated Sign System

B. Power Supply and Wiring

Use a power supply of 120/240 V, 3-wire, single phase, with a supply point where the Department and the serving electric utility determine, unless otherwise noted. The supply point is usually near the right-of-way line near the sign location.

The sign lighting pay Unit includes setting a wooden service pole that meets the requirements of Section 863 near the edge of the right-of-way to receive the service from the utility company, unless otherwise indicated. Use at least a 30 ft. (9 m) Class 5 pole or as shown on the plans.

1. Install the metallic service riser with a weather head on the service pole and a weatherproof housing containing circuit breakers of the appropriate voltage and ampere rating.

2. When specified on the plans, install a photoelectric control with the mounting hardware near the top of the service pole and a lighting contactor in a weatherproof housing on the service pole.

3. Ensure that the circuit breaker and lighting contactor have the number of poles required to open each ungrounded conductor.
   Ensure that the circuit breakers and lighting contactors have proper lugs, sized for the cable to be used. Do not cut the cable strands to attach to the circuit breakers or lighting contactors.

4. Install an approved meter base in the service riser when required by the power company or indicated on the plans.

5. Furnish and install an approved 650 V lightning arrester at the weatherproof enclosure and connect the arrester to the grounding system.

6. Furnish an approved padlock with two keys each for locking the weatherproof housings. Key the padlocks alike if more than one padlock is required on a project.

7. Enclose the wiring on the sign framework in rigid galvanized steel conduit. Use liquid-tight flexible conduit in transition areas between rigid members. Do not splice cable or wire except in junction boxes.

8. Splice the conductors according to the National Electric Code and the splice manufacturer’s recommendations. Splicing is subject to the Engineer’s approval.
   a. Make splices only in junction boxes and pole bases unless otherwise shown on the plans.
   b. Make the straight or line splices of conductors the same size with tin-plated copper compression tubular splices.
   c. Splice conductors of different sizes or different terminating directions by using tin-plated copper compression ring tongue terminals on each conductor. Bolt the terminals together with stainless steel or high-strength silicone bronze hardware.

9. Use lock nuts, pal nuts, or lock washers to keep the connection tight. Do not use split bolt connectors.

10. After splicing the conductor, insulate the splice with heat shrinkable tubing coated with adhesive on the inner wall supplied by the manufacturer.
    Select the shrink tube so that when it is applied over the connector it has an insulation thickness equal to or greater than the insulation thickness of the conductor used.
    Ensure that the heat shrinkable tubing is UL listed and meets ANSI C 119.1 (latest edition) requirements for submersible and direct buried splices.

11. When bolting connectors together:
    a. Wrap the bolted connection with cloth tape before applying the heat shrinkable tubing.
    b. Pad the sharp points and edges on splices to prevent the heat shrinkable tubing from splitting during shrinking.
    c. Position the shrink tubing so that at least 3 in. (75 mm) of seal length ± 0.05 in. (± 13 mm) is established on each side of the splice after the tube is fully recovered.
    d. Ensure that the spliced joints are watertight.
12. Include an approved 650 V lightning arrester inside the handhole of each structural support for illuminated signs.

13. Install in-the-line fuses in each ungrounded conductor inside the handhole of each structural support for illuminated signs.

14. Notify the power company at least 30 days before the connection to the power source is needed.

C. Power Control

The photoelectric control operates the lighting contactor that supplies power to the lighting circuit. If the supply voltage is other than 120/240 V, furnish and install a transformer in a weatherproof enclosure to provide 120 V control voltage.

1. Mount the circuit breaker, lighting contactor, and transformer, if required, in NEMA-3R lockable weatherproof cabinet(s) located on the service pole accessible from the ground.

2. Enclose the wiring to and from the photoelectric control in rigid galvanized conduit.

D. Grounding Rods

Install the grounding rods adjacent to each structural support foundation where the supply voltage enters and adjacent to the service pole.

1. Solidly connect to the grounding conductor the sign framework and metallic, noncurrent carrying materials in the lighting system.

2. Ensure that the neutral/grounding conductor is continuous and is connected to the luminaire housing, the ground rod at each structural support, and the ground rod at the service pole.

3. Drive the single ground rods vertically until the top of the rod is at least 12 in. (300 mm) below the finished ground.

4. Use round rod clamps to attach a length of No. 6 AWG, bare solid, soft drawn or medium hard drawn copper ground wire to the ground rod. Connect it to the grounding point on the structural support.

If penetration cannot be obtained in the above manner:

a. Place a ground rod system consisting of 3 parallel ground rods at least 6 ft. (1.8 m) center to center in a horizontal pattern and at least 12 in. (300 mm) below the finished ground.

b. Join these rods and connect them to the grounding point on the structural support with No. 6 AWG, bare solid, soft drawn, or medium-hard drawn copper ground wire and ground rod clamps.

E. Conduit, Boxes, Fittings, Circuit Breakers, Fuses, Wiring, and Supports

Furnish and install the conduit, boxes, fittings, circuit breakers, fuses, wiring supports, and accessories to complete the work for each circuit as required by the National Electrical Code.

F. Fuses and Fuse holders

Construct and install the fuse holder to retain the fuse on the load side if disconnected or broken apart. Install a waterproof boot, furnished by the fuse holder manufacturer, over each end of the fuse holder.

G. Lightning Arresters

House the lightning arrester in a watertight housing. Encapsulate or seal the lead entrance into the housing.

For units that are not factory sealed, apply silicone caulk to the lead entrance and install heat shrinkable tubing with precoated sealant on the interior surface over the lead entrance.

H. Externally Illuminated Signs

Ensure that the lighting system provides on the face of the signs at least 30 foot-candles (320 lx), average maintained, at 60 °F (15 °C) ambient temperature with a uniformity ratio (average/minimum) of no more than 3.5:1. Tilt the sign 3 degrees off perpendicular toward the pavement.
1. Luminaires and Lamps
   a. Mount luminaires so that the top of the luminaire is at least 18 in. (450 mm) below the bottom edge of the sign and at a horizontal distance to provide uniform illumination.
   b. Extend the luminaires within 2 ft. (600 mm) of the outside edge of the sign in each direction. The luminaire design will direct the longitudinal separation of luminaires.
   c. Support the luminaires and conduit runs with a framework of aluminum or hot dip galvanized steel channel solidly fastened to the structural support with galvanized steel or aluminum clamps. Do not drive holes into the structure.
   d. Ensure that luminaires are accessible from the maintenance walkway for maintenance and lamp replacement.

2. Ballasts
   Ensure that the ballasts for high intensity discharge (HID) or fluorescent lamps are integral with the luminaire housing or are in a separate weatherproof housing attached to the luminaire housing, unless otherwise specified. Use ballasts when using multiple circuits, unless otherwise specified, and when operating at voltages shown on the plans.

3. Light Shield
   Provide a light shield plate made of 0.10 in (2.54 mm) thick, B-209 alloy 6061-T6 aluminum sheet 12 in. (300 mm) wide and the combined length of the signs.
   Erect the shield below the signs at an elevation that will eliminate glare from the luminaires to motorists traveling in the opposite direction from the face of the sign. Mount the shield to the catwalk supports with U-clamps according to Section 911.

637.3.06 Quality Acceptance
The Department will accept luminous intensity using a color and cosine corrected lux meter. The Department will measure at random points by placing the meter flat against the surface of the sign with the light cell parallel to the face of the sign.

The maintained luxfoot-candle values will be calculated using depreciation factors of 0.75 for the luminaire and 0.70 for the lamp (combined value = 0.525) to provide a minimum of 30 foot-candles (320 lx) average maintained during the service life of the system.

A. Before Testing Period
   Complete and energize each lighting circuit as early as possible. Before beginning the testing period, have an electrician with a megger, voltmeter, and ammeter perform the following tests in the presence of the Department Inspectors for each lighting circuit.

1. Before connecting the phase conductors to the source breaker, the sign structure, or the lighting standard wiring and lightning arresters, megger the circuit conductors to ensure that the phase conductors are free of grounds.

2. Test systems of 480 V at 1,000 V dc. Test systems less than 480 V at 500 V dc. The minimum acceptable reading is one megohm after the test voltage has been applied for 10 minutes. Test the system as follows:
   a. Before turning the circuit breaker on at the service point, measure the service voltage between the phase conductors and between each phase conductor and the neutral or ground.
   b. If the proper voltage is observed, turn the circuit breaker on. Wait 10 minutes for the luminaires to warm up and repeat the above voltage measurements.
   c. After energizing the circuit for at least 10 minutes, measure the load current in each phase conductor and the neutral at the service point. Ensure that the current in the phase conductors is balanced and no current is in the neutral.
   d. Record the test data in the project records.
Section 637 — Illuminated Sign System

Final acceptance of the lighting system will be withheld for a 30-day testing period of continuous nightly automatic operation after the lighting work is complete or until other items in the Contract (except grassing) have been accepted, whichever occurs later. If a portion of this testing period occurs after Final Acceptance, other Work will not be charged against the Contract Time.

Correct defects in material or workmanship that occur during this 30-day period of continuous nightly automatic operation and until the Project is accepted, whichever occurs later. If defects are found during the 30-day test, continue testing it until achieving 30 days of continuous nightly automatic operation.

Assume the energy cost of each circuit or part of the circuit during this test period. Others will assume the energy costs after the successful 30-day test period.

B. After Testing Period

After the testing period and at the time of Final Acceptance, have an electrician with a voltmeter and ammeter perform the following tests in the presence of the Department Inspector for each lighting circuit.

1. Energize the circuit for at least 10 minutes and measure the service voltage between the phase conductors and between each phase conductor and the neutral or ground at the service point.

2. If the proper voltage is observed, measure the load current in each phase conductor and the neutral. Ensure that the current in the phase conductors is balanced and there is no current in the neutral.

3. Record this test data in the project records.

637.3.07 Contractor Warranty and Maintenance

637.4 Measurement

Each illuminated sign system completed and accepted at the location specified is measured for payment per Lump Sum.

637.4.01 Limits

637.5 Payment

Each illuminated sign system measured for payment will be paid for at the Lump Sum price bid for each system. Price and payment is full compensation for furnishing and installing each complete and functional system, including designs when furnished by the Contractor, drawings, electrical apparatus and wiring specified, required excavation, backfill, concrete for conduits, and other materials, labor, equipment, and incidentals to complete the Item.

Structural supports for overhead highway signs will be erected and paid for separately according to Section 638. Signs will be paid for according to Section 636.

Payment will be made under:

| Item No. 637 | Illuminated sign system—sta.___ | Per lump sum |

637.5.01 Adjustments

General Provisions 101 through 150.
**Section 638 — Structural Supports for Overhead signs**

### 638.1 General Description

This item includes the materials, design requirements, fabrication, and erection of structural supports for overhead signs, including excavation, foundations, anchor bolt assemblies, backfill, redressing, and re-grassing but exclusive of signs.

### 638.1.01 Definitions

Structural supports for overhead signs are defined generally as follows:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>A SIGN BRIDGE type structure that spans the roadway with more than two horizontal chords supported by two columns, one at each end. Each column shall have at least two braced vertical members.</td>
</tr>
<tr>
<td>II</td>
<td>A CANTILEVER type structure with two or more horizontal chords supported by a single column at one end.</td>
</tr>
<tr>
<td>III</td>
<td>A BUTTERFLY type structure with two or more horizontal chords extending an equal distance in opposite directions from a single column.</td>
</tr>
<tr>
<td>IV</td>
<td>A COMBINATION (Bridge-Cantilever) type structure with more than two horizontal chords supported by two columns, only one at one end and one at an intermediate point. Each column shall have at least two braced vertical members.</td>
</tr>
<tr>
<td>V</td>
<td>A CANTILEVER type structure with a maximum of two horizontal chords supported by a single column at one end.</td>
</tr>
<tr>
<td>VI</td>
<td>A SIGN BRIDGE type structure that spans the roadway with a maximum of two horizontal chords supported by two columns, one at each end.</td>
</tr>
<tr>
<td>VII</td>
<td>A BRIDGE MOUNTED (attached to a highway bridge) structural frame.</td>
</tr>
<tr>
<td>VIII</td>
<td>A BUTTERFLY type structure with a maximum of two horizontal chords extending an equal distance in opposite directions from a single column.</td>
</tr>
</tbody>
</table>

Type II and V structures' maximum horizontal dimension shall be 32 ft. (9.75 m). The horizontal dimension is measured from the column's centerline to the furthest point of the structure or sign.

Type III and VIII structures' maximum horizontal dimension shall be 25 ft. (7.6 m). The horizontal dimension is measured from the furthest point of the structure or sign on one side to the furthest point of the structure or sign on the other side. Place the sign(s) on the structure to create a slightly unbalanced condition about the column's centerline during wind loads.

Types V, VI, and VIII structural supports shall be used with flat sheet aluminum signs. If the vertical dimension of the largest sign is 42 in. (1050 mm) or less, one horizontal chord may be used.

A walkway is required only when called for on the signing plans.

Section 638 — Structural Supports for Overhead signs

Current issue of AASHTO Standard Specification for Transportation Materials and Methods of Sampling and Testing

638.1.03 Submittals

Submit to the Engineer shop drawings and design calculations for the structural supports, anchor bolt assemblies, and foundations for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper. The submission shall be prepared and stamped by the Design Engineer who shall be registered as a Professional Engineer in the State of Georgia.

The Engineer will distribute submitted documents to the Bridge Engineer (SLTS@dot.ga.gov) for review and provide the State Traffic Operations Engineer with a copy of the transmittal letter. For installations governed only by a permit, and not a GDOT contract, drawing and calculation submission should be made directly to the Bridge Engineer for review and approval, with a copy to the District Permit Engineer.

Detail the shop drawings to permit replacement of all members and include all dimensions, construction tolerances, elevations at top and bottom of foundations, and sizes of members. The shop drawings shall include the material designations of the structure and of the hardware for attaching the sign, the lane delineation of the roadway under the structure, and the walkway. See Figure 1, Figure 2, and Figure 3.
A. Structural Supports

Structural supports shall be designed to the following wind speeds using a 1700 Mean Recurrence Interval (MRI) for the listed counties:

- 150 mph: Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
- 140 mph: Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnal, Wayne
- 130 mph: Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady, Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
- 120 mph: For all counties not listed above

Structural supports shall be designed using the following criteria:

- Fatigue Category 1
- Truck induced gusts included

Design structural supports to use interchangeable components whenever feasible.

Design Type I, IV, and VI supports for 100 percent of the design sign area shown on the plans and 100 percent of the wind pressure as calculated by the SLTS.

Design bases for a minimum of four anchor bolts per column.

Design Type II, III, V, and VIII supports for 100 percent of the design area shown on the plans and 150 percent of the wind pressure as calculated by the SLTS. Design bases for a minimum of 8 anchor bolts per column.

Design Type VII supports for 100 percent of the design sign area shown on the plans and 100 percent of the wind pressure as calculated by the SLTS.

Type VII bridge mounted structural frames may be attached to concrete barrier, parapet, or deck or steel beams. Structural Supports shall not be attached to prestressed, post-tensioned, or reinforced concrete beams unless inserts were placed in beams during fabrication or construction. Make attachments to the concrete by bolting through the concrete or using chemical anchors not in direct tension. Mechanical anchors will not be allowed.

Attachments shall be flush on the traffic side of the concrete barrier, parapet, or deck. No attachments shall be welded to beams. When bolting to ASTM A 709 Grade 50W (A 709 M Grade 345 W) steel; bolts, nuts and washers shall be made from a steel that meets mechanical properties of ASTM A 325 (A 325M) and has weathering characteristics comparable and compatible to ASTM A 709 Grade 50W (A 709 M Grade 345W) steel. If the Structural Support is attached to a bridge beam, additional bracing will be required between the exterior beam and the first interior beam.

B. Walkways

When walkways are required by the signing plans, place walkways in front of the signs and extend them at least 1 ft. (300 mm) outside of the edge of all overhead signs and at least 2 ft. (600 mm) outside of the right edge of paving, or as directed by the Engineer. Provide walkways in front of the lower front chord, and do not locate a portion higher than the lowest part of any sign. Make the walkway continuous from end to end with a railing along the front side that can be folded down flush with the walkway when not in use.

C. Anchor Bolt Assemblies

Anchor bolt assemblies shall be of the proper length, area, and perimeter to transfer loads from the base plates to the foundations. The permanent template may be used in developing anchor bolts. Anchor bolts shall be at least 1-1/2 in. (38 mm) in diameter. Anchor bolt assemblies shall consist of a permanent template at the base, anchor bolts, leveling nuts, washers, temporary template, securing nuts, and #4 (#13) reinforcing bars.

The distance between the base plate and the top of the stem shall not exceed 4 in. (100 mm). Do not use grout between the base plate and the top of the stem. The anchor bolt shall project 1/4 to 1 in. (6 to 25 mm) above the securing nut. See Figure 1, Figure 2, and Figure 3.
D. Foundations

Unless otherwise required on the plans, design foundations as spread footings with a maximum factored bearing pressure of 3 KSF (140 kPa). No overstressing will be permitted. Drilled shaft foundation shall be used when called for on the plans and will require a soil investigation report that shall be included with your submittal. Drilled shafts shall not be used with Type II and V structures.

Unless otherwise shown on the plans:

- The top of the footing shall be at least 2 ft. (600 mm) below the finished ground surface.
- The bottom of the foundation shall be placed on or below the original ground or on fill compacted to at least 95 percent of the maximum laboratory dry density according to Section 208.
- The clearance between the anchor bolt assembly and the stem reinforcement shall be 2-1/2 in. (65 mm) minimum.
- One foundation per structure shall have a minimum of 2 in. (50 mm) rigid, galvanized steel conduits stubbed up 6 in. (150 mm) above the stem and capped a minimum of 3 ft. (1 m) outside the footing and a minimum of 18 in. (450 mm) below the finished ground surface for connecting to the underground power source or for future use.

638.2 Materials

Except for the Type VII structure, all structural members shall be tubular shapes. All materials shall meet the requirements of the applicable Specification. Do not use a material until the Office of Materials and Testing approves it.

Furnish one legible, reproducible copy of certified mill test reports including chemical analysis and physical test results covering steel and aluminum.

A. Aluminum Structures

Materials for aluminum structures shall comply the SLTS.

B. Steel Structures

All components of steel structures shall be galvanized in accordance with ASTM A 123/A 123 M or ASTM A 153/A 153 M, whichever is applicable. All components galvanized in accordance with ASTM A 123/A 123 M shall be quenched immediately upon removal from the zinc bath. If the contract plans require painting of the structural supports, the structural supports shall be painted with an approved paint system after galvanization.

- Structural steel, including base plates—Shall meet the requirements of the SLTS.
- Steel pipe—Shall meet the requirements of ASTM A 53 Types E or S. Grade B; ASTM A 139 Grade B; ASTM A 252 Grade 2; API 5L-X42; or API 5L-X52. The hydrostatic requirements are waived. Other alloys of steel may be accepted if minimum yield strength of the material is less than or equal to 60,000 psi.
- Walkway and sign connection bolts including U-bolts—Shall meet the requirements of Subsection 852.2.

All other connections shall be made with high strength ASTM A 325 (A 325 M) bolts with washers and nuts meeting all the requirements of Subsection 852.2.

C. Anchor Bolts

Anchor bolts, nuts and washers shall meet the requirements of Subsection 852.2, or ASTM F 1554 (F 1554 M), A 563 (A 563 M) and F 436 (F 436 M), except that threads shall be rolled and shall be 8 UN/8 UNR thread profile according to ANSI B1.1). Bolts shall have Class 2A threads, and nuts shall have Class 2B threads.

The permanent template shall meet the requirements of ASTM A 709 Grade 36 or 50 (A 709 M Grade 250 or 345) or shall be an approved equal. Construct temporary templates from a material rigid enough to prevent any movement and misalignment of the anchor bolts.
Section 638 — Structural Supports for Overhead signs

D. Concrete Foundations
   Class A concrete shall comply with Section 500.
   Reinforcement steel shall comply with Section 853, Grade 60 (420).

E. Silicone Caulking Compound
   Silicone caulking sealant shall comply with Subsection 833.2.06.A.1.a.1), Type A.

F. Neoprene
   Neoprene, or its approved equal, shall be approved by the Office of Materials and Testing.

G. Ground Rods
   Ground rods shall comply with Subsection 894.2.04.

H. Ground Wire
   Ground wire shall comply with Section 922.

I. Threadlocker Adhesive
   Threadlocker adhesive shall be an anaerobic threadlocking and sealing compound approved by the Office of Materials and Testing.

J. Rigid Steel Conduit
   Rigid steel conduit shall be a 2 in (50 mm) rigid steel conduit meeting the requirements of Subsection 923.2.01.A.2

638.2.01 Delivery, Storage, and Handling
   During shipment and handling, protect the metal components to prevent bending the components and damaging the galvanized coating.
   Handle galvanized steel components with rope slings or other methods approved by the Office of Materials and Testing.
   Do not use metal slings, chains, or hooks on galvanized surfaces.
   Repair minor damage to galvanizing, as determined by the Engineer, according to Section 645. Extensive galvanizing damage is cause for rejection.

638.3 Construction Requirements

638.3.01 Personnel
   General Provisions 101 through 150.

638.3.02 Equipment
   General Provisions 101 through 150.

638.3.03 Preparation
   A. Footings
      Footings may be designed as spread footings with a maximum factored bearing pressure of 3 KSF (144 kPa).
      Include a soil investigation and report for other footings in the submittal.
      1. Unless shown otherwise on the plans, extend the top of each footing at least 4 in. (100 mm) above the ground. Place the footings to miss present and known future underground installations.
Section 638 — Structural Supports for Overhead signs

2. Stub at least two 2 in. (50 mm) rigid, galvanized steel conduits up 6 in. (150 mm) into the riser of one footing and cap at a distance of 3 ft. (1 m) outside the foundation. Place the conduit at least 18 in. (450 mm) below the ground level to connect to the underground power feed or for future use.

638.3.04 Fabrication

Fabrication of structural supports and anchor bolt assemblies shall be according to the approved shop drawings and the plans. Only use fabricators of structural supports and anchor bolt assemblies that are listed on the Department’s Qualified Products List as a qualified fabricator of structural supports and anchor bolt assemblies.

A. General

Use aluminum or steel supports for signs. Steel supports shall be galvanized after fabrication. Connections may be welded, bolted, riveted, or fastened by other means if the connecting method ensures adequate strength and does not distract from the aesthetics of the structure. Do not weld splice structural members.

Fabricate columns, chords, and struts from one piece of material by using one longitudinal seam weld. Bolted splicing of truss chords may be allowed if shown on approved shop drawings. Use struts to brace all truss chords.

Provide an electrical outlet on the front horizontal chord with a cover for connecting to the power source or for future use. Weld into the column near the base the column with the conduit in the foundation, a handhole assembly, curved on the front to follow the contour of the column. Ensure that the handhole reinforcing frame has a tapped hole to accommodate the grounding lug and secure a cover to the frame with at least two screws. The column shall have a J-hook wire support welded inside near the top.

Provide brackets for mounting signs. These brackets shall be adjustable to permit mounting the sign faces at any angle between a truly vertical position and three degrees from vertical. Obtain this three-degree angle by rotating the top edge of the sign downward toward approaching traffic. All brackets shall be equal in length to the vertical dimension of the signs being supported.

B. Welding

All welding shall be done in the shop by current GDOT certified welders. The welders will weld the steel structures according to the latest AWS Structural Welding Code as modified by the GDOT Specifications and will weld aluminum structures according to Subsection 638.1.02.

C. Fabrication and Testing

Fabricate components in a jig or fixture to prevent distortion during and after welding and to ensure exact alignment at the time of erection.

Carefully check welds by visual and non-destructive inspection, by destructive testing of weld samples fabricated during welding, or by other methods approved by the Engineer. Sufficiently test weld samples to verify the reliability of production welding.

D. Galvanizing

After fabrication, thoroughly clean and galvanize all components of steel structures, including clamps and brackets, using the hot-dip process according to ASTM A 123/A123 M or ASTM A 153/A153 M, whichever is applicable.

Clean and galvanize interior and exterior surfaces of hollow sections. All components galvanized according to ASTM A 123/A 123 M shall be immediately quenched when removed from the zinc bath.

Galvanize Type VII bridge mounted structural frames except where the support is attached to weathering steel. When attached to weathering steel, fabricate the support of ASTM A 709 Grade 50W (A 709 M Grade 345W) steel or paint with an approved paint system to match the color of the weathering steel after galvanization.
Section 638 — Structural Supports for Overhead Signs

638.3.05 Construction

A. Protection of Metal

During shipment and handling, protect all metal components to prevent damage to galvanized coatings. Handle galvanized steel components with rope slings or alternate methods approved by the Office of Materials and Testing before use. Do not use metal slings, chains, or hooks on galvanized surfaces.

Repair minor damage to galvanizing, as determined by the Engineer, according to Sections 645. Metal components will be rejected if they have extensive damage to galvanizing.

B. Foundations

For construction methods, see Sections 207, 500, and 511.

Chamfer the edges of the stems 3/4 in. (19 mm). Stems shall have a Type III finish to at least 6 in. (150 mm) below the finished ground surface unless otherwise noted on the plans. The Engineer shall inspect the anchor bolt assembly installation before the placement of concrete. Complete the anchor bolt assembly installations so as to prevent movement during the concrete placement. Tolerance for the placement of anchor bolt assemblies shall be 3/8 in. (10 mm) horizontally and 1:20 (3 degrees) vertically. Do not remove the temporary template until the footing and stem concrete have been in place at least 24 hours.

The Office of Materials and Testing (OMAT) shall inspect the Type II and V sign structure footings before the column is erected. OMAT will perform a second inspection after the column is erected and will also perform ultrasonic testing of the anchor bolts at this time. Type II and V sign structures will not be accepted until the footing inspections have been performed and approved.

C. Erection

Erecting the structure shall include placing and leveling a leveling nut on each anchor bolt. Use a washer with each leveling nut. Set the column on the washers without the horizontal structure, and place and tighten a washer and securing nut on each anchor bolt. Tightening is turning the nut an eighth of a turn after the nut is snug tight, and then applying the threadlocker adhesive.

After tightening, inspect the connections to ensure full bearing of the top and the bottom washers on the base plate and to ensure that the distance between the top of the stem and the bottom of the base plate does not exceed 4 in. (100 mm). No structure will be accepted if this dimension is greater than 4 in. (100 mm).

Attach the horizontal structure to the column with ASTM A 325 (A 325 M) bolts. Install ASTM A 325 (A 325 M) bolts according to Subsection 501.3.04.F, High-Tensile Strength Bolt Connections. Do not reuse bolts and nuts after tightening them.

D. Type VII Bridge Mounted

Coat with silicone sealant all surfaces that are in contact with concrete. Separate with neoprene or an approved equal material all surfaces that are in contact with dissimilar metals.

E. Grounding

Install ground rods for each structural support adjacent to the foundation with the conduit as indicated below:

1. Vertically drive single, 8 ft. (2.4 m) long ground rods until the top of the rod is at least 12 in. (300 mm) below the finished ground.

2. Attach a length of #6 bare copper, 7-strand wire to the ground with suitable ground rod clamps and connect it to the grounding nut of the column.

3. If sufficient penetration cannot be obtained in the above manner, place a ground rod system consisting of 3 parallel ground rods a minimum of 6 ft. (1.8 m) center-to-center in a horizontal pattern and at least 12 in. (300 mm) below the finished ground. Join these rods and connect them to the grounding nut of the column with #6 bare copper, 7-strand wire and suitable ground rod clamps.
Section 638 — Structural Supports for Overhead signs

F. Finished Ground Surface

Ensure that the finished ground surface matches the typical section adjacent to the structural support. Do not adjust the ground surface around the stem to obtain 12 in. (300 mm) minimum projection above finished ground surface.

638.3.06 Quality Acceptance

General Provisions 101 through 150.

638.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

638.4 Measurement

The quantity measured for payment shall be each structure type at the specified location completed and accepted. This shall include design, fabrication, and construction of structural supports including anchor bolt assemblies, foundations, excavation, backfill, redressing, and re-grassing; but exclusive of signs.

638.4.01 Limits

General Provisions 101 through 150.

638.5 Payment

This item, measured according to Subsection 638.4, “Measurement,” for each structural support for overhead highway signs, is paid for at the Lump Sum Contract Unit Price bid for the complete structure.

Payment will be made under:

<table>

638.5.01 Adjustments

General Provisions 101 through 150.
Section 639 — Strain Poles for Overhead Signs and Signal Assemblies

639.1 General Description
This work includes furnishing and erecting overhead sign and signal support strain poles and steel wire strand cable according to this specification and the plans.

Make concrete or steel strain poles at any one location within the project from the same material unless the plans designate a particular type for that location.

Use timber strain poles only where designated on the plans.

639.1.01 Definitions
General Provisions 101 through 150.

639.1.03 Submittals
Submit to the Engineer shop drawings for steel and prestressed concrete strain poles for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper. The submission shall be prepared and stamped by the Design Engineer who shall be registered as a Professional Engineer in the State of Georgia.
Section 639 — Strain Poles for Overhead Signs and Signal Assemblies

The Engineer will distribute submitted documents to the Bridge Engineer (SLTS@dot.ga.gov) for review and provide the State Traffic Operations Engineer with a copy of the transmittal letter. For installations governed only by a permit, and not a GDOT contract, drawing and calculation submission should be made directly to the Bridge Engineer with a copy to the District Permit Engineer.

Design

Strain poles shall be designed to the following wind speeds using a 1700 Mean Recurrence Interval (MRI) for the listed counties:

- 150 mph: Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
- 140 mph: Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnall, Wayne
- 130 mph: Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady, Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
- 120 mph: For all counties not listed above

Strain poles shall be designed using the following criteria:

- Fatigue Category 1
- Truck induced gusts included (required only for mast arm poles)
- Galloping included (required only for mast arm poles)

639.2 Materials

Ensure that materials meet the requirements of the following Specifications:

Section 639 — Strain Poles for Overhead Signs and Signal Assemblies

A. Steel Strain Poles

Use shafts for steel strain poles fabricated of steel that conforms to one or more of the following:

- ASTM A 242/A 242 M
- ASTM A 709 Grade 50W (A 709 M Grade 345W)
- ASTM A 595
- AISI 1015
- AISI 1020
- SAE: 1015

Ensure that the steel characteristics or strength do not change significantly from welding.

1. Shaft

Use the appropriate shape of shaft which is a continuous taper and is constructed of corrosion resistant steel, unless otherwise specified, to the dimensions required for the specified classification type.

Form the shaft from one piece with one electrically welded longitudinal joint and no intermediate horizontal joints.

2. Pole

Use a pole with a mill certified yield strength of at least 48,000 psi (331 MPa). After forming and welding the pole, the shaft may be longitudinally cold rolled under enough pressure to flatten the shaft to conform to the required yield strength. For Type IV steel strain poles, ensure that the wall thickness is at least 3 gauge or 0.25 in. (6 mm).

3. Traffic Signal Strain Poles

Assemble traffic signal strain poles as follows:

a. Weld a handhole assembly, curved on the front to follow the contour of the pole, into the shaft near the base.

b. Include a tapped hole on the handhole reinforcing frame to accommodate the grounding lug.

c. Secure the cover to the frame using at least two screws.

d. Weld a J-hook wire support inside near the top of the shaft for the poles.

e. If an overhead power source is shown, use a clamp and clevis device to connect the wire to the pole and provide a weatherproof wire inlet close to the attachment. Conceal the other wiring to and from the controllers within the pole.

For traffic signal strain poles with mounted controller cabinets, provide a 2 in. (50 mm) half coupling wire inlet to mount the controller cabinet on the designated pole. Ensure that the location where cable enters the wire inlets at the top of the traffic signal strain poles has a neat design and appearance. Do not use junction boxes at the top of poles to facilitate cable entrances.

4. Grounding

Provide a 0.5 in (13 mm) approved grounding connector in the shaft. Equip the top of the shaft with a removable cap held securely in place.

Hot-dip galvanize the shaft according to ASTM A 123/A 123 M unless otherwise specified.

5. Base

Secure to the lower end of the shaft a one-piece cast steel base or a one-piece flat plate base that meets the requirements of ASTM A 27, Grade 65-35/A27 M Grade 450-240, or A 36/ A 36 M, as required.

a. Ensure that the base, after welding, develops the full strength of the adjacent shaft section to resist bending.

b. Attach the base to the concrete foundation with four bolts according to this subsection.

c. Provide four removable cast or pressed steel ornamental covers with each base and attach it to the base.
Section 639 — Strain Poles for Overhead Signs and Signal Assemblies

6. Anchor Bolts
   Furnish each pole with four anchor bolts of the size required in the manufacturer’s Shop Drawings. Ensure that the anchor bolts meet the requirements of Subsection 852.2.02.
   Galvanize the threaded portions according to ASTM A 153/A 153 M and the Plan details.

B. Prestressed Concrete Strain Poles
   Use shafts for these poles that comply with Subsection 865.2.01.B, except give the poles a steel trowel finish on the unformed side and any required pointing to eliminate air and water holes left by the steel forms. Use Class AAA concrete.
   Use a marking tool to identify the pole class and height or cast it with a die in the front face of the pole to produce letters and numbers at least 2 in. (50 mm) high and wide.

C. Miscellaneous Hardware
   Use hardware for steel and concrete strain poles with these features:
   1. The steel required to fabricate other structural components is weldable and conforms physically and chemically to applicable ASTM specifications.
   2. Nuts, bolts, and screws conform to these diameter requirements:
      • If diameters are less than 0.5 in. (13 mm), the hardware is passivated stainless steel that meets the requirements of AISI 300, commercial grade.
      • If diameters are 0.5 in. (13 mm) and larger, the hardware conforms to ASTM physical and chemical qualifications that ensure strength commensurate with the parts being connected. Galvanize the hardware according to ASTM A 153/A 153 M.
   3. Use galvanized steel ground rods 5/8 in. (16 mm) diameter, ± 1/16 in. (± 1.6 mm) and 8 ft. (2.4 m) long unless otherwise specified.
      Ensure that galvanizing has a coating of at least 2 oz/ft.² (610 g/m²) according to ASTM A 153/A 153 M.

D. Strain Poles for ATMS Applications
   Provide poles for supporting CCTV, VDS, and microwave radar detection devices that meet the following design specifications:
   • Limited to a live horizontal deflection at the top equal to or less than 1% of pole height in a 50 mph wind, with a design load of four static cameras and one movable camera.
   • Torsional deflection limited to a 1 degree, maximum.
   Install mounting brackets, as illustrated on the plans, which are galvanized steel and are compatible with the mounting design of the specified cameras and pan/tilt devices and are affixed to the pole to prohibit rotation.
   Install all wiring internal up to the camera mounting bracket with no external conduit on the pole.
   Provide a weatherproof wiring access point or handhole on the pole.

639.2.01 Delivery, Storage, and Handling
   General Provisions 101 through 150.

639.3 Construction Requirements

639.3.01 Personnel
   General Provisions 101 through 150.

639.3.02 Equipment
   General Provisions 101 through 150.

639.3.03 Preparation
   General Provisions 101 through 150.
Section 639 — Strain Poles for Overhead Signs and Signal Assemblies

639.3.04 Fabrication
General Provisions 101 through 150.

639.3.05 Construction

A. Timber Poles
Construct the following according to the plan:

1. Excavate the hole to the proper diameter and depth.
2. Erect the pole to an out-of-plumb position with its base resting on the bottom of the hole.
   Hold the pole in its out-of-plumb position until the cavity around the pole is filled with Class B or better concrete and is set and cured for at least 7 days. Then, apply tension to the pole.

B. Steel Poles
Construct the foundations for steel poles as follows:

1. Excavate a hole the size and depth shown on the plans. Remove and dispose of excavated material as directed by the Engineer.
2. Place the specified type and size anchor bolts according to the pole manufacturer’s recommendations. Hold these securely by a template to ensure proper position in the completed foundation.
   
   NOTE: Never attempt to realign the anchor bolts after pouring the foundation.
3. Place conduits in foundations, orient them to accommodate service cables, and securely hold them to avoid displacement.
4. Pour Class A concrete into the excavated area to the following depths:
   a. First pour against undisturbed earth up to 4 in. (100 mm) below the finished ground line.
   b. Then, using an approved form, continue to pour to the finished top of the foundation elevation, as specified.
5. Chamfer the top and formed portions of the foundation edges.
6. Give a Type III finish to all portions of the foundation above finished grade down to at least 2 in. (50 mm) below finished grade, according to Subsection 500.3.05.AB.4, Type III—Special Surface Coating Finish.

C. Prestressed Concrete Poles
Drill round holes or dig square holes for prestressed concrete poles.

1. Do not disturb the natural ground adjacent to the foundation more than necessary to construct the foundation.
2. Excavate to the lines and elevations shown on the Plans or established by the Engineer.
   a. Dispose of the excavated materials as directed.
   b. Regrade and grass the disturbed areas to match the contiguous area.
3. Backfill according to the Plans. Furnish and place Class A concrete, as required, according to the applicable portions of Section 500 and Plan details.
4. When leaving lifting eyes or loops on the pole to facilitate handling and erecting, burn them off and patch them after erecting.

D. Ground Rods
Install ground rods for steel and prestressed concrete strain poles adjacent to the strain pole base as follows:

1. Vertically drive the single ground rods 8 ft. (2.4 m) long until the top of the rod is at least 12 in. (300 mm) below the finished ground.
2. Use ground rod clamps to attach a length of No. 6 AWG solid copper wire to the ground rod. Connect the wire to the grounding nut of the strain pole base.
3. When penetration cannot be obtained in the above steps, place three parallel ground rods at least 6 ft. (1.8 m) center-to-center in a horizontal pattern and at least 12 in. (300 mm) below the finished ground.
Join the rods and connect them to the grounding nut of the pole base with No. 6 AWG solid copper wire and ground rod clamps.

E. Rake
Use the proper rake to erect the pole so that the pole will be plumb after the load is applied.

F. Erecting Cable
Follow these steps to erect the cable:
1. Install the top cable 6 in. (150 mm) from the top of the pole, unless otherwise indicated on the plans.
2. Install the bottom cable no more than 5 ft. (1.5 m) from the top of the pole according to plan details.
3. Secure the cable to each pole as shown on the Plans. Use preformed cable grips instead of cable clamps, if necessary.
4. Apply enough tension to pull timber poles toward each other past the plumb position by one degree.

639.3.06 Quality Acceptance
General Provisions 101 through 150.

639.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

639.4 Measurement
Highway signs are measured and paid for under Section 636.

A. Treated Timber Poles
Treated timber poles of the class and length specified are measured by the number of units installed, including guys, anchors, and hardware.

B. Steel Cable
Steel cable of the specified size are measured by the linear foot (meter), complete in place.

C. Steel Strain Poles
Steel strain poles are classified and measured for payment by each unit and by type according to the following table:

<table>
<thead>
<tr>
<th>Type</th>
<th>Span Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>I</td>
<td>Less than 60 ft. (18 m)</td>
</tr>
<tr>
<td>II</td>
<td>60 to 95 ft. (18 m to 29 m)</td>
</tr>
<tr>
<td>III</td>
<td>Greater than 95 ft. (29 m)</td>
</tr>
<tr>
<td>IV</td>
<td>Traffic signal strain pole</td>
</tr>
</tbody>
</table>

D. Prestressed Concrete Strain Poles
Prestressed concrete strain poles are measured for payment by each unit and pole type as specified in the above table.

639.4.01 Limits
General Provisions 101 through 150.
639.5 Payment

A. Treated Timber Poles
   Treated timber poles of the class and length specified will be paid for at the Contract Price bid per each. Payment is full compensation for poles, concrete encasements, excavation for pole and anchor holes, temporary pole alignment, bracing, guys, and items to complete the Work.

B. Steel Strain Poles
   Steel strain poles of the type specified, complete in place and accepted, including foundation, backfill, erection, and necessary re-grassing will be paid for at the Contract Unit price bid for each pole of each type.

C. Prestressed Concrete Strain Poles
   Prestressed concrete strain poles of the type specified, complete in place and accepted, including foundation, backfill, erection, and necessary re-grassing will be paid for at the Contract Unit Price bid for each pole of each type.

   When neither concrete nor steel strain poles are specified, either type is acceptable. Measurement is specified in Subsections 639.4.C. or 639.4.D. The payment item is Strain Poles, Type___.

D. Steel Cable
   Steel cable complete in place and accepted will be paid for at the Contract Unit Price bid per linear foot (meter) of each specified diameter. Payment is full compensation for furnishing and erecting the cable and for providing hardware including thimbles, but not hardware that is a part of the pole.

Payment will be made under:

<table>

639.5.01 Adjustments

General Provisions 101 through 150.
Section 640—Retro-reflectorized Railroad Cross Buck Sign

640.1 General Description
This work includes furnishing and erecting retro-reflectorized railroad cross buck signs, including wood or steel posts and concrete bases for steel posts at locations shown on the Plans or as directed by the Engineer.

640.1.01 Definitions
General Provisions 101 through 150.

640.1.02 Related References
A. Standard Specifications
   Section 500—Concrete Structures

B. Referenced Documents
   Specifications of the Association of American Railroads
   MUTCD

640.1.03 Submittals
General Provisions 101 through 150.

640.2 Materials
Use Class B or better concrete for steel posts that conforms to the dimensions and details shown on the plans and meets the requirements of Section 500. Ensure that the concrete surface is uniform and free of honeycomb.

Ensure that other elements of the sign conform to the requirements of the specifications, or to the specifications of the Association of American Railroads, whichever is indicated on the plans.

640.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

640.3 Construction Requirements

640.3.01 Personnel
General Provisions 101 through 150.

640.3.02 Equipment
General Provisions 101 through 150.

640.3.03 Preparation
General Provisions 101 through 150.

640.3.04 Fabrication
General Provisions 101 through 150.
640.3.05 Construction

A. Steel Post

Place a steel post as follows:

1. Set each steel post for a sign assembly in a concrete foundation according to the plans.
2. Securely hold each post vertically until the concrete is strong enough to hold the post and sign without support.
3. Replace cracked bases.
4. Backfill around the bases with satisfactory materials.
5. Carefully tamp the backfill in place.

After setting the steel post, curing the concrete, and backfilling, fasten the cross buck sign to the post according to the details shown in the plans.

B. Wood Post

Place a wood post as follows:

1. Place each post in a prepared dry hole at least 6 in. (150 mm) diameter.
2. Backfill the hole with a mixture of Portland cement and damp clean friable soil using 8 percent cement by volume.
3. Thoroughly tamp the resultant mixture in place around the post.
4. Erect the posts vertically to the depth and at an angle to the roadway as shown on the plans or directed by the engineer. The post shall penetrate the ground at least 4 ft. (1.2 m).

640.3.06 Quality Acceptance

General Provisions 101 through 150.

640.3.07 Contractor Quality and Maintenance

General Provisions 101 through 150.

640.4 Measurement

Retro-reflectorized railroad cross buck signs are measured for payment by the number in place completed and accepted.

640.4.01 Limits

General Provisions 101 through 150.

640.5 Payment

Cross buck signs measured for payment will be paid for per each. Payment is full compensation for furnishing and erecting the item complete in place according to the plans and specifications, and for providing materials and concrete, excavating, backfilling, and disposing of the surplus materials.

Payment will be made under:

640.5.01 Adjustments

General Provisions 101 through 150.
641.1 General Description
This work includes furnishing and erecting guardrail and appurtenances according to the specifications. Conform with
the lines, grades, and locations shown on the plans or as directed.
Place W-beam, T-beam, or “T” beam with modified offset block as shown on the plans and in the Proposal. Unless
designated otherwise, references to guardrail shall mean W-beam.

Unless provided for in the plans, this work also includes:

- Grading to provide the “T” distance shown on the standard behind the guardrail
- Grading to construct shoulder flares for approved guardrail anchorage systems and widened shoulders along
  Guardrail runs according to Section 205 and Section 208
- Furnishing and setting additional posts (all lengths) together with the necessary offset blocks and hardware
  (when specified in the plans or in the proposal)

641.1.01 Definitions
General Provisions 101 through 150.

641.1.02 Related References

641.1.03 Submittals
General Provisions 101 through 150.

641.2 Materials
A. Steel Guardrail
   Use steel Guardrail and steel posts unless specified otherwise on the plans or in the proposal.

B. Guardrail Auxiliary Items
   Ensure that the guardrail includes auxiliary materials and Work to make connections and other guardrail or
   structures required to complete the construction indicated on the plans.
C. Offset Blocks

Except at locations approved by the Engineer, use plastic offset blocks according to Subsection 859.2.05 Plastic Offset Blocks for “W” beam guardrail installation. Offset blocks for “T” beam guardrail installations shall be plastic, or modified steel offset blocks per the Standard Plans including Construction Details and Section 859. When approved by the Engineer, use treated wood offset blocks according to Subsection 859.2.04, Wood Guardrail Posts and Offset Blocks only in isolated areas of “W” beam or “T” beam guardrail installations, where standard size blocks would not provide a satisfactory fit.

Wood offset blocks and/or wood posts may be specified within the limits of an approved guardrail terminal. Use only one type of offset block within continuous runs of guardrail except in transitions or where specified in the plan details.

Ensure that materials meet the requirements of these specifications:

641.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

641.3 Construction Requirements

641.3.01 Personnel

General Provisions 101 through 150.

641.3.02 Equipment

General Provisions 101 through 150.

641.3.03 Preparation

General Provisions 101 through 150.

641.3.04 Fabrication

A. Guardrail Anchorages, Mounting Devices, and Brackets

Fabricate and install guardrail anchorages, mounting devices, brackets, and other appurtenances according to the plan details or as approved by the Engineer.
641.3.05 Construction

A. Erection of Posts
1. Wood guardrail posts shall not be used at any location except as required for guardrail terminals and guardrail anchorage.
2. Set the posts in post holes or drive them vertically at the positions, depth, spacing, and alignment shown on the plans.
3. Install posts for Guardrail on bridges or other structures as detailed on the plans.
4. Backfill post holes to the ground line with approved material tamped in place in layers of not more than 4 in. (100 mm) thick.
5. If posts are driven, protect the tops of the posts with a suitable driving mat or cap. Remove and replace posts damaged during driving, at no additional cost.
6. Backfill the post holes that are drilled in rock as indicated on the plans or directed by the Engineer.
7. Remove and reset posts that are out of alignment or too low in grade. Do not cut off posts that are too high; drive them to the proper elevation. Do not deviate more than 1/4 in. (6 mm) vertical and horizontal post alignment.
8. Fit the posts with an offset block according to this specification and plan details.
9. Set additional posts and appurtenances, when required, according to the requirements of this Section and the plan details.
10. When necessary to place posts in existing pavement, slope paving, etc., exercise extreme care in the cutting process, protect the adjacent areas, and remove all loose material. Cut holes in the existing paved area by drilling or sawing according to the plan details. Replace the pavement material according to the plan details with a controlled low strength flowable fill that has a maximum 28-day compressive strength of 100 psi according to Section 600.

B. Erection of Rail
Erect the rails to attain a smooth, continuous rail line that conforms to the line and grade of the highway.

Determine the height of the rail from the dimensions shown on the plans. Use bolts long enough to extend at least 1/4 in. (6 mm) beyond the nuts after they are firmly tightened.

Install reflectorized washers on guardrail and anchorages. Where double faced guardrail is located on the inside shoulder of medians, install reflectorized washers only on the side which is nearest to traffic. In stall reflectorized washers according to this specification and plan details.

C. Damaged Spelter Coating
Repair damaged spelter coating according to the requirements of Section 645.

D. Guardrail Terminals
Guardrail terminals shall be designed for use with “W” beam guardrail installations, which has been approved by FHWA as meeting NCHRP-350 and/or MASH Test Level 3 (TL-3) and listed on the Office of Materials and Testing Qualified Products List QPL-64. Where the terminal is connected to “T” beam guardrail installations, a transition is required as shown in the Standard details.

Construct guardrail terminals according to the manufacturer’s requirements except for the grading which will be as shown in the Plans and as directed by the Engineer. Obtain copies of the manufacturer’s details and installation instructions and provide copies of the same to the Engineer prior to the installation of the unit. Provide a FHWA letter of approval for NCHRP-350 and/or MASH, TL-3 compliance of the guardrail terminal to be used. Yellow and black nose striping, as shown on the Plans will be required on all guardrail terminal.

641.3.06 Quality Acceptance
General Provisions 101 through 150.
641.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

641.4 Measurement
A. Guardrail
   Guardrail of the type specified is measured in linear feet (meters), including terminal sections when installed.
   Measurement does not include guardrail terminals or guardrail anchorage assembly.
   When double faced guardrail of the type specified is installed, the single guardrail on each side of the posts is not
   measured separately. Each single rail is a component part of the double-faced guardrail installation.

B. Guardrail Terminal and Anchorage Assembly
   This Item is measured by the number of each type installed according to the details shown on the plans.

C. Guardrail Posts
   All lengths of guardrail posts when shown in the Plans or Proposal as a separate payment Item are measured by
   the Unit.

641.4.01 Limits
General Provisions 101 through 150.

641.5 Payment
Guardrail, of the type specified, complete in place including posts, offset blocks, and hardware will be paid for at the
Contract Price per linear foot (meter).
Guardrail terminals and guardrail anchorage assemblies will be paid for at the Contract Price per each assembly,
complete in place.
All lengths of guardrail posts when shown in the Contract documents as a separate Pay Item will be paid for at the
Contract Unit Price. Payment is full compensation for furnishing the posts, offset block, hardware, and Work to
complete the Item.
For projects that do not include grading as a Pay Item, payment for guardrail and guardrail anchorage systems on
shoulders includes:
   • Embankment material for shoulders as shown on the Standard Details or plans
   • Compacting embankment material for shoulders to the approximate density of the surrounding soils
   • Removing existing vegetation and obstructions before placing the embankment
   • Grassing the reconstructed area according to Section 700
Payment will not be increased or decreased when wood offset blocks are added to or substituted for steel or plastic
offset blocks.
### Section 641 — Guardrail

### 641.5.01 Adjustments

General Provisions 101 through 150.
Section 642—Cable Barrier

642.1 General Description
Specifications for this work will be included elsewhere in the Contract.
643.1 General Description
This work includes constructing fence and gates according to these specifications where shown on the plans or designated by the Engineer. Ensure that this work conforms with the lines and grades shown on the plans. The fence types covered by these specifications are:

- Chain-link
- Woven wire
- Barbed wire
- Field fence
- Barrier fence

643.1.01 Definitions
General Provisions 101 through 150.

643.1.02 Related References
A. Standard Specifications

   Section 862—Wood Posts and Bracing
   Section 863—Preservative Treatment of Timber Products
   Section 894—Fencing

B. Referenced Documents
   General Provisions 101 through 150.

643.1.03 Submittals
Furnish the Engineer, in duplicate, a materials certification for temporary barrier fence physical properties according to Section 106 of the specifications.

643.2 Materials
Ensure that materials conform to the following specifications:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concrete (Class A or B)</td>
<td>500</td>
</tr>
<tr>
<td>Wood Fence Posts and Bracing</td>

</tbody>
</table>
Section 643 — Fence

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Field Fence</td>
<td>894.2.05</td>
</tr>
</tbody>
</table>

A. Chain-Link Fence

Use the fencing material shown in Subsection 894.2.01. Ensure that posts, fabric, wire, appurtenances, and gates when required, are the same or matching type for each project, unless otherwise directed.

B. Woven-Wire or Barbed-Wire Fences

Use wood or steel post types as shown on the plans. Ensure that each project fence and post is the same type and shape, unless otherwise specified.

C. Temporary Barrier Fence

1. Use barrier fence fabricated from high-density polyethylene or polypropylene containing U.V. stabilizers
2. Ensure the barrier fence meets the following:
   a. Is free of manufacturing flaws
   b. Meets the following physical properties

<table>
<thead>
<tr>
<th>Maximum Mesh Opening Size</th>
<th>1 ¾ in. (45 mm) x 2 1/8 in. (54 mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roll Width</td>

</tr>
<tr>
<td>Minimum Yield Strength (MD)</td>
<td>750 lb./ft. (11 kN/m)</td>
</tr>
</tbody>
</table>

643.2.01 Delivery, Storage, and Handling

Do not store barbed-wire, woven-wire fence fabric, steel posts, hardware, and other materials on the ground. Place them in floored buildings, on platforms, or on wooden timbers or poles. Ensure that the floors, platforms, or props are high enough to prevent the wire and steel posts from touching ground or surface water.

Wire or steel posts that are damaged from improper storage between fabrication and final erection will be rejected.

643.3 Construction Requirements

643.3.01 Personnel

General Provisions 101 through 150.

643.3.02 Equipment

General Provisions 101 through 150.

643.3.03 Preparation

General Provisions 101 through 150.

643.3.04 Fabrication

General Provisions 101 through 150.

643.3.05 Construction

Construct fence (except for field fence) within the right-of-way line. Do not allow the permanent installation to encroach on adjacent property.
Section 643 — Fence

A. General Fencing Requirements

Follow these general requirements when placing the fence:

1. Construct the fence to follow the contour of the ground. Place the bottom of the fence fabric at least 1 in. (25 mm) from the ground surface, but no more than 6 in. (150 mm).

2. Clear the fence line a maximum of 8 ft. (2.4 m) wide and grade where necessary to provide a neat appearance.

3. When the ground profile in low areas changes abruptly, use longer posts to maintain the ground clearance. Stretch multiple strands of barbed wire on the posts with 6 in. (150 mm) or less vertical clearances between strands of barbed wire.

4. Connect the existing cross fences to new fencing, except for obviously unserviceable fences.

5. Place corner or end posts, whichever is appropriate, at the junction with existing fences and fasten the wires in the new and existing fences to the posts.

6. Install corner or pull posts for new fencing without placing tension on existing fence posts. At structures, fasten new fencing to end posts to permit livestock to pass through or under the structure freely, unless otherwise directed or shown on the Plans.

B. Posts and Appurtenances

Follow these steps to install posts and appurtenances:

1. Place and install the posts as shown on the plans. If the soil is Class I, II, III, or V, drive “C” and 2-3/8 in. (60 mm) tube-type line posts for all fence types at least 3 ft. (900 mm) deep instead of using concrete encasement.

2. Encase in concrete line posts installed in marshy or swampy areas (Class IV soils). Install posts in rock according to this subsection.

3. Encase the corner, end, and pull posts in concrete as shown on the plans.

4. Replace posts damaged by driving. When posts are set in concrete, fill the entire hole around the post with Class A or B concrete.

5. Hand mix concrete for batches of 1/2 yd³ (0.5 m³) or less. Firmly brace the posts and hold them in place until the concrete has set.

6. Ensure that the distance between the end, pull, and corner or angle post assemblies does not exceed the following:

<table>
<thead>
<tr>
<th>Fence Type</th>
<th>Distance</th>
</tr>
</thead>
<tbody>
<tr>
<td>For chain-link fence, straight line</td>
<td>500 ft. (150 m)</td>
</tr>
<tr>
<td>For chain-link fence, curved line</td>
<td>250 ft. *(75 m)</td>
</tr>
<tr>
<td>For woven-wire fabric</td>
<td>330 ft. (100 m)</td>
</tr>
<tr>
<td>Field fence</td>
<td>330 ft. (100 m)</td>
</tr>
</tbody>
</table>

7. On end, pull, and corner or angle post assemblies for woven-wire fence, add additional approach posts for greater stability when necessary or as directed by the Engineer.

8. Set posts placed on concrete walls, slabs, or solid rock in round holes 6 in. (150 mm) deep or as indicated on the plans.

9. Fill the space around the post with molten lead or a cement filler approved by the laboratory.

10. Repair the posts after cutting or drilling. Repair galvanized steel posts according to Section 645. Repair other metal posts according to the manufacturer’s recommendations.

11. Treat timber posts and braces with a preservative coating of the type specified in Subsection 863.2.01.
Section 643 — Fence

C. Fence Erection

Install fence fabric or barbed wire when posts are set and braced, except when posts are set in concrete footings. When posts are set in concrete footings, delay installing the fabric or wire to allow the concrete to cure at least 5 days. When barbed wire fence is required, install three strands unless otherwise indicated on the plans.

D. Gates

Ensure that the gate assemblies are the length, height, and type designated on the Plans. Install the gate to provide a 180-degree swing.

Weld the gate frames into units. Properly coat them after welding according to Section 894.

Stretch fabric that matches the fence fabric taut over the gate frame. Provide gate assemblies with a positive-type locking device, padlock, and keys.

E. Electrical Ground

Wherever a power line carrying more than 600 volts passes over the fence, install a ground rod.

1. Install the ground rod at the nearest point directly below the point of crossing.

2. Where possible, drive the rod into the ground for a full 8 ft. (2.4 m) of penetration.
   a. In rocky soil, drive the rod slanted to provide 18 in. (450 mm) of cover at the tip.
   b. In solid rock, install two ground rods at the nearest post on each side of the power line crossing where soil conditions will permit.

3. Use clamps to attach a length of No. 6 AWG bare copper, 7-strand wire between the fence and the ground rod.

F. Trespassing on Private Property

To trespass on private property outside the right-of-way or easements provided on the plans, obtain permission from the property owner for the intrusion.

Use field fence for replacing fence outside the right-of-way or for providing temporary fence at locations shown on the plans or directed by the Engineer. Field fence is considered permanent unless it is specified as temporary.

G. Maintaining Livestock

Construct the fence to prevent livestock from escaping. Schedule fence removal and new fence installation to provide continuous security of the livestock. If security is not maintained and animals or property are damaged or lost, compensate the owner or make repairs at no cost to the Department. Replace or repair damaged existing fences.

H. Temporary Barrier Fence

Install the barrier fence according to the manufacturer’s instruction. Use suitable strength metal, wood, or composite posts. Ensure the posts are long enough to be embedded to a depth that will provide stability to the fence have sufficient rigidity to hold the fence in a vertical position.

The maximum post spacing is 10 ft. (3 m). Attach the fence to the posts with nails, staples, or wire ties spaced every 6 in. (150 mm) along the posts. Do not allow the method of attachment to create a safety hazard.

At the completion of the project, or as directed by the Engineer, remove all barrier fence including posts and incidentals.

643.3.06 Quality Acceptance

Repair rusted wire or posts before Final Acceptance or remove and replace with new material at the Contractor’s expense. Do not replace the fence if rusting occurs as a result of ponding water after the fence is erected.

643.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.
643.4 Measurement

Fence will be measured by the linear foot (meter) along the bottom of the fence, from the outside of end posts for each continuous run of fence. Measurement for payment includes posts, post assemblies, pull, corner, and gate posts, and gates unless gates are a separate Pay Item.

When gates are paid for separately, they will be measured as complete Units of the type and size specified and installed.

Temporary barrier fence will be measured by the linear foot (meter) along the bottom of the fence outside of end posts for each continuous run of fence.

643.4.01 Limits

General Provisions 101 through 150.

643.5 Payment

The accepted quantities of fence, measured as indicated above, will be paid for at the Contract Unit Price per linear foot (meter) of the specified type and height of fence. Payment includes gates unless the gates are paid for separately.

The accepted quantity of gates, when listed as a separate Pay Item, will be paid for at the Contract Unit Price for each type and size of gate specified, complete in place, including posts and hardware, locks, keys, and other incidentals shown on the plans.

Payment includes clearing and grubbing, grading, excavating, backfilling, disposing of surplus materials, and furnishing materials and incidentals such as molten lead or cement filler on concrete walls, slabs, or solid rock to complete the work.

When field fencing is temporary, payment includes removal. Materials salvaged from temporary field fence remain the Contractor’s property.

The accepted quantities of temporary barrier fence measured as indicated above will be paid for at the Contract unit price per linear foot (meter) of fence. Payment to complete the item includes all necessary clearing, installation of fence including hardware and other incidentals, and removal of the fence. The barrier fence, posts, and all incidentals become the property of the Contractor upon removal.

Payment will be made under:

643.5.01 Adjustments

General Provisions 101 through 150.
645.1 General Description
This work includes field repairing damaged galvanized coatings, except coatings on wire and chain-link wire fence.
When galvanized materials are welded, the work applies to the welded area and to the damaged areas adjacent to the weld. It does not apply to new materials deficient in coating.

645.1.01 Definitions
General Provisions 101 through 150.

645.1.02 Related References

B. Referenced Documents
   General Provisions 101 through 150.

645.1.03 Submittals
General Provisions 101 through 150.

645.2 Materials
Use material for repairing galvanized coatings that conforms to the following:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Galvanizing Repair Compound</td>
<td>870.2.05</td>
</tr>
</tbody>
</table>

645.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

645.3 Construction Requirements

645.3.01 Personnel
General Provisions 101 through 150.

645.3.02 Equipment
General Provisions 101 through 150.

645.3.03 Preparation
Before applying repair compounds:
1. Clean the area of grease using an approved solvent recommended by the producer of the galvanizing repair compound.
2. Thoroughly brush the area with a stiff wire brush to remove dirt, loose galvanizing, welding slag, or other foreign material.

645.3.04 Fabrication
General Provisions 101 through 150.
645.3.05 Construction

Apply the repair compound smoothly and evenly with a moderately filled paint brush when the temperature of the steel, compound, and surrounding air is above 45 °F (7 °C). On smooth surfaces, ensure that the minimum dry film thickness is 2 mils (0.05 mm).

On rough and pitted surfaces, the Engineer may require more than one coat. When additional coats are required, allow a drying time of at least four hours between coats. Do not brush over partly dried applications.

645.3.06 Quality Acceptance

General Provisions 101 through 150.

645.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

645.4 Measurement

This work will not be measured separately for payment.

645.4.01 Adjustments

General Provisions 101 through 150.

645.5 Payment

This work shall be performed at the Contractor’s expense.

645.5.01 Adjustments

General Provisions 101 through 150.
Section 647—Traffic Control Signal Installation

647.1 General Description
This section contains requirements for installing traffic control signal equipment, submittal processes, testing, warranty, and contractor’s signal maintenance responsibilities. The contractor shall install all equipment, poles, bases, wiring, and incidental materials required for a complete and functional traffic control signal installation according to this section.

Traffic control signal installations include traffic signals, ramp meters, Pedestrian Hybrid Beacons (PHB), Rectangular Rapid Flashing Beacons (RRFB), flashing beacons, and school speed zone flashing beacons.

The Department shall perform reviews and grant approval on projects constructed at intersections and any other location under the jurisdiction of the Department. For intersections and locations not under the jurisdiction of the Department, the local agency having jurisdiction shall perform reviews and grant approval.

All specified traffic control signal equipment shall be installed without modification. The contractor shall install the traffic control signal equipment according to the contract.

For traffic control signal installations, no deviations in the design and operation of the traffic control signal are permitted without the written approval of the Engineer.

Table 1 provides a listing of roles, responsibilities and approval steps in the preconstruction and construction process.

### 647.1.01 Definitions, Acronyms, and Abbreviations

#### A. Definitions

1. **Activation**: a traffic control device becomes operational for the purposes of controlling traffic during the construction project.

2. **Authority Having Jurisdiction (AHJ)**: refers to GDOT, counties, or local municipalities.

3. **Construction Manager**: representative of the Engineer from the District Construction Office.

4. **Controller Cabinet Assembly**: a controller cabinet assembly equipped with a controller unit and auxiliary equipment necessary to regulate a flow of motorized and non-motorized users at signalized intersection or meter the flow of traffic onto a full access-controlled road facility.

5. **Controller Unit**: that part of a controller assembly that can receive and analyze field inputs, reacting to those inputs per programmed timing parameters, and providing outputs to the proper signal indications. Refer to Section 925 for material specifications of the controller unit.

6. **Failure**: traffic control device or ancillary equipment element becoming unable to comply with the Project requirements and applicable standards described in the contract.

7. **Field Cabinet**: a cabinet used to house electronic devices for traffic control device installations, UPS, flashing beacon, or other auxiliary equipment as defined in the contract.

8. **Make Ready Work**: work required by utility companies to adjust the position of power and communication lines in advance of attaching traffic control signal or network infrastructure.

9. **Operational Test**: consists of field test performed by the Department (all sections), followed by a burn-in period of a minimum of 30 calendar days (all sections), a final inspection and acceptance. These tests verify completion according to the contract, full functionality of all systems and, if applicable, communication over the GDOT network.

10. **Pedestrian Hybrid Beacon (PHB)**: an electrical device located primarily at mid-block locations to serve non-motorized users that is intentionally placed in a dark mode (no indications displayed) between periods of operation and, when operated, displays both steady and flashing traffic control signal indications (yellow and red) designed to control traffic.

11. **Power Disconnect**: Master switch to disconnect electrical power from the local utility to the traffic control signal.
12. **Power Service**: The point of electrical power provided by the local utility. Encompasses the power service drop and meter.

13. **Ramp Meter**: an electrical device located on a full access-controlled road facility that assigns motorized users the right-of-way as part of a lane merging process.

14. **Rapid Rectangular Flashing Beacon (RRFB)**: an electrical warning device located primarily at mid-block locations to serve non-motorized users that is intentionally placed in dark mode (no indications displayed) between periods of operation and, when operated, displays a flashing warning (yellow) indication when actuated by pedestrians.

15. **Repair Time**: the time it takes, exclusive of requirements for mobilization, travel time, and/or the coordination of any lane closures, to diagnose, repair, and re-establish full functionality and operations of the site(s).

16. **Response Time**: the time it takes the contractor to mobilize repair technician(s) from the time they receive the problem notification from the Department and arrive at the site(s).

17. **Submittal**: documentation required by the contract that the contractor must submit for the Department’s review, acceptance, or approval. Submittals may include product cut-sheets, shop drawings, working drawings, material test reports, material certifications, Project progress schedules, and schedule updates.

18. **Traffic Control Signal Installation**: a complete installation with a controller assembly, detection systems and required accessories, including necessary cabling, wiring, detection systems, controller, and communications to comprise an operational traffic signal, ramp meter, PHB, or RRFB per the contract.

19. **Traffic Control Signal**: an electrical device that provides visual information for transportation users to manage the movements of motorized and non-motorized users, including traffic signal, ramp meter, PHB, and RRFB.

20. **Traffic Signal**: an electrical device that assigns the right-of-way to motorized and non-motorized users, as defined by the MUTCD.

21. **Uninterruptible Power Supply (UPS)**: a power management device that serves a dual purpose of normalizing the flow of electricity from the power service and supplies backup power to the controller cabinet assembly when power is lost.

8. **Acronyms and Abbreviations**

The following acronyms, abbreviations, and terminology are used throughout the traffic control signal specifications.

1. **AASHTO** American Association of State Highway and Transportation Officials

2. **ADA** Americans with Disabilities Act

3. **ANSI** American National Standards Institute

4. **API** Application Programming Interface

5. **ASTM** American Society of Testing and Materials

6. **ATMS** Advanced Traffic Management System

7. **AWG** American Wire Gauge

8. **AWW** A.W. Williams Inspection

9. **CALTRANS** California Department of Transportation

647.1.03 Submittals

A. General

1. All submittals shall consist of a single file in electronic PDF file format as specified herein.
2. All submittals shall be submitted to the Construction Manager.
3. All incidental materials required for any pay item shall be contained in the submittal regardless of whether it was listed in the specifications.
4. Do not submit partial submittals for a pay item.
5. Items with long procurement times, such as poles, may be submitted separately to accommodate work schedule.
6. Do not procure or install materials or components proposed on the contract until material submittals or shop drawings are submitted for review and approved by the Department.
7. The Department will not be liable for any equipment or material purchased, work done, or delay incurred prior to the Department's approval of said equipment or material through the materials submittal data process.
8. The Department will approve or reject all submittals within 21 calendar days of receipt of a complete package, unless otherwise specified or indicated by the Department.
9. Do not interpret approval of the submittals as approval of any deviation unless such deviation is identified in writing in the submittal cover letter.
10. Any failure of the Department to discover or note any unsatisfactory material will not relieve the contractor of his responsibility for providing a complete operable Traffic Control device installation as called for under the terms of the contract.
Section 647 — Traffic Control Signal Installation

B. Material Selection

1. Use only product materials that are on the Department’s QPLs. These products have been evaluated by the Department and may be used without sampling or pre-testing. They include, but are not limited to:
   a. QPL-5 Electrical Conduit
   b. QPL-34 Work Zone Traffic Control Devices
   c. QPL-35 Drive Type Galvanized Steel Sign Posts
   d. QPL-46 Traffic Markings Producers
   e. QPL-48 Traffic Signal & ITS Equipment
   f. QPL-52 Overhead Signs Supports, Strain Poles, and Lighting Standards
   g. QPL-61 Reinforcement Steel Rolling Mills
   h. QPL-63 Ground Mounted Breakaway Sign Supports
   i. QPL-69 Flexible Delineator Post
   j. QPL-71 Glass Beads
   k. QPL-72 Guy Wire/Span Cable
   l. QPL-75 Inductive Loop Sealants
   m. QPL-76 Raised Pavement Markers and Channel Markers
   n. QPL-78 Traffic Signal Pull and Junction Boxes
   o. QPL-80 Highway Sign Manufacturers

11. Submit a letter to the Construction Manager stating which QPL items will be used. Submittal letter shall include QPL number and product description.

12. The Construction Manager or designee will determine that the construction item is the same material identified on the appropriate QPL and will acknowledge receipt of these items in the project diary or as required by the construction manual. Support poles are verified by the Office of Bridge and Structures.

13. The Construction Manager or designee will notify the contractor of the acceptability of any accessories not covered by the QPL for use on the project.

C. Material Submittal Process

1. Written approval of product materials not listed on the QPL is required from the Construction Manager or designee.

2. The Construction Manager or designee may determine that submitted material is approved, in which case no further action is required. If rejected, the Contractor shall re-submit materials within 21 calendar days of notification of rejection. Resubmittal of subsequent materials for review shall be considered the start point of a new approval cycle as described.

3. The Construction Manager or designee will advise, in writing, as to the acceptability of the material submitted.

D. Submittal Costs

1. No separate measurement or payment will be made for submittal costs.

2. All costs associated with reproduction of submittal material documents, samples, and mailing expenses shall be the responsibility of the contractor and are not subject to reimbursement by the Department.

3. All submittal material becomes the property of the Department.
E. Submittal Requirements

1. Steel Strain Pole, Concrete Strain Pole, or Steel Pole Certification
   a. Prior to ordering signal poles, locate utilities and stake the Right-of-Way for the purpose of adjusting pole locations, if necessary. Coordinate with the District office and local agencies to verify the location of any buried traffic/ITS communication lines. The Department is not a member of 811.
   b. Obtain approval from the Construction Manager or designee for any design deviation from the contract.
   c. Final pole locations will be approved by the Construction Manager or designee. Determine the final length of mast arms based on field adjusted pole locations.
   d. Instruct the supplier or manufacturer of the strain poles or steel poles with mast arms to submit a certification, including mill certificates to the Construction Manager and:
      Georgia Department of Transportation
      Office of Materials and Testing
      15 Kennedy Drive
      Forest Park, GA 30297
   e. Instruct the supplier or manufacturer to include the following in the certification:
      i. A statement that the items were manufactured according to the specifications, including the specification section number
      ii. Project number
   f. Instruct the supplier or manufacturer to send the transmittal letter to the Department in PDF file format.
   g. Prepare shop drawings and related signal strain pole design calculations, following the vertical clearance requirements and span wire sag requirements.
   h. Show roadway and pole base elevations on the drawings. Account for any pole locations that deviate from the proposed plans.
   i. Show all dimensions and material designations of the designs on the drawings. See Section 501.1 for the shop drawing requirements for poles and anchor bolts.
   j. Submit all shop drawings and related signal strain pole design calculations to the Construction Manager. The pole submittal information will be forwarded to the State Bridge and Structural Design Engineer for review and approval.
   k. Provide bending moment at yield to determine the foundation size according to the signal strain pole foundation drawings. Obtain written approval prior to pole fabrication and installation.
   l. Upon acceptance of the pole certification, provide one copy of the design calculations and shop drawings to the agency responsible for maintaining the traffic control signal installation.

2. Traffic Control Signal Item Certification
   a. Submit material catalog product numbers and descriptions to the Department and maintaining agency.
   b. Reference the P.I. number and QPL number for the following traffic control signal items:
      iii. Signal faces (vehicular and pedestrian)
      iv. LED signal modules (vehicular and pedestrian)
      v. Mounting hardware
      vi. Controller units
Section 647 — Traffic Control Signal Installation

vii. Controller cabinet assemblies
viii. UPS
ix. Detection system
x. Monitors
xi. Cable
xii. Load switches
xiii. Blank-out signs
xiv. Lane use signals
xv. Preformed cabinet bases
xvi. Other related signal equipment (including conduit, pullboxes, grounding electrodes, enforcement indications, etc.)

3. Test Results Submittals

a. Submit applicable quality control testing from the manufacturers for the following items:
   i. Controller unit
   ii. Controller cabinet assembly
   iii. Conflict monitor testing
   iv. Detection system testing
   v. Signal cable and inductance loop wire
   vi. Other operational testing required by the Department

b. Provide a copy of the applicable test result submittals to the maintaining agency, if different than the Department.

c. Refer to Section 647.3 for details on testing requirements.

4. Mast Arm Pole Charts

a. For locations with mast arm pole installations, submit Mast Arm Pole Chart for review and approval by the State Bridge and Structural Design Engineer. The Mast Arm Pole Chart shall be a drawing formatted on an 11 in. x 17 in. (279 mm x 432mm) ANSI B sheet showing the following in both plan and cross-section views:
   i. Curb lines
   ii. Location of mast arm pole based on utility information and field location verified by contractor. (Final location of mast arm pole shall meet the criteria for setback from the road as specified in the AASHTO Roadside Design Guide and in the Standard Detail Drawings.)
   iii. Distance labeling from both adjacent curbs to mast arm pole
   iv. Distance labeling along mast arm from pole to curb and from curb to each proposed traffic signal face
   v. Directional arrow
   vi. Street names
   vii. Position of luminaire arms

b. Once the Master Arm Pole Chart is approved, use the distances measured to the proposed traffic signal face locations when ordering the mast arm to verify that the mast arm is fabricated with pre-drilled holes for traffic signal face wiring in the correct locations.
Section 647 — Traffic Control Signal Installation

647.2 Materials

647.201 Delivery, Storage, and Handling

A. Include shipping and handling fees in the Contractor’s base price.

B. Be responsible for equipment, components, and materials prior to installation and final acceptance.

C. Take precautions to protect materials from theft, vandalism/tampering, dents, scratches, dust, temperature, weather, cutting, paint, and other hazardous conditions prior to installation.

D. Replace damaged or lost material as required by the Department.

647.2.02 Tools and Equipment

A. Furnish equipment, tools, and superintendence for the completion of the work to be done in accordance with contract.

B. Verify equipment and tools mobilized for the work are in 100% working order and calibrated, if applicable, such as loop and ground testing equipment, prior to placing it in commission for the project.

C. Verify equipment and tool operators are trained and qualified before operating equipment on the project.

647.2.03 State-Supplied Equipment

A. Coordinate with the Construction Manager or designee to receive Traffic Control Signal Equipment from the Department.

B. contractor shall acknowledge receipt of equipment, noting an itemized list of equipment and quantities, on Department 592 form.

C. Inspect the equipment for damage and verify that equipment will power on within 14 calendar days after receiving the equipment.

   1. Report to the Department, in writing, that the state-supplied equipment was received in good condition and operates when power is properly applied.

   2. Notify the Department in writing if the state-supplied equipment is defective. The Construction Manager or designee will coordinate the replacement of defective equipment.

   3. If no written dissent is received after 14 calendar days or if equipment is installed in the field, the Department shall consider this equipment to be satisfactory and accepted.

D. Supply new, like kind equipment to replace any state-supplied equipment that is lost or damaged while in contractor’s possession.

647.2.03 State-Supplied Equipment

See Section 925 for traffic control signal equipment specifications.
647.3 Construction

647.3.01 Construction Management Requirements

A. Contractor Superintendent

1. Submit the name of the Traffic Control Device Contractor Superintendent and a summary of the individual's relevant experience and qualifications to the Department for approval.

2. Do not change the Traffic Control Device Contractor Superintendent without the prior written approval of the Department.

3. Traffic Control Device Contractor Superintendent or designee shall be present to supervise work performed by subcontractors.

4. Provide a Qualified Electrician as defined in Section 755 when installing and connecting the power service to the traffic control equipment.

B. Utility Coordination

1. Utility Permit Application
   a) Establish the electrical power service for each traffic control device as specified in the contract.
   b) Furnish or install equipment and materials that shall become part of the regional utility facility.
   c) Coordinate such work with the utility representatives.
   d) Furnish and install additional power outlet strips in new and existing equipment racks if needed for the new equipment.
   e) Furnish equipment and materials and perform work in accordance with the contract and applicable utility agency standards and procedures.
   f) Meet standards required by utility companies as related to the equipment, materials, and installation associated with attachment to related power service feeds.
   g) Test the power utility service to confirm voltage levels and current capacity and the serviceability of any circuit connected to the traffic control device.
   h) Power utility representatives are not authorized to revoke, alter, or waive any requirements or design of materials or facilities provided under the specifications.
   i) The inspection of the contractor's work by the utility providers or the failure to inspect the contractor's work by the utility provider representatives shall not relieve the contractor of any requirements of the specifications.
   j) Notify the Department and the utility providers' representatives of planned work.

2. Utility Maintenance
   a) The contractor shall be responsible for establishing utility services and ongoing monthly costs related to utility services until Final Acceptance of the traffic control devices.
   b) After Final Acceptance, provide an orderly transfer of the services and permits to the local government or maintaining agency.

3. Utility Adjustments
   a. Refer to the local utility for utility clearance requirements.
   b. Verify make ready work has been completed.

C. As Built Plans

1. Provide detailed as-built plans of the work performed.

2. Submit within 30 calendar days after completion of installation or as otherwise specified in the contract.
Section 647 — Traffic Control Signal Installation

3. Show all changes and deviations from the original plans using electronic PDF file format, with markup shown in red text and lines.

4. Include all materials and installation work, along with all structural elements, assemblies and communications for each traffic control device in the as built plans.

5. Provide the following information regarding electrical service:
   a. Address of the service pole.
   b. Power services from the meter base, including all cables from the service point.
   c. The electric provider’s name, the account number and the meter base information.
   d. Show routes and locations of the final cable installation.

6. Include any other device-specific details that are required in the individual specifications.

D. Traffic Control Signal Equipment Modification and Removal

1. The Department may continue to maintain project related traffic control devices after issuance of Notice to Proceed. The Construction Manager or designee will coordinate the contractor assuming responsibilities for maintenance, operations, and response to existing traffic control devices at the time work begins.

2. Remove existing signal equipment that is not used in the final installation when the new signal equipment is operational.

3. Carefully remove equipment to minimize damage and retain it in its original form. This equipment may include:
   a. Strain poles, including the foundation down to 3 ft. (0.9 m) below ground level finished grade.
   b. Timber poles shall be completely removed, including the portion below ground level.
   c. Controller cabinet assembly, including contents, preformed cabinet base, and work pads.
   d. Original traffic signal faces, including span wire support.
   e. CCTV cameras
   f. Vehicle and pedestrian detection systems
   g. Other equipment not retained in the final installation.

4. Verify that unused equipment is secured and disposed of in accordance with all regulations and the Department’s specifications.

5. Replace traffic control signal equipment that the Construction Manager or designee determines has been damaged or destroyed during installation, modification, or removal of the traffic control signal, at no expense to the Department. Replace with new material.

6. If the Department finds that the existing material shown in the contract to be relocated is unsatisfactory, replace with new material. The costs shall be paid for at contract prices, if applicable, or as extra work.

7. Remove old traffic signal faces by the end of the day that the new signal equipment is placed in operation. Remove all other signal equipment within 7 calendar days after operations of the newly installed equipment.

E. Equipment Disposal

1. Return all removed or replaced traffic control signal equipment to District Traffic Signal Shops unless otherwise noted in the contract or as directed by the Construction Manager or designee.

2. Provide an inventory list and arrange a mutually agreeable delivery time with the Construction Manager or designee 24 hours in advance.

3. Contractor shall be responsible for proper disposal of all materials not returned to the District Traffic Signal Engineer.
647.3.02 Warranty and Maintenance

A. General

1. See Section 150.

2. If a traffic signal that is the responsibility of the contractor is not functioning:
   a. Non-Emergency
      i. Commence work on this signal within 48 hours of the written notice from the Department. Failure to respond will result in a per calendar day charged against monies due or that may become due until the maintenance work is started. See Section 108.
      ii. In addition, the cost of labor and material will be charged by the Department if the Department takes corrective action using its own forces or local municipality forces.
      iii. The contractor shall be responsible for all materials, equipment, and expertise necessary to correct signal malfunction or repair.
   iv. The Department or local municipality shall not be held responsible or liable for alleged damage to the signal or as a result of the signal malfunction due to problems that may occur after the Department or local municipality forces make repairs. Emergency
   v. If the Department determines that the signal malfunction or failure is an operational hazard, take corrective action within three hours of the first attempt of notification.
   vi. Response shall be considered only when qualified personnel and equipment are provided.
   vii. Failure to respond within three hours shall result in a non-refundable deduction of money of $1,000.00 with an additional charge of $500.00 per hour thereafter until qualified personnel and equipment arrive onsite and begin corrective action.
   viii. In addition, the cost of labor and material will be charged by the Department if the Department takes corrective action using its own forces or local municipality forces.
   ix. The Department shall not be held responsible or liable for alleged damage to the signal or as a result of the signal malfunction due to problems that may occur after Department or local municipality forces make emergency repairs.
   x. The contractor shall be responsible for all materials and equipment necessary to correct signal malfunction or repair.
   xi. Final Acceptance will not be given until payment for such work is received.

B. Maintenance

1. Provide maintenance support services and assume responsibility of existing traffic control devices, the Department’s communications network, and ancillary equipment damaged by the contractor, including labor, equipment, and materials associated with the repair or replacement of said materials and equipment from the first day of field impact continually until project acceptance. Refer to Section 105 for requirements.

2. Provide maintenance support services during construction between construction initiation and project acceptance by the Department as follows:
   a. See Section 105 for requirements. The Department reserves the right to deduct the cost of maintenance activity from monies due or to become due the contractor if the contractor fails to remedy unsatisfactory maintenance within 48 hours after receipt of such notice.
   b. During the construction period, the Construction Manager or designee will send a written problem notification of the issue.
   c. Provide a technical support phone line and the ability to provide replacement parts/material for both warranty and non-warranty repair.
d. Provide full technical support, including material and labor, and consultation to the Department or a user that is responsible for maintenance of the traffic control devices during the contract.

e. Enter a precise description of repair work performed into the log book (supplied by the Department and located in the controller cabinet assembly).

f. The Department will designate representatives and alternates as contact persons for the contractor.

3. Provide maintenance support services following project acceptance during the remaining warranty period. The traffic control device equipment manufacturer(s) or the party designated by the manufacturer(s) shall be responsible for providing repairs or replacements for failed equipment as follows:

a. During the warranty period, the Department’s coordinator of maintenance or designee will send problem notification to the manufacturer(s) or the party designated by the manufacturer(s).

b. The manufacturer or designated party shall respond to the Department, the Department’s designee, or maintaining agency within one business day of receiving the problem notification.

c. As requested by the Department, the Department’s designee, or maintaining agency, perform remote diagnostic tests and provide a technical support phone line to assist with troubleshooting and repair activity.

d. Furnish replacements for any non-critical part or equipment found to be defective during the warranty period at no cost to the Department, the Department’s designee, or maintaining agency within 14 calendar days of notification by the Department.

e. Provide firmware or software updates provided by the manufacturer associated with the system at no cost to the Department, the Department’s designee, or maintaining agency during the warranty period.

f. Updates provided by the manufacturer or the party designated by the manufacturer shall not degrade the original functionality of the product under warranty.

C. Warranty

1. Provide manufacturer’s warranties on electrical, electronic, or mechanical equipment furnished, except state-supplied equipment.

2. Verify that warranties are consistent with those provided as customary trade and industry standard practices; or as otherwise specified in the contract.

3. Verify that warranties are continuous and state that they are subject to transfer.

4. Acceptance or approval of the work does not waive warranties where required by the specifications. Final Acceptance will not be granted until all warranties are received.

5. Repair and/or replace all equipment and material supplied under the contract that have been determined by the Department to not meet specifications.

6. The Department reserves the sole right to determine suitability or unsuitability of the supplied equipment and material. The contractor shall bear the total cost of delivery and transportation related to the repair and replacement of equipment and material throughout the duration of the contract unless otherwise approved by the Department.

7. Transfer to the Department any warranties remaining on all items after Final Acceptance. Perform transfer at 12:01 AM of the day following acceptance.
647.3.03 Testing

A. Department Responsibilities

1. The Department will observe, provide inspection and testing oversight, review, accept, and reject inspections and operational tests.

2. During the Operational Test:
   a. The Department will notify the Contractor upon failure or malfunction of equipment.
   b. If the contractor does not provide the services enumerated above under the contract responsibilities, the Department or its authorized agents may, in the interest of public safety, take emergency action.
   c. The Department will deduct costs from the monies due or to become due the contractor under the contract as a result of these emergency actions.
   d. Such action by the Department will not void any guaranties or warranties or other obligations set forth in the contract.

B. Test Results Submittal

1. Submit the results of the testing of the following items to the Construction Manager.

2. A copy of the test result submittals shall be provided to the maintaining agency.

3. Submit test results of the following applicable items:
   a. Controller and Cabinet Testing from Manufacturer (Including conflict monitor)
   b. Inductance Loop Detector or other Detection System Testing
   c. IP Communications
   d. Audible Pedestrian Pushbuttons
   e. UPS
   f. Railroad Preemption
   g. Connected Vehicle Devices
   h. Other specialized equipment by other agency (e.g. emergency pre-emption, bus rapid transit, etc.)

C Activation of Traffic Control Device

1. Traffic Control Signals may be activated prior to full completion to meet the traffic control needs of the contract.

2. Contractor shall pretest all furnished and installed hardware, wiring and connections prior to the Department’s field tests.

3. The Department shall conduct a field test to verify that essential elements are installed and in working order prior to activation. The field test of partial installation shall follow the field test procedure as defined for the Operational Test.

4. An Operational Test shall not be performed until all equipment is installed.

D. Operational Test

1. An Operational Test is a multiple step procedure that shall be performed upon each traffic control device to verify working order of assembled components of the traffic control device and perform the desired functions for a specific installation is met per the contract.

2. Operational Tests shall be coordinated with the Construction Manager or designee.

3. Contractor shall pretest all furnished and installed hardware, wiring and connections prior to the Department’s field tests.

4. The Operational Test shall consist of the following steps:
a. Field test
   i. The Department shall conduct a field test to verify all traffic control device components are installed and the device is ready for full operation.
   ii. The field test shall demonstrate that all components:
        a) Hardware, cable, and connections furnished and installed by the contractor operates correctly.
        b) All functions are in conformance with the contract.
        c) All circuits have continuity.
        d) Grounded according to this Section and Section 682.
        e) Unless otherwise directed by the Department, sidewalks and ramps shall be complete and accessible to the pedestrian detection system and pedestrian signal faces shall be operational to begin the burn-in period.
        f) Contractor shall promptly address any corrective list items identified during the field test.
        g) The traffic control device shall not be activated, and the operational test shall not continue until the field test is accepted by the Department.

iii. Conflict Monitor Test for Traffic Signals
    a) The conflict monitor field test only tests for proper detection and triggering of a conflict monitor in response to a displayed pattern.
    b) Test the conflict monitor for each traffic signal.
    c) Provide a law enforcement officer to provide traffic control during the conflict monitor test.
    d) Conflicting Signal Test
       1) Verify and record the allowed channel configurations.
       2) Use stop time feature to hold phase and apply line voltage to each conflicting signal phase. Verify the conflict is detected and controller cabinet assembly is sent to into flash mode.
       3) Advance controller unit to next phase and apply line voltage to each conflicting phase.
    e) Red Failure Test
       1) Check Red Failure feature by removing and reinserting load switches in sequence.
       2) Verify that all monitored channels indicate Red failure.

b. Burn-in Period
   i. Demonstrate through burn-in of day-to-day full operations (all components installed and operational) of the traffic control device, defined in the contract, including functional/system performance requirements, electrical requirements, vehicle and pedestrian detection system requirements, data communication requirements, environmental requirements, documentation, and interface requirements with other components of the system are fully satisfied.
   ii. Repair or replace system failure or failed device during any portion of the burn-in test without disrupting the system’s operation. After repairing the equipment, the Department will determine proper function.
   iii. All costs associated with the maintenance, repair, or replacement of the traffic control devices shall be the responsibility of the contractor between the time the contractor initiates work and traffic control device acceptance from the Department.
   iv. The duration of the burn-in test will be maintained by the Department as follows:
Section 647 — Traffic Control Signal Installation

a) The test period shall be a minimum of 30 calendar days, which may be consecutive or non-consecutive calendar days. The test duration may be extended based on the issues or failures experienced during the test.

b) The test period shall be paused in the event of a device or system failure and restarted upon correction of the failure(s).

c) Successful completion to be granted on the 30th day of the test period if no failures occur.

d) If any cabinet equipment failure occurs, final acceptance will be withheld until all the equipment is functioning properly for 30 consecutive calendar days after repair. Cabinet equipment shall include:
   1) All components supplied with the cabinet shell as prescribed in Section 925.
   2) The 2070 controller chassis or any modules within the controller.
   3) All electronic components or wiring of the vehicle detection system

e) If equipment failure occurs during the 16th through 30th day, final acceptance will be withheld until all the equipment is functioning properly for 15 consecutive calendar days after repair. These items shall include only:
   1) LED signal indications
   2) Piezo driven pedestrian pushbuttons
   3) 222L loop detector cards
   4) 242L DC isolators
   5) Load switches

f) If a specific piece of equipment has malfunctioned more than three times during the test period, replace the equipment with a new unit and continue the test period for an additional 30 calendar days.

g) The burn-in period shall not be measured separately for individual components or subsystems.

h) Burn-in test applies to all furnished and installed equipment.

i) If failed or malfunctioning of equipment furnished by others prevents the burn-in test from continuing, the Department will suspend the burn-in test and resume when all equipment failures are corrected.

j) At the conclusion of the burn-in period, a final field inspection shall be performed by the Department to verify all components are working in a satisfactory manner.

k) On projects with multiple traffic control devices, each device will be considered an individual device and burn-in tests shall be in independent of each other. Equipment failures at one location shall not impact the burn-in period of other locations.

v) Upon successful completion of the overall burn-in test, the traffic control device will be eligible for maintenance acceptance and final inspection and acceptance.

vi) The Department will determine burn-in period acceptance after satisfactory completion of the required burn-in period and based on a comprehensive field inspection of the complete system in accordance with the specifications.

vii) The system shall be maintained in accordance with Section 105.14 until final acceptance of the entire contract.

5. For Maintenance Acceptance, perform the following tasks:

i) Conduct final inspection and close-out after successfully completing the burn-in test and providing written notification of substantial completion and receiving Department approval.

ii) The final inspection and close-out activities include:
   a) Demonstrate the overall system is fully operational.
Section 647 — Traffic Control Signal Installation

b) Verify traffic control devices and components are in their correct final configuration.
c) Verify submittals including test reports are submitted and approved by the Department.
d) Verify final punch list items are completed.
e) Verify final cleanup requirements are completed and the field conditions are restored to their original condition.
f) Obtain approval of final as-built plans.
g) Deliver spare parts and materials.
h) Complete all training services.
i) Transfer all warranties to the Department.

6. Contractor shall maintain all work under the contract in accordance with the specifications during the burn-in period.

7. Contractor shall replace or repair the defective equipment during the burn-in period within 48 hours of notification by the Department, unless an emergency is declared.

8. Notification of substantial completion is defined by the Department as 100% of the infrastructure and traffic control devices and components have been furnished, installed, configured, integrated, and tested. When substantial completion has been met, as determined by the Department, the final inspection and close-out activities will be conducted.

E. Sequence

1. The contractor shall notify the Construction Manager in writing that the installation and pretests of the furnished equipment is complete.
2. The Construction Manager or designee will perform the field test within 14 calendar days.
3. The Construction Manager or designee will provide an in-depth inspection and provide a written corrective list of items for the contractor to correct. Within 14 calendar days of the notification, the contractor shall correct the items noted.
4. When defects are resolved, the Construction Manager or designee will authorize the contractor to activate the traffic control device and begin 30-day burn-in test.
5. If programming of the controller unit’s firmware application is not a pay item for the contract, the Construction Manager or designee will coordinate programming the controller unit within 14 calendar days.
6. The Construction Manager or designee will send the Construction Manager a letter showing the start, termination, suspension, or successful completion of the operational test.
7. Request in writing the Department’s approval to start the Traffic Control Device final inspection a minimum of 14 calendar days prior to the requested start date. The Department reserves the right to reschedule the start date if needed. The start date for the final inspection shall not be prior to the successful completion of the overall burn-in test.
8. Upon unsuccessful or incomplete Traffic Control Device final inspection, the contractor will make the necessary corrections and conduct a new Traffic Control Device final inspection. Allow the Department up to 14 calendar days to conduct a final inspection.
9. The Department reserves the right to require, at no additional expense to the Department, the attendance of a qualified technical representative of the equipment or software manufacturers to attend a portion of a Traffic Control Device final inspection.

F. Final Inspection and Acceptance

1. The contractor shall obtain written acceptance of the traffic control device installation from the Construction Manager or designee before Final Acceptance.
Section 647 — Traffic Control Signal Installation

G. Communications Testing
1. Install basic network device configuration and test IP addressable equipment with the Department’s network.
2. Provide notice of testing and submit test results to the Department.
3. Include notification and review periods, testing periods, and burn-in time in the overall progress (construction) schedule.

H. UPS Testing
1. Each UPS shall be given a minimum of five, 4-hour full battery cycle tests during the Operational Test period.
2. Tests to be administered manually, if necessary. The UPS log may be used to demonstrate proper operation during power outages of 4 hours to supplement the Operational test.

647.3.04 Construction Requirements
A. General
1. Traffic Control Signal installations shall meet the appropriate NESC requirements.
2. Comply with NEC requirements and Section 680.3 for grounding and bonding requirements for the power service.
3. The NEC will apply up to the power service termination within the traffic control device cabinet. Beyond that point, IMSA shall apply unless stated otherwise in this Section.
4. No splicing of cables or exposed wiring is permitted except for loop wires to loop lead-in cable.
5. Provide wiring entry and exits that are made at the side or underneath components; no exposed top entry or exits are permitted. This requirement extends to enclosures, junction boxes, support arms, or any other externally exposed devices.
6. Route and secure wiring and cabling to avoid sharp edges and to avoid conflicts with other equipment or cabling.
7. Electrical work shall comply with applicable requirements of the local power utility.
8. Install equipment in new or existing rack space in accordance with the equipment manufacturer’s recommendations, including mounting, interconnection wiring and electrical service.
9. Furnish and install mounting hardware and incidental materials, including fasteners and auxiliary supporting frames/brackets, as recommended by the manufacturer.
10. Furnish and install hardware, materials, wiring/cabling, configuration, and any other incidental items necessary for fully operational components and subsystems shown in the contract and Section 647, except when specifically identified as existing or as work to be performed by the Department.
11. Cables, Conduit, and Power Service
   a. Cables
      i. Furnish and install electrical cables for traffic control devices and the power service as required by the
      ii. Contract.
      iii. Identify all conductors of all cables by color and number.
      iv. Identify the conductor function in as-built documentation included in the controller cabinet assembly documentation.
      v. Cut unused conductors to a length that can reach any appropriate terminal.
      vi. Bend back unused conductors over their outer jackets and individually tape them.
      vii. Install cabling inside new hollow metal or concrete support poles unless otherwise specified.
      viii. Neatly install and route cabling to minimize movement in the wind and chafing against the pole, device, or bracket.
ix. Use weatherheads on all nipple and exposed conduit openings.

x. Form a drip loop at the weatherhead and route cabling to minimize water entry into the cable connector. Use a 24 in. (600 mm) diameter drip loop where cables enter a weatherhead.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

b. Conduit
   i. Where devices are installed on existing wood poles, install power service cabling on the wood poles in rigid metal conduit risers.
   ii. Provide conduit with a minimum 1 in. (25 mm) diameter for power service cabling.

c. Install meter base per Standard Details. Do not install the meter base on the cabinet.

d. Safety switch
   i. For aerial power service attachments, install on signal poles at the top of the pole.
   ii. For underground power service, install a minimum of 15 feet high above ground.
   iii. Safety switches shall not be installed on the cabinet.

12. Surge Protection Devices
   a. Protect all copper wiring and cabling entering the controller cabinet assembly by surge protection devices as specified in this section and Section 925 minimum requirements.
   b. Use a minimum No. 16 AWG grounding for each surge protection device, or larger if recommended by the surge protection device manufacturer.
   c. Use insulated green wire and connect the ground wire directly to the ground buss bar.
   d. Do not *daisy chain* the grounding wires of other devices, including other surge protection devices.
   e. Label all surge protection devices with silk-screened lettering on the mounting panel.
   f. Furnish and install all necessary transient surge protection device to protect detector and controller cabinet assembly equipment.

13. Grounding
   a. Ground the controller cabinet assemblies, controller, poles, pullboxes, and conduit to reduce extraneous voltage to protect personnel or equipment.
   b. Ground all span wire and down guy assemblies as shown on Standard Detail Drawings. Bond all span wire together and bond to ground at every pole.
   c. Provide permanent and continuous grounding circuits with a current-carrying capacity high enough and an impedance low enough to limit the potential above the ground to a safe level.
   d. Join the grounding electrodes and connect them to the grounding buss of the controller cabinet assembly with No. 6 AWG solid copper wire.
   e. Use the shortest possible ground lead to the grounding source.
   f. All components, including mounting hardware, shall be grounded and bonded per manufacturer’s recommendations and NEC. Dress and route grounding wires separately from all other controller cabinet assembly wiring.

B. Installation of Grounding Conductors and Electrodes
   1. Install grounding electrodes of size, length and material specified in Section 682.
   2. Ground any pole-mounted equipment to the pole, except 336 controller cabinet assemblies and power service if pole mounted.
   3. Install grounding electrodes adjacent to the traffic signal pole bases, preformed controller cabinet assembly bases, and in pullboxes to protect the grounding system.
   4. Install a minimum of 3 grounding electrodes for each pole, pedestal and the controller cabinet assembly.
Section 647 — Traffic Control Signal Installation

5. Grounding electrode stacking may be permitted in areas where ground conditions allow. The contractor shall coordinate with the Construction Manager or designee to have a Department representative observe stacked electrode installation.

6. Test electrodes according to Section 682. Report final test results.

7. Timber Poles
   a. Use a minimum No. 6 AWG solid copper wire bonded to the grounding electrode and extending upward to a point perpendicular to the uppermost span.
   b. Place wire staples no greater than 2 ft. (600 mm) apart to secure the ground wire to the pole.
   c. Connect the span wire to the pole ground using copper split bolt connectors

8. Cabinets
   a. All cabinets
      i. Connect the power company neutral, conduit ground, and grounds of equipment housed in the controller cabinet assembly to the buss-bar.
      ii. Use a No. 6 AWG solid copper wire bonded between the buss and grounding electrode.
      iii. Connect neutral conductors to the controller cabinet assembly buss-bar and ground them at each terminal point.
      iv. Ground the controller cabinet assembly with a No. 6 AWG solid copper wire between the buss-bar to the grounding electrodes. Bends shall not exceed 4 in. (100 mm) radius.
   b. 336 Cabinet Assembly
      i. Provide a separate grounding electrode for pole mounted controller cabinet assemblies.
      ii. Do not use the pole ground as the cabinet assembly ground.
      iii. Bond the pole grounding electrode to the pole mounted cabinet assembly’s grounding electrode.

647.3.05 Installation of Traffic Control Devices

A. Controller Cabinet Assembly
   1. Location
      a. Locate in accordance with the contract.
      b. If field conditions require the controller cabinet assembly location needs to be moved, the following criteria shall be met:
         i. Controller cabinet assembly and technician work pads shall remain within the provided right-of-way.
         ii. Locate controller cabinet assembly away from the edge of pavement or curb line to prevent damage from errant vehicles and protect maintenance personnel.
         iii. Position the front panel door of the controller cabinet assembly away from the intersection, providing a view of the vehicular and pedestrian traffic signal faces for technicians.
         iv. Comply with ADA sidewalk horizontal clearance requirements. This includes when controller cabinet assembly doors are open.
         v. Avoid low lying and drainage areas likely to collect and hold surface water.
   2. Installation
      a. Install pole or base-mounted as indicated in the contract.
      b. Verify controller cabinet assembly prefabricated base does not extend more than 9 in (225 mm) above final grade.
c. Seal base-mounted controller cabinet assemblies to their base using silicone-based sealer. Pliable sealant used shall not melt or run at temperatures as high as 212 °F (100 °C).

d. Mount ground-mounted cabinet to prefabricated base.

e. Install technician pad in front and rear of the controller cabinet assembly door, and if applicable in front of UPS auxiliary cabinet door. See Standard Detail Drawings for pad information.

f. Close all unused conduits in the controller base with an appropriately sized PVC cap. Do not permanently affix the conduit cap to the conduit.

3. Controller Cabinet Assembly Field Wiring

a. Install cabling and conductors that comply with NEC, UL and IMSA.

b. Install all cabling and conductors in a neat and secured fashion.

c. Cut signal conductor cables, inductance loop lead-in cable or other detection system cabling, and fiber optic drop cable to provide 10 ft. (3 m) of slack inside the controller cabinet assembly or pullbox adjacent to the controller cabinet assembly. Neatly coil and organize wire in the bottom of the controller cabinet assembly.

d. Use at least No. 6 AWG wire for the conductors between service drop and AC+ and the AC- terminals.

e. Do not mount electrical meter to the controller cabinet assembly. Submit power pedestal or other method of providing location for mounting.

f. Label all field terminals and conductors to identify the specific field input.

g. Crimp terminal connections to conductors with a ratchet-type crimping tool that does not release until the crimping operation is completed.

h. Supply the controller cabinet assemblies with wiring diagrams, schematic drawings, pin assignment charts, and manuals for circuits and components. Store these documents in the controller cabinet assembly in a resealable, weathertight container.

i. Label individual conductors with a label maker using UV-protected labels and attach to each wire/cable and cover with transparent tape.

B. Auxiliary Controller Cabinet Assembly Equipment

1. Provide auxiliary controller cabinet assembly equipment or special purpose equipment with connecting harnesses, if necessary, or as shown in the contract.

2. Position the equipment in the controller cabinet assembly. Additional wiring may be necessary to install the equipment. Verify additional cabling meets appropriate specifications for the application, is enclosed in NEMA enclosure and is neatly secured.

3. Connect the auxiliary equipment to appropriate cable harness, pre-mounted rack, or socket.

C. Controller Unit

1. Identify the controller unit and other auxiliary equipment by model and revision numbers. These numbers shall agree with previously submitted and approved catalog submittals.

2. Assemble the controller unit, controller cabinet assembly, and auxiliary equipment to provide the operational phasing sequence specified in the contract.

3. Verify the controller unit functions as a unit with the controller cabinet assembly.

4. Verify controller unit and auxiliary equipment are provided AC power from receptacles marked for controller power.

5. Controller units shall be purchased with the Department’s firmware preinstalled (current version). Firmware version shall be considered current as of the activation date.

6. For ramp metering application, verify the Watchdog Timer Muzzle Jumper is selected on the field input/output module of the controller unit. This is required for operating with a 208 monitor.
Section 647 — Traffic Control Signal Installation

D. Conflict Monitor

1. Mount conflict monitor in a rack with appropriate connectors to attach to the wiring harness.
2. Program the conflict monitor according to the signal operation indicated in the contract before activation of the traffic control device.
3. Provide conflict monitoring programming tools to the maintaining agency.
4. Configure and equip the conflict monitor to monitor all red signal indication.
5. Verify that the red output for unused or vacant load bays or output slots is jumpered to 120 VAC+.
6. At ramp meters, mount model 208 monitor in rack and program the monitor per the contract.

E. Signal Poles and Support

1. General Installation Requirements
   a. See Section 501 for signal pole materials certification and Section 925 for traffic control signal equipment.
   b. Refer to the contract for pole locations.
   c. Where necessary, adjust pole location to avoid utility conflicts. Relocations greater than 5 ft. (1.5 m) shall require updates to the design plans.
   d. Provide minimum clearance distances between the signal pole and the roadway as specified in the contract.

   **NOTE:** Field drilled holes to any traffic signal pole or mast arm pole requires written approval from the Office of Bridge and Structural Design.

   e. Concrete Testing
      i. The Construction Manager may create concrete cylinders for testing during the pour.
      ii. The Construction Manager shall the make cylinder and submit it for testing to the Office of Materials and Testing.
      iii. If the concrete foundation fails to meet the requirements and is not accepted, the foundation shall be replaced upon notification of failure.
   f. Verify that the pole foundations and pedestals with the anchor-type base that meet the requirements of Section 500 and Section 639.
   g. The Office of Materials and Testing will inspect the anchor bolts. If approved, the Office of Materials and Testing will display the inspector’s hammer stamp mark on the top of the bolt.
   h. Instruct the supplier to furnish a mill certificate that shows the alloy and physical properties of the steel used in fabricating the anchor bolts. The bolts may be subjected to a tensile and shear strength test.
   i. Do not install or locate poles without the Department’s approval.
   j. Install pole foundations according to soil zones identified in the Standard Detail Drawings.
   k. After installing poles and applying the load of the signal span, inspect them for plumb and for the horizontal position of the mast arm, when applicable.
   l. Verify all threads of the nut are threaded onto the anchor bolt.
   m. Power Service Attachment
      i. Install a service bracket and insulator on one pole at each intersection to attach power service wire as specified in the contract.
      ii. Install a disconnect box on the controller cabinet assembly pole at each intersection to attach power service. Underground services may utilize a ground mounted power service assembly.
n. Install poles to which controller cabinet assemblies are attached with mounting plates, bolts, nipples, and at least two (2) 2.5 in. (64 mm) threaded openings at the top and at least two (2) 2.0 in. (50 mm) at the bottom of the pole.

o. Galvanized Finish (Steel Poles)
   i. Correct deficiencies by using the leveling nuts on the anchor bolts or by adjusting the mast arm.
   ii. After the Department approves the pole installation, provide an acceptable method of protecting the area between the pole base and the top of the foundation to prevent the accumulation of debris.
   iii. The Department will examine the pedestals and poles for damaged paint or galvanizing. Restore the finish coating where necessary.
   iv. If the finish or galvanized steel materials is scratched, chipped, or damaged, the material will be rejected. The finish shall be replaced as specified under Section 645 with the Department’s approval.
   v. For poles or arms that need galvanization, thoroughly clean the steel poles and arms and touch up non-galvanized parts with i-d red or original-type primer.

p. Attach the fittings to the poles as specified by the manufacturer. The fittings may include:
   i. Cast aluminum cap
   ii. Pole clamp hardware for span wire attachment
   iii. Weatherhead with chase nipples and couplings
   iv. Galvanized elbow with bushing installed by cutting the pole and welding in place around the entire circumference

2. Concrete Strain Poles
   a. Provide concrete strain poles that meet the requirements of Section 639 and Standard Detail drawings.
   b. Verify pole hole orientations for pedestrian signal faces, pedestrian pushbutton stations, luminaire arms, etc., with the Department prior to proceeding with traffic control signal installation. For poles at controller cabinet assembly location, provide at least two (2) 2.5 in. (64 mm) openings at the top of pole and at least two (2) 2.0 in. (50 mm) threaded openings at the bottom.
   c. Provide caissons or foundations that conform to the Construction Detail for Strain Pole and Mast Arm Pole Foundations in the Standard Detail Drawings.
   d. Determine the required foundation size based on the manufacturer’s specified bending moment at yield for each pole.
   e. Rake the poles during installation to provide a pole that is plumb once the load is applied.
   f. Install concrete strain poles so that the angle of variance between the eye bolt on the pole and the span wire is less than 10 degrees.
   g. Plug all unused holes. Use grout or threaded fittings. Match the finish of the pole.

3. Steel Strain Poles
   a. Verify that anchor bolts, reinforcing bars, and grounding electrodes conform to Section 639 and Section 852 and are placed in the excavation.
   b. Support the anchor bolts with a template to provide the proper bolt circle for the pedestal or pole to be installed.
   c. Install anchor bolts without modifications. Refer to signal details for proper installation.
   d. Wire the reinforcing bars together or to the anchor bolts.
   e. Wire the conduits in the base to the reinforcing bars for support. Verify that they are accessible above and beyond the foundation’s finish level.
Before pouring the foundation concrete, determine that the anchor bolt orientation is correct so that the tensile load is divided between at least two anchor bolts. Pour and vibrate the concrete with the Department present.

4. Mast Arms
   a. Install mast arms that can accommodate signal face mounting hardware and that adhere to the manufacturer’s recommended procedures and Section 925 and Section 915. Do not add holes.
   b. Seal the openings in the mast arms to prevent pests from entering.
   c. Align the mast arm to allow the traffic signal faces to hang plumb at the correct height without using extensions.
   d. Verify all mast arms are galvanized unless indicated otherwise in the contract.

   **NOTE:** Submit a *Mast Arm Pole Chart* to the Department and the Office of Bridge and Structural Design for review and approval as described in Section 647.1.03.E.4.

   e. Verify pole hole orientations for pedestrian signal faces, pedestrian pushbutton stations, luminaire arms, etc., with the Department prior to proceeding with traffic control signal installation.

5. Pedestrian Pedestals
   a. Install aluminum pedestal poles that adhere to Section 850 on breakaway aluminum bases that meet the requirements for breakaway construction. See Section 925 for breakaway base requirements. See the Standard Detail Drawings for Pole and Foundation Details.
   b. Secure at least four anchor bolts in a concrete foundation as shown in the Construction Detail.
   c. As an alternate to a concrete foundation, install a pedestal pole foundation anchor assembly (Section 925.2.21.E).
   d. Install the foundation until the top of the base plate is level with the ground.
   e. Slide bolt heads through the keyhole and under the base plate against the bolt head keepers with threads up.
   f. Adhere to the manufacturer’s instructions for installation.
   g. Use a universal driving tool with the correct kelly bar adaptor and bolts supplied with the tool.
   h. Attach driving tool assembly to the foundation base plate using the bolts provided with each foundation. Be sure to align the tool soothe holes in the tool line up with the proper bolt circle on the foundation.
   i. Stand the foundation, with the attached drive tool assembly, upright and attach the drive-tool-foundation to the kelly bar.
   j. Raise the kelly bar until the foundation swings free of the ground.
   k. Maneuver the kelly bar until the point of the foundation is over the marked installation location.
   l. Lower the kelly bar until the point of the foundation is forced into the ground and the helix is flush with the ground surface.
   m. Verify the shaft of the foundation is plumb by checking the shaft with a level on two sides that are at least 90 degrees from each other.
   n. Recheck the shaft to be sure it is plumb when the foundation has penetrated 1 ft. (300 mm) into the ground.
   o. When the base plate of the foundation is 1 in. (25 mm) to 2 in. (50 mm) above the ground line, remove driving tool.
   p. Contain the wiring inside the pole or in approved hardware. Do not allow conduit outside the pole.
   q. Position the pedestal pole plumb and high enough to clear the pedestrian’s signal face as shown in the contract.
Section 647 — Traffic Control Signal Installation

r. Verify that the bottom of the pedestrian signal housing including brackets at the preferred mounting height of 10 ft. (3 m) above the ground line. If conditions dictate, or specified in the contract, pedestrian signal housings may be mounted at a minimum of 7 ft. (2.1 m) above the ground line.
s. If using a vehicle signal housing, verify pole is adequate to give traffic signal face a height of 12 ft. (3.6 m).

6. Timber Poles
   a. Timber poles do not require the use of concrete for filling the cavity around the pole base.
   b. Use timber poles that meet the requirements of Section 861 and Section 639.
   c. Use Class II for all signal support poles. Use Class IV for aerial loop lead-in or communication cable if approved by the Department. Poles shall be inspected and include AWW stamp.
   d. Use guy wires with guy timber poles as shown in the contract.
   e. Use guy helper cables with separate guy wires when helper signal span cables are indicated in the contract.

NOTE: Never attach down guy wires to eye bolts. Attach down guy wires to angle guy attachment only and install insulating rods on all down guy installations as detailed on Standard Detail Drawings.

F. Power Disconnect
   1. See Section 924 for material requirements.
   2. Install a power disconnect box at each intersection as shown in the contract and Standard Detail Drawings.

G. Uninterruptable Power Supply (UPS)
   1. General
      a. Install UPS according to the contract.
      b. Install UPS and battery bank in accordance with manufacturer’s recommendations.
      c. With the UPS submittal, provide calculations for determining the size of the inverter and batteries based on the power requirements for each location.
      d. Verify that all auxiliary items are included in the power calculations.
      e. Verify the submittal specifies the model number and the firmware revision that is being supplied.
   2. Refer to the contract for the appropriate external cabinet mounting installation, if applicable.
      a. Type A mounting shall be typically used for installing at locations with an existing traffic control device cabinet.
         i. Total of 8 bolts per cabinet with 2 flat washers per bolt and 1 K-lock nut per bolt
         ii. Cabinet mounting bolts shall be:
             a) 18-8 Stainless Steel Hex Head (Fully Threaded)
             b) 0.375 in. (10 mm) – 16 X 1 in. (25 mm)
         iii. Washers shall be:
             a) Designed for 0.375 in (10 mm) bolt
             b) 18-8 Stainless Steel 1 in OD round flat type
             c) K-lock washer shall be:
                1) 18-8 Stainless Steel, Hex Nut Assembled with Free-Spinning Tooth Washer
                2) 0.375 in. (10 mm) – #16 Screw size
iv. External cabinet couplings to the controller cabinet shall provide a conduit for power connections between the Model 332 Cabinet and the external cabinet.

   a) The couplings shall consist of three parts and meet the following requirements:
      1) 2 in. Nylon Insulated, Steel Chase Nipple
      2) 2 in. Sealing, Steel Locknut
      3) 2 in. Nylon Insulated, Steel Bushing

   b) Provide external cabinet with all bolts, washers, nuts, and cabinet-cabinet coupler fittings for mounting the external cabinet to the Cabinet.

b. Type B mounting shall be typically used for locations with a new traffic controller cabinet and foundation.

   i. The cabinet installation shall provide the external battery cabinet as a base mount cabinet on the same foundation as the Cabinet.

   ii. Connections between the cabinets shall be through conduit in the cabinet base.

   iii. The external cabinet shall be installed so that it is centered on the 30 in. (762 mm) left side of the cabinet.

   iv. Bolt UPS cabinet to pre-fab base.

   v. UPS cabinet opening shall be larger than the pre-fab base opening.

H. Traffic Signal Faces

   1. General

      a. Place traffic signal faces according to the contract. If a change to traffic signal placement is required, the revised location shall be approved by the Department in advance of installation and in compliance with the MUTCD.

      b. Verify all traffic signal faces at an installation have the same appearance for the signal faces and the LED modules.

   2. Vertical clearance

      a. Measure the vertical clearance from the pavement to the lowest part of the assembly, including brackets and backplates.

      b. For traffic signal faces located above the roadway, provide vertical clearance that is a minimum of 17 ft. (5.2 m), 18 ft. (5.5m) preferred minimum, and a maximum of 19 ft. (5.8 m) above the roadway surface.

      c. For traffic signal faces located on a pole, provide vertical clearance that is a minimum of 12 ft. (3.6 m) and a maximum of 19 ft. (5.8 m) above the sidewalk or pavement grade of the center of the highway, whichever grade is higher.

      d. Adjust signal faces on the same approach to have the same vertical clearance.

   3. Housing

      a. Mount one aluminum reinforcing support plate in the top of the red (top) section of all three and four-section traffic signal face for the installation of mounting hardware.

      b. Provide traffic signal faces that use stainless steel hardware and are weathertight.

      c. Provide traffic signal faces that sealed for mounting in all possible configurations.

      d. Provide traffic signal faces that have housing door that positively latches using two eyebolts and wing nuts.

      e. Verify the signal door has hinge lugs molded on one side and two latch jaws are molded on the other side.

      f. When constructing side by side signal sections, verify that both doors can open at the same time (butterfly).

      g. When doors are open, verify that the door will remain attached to housing

      h. Verify bottom section has drainage holes.
4. **Wiring**
   a. Connect the signal cable to the wire in each traffic signal face to provide the correct signal indication when the cables are connected to the controller cabinet assembly back panels.
   b. Use wire nuts to make the connections to the LED signal modules lead-in.
   c. Make all connections in the top section of the traffic signal face.
   d. Do not splice cables.
   e. Verify that the black signal conductor jacket is inserted into the traffic signal face a minimum of 6 in. (150 mm).

5. **Optically Programmable Signal Faces**
   a. Install optically programmable (OP) traffic signal faces as shown in the contract, and as directed by the manufacturer.
   b. Mount OP signal faces securely or tether them to limit movement.
   c. Mask the OP lamp for directing visibility under the Department’s supervision.
   d. Tether traffic signal faces that have tunnel visors longer than 12 in. (300 mm).
   e. Attach traffic signal faces to mast arms using rigid mounting brackets.
   f. Adjust traffic signal faces on mast arms so that all red indications on the same mast arm are at the same elevation.

6. **Ramp Meter Signal Faces**
   a. Install ramp metering traffic signal faces as shown in the contract.
   b. Mount and adjust ramp metering signal faces as per the Standard Detail Drawings.
   c. Mount and adjust ramp meter enforcement device (light) as per the Standard Detail Drawings.
   d. The enforcement device shall be able to be viewed from downstream on the ramp.

7. **Lane Use Signal Faces**
   a. Install lane control signal faces for reversible lane systems as shown in the contract.
   b. Center each signal over the lane or lanes under signal control.
   c. Leave a vertical clearance for blank-out signs shall be a minimum of 17 ft. (5.2 m) above the roadway surface.
   d. Use a spirit level to verify that the bottom edge of each sign is horizontal.
   e. Label all LED modules with their turn on date on the backside of the LED insert.

I. **Pedestrian Signal Faces**
   1. Install pedestrian signal faces as directed in the contract.
   2. Install the pedestrian signal faces as shown on the Standard Detail Drawings.
   3. Leave a vertical clearance from the bottom of the pedestrian signal face to the ground at a preferred height of 10 ft. (3 m) unless specified in the contract or by the Department.
   4. Use serrated locking devices that firmly hold the pedestrian signal faces in the required alignment.
J. Cable

1. General
   a. Install and connect electrical cable to the proper equipment to produce an operating traffic control signal system.
   b. All wiring from the control cabinet assembly input and output files to field terminations shall be in accordance with IMSA, NEMA, UL, and the Department's Traffic Signal Wiring Standards. Referenced IMSA specification cables and applications can be found in Section 925.
   c. Make a minimum 1 ft. (300 mm) diameter 3-turn weather drip loop as shown in the Standard Detail Drawings at the entrance to each traffic signal face.
   d. Neatly tie signal cables leaving a structure or weatherhead to enter a signal fixture. Tie the cables to the messenger cable as illustrated in the Standard Detail Drawings.

2. Traffic signal face
   a. Install one 7-conductor signal cable for each signal phase and right turn overlap from the controller cabinet assembly to the appropriate signal face.
   b. From this leftmost traffic signal face, install a 7-conductor signal cable to every other traffic signal face on the same phase, if present.
   c. The standard wiring color code for vehicular signal faces shall be in accordance with Table 3.

Section 647 — Traffic Control Signal Installation

3. Pedestrian signal face
   a. Install one 7-conductor signal cable from the controller cabinet assembly to each location with a pedestrian signal face.
   b. Seven-conductor cable can operate either one or two pedestrian signal faces.
   c. The standard wiring color code for pedestrian signal faces shall be in accordance with Table 4.

Section 647 — Traffic Control Signal Installation

K. Span Wire

1. Span Wire Sag Minimum Sag Requirements
   a. Meet minimum sag requirements specified by the pole manufacturer.
   b. Span wire used with strain pole installation shall have a minimum 5% sag.
   c. Span wire used with timber pole installation shall have a minimum 2.5% sag.

2. Span Wire Sag Calculation Requirements
   a. Sag is the amount of vertical drop measured from the pole attachment point to lowest part of the span.
   b. Allowable sag is calculated by measuring the longest distance between poles and multiplying by the desired percentage of sag, unless specified by the pole manufacturers.
   c. Calculate attachment points for the messenger strand at the signal pole according to the Standard Detail Drawings.
   d. Provide the Construction Manager or designee with sag calculations for review and approval.

3. Span Wire Type
   a. Use minimum 0.375 in. (9.5 mm) span wire to support traffic signal faces, signal conductors, and other hardware only. Larger messenger cable shall be used as required based on span calculations.
   b. Use minimum 0.25 in. (6.35 mm) messenger cable to support the aerial communications cable plant and aerial loop lead installations.
   c. All messenger strand installations shall include standard industry bonding and grounding including NEC Article 770 and NESC Section 9.
   d. Ground all span wire and down guy assemblies as shown on Standard Detail Drawings. Bond all span wire together and bond to ground at every pole.
   e. All cabling and messenger installed shall meet the requirements provided by the utility pole owner.
   f. Install span wire and messenger wire where specified in the contract and in accordance with the Standard Detail Drawings.
   g. Use helper cables where specified in the contract and on the Standard Detail Drawings.
   h. For construction of a box or modified box span, use bullrings. Be consistent throughout the intersection in use of bull rings or strand vices. If bull rings are not used, strand vices shall be interlocked.

4. Span Wire Cable Mounting
   a. When using aluminum wrap or aluminum ties, space at a maximum of 6 in. (150 mm) increments.
   b. Aluminum wrap shall have at least three turns of wrap.
   c. Use lashing wire only for aerial loop lead-in and fiber optic cabling.

5. Installation
   a. Attach cables to messenger cable using lashing wire, aluminum ties, or lashing rods.
   b. Verify that messenger strand clearances conform with local utility company standards.
   c. Only use lashing rods that are of the same material as the messenger strand.
   d. If lashing rods are used, use lashing rods sized for the cables and messenger strand.
   e. Before erecting the messenger strand, determine the suspension strand length to span the distance between the poles.
   f. Run the messenger strand from structure to structure without splicing.
   g. Drill wood poles to receive the eye bolts so that the span wire and eyebolt at each connection form a straight angle.
   h. The angle of variance shall be continuously maintained at less than 10 degrees.
i. Attach down guy wires to guy hooks. Use a minimum 0.375 in. (9.5 mm) messenger cable for down guys.

j. Make stranded messenger cable attachment points with the appropriate size strand vices or two bolt suspension clamps.

k. Use standoff brackets as needed to prevent damage from poles, trees, or other structures.

L. Underground Cable for Signal Circuits

1. Install underground cable for signal circuits includes cable, with conduit, as shown in the contract.

2. Do not exceed 40% conduit fill per the NEC.

3. Pull cables into conduits without electrical or mechanical damage.

4. Pull all cables through a single conduit simultaneously.

5. Pull cables by hand only. The use of trucks or other motorized equipment is not permitted, unless approved by the Department. If mechanical pulling is approved, do not exceed the manufacturer’s tension rating for the cable.

6. Pull cables with a cable grip that firmly holds the exterior covering of the cable.

7. Handle and install the conductors to prevent kinks, bends, or other distortion that may damage the conductor or outer covering.

8. Use powdered soapstone, talc, or other inert lubricants to place conductors in conduit according to manufacturer’s recommendations.

9. When pulling cables through hand holes, pole shafts, etc., use a pad of firm rubber or other material between the cable and the opening edges to prevent cable damage.

10. Splicing of signal conductors is not permitted.

M. Communications Cable

See Section 935 for fiber optic cable communication system requirements.

N. Pullboxes

1. Install pullboxes as shown in the contract.

2. Verify that pullboxes conform to the Standard Detail Drawings.

3. Do not relocate pullboxes on the curb side of the signal pole in the intersection radius return.

4. Horizontal adjustments of less than 5 ft. (1.5 m) may be made to pullbox locations to avoid obstacles, if necessary.

5. Orient pullboxes with the longest dimension parallel to the roadway.

6. Include provisions for drains in pullbox excavations as specified.

7. Do not place the aggregate for the drain until the Department approves the excavation.

8. Do not set the pullbox until the aggregate is in place.

9. Obtain the Department’s approval and begin backfilling and installing the frame and cover.

10. The distance between pullboxes in a run of conduit shall not be greater than 100 ft (30 m), unless otherwise shown in the plans or approved by the Engineer, except for fiber optic cable.

11. Set the pullboxes in place, level, and install conduits.

   a. Conduit entrance shall be through the open bottom in Types 1, 2, 3, 4S, and 5S.

   b. Conduit entrance shall be directly through cored holes in the side walls in Types 4 and 5.

   c. Conduit entrance shall be through the conduit terminators in Types 6 and 7.

12. Where conduit entrance shall be through the side wall in Types 4 and 5, or for conduit other than the terminator size provided in Types 6 and 7, use field cored conduit entrance holes in the side wall of the box. All field coring shall be made with a diamond-tipped masonry hole saw and according to the pullbox manufacturer’s recommendations.
13. Use an approved HDPE to EPVC coupling or an underground-type conduit adhesive where joining conduit or conduit bodies of dissimilar materials, such as HDPE-to-EPVC sweeps into pullboxes or installing into pullbox conduit terminators.

14. Install the pullbox at a location that is level with the surrounding ground or pavement. Do not place a pullbox in a ditch or depression. Unless otherwise shown in the contract, when installed either in a sidewalk or in the ground, the top of the pullbox shall be level with the sidewalk or ground surface.

15. Metal lids or covers shall be properly grounded.

O. Conduit and Fittings

1. Install conduit by type (GRS, HDPE, PVC) as shown in the contract.

2. Refer to the NEC for conduit fill percentages. Install additional conduits as necessary to meet 40 percent maximum fill.

3. Verify that conduit conforms to Section 682, Section 923, and Section 925 with the addition of flexible conduit only where shown in the Details or as directed to do so in writing by the Construction Manager or designee.

4. Use the conduit size specified in the contract. Obtain a supplemental agreement from the Department prior to installing conduit other than the size specified in the contract.

5. See Section 682.3 for the construction of underground conduit.

6. See Section 682.3 for the construction of encased conduit.

7. See Section 682.3 for the construction of backfilling conduit.

8. In addition to the installation requirements of Section 682:
   a. Coat metallic conduit threads with red- or white-lead pipe compound, thermoplastic, or Teflon seal. Verify that they are securely connected.
   b. Install bushings in the conduit to protect the conductors.

P. Blank-out Signs

1. Install blank-out signs as shown in the contract.

2. Fasten the signs to a stationary structure or to a messenger strand support system.

3. Center each sign over the lane or lanes under sign control, where applicable.

4. Leave a vertical clearance for blank-out signs as shown in the contract.

5. Use a spirit level to verify that the bottom edge of each sign is horizontal.

Q. PHB Installation Requirements

1. Install PHB as shown in the contract.

2. Install solar or electrical power service as indicated in the contract.

3. Provide pedestrian detection system, controller cabinet assembly and necessary components for a fully functional PHB.

R. RRFB Installation Requirements

1. Install RRFB as shown in the Contract.

2. Install solar or electrical power service as indicated in the contract.

3. Provide pedestrian detection system.

S. Flashing Beacon

1. Furnish and install the flashing beacon controller at the locations shown in the contract.

2. Install it as a complete unit (solid state flasher and field cabinet with time clock, if applicable) and verify that it conforms to this section.
Section 647 — Traffic Control Signal Installation

3. Install solar or electrical power service as indicated in the contract.

647.3.06 Training Requirements
See Section 937.4 for training requirements for vehicle detection systems.

647.4 Measurement
647.4.01 General
Traffic control signal items complete, in place, and accepted of the kind, size, and type specified are measured as follows:

A. Traffic Signal Installation
Complete and fully functional Traffic Signal installation, vehicular detection and pedestrian detection systems excepted, will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

Materials included in this pay item include:
1. Controller Cabinet Assembly and required interior components.
2. Controller unit.
3. All signal conductors (excludes wiring associated with detection systems).
4. Span wire and guy wires, if applicable.
5. Vehicle signal faces with backplates.
6. Pedestrian signal faces.
7. Pull boxes and conduits containing traffic control signal power service, signal conductors, inductance loop lead-in cables, communications drop cable, auxiliary devices and spare conduits.
8. Power service installation and monthly charges prior to acceptance
9. Grounding conductors and electrodes.
10. Maintenance of equipment prior to acceptance.

The type of detection system specified in the contract shall be measured according to Section 937.4.

B. Ramp Meter Installation
Complete and fully functional Ramp Meter installation, vehicular detection system excepted, will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

Materials included in this pay item include:
1. Controller Cabinet Assembly and required interior components.
2. Controller Unit.
3. All signal conductors (excludes wiring associated with detection systems).
5. All signs and beacons.
6. Pull boxes and conduits containing ramp meter power service, signal conductors, inductance loop lead-in cables, communications drop cable, auxiliary devices and spare conduits.
7. Power service installation and monthly charges prior to acceptance
8. Grounding conductors and electrodes
9. Maintenance of equipment prior to acceptance.

The type of detection system specified in the contract shall be measured according to Section 937.4.
C. PHB Installation
Complete and fully functional PHB installation will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

D. RRFB Installation
Complete and fully functional RRFB installation will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

E. Flashing Beacon Installation
Complete and fully functional flashing beacon installation will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

F. School Speed Zone Flashing Beacon Installation
Complete and fully functional School Speed Zone Flashing Beacon installation will be paid for by lump sum, including furnishing labor, materials, tools, equipment, and incidentals required to complete the work unless otherwise specified in this section.

G. Traffic Signs
Highway signs are measured and paid for under Section 636.

H. Strain Poles
Strain poles are measured and paid for under Section 639.

I. Conduit for Communications
Conduit for underground, trunk line communications is measured under Section 682.

647.4.02 Limits
General Provisions 101 through 150.

647.5 Payment
647.5.01 General
1. The lump price bid for traffic control devices covers all items of work in this section including furnishing labor, materials, tools, equipment, and incidentals required to complete the work. It excludes only the vehicle detection and pedestrian detection systems for applicable devices, which are paid for in Section 637.

2. Costs for installation shall include operation and maintenance costs until written acceptance is issued by the Construction Manager.

3. Include payment for removal; disposal of existing pavement, shoulder surface, base and sub-grade; and restoration to original condition in the contract price for the items to which they pertain. These will not be paid for separately.

4. Furnishing, installing, and removing sheeting, bracing, and supports will not be paid for separately, but is included in the contract prices for other items.

5. No additional payment will be made for testing and storing state-supplied or contractor-furnished traffic control signal equipment.

6. No payment will be made for individual items unless a pay item is included in the contract for the specific item.
7. Payment will be made under:

<table>
<thead>

</tr>
</tbody>
</table>

Payment for various elements of traffic control devices will be as shown in the contract.

B. Partial Payment

Prior to commencement of the work, the contractor shall initiate a partial payment process for the lump sum traffic signal pay items by submitting a written payment schedule of the installation items for consideration and approval by the Construction Manager. The submittal should consider staged work. The Engineer’s determination of any progress amount paid shall be final. In the event a submittal is not provided, the following schedule below shall be utilized.

<table>

* Payment for communications conduit installation will be as described in Section 682. All other conduit installation as required for a traffic control signal installation shall be measured and payment made as part of the complete traffic control signal installation.

647.5.02 Adjustments

General Provisions 101 through 150.
Section 648 — Traffic Impact Attenuator

648.1 General Description
This work includes furnishing and installing impact attenuator units/arrays to conform with plan locations and details and/or as directed by the Engineer. All impact attenuator units/arrays shall be tested and approved at the specified NCHRP 350 and/or MASH Test Level.

648.1.01 Definitions
General Provisions 101 through 150.

Gating—A gating end treatment allows a vehicle impacting the nose or the side of the unit at an angle near the nose to pass through the device

Non- Gating—A non-gating end treatment is capable of redirecting a vehicle impacting the nose or the side of the unit along the unit’s entire length.

648.1.02 Related References
A. Standard Specifications
   General Provisions 101 through 150

B. Referenced Documents
   American Association of State Highway and Transportation Officials (AASHTO) Manual for Assessing Safety Hardware (MASH)
   ASTM A 123/A 123M
   QPL 64
   AASHTO Roadside Design Guide (RDG)

648.1.03 Submittals
A. Installation Drawings
   Submit all required certifications, test reports and drawings of details for completing the installation. Obtain Engineer’s approval of these documents before beginning work on attenuator installation. Portable Impact Attenuator arrays shall meet the requirements of Ga. Std. 4960 and manufacturer specifications.

B. Manufacturer’s Information
   Submit certification from the manufacturer that the attenuator unit/array and its interconnecting hardware replicates an NCHRP-350 and/or MASH approved attenuator in an accepted letter from the FHWA. Furnish items such as manufacturer’s brochures or specifications that completely outline the manufacturer’s recommendations for materials and installation methods. All workmanship and materials are subject to the Engineer’s approval.

648.2 Materials
A. Attenuator
   1. Ensure that materials are in accordance with the manufacturer’s recommendations, specifications and details.
   2. Use attenuators that have been classified as “accepted” by the Department’s Office of Materials and Research and approved by the Federal Highway Administration (FHWA) as meeting NCHRP-350 and/or MASH for the test level specified.
3. Where restoration and/or repair cannot be accomplished without the necessity of removing the unit/array from the original location, ensure replacement unit/array installation upon removal of the damaged unit/array. Furnishing, installing and maintaining the replacement will be at no additional cost.

4. Where required, ensure the approach end of the attenuator is equipped with a reflectorized object marker in accordance with plan details. The object marker may be furnished by the manufacturer of the attenuator or by others. Ensure that the front most section of the unit (the "nose") is yellow in color unless specified otherwise.

5. Where required, use an approved back-up system as specified in the plans.

6. For non-gating attenuators, anchor the attenuator to the pavement according to a system recommended by the manufacturer for the type pavement encountered.

7. Use Class "A" concrete for concrete pads, concrete back up if used, and concrete transition where required.

8. Use metal components and hardware galvanized according to ASTM A 123/A 123M unless otherwise specified. Ensure all metal components and hardware of permanent attenuators are free of corrosion when shipped.

9. In freezing conditions, water and sand filled attenuators shall be freeze treated according to the manufacturer's recommendations.

648.2.01 Delivery, Storage, and Handling

A. General
General Provisions 101 through 150.

648.3 Construction Requirements

648.3.01 Personnel
General Provisions 101 through 150.

648.3.02 Equipment
General Provisions 101 through 150.

648.3.03 Preparation
General Provisions 101 through 150.

648.3.04 Fabrication

A. Design Criteria and Type Selection
The Impact Attenuator Unit/array Type will be shown on the plans and designated by four characters.

- First character
  Indicates the type of permanent installation.
  The letter "P" designates a permanent (non-gating) installation that is considered reusable. Reusable installations have major components that may be able to survive multiple impacts intact and can be salvaged when the unit is being repaired. Some of the components, however, need to be replaced after a crash to make the entire unit crashworthy again.
  The letter “S” designates a permanent (non-gating) installation that is considered low-maintenance and/or self-restoring. Low-Maintenance and/or self-restoring installations either suffer very little, if any, damage upon impact and are easily pulled back into their full operating condition, or they partially rebound after an impact and may only need an inspection to ensure that no parts have been damaged or misaligned.

- Second character
  Designates the required NCHRP 350 and/or MASH test level.
Section 648 — Traffic Impact Attenuator

- Third character
  Indicates the traffic flow direction(s).
  The letter "B" indicates bi-directional traffic typical for median applications or when the unit is installed on the shoulder of a two-lane, two-way traffic facility. Bi-directional means traffic flows in opposite directions at the site of the attenuator installation.
  The letter "U" indicates uni-directional traffic flow typical for gore areas. Uni-directional means traffic on both sides traveling the same direction, from the nose to the rear of the unit.
  The letter "S" indicates traffic flow in one direction on a single side only, typical for a unit located on the outside shoulder of a roadway with one-way traffic and the other side of the attenuator not being exposed to traffic.

- Fourth character
  Indicates the numerical value of the width, in inches (millimeters), of the base of the rigid object that the attenuator will be shielding.
  At bridge columns, this character is typically the width of the column plus the barrier base widths on the column sides at the pavement surface.

B. Example
A Type P-3-U-60 attenuator designates a permanent non-gating reusable installation tested and approved at NCHRP 350 and/or MASH test level 3
  Uni-directional traffic flow a 60 in. (1500 mm) wide base for the rigid object being shielded.
  Temporary portable units/arrays may be either gating or non-gating based on construction sequencing and/or field conditions, See Specification Section 150. Unless otherwise specified, all permanent attenuators shall be non-gating.

648.3.05 Construction
Field locate the position of the attenuator nose as shown on the plans prior to beginning the installation. Have any variations approved by the Engineer.

If the length of the attenuator unit/array is less than that indicated in the plan details for the specified conditions, the length of the concrete transition section or the length of the longitudinal barrier shall be increased as needed to provide a proper beginning point for the attenuator nose as shown in the plans.

The length of the system will be the combined length of the attenuator unit/array, the back-up system and any required transition. The length of the system shall not be excessive to the extent that it intrudes appreciably within the clear offset distance as shown on the plans.

The increased length of transition or barrier is considered as an incidental part of the system and will not be itemized separately.

Temporary portable units/arrays shall be installed, moved, reinstalled and maintained as required.

648.3.06 Quality Assurance
Obtain certification from the manufacturer that the impact attenuator unit/array installed meets all required approvals and specifications and furnish these to the Engineer.

Furnish any mill test/galvanizing test reports and heat numbers for all metal components of the unit per current requirements of the Department’s Office of Materials and Research.

648.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.
648.4 Measurement
Each traffic impact attenuator of the type specified, complete, in place and accepted at its location will be measured by the unit/array, including components, hardware, anchors, incidentals, freeze treated water or sand, and labor for each installation shown on the plans or as directed by the Engineer.

Site preparation work, as described under 648.3.03, Preparation is measured and paid for separately under the respective items involved unless otherwise specified.

Temporary units/arrays will be measured for payment only once, regardless of how often they are moved. See Specification Section 150.

648.4.01 Limits
General Provisions 101 through 150.

648.5 Payment
Impact Attenuator Units/Arrays will be paid for per each type specified. Payment is full compensation for all materials, labor, and incidentals necessary to complete the Item including installing, moving, reinstalling and maintaining Units/Arrays as required.

Payment will also include the back-up system and transitions where required.

Payment will be made under:

<table>
<thead>
<tr>

</table>

648.5.01 Adjustments
General Provisions 101 through 150.
Section 649—Concrete Glare Screen

649.1 General Description
This work includes erecting a Portland cement concrete glare screen according to plan dimensions on top of a concrete median barrier.

649.1.01 Definitions
General Provisions 101 through 150.

649.1.02 Related References
A. Standard Specifications
   Section 621—Concrete Barrier
B. Referenced Documents
   General Provisions 101 through 150.

649.1.03 Submittals
General Provisions 101 through 150.

649.2 Materials
Use materials that comply with Section 621 and the plan details.

649.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

649.3 Construction Requirements

649.3.01 Personnel
General Provisions 101 through 150.

649.3.02 Equipment
General Provisions 101 through 150.

649.3.03 Preparation
General Provisions 101 through 150.

649.3.04 Fabrication
General Provisions 101 through 150.

649.3.05 Construction
Construct the glare screen using one of the following alternatives:

A. Alternative One
   Cast the median barrier and while the concrete is still plastic, insert “D” bars into the fresh concrete as indicated on the Plans. Wait until the median barrier concrete has reached a compressive strength of 2000 psi (14 MPa) or an age of seven days. Then place a second course of barrier, of the dimensions shown on the plans, on top of the first course and finish and cure according to Subsections 621.3.05.C and 621.3.05.D.
Section 649 — Concrete Glare Screen

B. Alternative Two

As an alternative to inserting “D” bars into the plastic concrete, wait until the median barrier concrete has reached a compressive strength of 2,000 psi (14 MPa), then drill holes for the “D” bars and epoxy them in place.

Construct the second course of barrier on top of the first course according to plan dimensions. Finish and cure according to Subsections 621.3.05.C and 621.3.05.D.

649.3.06 Quality Acceptance
General Provisions 101 through 150.

649.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

649.4 Measurement
Concrete glare screen is measured for payment in linear feet (meters) of accepted work of each specified height. The surface is measured along the top of the glare screen.

649.4.01 Limits
General Provisions 101 through 150.

649.5 Payment
This work will be paid for at the Contract Unit Price per linear foot (meter) for each specified height. Payment will be full compensation for furnishing materials and performing the work.

Payment will be made under:

| Item No. 649 | Concrete glare screen (height) | Per linear foot (meter) |

649.5.01 Adjustments
General Provisions 101 through 150.
Section 651—Raised Traffic Bars

651.1 General Description
This work includes furnishing and placing raised traffic bars according to the type, locations, and specifications in the plans.

651.3.04 Fabrication
General Provisions 101 through 150.
**Section 651 — Raised Traffic Bars**

### 651.3.05 Construction

#### A. Precasting

1. **Concrete**
   
   Use concrete materials, and mix and place concrete, to comply with Section 500 for Class A, Air Entrained.

2. **Forms**
   
   Use forms that meet the requirements of Section 500. Make the insides of forms accessible for tamping and vibrating the concrete.

3. **Finish**
   
   Unless otherwise specified on the Plans, finish bars according to Subsection 500.3.05.AB. For unformed areas, use Type IV—Floated Surface Finish, unbroomed. For formed areas, use Type I—Ordinary Surface Finish.

4. **Curing**
   
   Cure bars according to Subsection 500.3.05.Z, except do not use curing compound on the bottom surfaces.

#### B. Installation

Follow these steps to cement bars to the pavement:

1. Sandblast clean the highway surface of dirt, curing compound, grease, oil, moisture, loose or unsound layers, and other material that would prevent the bar adhesive from bonding.

2. Use epoxy resin type IR or IS adhesive as follows:
   
   a. Use type IR when pavement temperature is between 50 ° to 60 °F (10 ° to 15 °C), or when traffic conditions require a rapid set.
   
   b. Use type IS when pavement temperatures are above 60 °F (15 °C) and when traffic conditions permit.
   
   c. Do not place bars when pavement temperatures drop below 50 °F (10 °C).

3. Place enough adhesive on the cleaned pavement, or on the bottom of the bar, to completely cover the area of contact with no voids. Allow a slight amount of adhesive to extrude from all sides of the bar after it has been pressed into place.

4. Position the bar and press it firmly into the pavement. Immediately and completely remove excess adhesive around the edge of the bar with a clean, absorbent cloth. Do not use thinners or solvents to remove the adhesive. Protect the bar from impact until the adhesive hardens to the degree designated by the Engineer.

#### C. Adhesive Qualities

Do not use a viscous or partially set batch of adhesive that does not extrude from under the bar edges when pressed to the pavement.

Do not heat any adhesive above 120 °F (49 °C).

Prepare adhesive as follows:

1. Before combining Package A and B, thoroughly stir each package. Reject material that cannot be readily redispersed.

2. After stirring, mix one volume from Package A with one volume from Package B until obtaining a uniform color with no visible streaks of either component.

3. Cement bars in place within 10 minutes of starting to mix the adhesive.

4. To prolong the pot life of the adhesive, either let it cool after mixing the components or spread out a thin layer on a board before applying it.

5. When an approved fast setting adhesive is used, mix the components using a 2-component type automatic mixing and extrusion apparatus. Place the bars immediately after the adhesive has been mixed and extruded.
Section 651 — Raised Traffic Bars

651.3.06 Quality Acceptance
General Provisions 101 through 150.

651.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

651.4 Measurement
Complete and in-place raised traffic bars, of the type specified, are measured by the linear foot (meter) along the bottom front face of the bar.

651.4.01 Limits
General Provisions 101 through 150.

651.5 Payment
Raised traffic bars will be paid for at the Contract Unit Price per linear foot (meter). Payment is full compensation for furnishing and installing the bar.

Payment will be made under:

| Item No. 651. | Raised traffic bars, type_____ | Per linear foot (meter) |

651.5.01 Adjustments
General Provisions 101 through 150.
Section 652—Painting Traffic Stripe

652.1 General Description
This work includes furnishing and applying reflectorized high build standard and high build wet weather traffic line paint according to the plans and these specifications.
This Item also includes applying words and symbols according to plan details, specifications, and the current Manual on Uniform Traffic Control Devices.

652.1.01 Definitions
Painted Stripes: Solid or broken (skip) lines. The location and color are designated on the plans.
Skip Traffic Stripes: Painted segments with unpainted gaps as specified on the plans. The location and color are designated on the plans.

General Provisions 101 through 150.

652.2 Materials
Ensure that materials for painting traffic stripe, words, and symbols meet the following requirements:
A. Traffic Line Paint

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Traffic Line Paint 6A and 6B</td>
<td>870.2.02.A.4 and 870.2.02.A.5</td>
</tr>
</tbody>
</table>
B. Glass Spheres and Reflective Composite Optics

Use glass spheres and/or reflective composite optics for the reflective media system that ensures the high build paint pavement markings meet the reflectance performance requirements in Subsection 652.3.06. Do not use glass spheres and/or reflective composite optics containing greater than 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to the most recent US EPA Methods 3052 and 6010, or other approved methods.

Ensure glass spheres meet the requirements of AAHTO M 247. Use glass spheres produced from an approved source listed on QPL 71. Glass beads conforming to an alternative gradation may be used provided all other requirements of AASHTO M 247 and this specification are met. Obtain approval from the Office of Materials and Research to use alternate gradations.

652.2.01 Delivery, Storage, and Handling

A. Storage

Ensure the paint does not cake, liver, thicken, curdle, gel, or show any other objectionable properties after storage for six months above 32 °F (0 °C).

B. Handling

Mix thoroughly before use.

652.3 Construction Requirements

652.3.01 Personnel

General Provisions 101 through 150.

652.3.02 Equipment

A. Traveling Traffic Stripe Painter

Use a traffic stripe painter that can travel at a predetermined speed both uphill and downhill, applying paint uniformly. Ensure that the painter feeds paint under pressure through nozzles spraying directly onto the pavement.

Use a paint machine equipped with the following:

1. Three adjacent spray nozzles capable of simultaneously applying separate stripes, either solid or skip, in any pattern.

2. Nozzles equipped with the following:
   - Cutoff valves for automatically applying broken or skip lines
   - A mechanical bead dispenser that operates simultaneously with the spray nozzle to uniformly distribute glass spheres and/or reflective composite optics at an application rate to meet the reflectance performance requirements in Subsection 652.3.06.
   - Line-guides consisting of metallic shrouds or air blasts

3. Tanks with mechanical agitators

4. Small, portable applicators or other special equipment as needed

B. Hand Painting Equipment

Use brushes, templates, and guides when hand painting.

C. Cleaning Equipment

Use brushes, brooms, scrapers, grinders, high-pressure water jets, or air blasters to remove dirt, dust, grease, oil, and other foreign matter from painting surfaces without damaging the underlying pavement.
**652.3.03 Preparation**
Locate approved paint manufacturers on QPL 46.
Before starting each day's work, thoroughly clean paint machine tanks, connections, and spray nozzles, using the appropriate solvent.
Thoroughly mix traffic stripe paint in the shipping container before putting it into machine tanks.
Before painting, thoroughly clean pavement surfaces of dust, dirt, grease, oil, and all other foreign matter.

**652.3.04 Fabrication**
General Provisions 101 through 150.

**652.3.05 Construction**

**A. Alignment**
Ensure that the traffic stripe is the specified length, width, and placement. On sections where no previously applied markings are present, ensure accurate stripe location by establishing control points at spaced intervals. The Engineer will approve control points.

**B. Application**
Apply traffic stripe paint by machine. If areas or markings are not adaptable to machine application, use hand equipment.

1. **Application Rate**
   Paint will be subject to application rate checks.
   Apply 5 in (125 mm) wide traffic stripe at the following minimum rates:
   a. Solid Traffic Stripe Paint: At least 34 gal/mile (80 L/km)
   b. Skip Traffic Stripe Paint: At least 10 gal/mile (24 L/km)

   **NOTE:** Change minimum rate proportionately for varying stripe widths.

2. **Thickness**
   Maintain 25 mils (0.58mm) minimum wet average thickness above the surface of the pavement.

3. **Do not apply paint to areas of pavement when:**
   - The surface is moist or covered with foreign matter.
   - Air temperature in the shade is below 50 °F (10 °C)
   - Wind causes dust to land on prepared areas or blows paint and glass spheres and/or reflective composite optics around during application

4. **Apply a layer of glass spheres and/or reflective composite optics immediately after laying the paint. Apply glass spheres and/or reflective composite optics at a rate to meet the reflectance performance requirements in Subsection 652.3.06.**

**C. Protective Measures**
Protect newly applied paint as follows:

1. **Traffic**
   Control and protect traffic with warning and directional signs during painting. Set up warning signs before beginning each operation and place signs well ahead of the painting equipment. When necessary, use a pilot car to protect both the traffic and the painting operation.
Section 652 — Painting Traffic Stripe

2. Fresh Paint
   Protect the freshly painted stripe using cones or drums. Repair stripe damage or pavement smudges caused by traffic according to Subsection 652.3.06.

D. Appearance and Tolerance of Variance
   Continually deviating from stated dimensions is cause for stopping the work and removing the nonconforming stripe. (See Section 656—Removal of Pavement Markings.) Adhere to the following measurements:
   1. Width
      Do not lay stripe less than the specified width. Do not lay stripe more than 1/2 in. (13 mm) over the specified width.
   2. Length
      Ensure that the 10 ft. (3 m) painted skip stripe and the 30 ft. (10 m) gap between painted segments vary no more than ± 1 ft. (300 mm) each.
   3. Alignment
      a. Ensure that the stripe does not deviate from the intended alignment by more than 1 in. (25 m) on straight lines or curves of 1 degree or less.
      b. Ensure that the stripe does not deviate by more than 2 in. (50 mm) on curves exceeding 1 degree.

652.3.06 Quality Acceptance

A. General
   For a minimum of 30 days from the time of placement, ensure the high build traffic paint pavement marking material shows no signs of failure due to blistering, excessive cracking, shipping, bleeding, staining, discoloration, oil content of the pavement materials, smearing or spreading under heat, deterioration due to contact with grease deposits, oil, diesel fuel, or gasoline drippings, spilling, poor adhesion to the pavement material, vehicular damage, and normal wear. In the event that failures mentioned above occur, ensure corrective work is completed at no additional cost to the Department.
   Obtain pavement marking retro-reflectivity values with a 30-meter geometry retro-reflectometer.

B. Initial Retro-reflectivity
   1. Longitudinal Lines
      Within 30 days of installation, ensure the in-place markings meet the following minimum reflectance values:
      a. High Build Wet Weather Traffic Paint

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>100 mcd/lux/m²</td>
</tr>
</tbody>
</table>

b. High Build Standard Traffic Paint

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
</tbody>
</table>

For each center line, edge line, and skip line, measure retro-reflectivity 9 times for each mile; 3 times within the first 500 feet, 3 times in the middle, and 3 times within the last 500 feet. For projects less than one mile in length, measure retro-reflectivity 9 times as above.
   Record all retro reflectivity measurements on the form OMR CVP 66 in SOP 39.
Section 652 — Painting Traffic Stripe

2. Messages, Symbols, and Transverse Lines
   Within 30 days of installation, ensure the in-place markings when tested according to ASTM E 1710 meet the following minimum reflectance value of 275 mcd/lux/m².
   Perform at a minimum, one retro-reflectivity measurement at one message, one symbol and one transverse line per intersection. Take one measurement per mile for locations other than intersections (i.e. school messages, railroad messages, bike symbols etc.)

C. Six Month Retro-reflectivity (Longitudinal Lines)
   Maintain the following minimum reflectance values for 180 days after installation:
   a. Wet Weather High Build Wet Weather Traffic Paint

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>100 mcd/lux/m²</td>
</tr>
</tbody>
</table>

   b. High Build Standard Traffic Paint

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
</tbody>
</table>

Retest the in-place markings according to Subsection 652.3.06.B.1, 180 days after installation to ensure these minimum retroreflectance values are maintained.

NOTE: The Contractor is responsible for retro-reflectivity testing. Furnish initial test results to the Engineer within 30 days of application. Furnish 6-month test results to the Engineer within 180 days of application or prior to final acceptance, whichever comes first.

D. Thickness
   At the time of installation, check the thicknesses on all skip lines, edge lines and center lines according to ASTM D 4114.
   For each center line, edge line, and skip line, measure thickness above the pavement 3 times for each mile; once within the first 500 ft., once in the middle, and once within the last 500 ft. For projects less than one mile in length, measure the thickness above the pavement 3 times.
   Record thickness measurements on the form OMR CVP 66 in SOP 39.
   Submit results to the Engineer.

E. Corrective Work
   For each mile section, if paint stripe fails to meet plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, perform it according to Section 656 and place it according to this specification. No additional payment will be made for removal and replacement of unsatisfactory striping. Ensure corrective work is completed at no additional cost to the Department. Perform testing according to this specification. Any retest due to failures will be performed at no additional cost to the Department. Furnish all test reports to the Department.

   Retro-reflectivity and Thickness Longitudinal Line Deficiency: A deficiency will ensure when two or more Location Average results as recorded on form OMR CVP 66 within a One-Mile Section do not meet the performance criteria herein. The entire line within this one-mile section will be determined to be deficient. If the evaluated section is less than 1.0 mile, a single Location Average result not meeting the performance criteria herein will result in the entire line to be determined to be deficient.
Retro-reflectivity Transverse Markings and Symbol Deficiency: A single Location Average result on the marking or symbol not meeting the performance criteria herein will result in the marking or symbol to be determined to be deficient.

F. Acceptance Criteria

Ensure that stripes and segments of stripes are clean-cut and uniform. Markings that do not appear uniform or satisfactory, either during the day or night, or do not meet specifications, will be corrected at the Contractor’s expense. Paint will be subject to application rate checks.

1. Correction of Alignment

When correcting a deviation that exceeds the permissible tolerance in alignment, do the following:

a. Remove the affected portion of stripe, plus an additional 25 ft. (8 m) in each direction according to Section 656—Removal of Pavement Markings.

b. Paint a new stripe according to these specifications.

2. Removal of Excess Paint

Remove misted, dripped, or spattered paint to the Engineer’s satisfaction. Do not damage the underlying pavement during removal.

Refer to the applicable portions of Section 656—Removal of Pavement Markings.

652.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

652.4 Measurement

When traffic stripe is paid for by the square yard (meter), the number of square yards (meters) painted is measured and the space between stripes is included in the overall measurement.

Linear measurements are made on the painted surface by an electronic measuring device attached to a vehicle. On curves, chord measurements, not exceeding 100 linear feet (30 linear meters), are used.

Traffic stripe and markings, complete in place, are measured and accepted for payment as follows:

A. Solid Traffic Stripe

Solid traffic stripe is measured by the linear foot (meter), linear mile (kilometer), or square yard (meter). Breaks or omissions in solid lines or stripes at street or road intersections are not measured.

B. Skip Traffic Stripe

Skip traffic stripe is measured by the gross linear foot (meter) or gross linear mile (kilometer). Unpainted spaces between the stripes are included in the overall measurements if the plan ratio of 1 to 3 remains uninterrupted. Measurement begins and ends on a stripe.

C. Pavement Markings

Markings are words and symbols completed according to plan dimensions. Markings are measured by the unit.

652.4.01 Limits

General Provisions 101 through 150.
Section 652 — Painting Traffic Stripe

652.5 Payment
Payment will be full compensation for the work under this section, including the following:

- Cleaning and preparing surfaces
- Furnishing materials, including paints, beads, and thinners
- Applying, curing, and protecting paints
- Protecting traffic, including providing and placing necessary warning signs
- Furnishing tools, machines, and other equipment necessary to complete the Item

Payment will be made under:

652.4.01 Adjustments
General Provisions 101 through 150.
Section 653—Thermoplastic Traffic Stripe

653.1 General Description
This work includes furnishing and applying standard, wet weather, and audible profiled thermoplastic reflectorized pavement marking compound. Ensure markings conform to plan details and locations, these specifications, and the Manual on Uniform Traffic Control Devices.

Thermoplastic traffic stripe consists of solid or broken (skip) lines, words, and symbols according to plan color, type, and location.

653.1.01 Definitions
Thermoplastic Marking Compound: A heated compound extruded or mechanically sprayed on the pavement that cools to pavement temperature. When combined with glass spheres and/or reflective composite optics it produces a reflectorized pavement marking.

Short Lines: Crosswalks, stop bars, arrows, symbols, and crosshatching. Extrude short lines rather than spraying them on.

   EPA Method 7000A
Section 653 — Thermoplastic Traffic Stripe

653.1.03 Submittals

Ensure the producers of the thermoplastic compound and the producers of both the intermix and drop-on glass spheres furnish to the Department copies of certified test reports showing results of all tests specified in this Section. Also ensure that producers certify that the materials meet the other requirements of this Section by submitting copies of certification at the time of sampling.

653.2 Materials

A. General Characteristics of Thermoplastic

Use thermoplastic material produced from an approved source listed on QPL 46. Use thermoplastic material that meets the requirements of AASHTO M 249 with the following exceptions:

1. Material Composition

   Ensure the resin of the thermoplastic material is an alkyd binder. Ensure the alkyd binder consists of a mixture of synthetic resins and a high boiling point plasticizer. Ensure at least one synthetic resin is a solid at room temperature. Ensure at least 50 percent of the binder composition is 100 percent maleic-modified glycerol ester resin. Ensure at least 18 percent by weight of the entire material formulation consists of binder. Do not use alkyd binder that contains petroleum-based hydrocarbon resins. Ensure the finished thermoplastic material is not adversely affected by contact with pavement materials or by petroleum droppings from traffic. Use thermoplastic material that has been evaluated (2-year field evaluation) by the National Transportation Product Evaluation Panel (NTPEP) test facility or other approved test facility.

2. Suitability for Markings

   Use thermoplastic material that is especially compounded for traffic markings and has the following characteristics:
   - Prevents markings from smearing or spreading under normal traffic conditions at temperatures below 120 °F (49 °C)
   - Gives a uniform cross section, with pigment evenly dispersed throughout the material
   - Has a uniform material density and character throughout its thickness
   - Allows the stripe to maintain its original dimensions and placement
   - Ensures that the exposed surface is free from tack and is not slippery when wet
   - Does not lift from the pavement in freezing weather
   - Has cold ductility properties that permit normal movement with the road surface without chipping or cracking
3. Color

Confirm the color of thermoplastic by providing data from the manufacturer to the Area Manager as follows:

a. White – Use titanium dioxide that meets the requirements of ASTM D 476, Type II, Rutile, as the pigment for white thermoplastic material. Do not use anatase titanium dioxide pigment. Ensure thermoplastic material is free from dirt or tint. Ensure white thermoplastic material heated for 240 ± 5 minutes at 425 ± 3 °F (218 ± 3 °C) and cooled to 77 ± 3 °F (25 ± 2 °C) matches Federal Test Standard Number 695B-Color 17925. Ensure that the Y tristimulus value is measured to be a minimum value of 45. Ensure the material, when compared to the magnesium oxide standard using a standard color spectrophotometer according to ASTM D 4960, meets the following:

<table>
<thead>
<tr>
<th>Scale</th>
<th>Definition</th>
<th>Magnesium Oxide Standard</th>
<th>Sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rd</td>
<td>Reflectance</td>
<td>100</td>
<td>75 min.</td>
</tr>
<tr>
<td>a</td>
<td>Redness-Greenness</td>
<td>0</td>
<td>-5 to + 5</td>
</tr>
<tr>
<td>b</td>
<td>Yellowness-Blueness</td>
<td>0</td>
<td>-10 to + 10</td>
</tr>
</tbody>
</table>

b. Yellow – Use only non-hazardous pigments as defined by the Resource Conservation and Recovery Act (RCRA) Subarticle C rules, table 1 of 40 CFR 261.24 “Toxicity Characteristic”. Do not use yellow thermoplastic containing more than 3.0 ppm lead by weight when tested in accordance with the most recent EPA Methods 3050 and 6010 or 7000. Ensure yellow thermoplastic material heated for 240 ± 5 minutes at 425 ± 3 °F (218 ± 2 °C) and cooled to 77 ± 3 °F (25 ± 2 °C) matches AMS-STD-595. Ensure that the Y tristimulus value is measured to be a minimum value of 45. Ensure the material, when compared to PR#1 Chart using a standard color spectrophotometer according to ASTM D 4960, plots within the following chromaticity coordinates:

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>0.455</td>
<td>0.510</td>
<td>0.472</td>
<td>0.530</td>
</tr>
<tr>
<td>Y</td>
<td>0.444</td>
<td>0.485</td>
<td>0.400</td>
<td>0.456</td>
</tr>
</tbody>
</table>

c. Black – The black pigment must produce a completely opaque, black stripe when applied on the road and after 70 hr of weatherometer exposure in accordance with ASTM G 155 using Exposure Cycle 1 with a quartz inner filter glass and Type “S” Borosilicate outer filter glass. Ensure that Y tristimulus value is measured to be a maximum value of 5.

d. Ensure the in-service daytime chromaticity for yellow, white, and black material plots within the following coordinates after a period of 30 days:

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
</tr>
</thead>
<tbody>
<tr>

<td>0.429</td>
<td>0.510</td>
<td>0.485</td>
</tr>
<tr>
<td>Black</td>
<td>0.355</td>
<td>0.355</td>
<td>0.305</td>
<td>0.305</td>
</tr>
</tbody>
</table>
4. **Indentation Resistance**
   Measure the hardness by a Shore Durometer, Type A2, as described in ASTM D 2240. Maintain the temperature of the Durometer, 4.4 lb. (2 kg) load and the specimen for 2 hours at 115 °F (45 °C). Apply the Durometer and 4.4 lb. (2 kg) load to the specimen. The reading must fall between 50 to 75 units, after 15 seconds.

5. **Reheating**
   Ensure that the compound does not break down, deteriorate, scorch, or discolor if held at application temperature of 425 °F (218 °C) for 6 hours and if reheated up to 4 times to the application temperature. Ensure that the color of white and yellow thermoplastic comply with Subsection 653.2.A.3.a and Subsection 653.2.A.3.b after prolonged heating or reheating.

6. **Intermixed Glass Spheres and Reflective Composite Optics**
   Ensure glass spheres meet the requirements of AASHTO M 247.
   Do not use glass spheres and/or reflective composite optics containing greater than 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to US EPA Methods 3052 and 6010C, or other approved methods.

7. **Flashpoint**
   Ensure the thermoplastic flashpoint is not less than 500 ºF (260 °C) as determined by ASTM D 92.

B. **Drop-On Glass Spheres and Reflective Composite Optics**
   Ensure glass spheres meet the requirements of AASHTO M 247. Use spheres produced from an approved source listed on QPL 71. Glass spheres conforming to an alternative gradation may be used provided all other requirements of AASHTO M 247 and this specification are met. Do not use glass spheres and/or reflective composite optics containing greater than 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to US EPA Methods 3052 and 6010C, or other approved methods.

C. **Sealing Primer**
   Place the particular type of binder-sealer at the application rate as recommended in writing by the thermoplastic material manufacturer.

653.2.01 Delivery, Storage, and Handling
Use material delivered in 50 lb. (22.7 kg) unit cardboard containers or bags strong enough for normal handling during shipment and on-the-job transportation without loss of material.

Ensure that each unit container is clearly marked to indicate the following:
- Color of the material
- Process batch number or similar manufacturer’s identification
- Manufacturer’s name
- Address of the plant
- Date of manufacture
653.3 Construction Requirements

653.3.01 Personnel
General Provisions 101 through 150.

653.3.02 Equipment
Depending on the marking required, use hand equipment or truck-mounted application units on roadway installations.

A. Application Machine
   Ensure that each application machine is equipped with the following features:
   - Parts continuously mix and agitate the material.
   - Truck-mounted units for lane, edge, and center lines operate at a uniform, predetermined rate of speed, both uphill and downhill, in order to produce a uniform application of striping material and capable of following straight lines and making normal curves in a true arc.
   - Conveying parts between the main material reservoir and the shaping die or gun prevent accumulation and clogging.
   - Parts that contact the material are easily accessible and exposable for cleaning and maintenance.
   - Mixing and conveying parts, including the shaping die or gun, maintain the material at the plastic temperature with heat transfer oil or electrical element-controlled heat. Do not use an external source of direct heat.
   - Parts provide continuously uniform stripe dimensions.
   - Applicator cleanly and squarely cuts off stripe ends and applies skip lines. Do not use pans, aprons, or similar appliances that the die overruns.
   - Parts produce varying widths of traffic markings.
   - Applicator is mobile and maneuverable enough to follow straight lines and make normal curves in a true arc.

B. Automatic Bead Dispenser
   Apply glass spheres and/or reflective composite optics to the surface of the completed stripe using a dispenser attached to the striping machine to automatically dispense the beads/optics instantaneously upon the installed line. Synchronize the glass sphere/optics dispenser cutoff with the automatic cutoff of the thermoplastic material.

C. Special Kettles
   Use special kettles for melting and heating the thermoplastic material. Use kettles equipped with automatic thermostatic control devices that provides positive temperature control and prevents overheating. Ensure that the applicator and kettles are equipped and arranged according to the requirements of the National Fire Underwriters.

D. Hand Equipment
   Use hand equipment for projects with small quantities of lane lines, edge lines, and center lines, or for conditions requiring the equipment. Use hand equipment approved by the Engineer.
   Ensure hand equipment can hold 150 lbs. (68 kg) of molten material and is maneuverable to install crosswalks, arrows, legends, lane, edge, and center lines.

E. Auxiliary Vehicles
   Supply the necessary auxiliary vehicles for the operation.

653.3.03 Preparation
For asphaltic concrete pavement, do not begin placement of thermoplastic striping until 15 calendar days after completion of the final surface course.

653.3.04 Fabrication
General Provisions 101 through 150.
653.3.05 Construction

A. General Application

Notify the Engineer prior to the placement of the thermoplastic materials. Furnish the Engineer with the manufacturer’s name and batch numbers of the thermoplastic materials and glass spheres to be used. Ensure that the approved batch numbers appear on the thermoplastic materials and glass spheres packages.

Thoroughly clean pavement areas to be striped. Use hand brooms, rotary brooms, air blasts, scrapers, or other approved methods that leave the pavement surface clean and undamaged. Take care to remove all vegetation and road film from the striping area. Ensure all new Portland cement concrete pavement surfaces are mechanically wire brushed or abrasive cleaned to remove all laitance and curing compound before being striped.

Lay stripe with continuous uniform dimensions.

Apply the type of stripe at each location according to the Plans, using one of the following methods:

- Spray techniques
- Extrusion methods wherein one side of the shaping die is the pavement and the other three sides are contained by or are part of the suitable equipment to heat and control the flow of material.
- Extrusion methods using a pressurized ribbon gun to control the application of material.

1. Temperature

Apply thermoplastic traffic stripe only when the pavement temperature in the shade is above 40 °F (4 °C). To ensure optimum adhesion, install the thermoplastic material in a melted state at the manufacturer’s recommended temperature but not at less than 375 °F (190 °C).

2. Moisture

Do not apply when the surface is moist. When directed by the Engineer, perform a moisture test on the Portland cement concrete pavement surface. Perform the test as follows:

   a. Place approximately 1 yd² (1m²) of roofing felt on the pavement surface.
   b. Pour approximately 1/2 gallon (2 L) of molten thermoplastic onto the roofing felt.
   c. After 2 minutes, lift the roofing felt and inspect to see if moisture is present on the pavement surface or underside of the roofing felt.
   d. If moisture is present, do not proceed with the striping operation until the surface has dried sufficiently to be moisture free.

3. Sealing Primer

To ensure optimum adhesion, apply a binder-sealer material before installing the thermoplastic in each of the following cases:

   • Where directed by the Engineer for sprayed thermoplastic
   • Old asphaltic concrete pavements with exposed aggregates
   • Portland cement concrete pavements
   • Bridge Deck Polmer Overlay

Ensure that the binder-sealer material forms a continuous film that mechanically adheres to the pavement and dries rapidly. Use a binder-sealer currently in use and recommended by the thermoplastic material manufacturer according to QPL 46.

Apply the binder-sealer immediately in advance of, but concurrent with, the application of the thermoplastic material. Apply in a continuous film over the pavement surface.

4. Bonding to Old Stripe

If the old stripe is to be renewed by overlaying with new material, ensure the new material bonds to the old line without splitting or cracking.

5. Offset from Construction Joints

Off-set longitudinal lines at least 2 in (50 mm) from construction joints of Portland cement concrete pavements.
6. Crosswalks, Stop Bars, and Symbols
Make crosswalks, stop bars, and symbols at least 3/32 in (2.4 mm) thick at the edges and no more than 3/16 in (4.8 mm) thick at the center.

7. Thickness
a. Maintain the following minimum average dry thicknesses above the surface on all types of pavements
   - 0.090 in. (2.3 mm) * for lane lines
   - 0.060 in. (1.5 mm) * for edge lines
   - 0.120 in. (3.0 mm) * for gore area lines
   - 0.120 in. (3.0 mm) * for polymer overlay edge lines and lane lines
   (See below for '*' reference.)

   Compute the minimums by the amount of material used each day, as follows:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(For 6 in wide stripe)</td>
<td>* Average Thickness (in) =</td>

</tr>
</tbody>
</table>

b. Audible Profiled Thermoplastic – Apply a flat edge line having a thickness of 0.100 inches – 0.150 inches (100 mils – 150 mils) above the surface on all types of pavements, exclusive of bumps.

8. Glass Spheres and Reflective Composite Optics
a. Apply glass spheres and/or reflective composite optics to installed stripe surface above the minimum rate recommended by the thermoplastic material manufacturer to produce the required retro-reflectivity value in accordance with Subsection 653.3.06.

b. Apply the glass sphere and/or reflective composite optics top-coating with a pressure-type gun specifically designed for applying glass spheres and/or reflective composite optics that will embed at least one-half of the sphere’s and optic’s diameter into the thermoplastic immediately after the material has been applied to the pavement.

c. Audible Profiled Thermoplastic– Apply glass sphere and/or reflective composite optics to all markings at the rates determined by the manufacturer’s recommendations as identified in the APL system.

9. Dimensions of Raised Bumps:
a. Apply the raised bumps with a profile such that the leading and trailing edges are sloped at a sufficient angle to create an audible and vibratory warning.

b. Bumps on the edge line and centerline marking shall be at least 0.45 in. (11 mm) at the highest point of the bump, above the pavement surface including the base line. The height measures after the application of the drop-on retroreflective elements or glass spheres.

c. Bumps shall have a minimum baseline coverage dimension of 2.5 in. (65 mm) in both the transverse and longitudinal directions.

d. The bumps may have a drainage channel. The width of each drainage channel will not exceed 0.25 in. (6 mm) at the bottom of the channel. The longitudinal distance between bumps shall be approximately 30 in. (762 mm).

---

\]
B. Removing Existing Stripe

Remove existing stripe according to Section 656.

Remove 100 percent of existing traffic stripe from:

- Portland cement concrete pavement where the new stripe will be placed at the same location as the existing marking
- Pavement where the new stripe will be placed at a different location from the existing markings

C. Tolerance and Appearance

a. No traffic stripe shall be less than the specified width and shall not exceed the specified width by more than 1/2 in. (13 mm). The length of the 15 ft. (4.5 m) segment for skip stripe and the 25 ft. (7.5 m) gap between segments may vary plus or minus 1 ft. (300 mm). The alignment of the stripe shall not deviate from the intended alignment by more than 1 in. (25 mm) on straight lines. On curves up to and including 1 degree (radius of 1745 m or greater), the alignment of the stripe shall not deviate from the intended alignment by more than 1 in. (25 mm). On curves exceeding 1 degree (radius less than 1745 m), the alignment of the stripe shall not deviate from the intended alignment by more than 2 in. (50 mm).

b. Stop work when deviation exceeds the above dimensions and remove the nonconforming stripe.

c. No more than 1 percent of the bumps or more than three consecutive bumps are missing or broken (less than half a bump remaining) within the first 45 days under traffic, replace all failed bumps at no cost to the Department.

d. If the bumps are replaced and more than 2 percent of the replaced bumps fail within the first 45 days under traffic, the replacement period will be extended an additional 45 days from the date all replacement bumps were installed.

e. If at the end of the additional 45 days more than 2 percent of all bumps (initial and replacement) fail, replace all failed bumps at no expense to the Department.

D. Traffic Marking Protection (Audible Profile Thermoplastic)

Do not allow traffic onto or permit vehicles to cross newly applied pavement markings until they are sufficiently dry. Remove and replace any portion of the pavement markings damaged by passing traffic or from any other cause, at no additional cost to the Department.

653.3.06 Quality Acceptance

A. General

For a minimum of 30 days from the time of placement, ensure the thermoplastic pavement marking material and/or audible profiled thermoplastic shows no signs of failure due to blistering, excessive cracking, chipping, bleeding, staining, discoloration, oil content of the pavement materials, smearing or spreading under heat, deterioration due to contact with grease deposits, oil, diesel fuel, or gasoline drippings, spilling, poor adhesion to the pavement material, vehicular damage, and normal wear. In the event that failures mentioned above occur, ensure corrective work is completed at no additional cost to the Department.

Obtain pavement marking retroreflectivity values with a 30-meter geometry retro-reflectometer.

B. Initial Retroreflectivity

1. Longitudinal Lines

Within 30 days of installation, ensure the in-place markings meet the following minimum reflectance values:

a. Standard

<table>
<thead>
<tr>
<th>Condition</th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>

b. Wet Weather

<table>
<thead>
<tr>
<th>Condition</th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>125 mcd/lux/m²</td>
</tr>
</tbody>
</table>
c. Audible Profile Thermoplastic

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
</tbody>
</table>

For each center line, edge line, and skip line, measure retroreflectivity 9 times for each mile; 3 times within the first 500 ft. (152 m), 3 times in the middle, and 3 times within the last 500 ft. (152 m). For projects less than one mile (1600 m) in length, measure retroreflectivity 9 times as above.

Record all retroreflectivity measurements on the form OMR CVP 66 in SOP 39.

2. Messages, Symbols, and Transverse Lines

At the time of installation, ensure the in-place markings when tested according to ASTM E 1710 meet the following minimum reflectance value of 275 mcd/lux/m².

Perform at a minimum, one retroreflectivity measurement at one message, one symbol and one transverse line per intersection. Take one measurement per mile (1600 m) for locations other than intersections (i.e. school messages, railroad messages, bike symbols etc.)

C. Six Month Retroreflectivity (Longitudinal Lines)

Maintain the following minimum reflectance values for 180 days after installation:

1. Standard

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>

2. Wet Weather

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>125 mcd/lux/m²</td>
</tr>
</tbody>
</table>

3. Audible Profile Thermoplastic

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>300 mcd/lux/m²</td>
<td>250 mcd/lux/m²</td>
</tr>
</tbody>
</table>

Retest the in-place markings according to Subsection 653.3.06.B.1, 180 days after installation to ensure these minimum retro-reflectance values are maintained.

**NOTE:** The Contractor is responsible for retro-reflectivity testing. Furnish initial test results to the Engineer within 30 days of application. Furnish additional testing for a period that totals 180 days from initial application or the stoppage of contract time, whichever comes first.

D. Thickness

1. New Striping

Check the thicknesses on all skip lines, edge lines and center lines with an approved traffic marking thickness gage consisting of 3 dials as follows:

For each center line, edge line, and skip line, measure thickness above the pavement 3 times for each mile (1600 m); once within the first 500 ft. (150 m), once in the middle, and once within the last 500 ft. (150 m). For projects less than one mile (1600 m) in length, measure the thickness above the pavement 3 times.

Record all thickness measurements on the form OMR CVP 66 in SOP 39.

2. Recapping Refurbishment Thermoplastic

Place durable tape, film, or metal plate of known and uniform thickness on an area to be striped. After the stripper has passed over, remove the sample and measure the thickness with calipers or a micrometer.

For each center line, edge line, and skip line, measure thickness above the pavement 3 times for each mile (1600 m); once within the first 500 ft. (150 m), once in the middle, and once within the last 500 ft. (150 m). For projects less than one mile (1600 m) in length, measure the thickness above the pavement 3 times.

Submit results to the Engineer.
3. Audible Profiled Thermoplastic

Ensure the thickness of white and yellow pavement marking conform to Subsection 653.3.05.A.7.b

Record all thickness measurements on the form OMR CVP 66 in SOP 39 and submit to the Engineer.

The Engineer will verify the thickness of the pavement marking in accordance with Subsection 653.3.05.A.7.b within 30 days of receipt of the Contractor’s certification.

Thickness measurement may be performed using a strong adhesive tape to install a metal plate (approximately 6 inches (150 mm) wide by 8 inches (200 mm) long, the thickness of the plate can by 1/8 inch (3 mm) as long as the plate does not deform) to the roadway where the pavement marking will be placed. After the material has dried remove the plate and check the thickness of the pavement marking material on the plate with a micrometer.

E. Corrective Work

For each mile (1600 m) section, if the thermoplastic traffic stripe fails to meet Plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, perform it according to Section 656 and place it according to this specification. No additional payment will be made for removal and replacement of unsatisfactory striping. Ensure corrective work is completed at no additional cost to the Department. Perform testing according to this specification. Any retest due to failures will be performed at no additional cost to the Department. Furnish all test reports to the Department.

Retro-reflectivity and Thickness Longitudinal Line Deficiency: A deficiency will ensue when two or more Location Average results as recorded on form OMR CVP 66 within a One-Mile (1600 m) Section do not meet the performance criteria herein. The entire line within this one-mile (1600 m) section will be determined to be deficient. If the evaluated section is less than 1.0 mile (1600 m), a single Location Average result not meeting the performance criteria herein will result in the entire line to be determined to be deficient.

Retro-reflectivity Transverse Markings and Symbol Deficiency: A single Location Average result on the marking or symbol not meeting the performance criteria herein will result in the marking or symbol to be determined to be deficient.

653.07 Verification

See SOP 39

653.4 Measurement

When stripe will be paid for by the square yard (meter), the actual number of square yards (meters) painted will be measured. The space between the stripes will be included in the overall measurement.

Linear measurements may be made by electronic measuring devices attached to a vehicle.

Thermoplastic traffic stripe, complete in place and accepted, is measured as follows:

A. Solid Traffic Stripe (Including Audible Stripe)

Stripe is measured by the linear foot (meter), linear mile (kilometer), or square yard (meter). Breaks or omissions in solid lines or stripes at street or road intersections are not measured for payment.

B. Skip Traffic Stripe

Skip stripe is measured by the gross linear mile (kilometer) as specified. The unpainted space between the painted stripes is included in the overall measurement if the plan ratio of one to three (15 ft. [4.5 m] segment and 25 ft. [7.5 m] gap or other patterns as designated on the plans) remains uninterrupted. Measurement begins and ends on a stripe.

C. Words and Symbols

Each word or symbol complete according to plan dimensions is measured by the Unit.

653.01 Limits

General Provisions 101 through 150.
Section 653 — Thermoplastic Traffic Stripe

653.5 Payment
Payment is full compensation for the Work under this section, including:

- Cleaning and preparing surfaces
- Furnishing all materials
- Applying, curing, and protecting stripe
- Protecting traffic, including providing necessary warning signs
- Furnishing tools, machines, and other equipment necessary to complete the Item

Measurement and payment for removing pavement markings will be according to Section 656 when shown in the Proposal as a payment Item. Otherwise, removal will not be paid for separately, but will be included in the payment for other Work under this section.

Payment will be made under:

</tbody>
</table>

654.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

654.3 Construction Requirements

654.3.01 Personnel
General Provisions 101 through 150.
654.3.02 Equipment
Before beginning construction, clean marker replacement equipment and ensure that it is mechanically sound.

A. Containers and Stirring Devices
   Clean containers and stirring devices (paddles, propellers for drills, etc.) before hand-mixing epoxy.

B. Automatic Mixing Device
   1. Cleaning
      Clean the mixing head to the automatic epoxy mixing equipment after stopping work for any extended period of time. The length of down-time allowed depends on the pot life of the adhesive system being used.
   2. Mixing Ratio
      Use an automatic mixing device that delivers separate components to the mixing head in a one-to-one ratio by volume.
   3. Sample Valves
      Equip the lines feeding the mixing head with suitable valves to allow samples to be taken for checking the ratio of each component.

C. Bituminous Adhesive Equipment
   Clean and maintain equipment for melting, stirring, and dispensing bituminous adhesive according to the bituminous adhesive manufacturer’s requirements.

654.3.03 Preparation
General Provisions 101 through 150.

654.3.04 Fabrication
General Provisions 101 through 150.

654.3.05 Construction
A. Adhesive Types
   Cement markers to pavement surfaces with a Type I-R Epoxy or Type I-S Epoxy (see Section 886), or with a bituminous adhesive (see Section 868). Space markers according to the plans.
   1. Type I-R Epoxy. Use Type I-R Epoxy when the pavement temperature is above 50 °F (10 °C), or when traffic conditions require a rapid setting system.
   2. Type I-S Epoxy. Use Type I-S Epoxy when the pavement temperature is above 60 °F (15 °C) and traffic conditions permit a slower setting system.
   3. Bituminous Adhesive. Use bituminous adhesive when the pavement temperature is above 40 °F (4 °C) or when traffic conditions require a rapid setting material.

B. Handling and Applying Adhesives
   Obtain an epoxy adhesive furnished as two separate components. Combine and use the components as follows:
   1. Immediately before use, thoroughly stir the individual components with separate paddles. Reject material permanently increasing in viscosity or showing settling of pigments, filler, or thixotropic additives that cannot be readily redispersed.
   2. After stirring or agitating the two separate components, mix them in a one-to-one ratio and blend thoroughly until obtaining a uniform color without streaks.
   3. At time of mixing, ensure that the temperature of both components is 60 ° to 80 °F (15 ° to 27 °C). If necessary, heat components using indirect heat to avoid locally overheating and decomposing the material. Do not heat adhesive above 120 °F (49 °C).
4. Place markers between the start of mixing the epoxy system and the termination of the pot life. The Engineer will designate the allowable pot life based on environmental factors. Never use a partially set mixed system that does not readily extrude around the perimeter of the marker when pressed to the roadway.

5. When using an approved fast-setting epoxy system, mix the separate components with a two-component type automatic mixing and extrusion apparatus, and place markers immediately.

6. Use bituminous adhesive furnished in approximately 30 lb. (14 kg) cubes.
   a. Heat the cubes in an oil-jacketed melting pot.
   b. Maintain the bituminous adhesive at the manufacturer-recommended temperature during placement of the markers.
   c. Discard bituminous adhesive heated above 450 °F (232 °C).

C. Placement of Markers

1. Surface Cleaning
   Clean pavement of dirt, curing compound, grease, oil, paint, moisture, loose or unsound layers, or other material that would impair the bond between the adhesive and the roadway.
   a. Use either sand-blasting or grinding equipment to clean. Remove the dust before placing the marker.
   b. Provide cleaning equipment air lines with suitable traps to prevent oil or moisture from being redeposited on the road surface.

2. Placement Limits
   Place markers as follows:
   a. Do not place markers over joints in rigid pavement.
   b. Do not place markers when pavement temperature is below 40 °F (4 °C).
   c. When possible, wait 60 to 90 days before placing markers using epoxy adhesive on newly constructed asphaltic concrete pavements.

3. Marker Placement Using Epoxy Adhesives
   Place markers using epoxy adhesives as follows:
   a. Place enough adhesive on the cleaned pavement or the bottom of the marker to completely cover the contact area of the marker.
   b. Press the marker firmly to the pavement.
   c. Allow a slight bead of epoxy adhesive to extrude from under the marker edges.
   d. Remove adhesive on the face of the marker or adhesive that obscures the marker. Do not use thinners or solvents to clean epoxy adhesives from the markers.

4. Marker Placement Using Bituminous Adhesives
   Place markers using bituminous adhesives as follows:
   a. Place enough bituminous adhesive on the cleaned pavement or the bottom of the marker to completely cover the contact area of the marker.
   b. Press the marker firmly to the pavement.
   c. Allow a slight bead of adhesive to extrude from under the marker edges.
   d. Remove adhesive on the face of the marker or adhesive that obscures the marker.
   e. Place the marker before the bituminous adhesive cools and does not extrude around the perimeter of the marker when pressed to the roadway.

654.3.06 Quality Acceptance
Refer to QPL 74 for raised pavement markers that have met these requirements.
Section 654 — Raised Pavement Markers

**654.3.07 Contractor Warranty and Maintenance**
General Provisions 101 through 150.

**654.4 Measurement**
The number of each type of installed and accepted pavement marker is counted separately for payment.

**654.4.01 Limits**
General Provisions 101 through 150.

**654.5 Payment**
Raised pavement markers will be paid for at the Unit Price for each Unit of each type. Payment is full compensation for furnishing and installing each marker.

When designated, payment will also include recessing the marker.

Payment will be made under:

<table>

655.3.02 Equipment
General Provisions 101 through 150.

655.3.03 Preparation
General Provisions 101 through 150.

655.3.04 Fabrication
General Provisions 101 through 150.

655.3.05 Construction
Install the raised markers for pavement arrows according to Subsection 654.3.05.

A. Painted Arrows
   Apply painted arrows according to Section 652.

B. Thermoplastic Arrows
   Except as noted below, place thermoplastic according to Section 653. Do not sand blast arrows to be coated with thermoplastic.
   1. Apply thermoplastic 125 mils (3.18 mm) thick.
   2. Screed or level the thermoplastic.
   3. Immediately embed the raised reflector in the molten thermoplastic.

C. Preformed Plastic Pavement Markings
   Apply preformed plastic pavement markings according to Section 657.

655.3.06 Quality Acceptance
General Provisions 101 through 150.

655.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

655.4 Measurement
Each type of arrow is measured by the Unit.

655.4.01 Limits
General Provisions 101 through 150.

655.5 Payment
Each arrow will be paid for per Unit placed. Payment is full compensation for furnishing materials, cleaning, and installing the completed arrow with raised reflectors.
### Section 655 — Pavement Arrow with Raised Reflectors

Payment will be made under:

656.1.03 Submittals
General Provisions 101 through 150.

656.2 Materials
General Provisions 101 through 150.

656.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

656.3 Construction Requirements
656.3.01 Personnel
General Provisions 101 through 150.

656.3.02 Equipment
General Provisions 101 through 150.

656.3.03 Preparation
General Provisions 101 through 150.

656.3.04 Fabrication
General Provisions 101 through 150.

656.3.05 Construction
Remove pavement markings before changing the traffic pattern. This specification does not relieve the Contractor of the responsibilities in Section 150 or Subsection 107.07.

Utilize blasting, such as sand blasting or water blasting, grinding, or other approved methods to completely remove pavement markings without materially damaging the pavement surface or texture. Repair (at the Contractor’s expense) damage to the pavement or other surface from removing the markings. Use repair methods acceptable to the Engineer.
Section 656—Removal of Pavement Markings

A. Blast Cleaning

Do not allow sand and other debris to accumulate and interfere with drainage or create a traffic hazard.

1. When blast cleaning within 10 ft. (3 m) of a lane occupied by public traffic, immediately remove residue and dust when the sand hits the pavement surface.

2. Use a vacuum attachment operating simultaneously with blast cleaning, or use other methods approved by the Engineer.

3. Ensure that sand for blast cleaning conforms to Section 804.

656.3.06 Quality Acceptance

General Provisions 101 through 150.

656.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

656.4 Measurement

Removal of existing pavement markings is measured by the linear foot (meter), linear mile (kilometer), gross linear foot (meter), gross linear mile (kilometer), or square yard (meter) of the designated width and the type of stripe.

Where removal of traffic markings will be paid for by the square yard (meter), the actual number of square yards (meters) removed will be paid for. The space between the stripes or letters will be included in the overall measurement.

Removal of words in existing traffic markings is measured per each word removed.

656.4.01 Limits

General Provisions 101 through 150.

656.5 Payment

When shown as a Pay Item on the Plans, payment for removing pavement markings will be at the Contract Unit Price for the Unit. Payment is full compensation for furnishing materials, labor, equipment, and traffic control necessary to perform the work.

Payment will be made under:

<table>
<thead>
<tr>

QPL 74
SOP 39

657.1.03 Submittals
Transfer to the Department manufacturer warranties or guarantees for heat-applied and wet reflective preformed plastic marking materials. Ensure that warranties or guarantees state that they are subject to transfer.

657.2 Materials
Select one of the following types of preformed marking material according to the plans and proposal:

- Type TR – Temporary Removable Plastic Marking
- Type TN – Temporary Non-Removable Plastic Marking
- Type PA – Permanent Plastic Marking
- Type PB – Permanent Patterned Plastic Marking
- Type PB-WR – Permanent Patterned Wet Reflective Plastic Markings

For a list of sources, see QPL-74.
Section 657 — Preformed Plastic Pavement Markings

A. General Requirements for Preformed Pavement Markings

1. Shapes and Sizes
   Use markings that conform to the shapes and sizes outlined in the Manual on Uniform Traffic Control Devices for Streets and Highways.

2. Pigmentation
   Use white or yellow pigmented plastic according to each marking type.

3. Adhesion
   Use markings that can be affixed to bituminous or Portland cement concrete pavements by pressure-sensitive precoated adhesive or a liquid contact cement.
   Ensure that marking adhesive adheres to the roadway under normal climactic and traffic conditions.

4. Conformability
   Use markings that will mold to pavement contours, breaks, faults, and the like, by normal action of traffic at normal pavement temperatures.

5. NTPEP Evaluation
   Use markings evaluated by the National Transportation Product Evaluation Program (NTPEP).

6. Glass Spheres and/or Reflective Composite Optics
   Use markings with a layer of glass spheres and/or reflective composite optics bonded to the surface according to the marking type. Type PB and PB-WR contain glass beads and/or reflective composite optics. Types TR, TN, and PA contain only glass beads.
   Do not use glass spheres and/or reflective composite optics containing greater than 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to US EPA Methods 3052 and 6010C, or other approved methods.
   Use glass spheres with less than 2% by weight showing any milkiness, scoring or scratching. Use clear, transparent spheres that are free from air inclusions and conform to the following:

<table>
<thead>
<tr>
<th>Glass Spheres</th>
</tr>
</thead>
<tbody>
<tr>
<td>Refractive Index, (tested by oil immersion)</td>
</tr>
<tr>
<td>Uniform Distribution of Spheres</td>
</tr>
</tbody>
</table>

7. Reflective Intensity (Types TR, TN and PA)
   Determine reflective intensity in accordance with ASTM D4061 or E1710.
   Ensure that marking types TR, TN, and PA use white or yellow film with the initial reflective intensity indicated in the table below, when measured at the angles shown.

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Observation Angle</td>
<td>1.05°</td>
<td>1.05°</td>
</tr>
<tr>
<td>Entrance Angle</td>
<td>88.8°</td>
<td>88.8°</td>
</tr>
<tr>
<td>Reflective Intensity – Millicandelas per square meter per lux</td>
<td>500</td>
<td>300</td>
</tr>
</tbody>
</table>
Section 657 — Preformed Plastic Pavement Markings

8. Composition

Use markings made of high-quality polymeric materials and pigments. Ensure types TR and PA contain the following composition of materials:

<table>
<thead>
<tr>
<th>Material</th>
<th>Min% By Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resins and Plasticizers</td>
<td>20</td>
</tr>
<tr>
<td>Pigments</td>
<td>30</td>
</tr>
<tr>
<td>Graded Glass Spheres</td>
<td>33</td>
</tr>
</tbody>
</table>

B. Requirements for Temporary Markings (Types TR and TN)

1. Temporary Removable Markings (Type TR)

Use temporary, removable markings that meet the following requirements:

a. Removability
   - Ensure the marking material can be removed from asphaltic and Portland cement as follows:
     - Lifted intact or in large pieces.
     - Lifted either manually or with a roll-up device.
     - Lifted at temperatures above 40 °F (5 °C) without using heat, solvents, sand blasting, or grinding.
   - Ensure the pavement shows no objectionable staining or damage after removing the marking.

b. Elongation and Tensile Strength

<table>
<thead>
<tr>
<th>Elongation</th>
<th>50% maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength</td>
<td>40 lbs./in.² (275 kPa) minimum</td>
</tr>
</tbody>
</table>

Test as follows:

1) Cut a 1 in. by 6 in. (25 mm by 150 mm) specimen.
2) Test at a temperature between 70 °F and 80 °F (21 °C and 27 °C).
3) Test at a jaw speed of 12 in./min (300 m/min).

c. Adhesion

Ensure that temporary marking material meets the adhesion requirements of ASTM D4592.

d. Glass Sphere Retention

Confirm the glass sphere retention quality of marking material in both of the following ways:

1) Laboratory Test
   - Take a 2 in. by 6 in. (50 mm by 150 mm) sample.
   - Bend the sample over a ½ in. (13 mm) diameter mandrel, leaving the 2 in. (50 m) side perpendicular to the mandrel axis.
   - Ensure that the area on the mandrel shows no more than 10 percent of the beads entrapped by the binder less than 40 percent.

2) Field test

Ensure the Spheres cannot be easily removed by scratching the material firmly with the thumbnail.
Section 657 — Preformed Plastic Pavement Markings

e. Skid Resistance
   Ensure that the material surface provides a 35 BPN minimum skid resistance value when tested according to ASTM E 303.

f. Thickness
   Ensure that the removable marking material is at least 20 mils (0.50 mm) thick not including the backing adhesive.

2. Temporary Non-Removable markings (Type TN)
   This type of pavement marking may use a conformable metallic foil backing with a precoated pressure-sensitive adhesive. Skid Resistance
   a. Ensure the retroreflective pliant polymer surface provides a skid resistance value of at least 35 BPN. Test according to ASTM E 303.
   b. Elongation and Tensile Strength
      No test for elongation and tensile strength is required for type TN marking.
   c. Glass Sphere Retention
      Refer to Subsection 657.2.B.1.d, Glass Sphere Retention.
   d. Thickness
      Ensure the nonremovable marking material is at least 20 mils (0.50 mm) not including the adhesive backing.

C. Requirements for Permanent Markings (Types PA, PB and PB-WR)

1. Permanent Plastic Marking (Type PA)
   Provide permanent plastic markings with these features:
   a. Adhesive and Backing
      Use markings supplied with the following:
      • A precoated adhesive
      • An easily removable backing to protect the adhesive
      • An adhesive backing that allows repositioning of the marking on the surface before permanently sticking with greater pressure
      In addition, supply rolls of lane lines with a precoated adhesive but without the protective backing material.
   b. Pigments
      1) White
         Use white marking material meeting the initial color requirements of ASTM D4505.
      2) Yellow
         Use yellow marking material meeting the initial color requirements of ASTM D4505.
      3) Appearance
         Ensure that each marking meets the following appearance standards:
         • Markings are extruded to a uniform thickness.
         • Edges are smoothly cut and true.
         • Glass spheres are retained on all sides by the plastic base material.
         • The wearing surface is free of indentations, displaced spheres, or other irregularities that retain dirt, dust, or other foreign materials.
   c. Thickness
      Ensure the permanent material is at least 60 mils (1.52 mm) thick, without the pre-coated adhesive.
Section 657 — Preformed Plastic Pavement Markings

d. Glass Sphere Retention
   Confirm that the surface glass spheres are strongly bonded and are not easily removed by traffic. Test them as follows:
   1) Use a Taber Abraser with an H-18 wheel and 125-gram load.
   2) Inspect the sample at 200 cycles under the microscope to observe the extent and type of bead failure.
   3) Ensure that no more than 15 percent of the spheres have popped-out.
   4) Verify that the predominant mode of failure is “wear-down” of the spheres.

e. Tensile Strength and Elongation
   Ensure that the permanent markings have the following elongation and tensile strength when tested according to ASTM D 638:

   | Elongation  | 50% maximum |
   | Tensile Strength | 150 psi (1035 kPa) minimum |

   Test as follows:
   
   **NOTE: Run this test 3 times and base the result on an average of the 3 tests.**

   1) Cut 3 specimens, 1 in. by 6 in. (25 mm by 150 mm) each.
   2) Place 1 in.² (625 mm²) of carborundum extra-coarse emery cloth or its equivalent at each end of the test specimens to prevent the adhesive from sticking to test equipment.
   3) Test at a temperature between 70 ° and 80 °F (21° and 27 °C).
   4) Test at a jaw speed of 10 to 12 in./min (250 mm to 300 mm/min).

f. Skid Resistance
   Test the plastic surface to verify that it provides a skid resistance value of at least 45 BPN. Test according to ASTM E 303.

g. Adhesive
   Ensure permanent markings meet the adhesion requirements of ASTM D4505.

2. Permanent Patterned Plastic Marking (Type PB)
   Use patterned plastic markings with these features:

   a. Patterned Surface
      Ensure that the patterned surface has the following characteristics:
      - A reflective layer of glass spheres and/or reflective composite optics bonded to a durable polyurethane topcoat.
      - The raised area comprises approximately 40% ± 15% of the total marking face.
      - The surface presents a near vertical face (β angle of 0° to 60°) to traffic from any direction.
      - The Office of Materials and Research approves the pattern configuration.
      - The channels between raised areas are free of exposed beads or particles.

   b. Adhesive and Backing
      Refer to Subsection 657.2.C.1.a, Adhesive and Backing.

   c. Pigments
      Refer to Subsection 657.2.C.1.b, Pigments.
d. Glass Spheres and Reflective Composite Optics
   Ensure that the top layer of glass spheres and/or reflective composite optics are bonded to a durable polyurethane surface.

e. Thickness
   Ensure the permanent material is at least 60 mils (1.52 mm) thick at the thickest portion of the patterned cross-section, and at least 20 mils (0.508 mm) at the thinnest portion of the cross-section.

f. Tensile Strength and Elongation
   Refer to Subsection 657.2.C.1.e, Tensile Strength and Elongation.

g. Skid Resistance
   Refer to Subsection 657.2.C.1.f, Skid Resistance.

h. Dry Reflective Intensity
   Determine reflective intensity in accordance with ASTM D 4061 or E1710. Initial minimum dry reflective values are as follows:

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Observation Angle</td>
<td>1.05°</td>
<td>1.05°</td>
</tr>
<tr>
<td>Entrance Angle</td>
<td>88.8°</td>
<td>88.8°</td>
</tr>
<tr>
<td>Reflective Intensity</td>
<td>600</td>
<td>400</td>
</tr>
</tbody>
</table>

3. Permanent Patterned Wet Reflective Plastic Marking (Type PB-WR)
   Use patterned plastic markings with these features:
   a. Patterned Surface
      Ensure that the patterned surface has the following characteristics:
      • A reflective layer of glass spheres and/or reflective composite optics bonded to a durable polyurethane topcoat.
      The raised area comprises approximately 40% ± 15% of the total marking face.
      The surface presents a near vertical face (β angle of 0° to 60°) to traffic from any direction.
      The Office of Materials and Research approves the pattern configuration.
      The channels between raised areas are free of exposed beads or particles.

   b. Adhesive and Backing
      Refer to Subsection 657.2.C.1.a, Adhesive and Backing.

   c. Pigments
      Refer to Subsection 657.2.C.1.b, Pigments.

   d. Glass Spheres Beads and Reflective Composite Optics
      Ensure that the top layer of glass spheres and/or reflective composite optics are bonded to a durable polyurethane surface.

   e. Thickness
      Ensure the permanent material is at least 60 mils (1.52 mm) thick at the thickest portion of the patterned cross-section, and at least 20 mils (0.508 mm) at the thinnest portion of the cross-section.

   f. Tensile Strength and Elongation
      Refer to Subsection 657.2.C.1.e, Tensile Strength and Elongation.
g. Skid Resistance
   Refer to Subsection 657.2.C.1.f, Skid Resistance.

h. Dry Reflective Intensity
   Determine reflective intensity in accordance with ASTM D 4061 or E1710. Initial minimum dry reflective values are as follows:

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Observation Angle</td>
<td>1.05°</td>
<td>1.05°</td>
</tr>
<tr>
<td>Entrance Angle</td>
<td>88.8°</td>
<td>88.8°</td>
</tr>
<tr>
<td>Reflective Intensity – Millicandelas per square meter per lux</td>
<td>600</td>
<td>400</td>
</tr>
</tbody>
</table>

i. Wet Reflective Intensity
   Determine wet reflective intensity in accordance with ASTM E2177. Ensure that markings meet the following initial minimum wet retroreflective intensity.

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Divergence Angle</td>
<td>1.05°</td>
<td>1.05°</td>
</tr>
<tr>
<td>Incidence Angle</td>
<td>88.8°</td>
<td>88.8°</td>
</tr>
<tr>
<td>Reflective Intensity --Millicandelas per square meter per lux</td>
<td>250</td>
<td>200</td>
</tr>
</tbody>
</table>

### 657.3 Construction Requirements

General Provisions 101 through 150.

#### 657.3.01 Personnel
Send a factory-trained representative from the material manufacturer to the jobsite at the start of each project.

#### 657.3.02 Equipment
General Provisions 101 through 150.

#### 657.3.03 Preparation
General Provisions 101 through 150.

#### 657.3.04 Fabrication
General Provisions 101 through 150.

#### 657.3.05 Construction
Remove existing pavement markings according to Subsection 653.3.05.B, Removing Existing Stripe.

A. Pre-Conditions for Applying Markings (Types PB and PB-WR)

1. Meet the following conditions before applying markings onto new asphaltic pavements:
   - The ambient temperature is 40 °F (4 °C) and rising.
   - New asphaltic pavement temperature is at least 120 °F (49 °C).
   - The plastic can be applied to new asphaltic pavement immediately before the new surface is rolled for the final time.
   - Conventional steel rollers and water used with them do not impede the plastic’s application.
2. Meet the following conditions before applying markings onto all pavements:
   - The ambient temperature is 40 °F (4 °C) and rising.
   - The pavement temperature is at least 40 °F (4 °C) and rising.
   - The previous night temperature did not fall below 40 °F (4 °C).
   - No significant rainfall occurred 24 hours prior to the plastic’s application.

B. Pre-Conditions for Applying Markings (Types TR, TN, and PA)
   1. Meet the following conditions before applying markings onto new asphaltic pavements:
      - The ambient temperature is 60 °F (15 °C) and rising.
      - New asphaltic pavement temperature is at least 120 °F (49 °C).
      - The plastic can be applied to new asphaltic pavement immediately before the new surface is rolled for the final time.
      - Conventional steel rollers and water used with them do not impede the plastic’s application.
   2. Meet the following conditions before applying markings onto all pavements:
      - The ambient temperature is 60 °F (15 °C) and rising.
      - The pavement temperature is at least 70 °F (21 °C) and rising.
      - The previous night temperature did not fall below 40 °F (4 °C).
      - No significant rainfall occurred 24 hours prior to the plastic’s application.

C. Remove Existing Stripe
   Remove at least 90% of existing traffic stripe under either of the following conditions:
   - On Portland cement concrete pavement where the new stripe is to be placed at the same location as the existing marking
   - On all pavements where the new stripe is to be placed at a location different from the existing marking

D. Applying Markings
   Apply markings as follows:
   1. Thoroughly clean the pavement. Clean with compressed air, hand brooms, rotary brooms, scrapers, or other approved methods which leave the pavement thoroughly clean and undamaged. Remove all vegetation and road film from the area to be striped. Mechanically wire brush or abrasive blast clean all new Portland cement concrete pavement surfaces to remove all laitance and curing compound from the area to be striped.
   2. Apply an adhesive activator according to the manufacturer’s recommendations, when required.
   3. Position markings according to the plans.
   4. Press positioned markings firmly onto the pavement.
   5. Offset longitudinal lines at least 2 in. (50 mm) from construction joints of Portland cement concrete pavements.

E. Tolerances and Appearance
   1. Cut off all stripe ends squarely and cleanly.
   2. The length of the 10 ft. (3 m) segment for skip stripe and the 30 ft. (9 m) gap between segments may vary plus or minus 1 in. (25 mm). Do not allow the alignment of skip stripe to deviate from the intended alignment by more than 0.5 in. (13 mm). Do not allow the alignment of edge stripe to deviate from the intended alignment by more than 0.5 in. (13 mm) on tangents and on curves with a radius up to and including one degree. Do not allow the alignment of edge stripe to deviate from the intended alignment by more than 1 in. (25 mm) on curves exceeding one degree.
   3. Stop work when deviation exceeds the above dimensions and remove the nonconforming stripe.
657.3.06 Quality Acceptance

A. General
Segments of preformed plastic traffic stripe that have been placed according to the plans and specifications may be accepted 30 days after the required work is complete in that segment. If Preformed Plastic Traffic Stripe fails to meet plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, perform it according to Section 656 and replace it according to this Specification. No additional payment will be made for removal and replacement of unsatisfactory striping.

Obtain pavement marking retroreflectivity values with a 30-meter geometry retro-reflectometer.

B. Initial Retro-reflectivity

1. Longitudinal Lines
Within 30 days of installation, ensure the in-place markings meet the following minimum reflectance values:
   a. Type PB

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>600 mcd/lux/m²</td>
<td>400 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>250 mcd/lux/m²</td>
<td>200 mcd/lux/m²</td>
</tr>
</tbody>
</table>

   For each center line, edge line, and skip line, measure retro-reflectivity 9 times for each mile; 3 times within the first 500 ft. (152 m), 3 times in the middle, and 3 times within the last 500 ft. (152 m). For projects less than one mile in length, measure retro-reflectivity 9 times as above.

   Record all retro-reflectivity measurements on the form OMR CVP 66 in SOP 39.

   b. Type PB-WR

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>600 mcd/lux/m²</td>
<td>400 mcd/lux/m²</td>
</tr>
</tbody>
</table>

2. Messages, Symbols, and Transverse Lines
Within 30 days of installation, ensure both Type PB and Type PB-WR in-place markings when tested according to ASTM E 1710 meet the following minimum reflectance value of 600 mcd/lux/m².

   Perform at a minimum, one retro-reflectivity measurement at one message, one symbol and one transverse line per intersection. Take one measurement per mile for locations other than intersections (i.e. school messages, railroad messages, bike symbols etc.)

C. Six Month Retro-reflectivity (Longitudinal Lines)
Maintain the following minimum reflectance values for 180 days after installation:

1. Type PB

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>600 mcd/lux/m²</td>
<td>400 mcd/lux/m²</td>
</tr>
</tbody>
</table>

2. Type PB-WR

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>600 mcd/lux/m²</td>
<td>400 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>250 mcd/lux/m²</td>
<td>200 mcd/lux/m²</td>
</tr>
</tbody>
</table>
Retest the in-place markings according to Subsection 657.3.06.B.1 180 days after installation to ensure these minimum retro-reflectance values are maintained.

NOTE: The Contractor is responsible for retro-reflectivity testing. Furnish initial test results to the Engineer within 30 days of application. Furnish 6-month test results to the Engineer within 180 days of application or prior to final acceptance, whichever comes first.

D. Corrective Work

For each mile section, if preformed plastic pavement marking traffic stripe fails to meet plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, perform it according to Section 656 and place it according to this specification. No additional payment will be made for removal and replacement of unsatisfactory striping. Ensure corrective work is completed at no additional cost to the Department. Perform testing according to this specification. Any retest due to failures will be performed at no additional cost to the Department. Furnish all test reports to the Department.

Retro-reflectivity Longitudinal Line Deficiency: A deficiency will ensure when two or more Location Average results as recorded on form OMR CVP 66 within a One-Mile Section do not meet the performance criteria herein. The entire line within this one-mile section will be determined to be deficient. If the evaluated section is less than 1.0 mile, a single Location Average result not meeting the performance criteria herein will result in the entire line to be determined to be deficient.

Retro-reflectivity Transverse Markings and Symbol Deficiency: A single Location Average result on the marking or symbol not meeting the performance criteria herein will result in the marking or symbol to be determined to be deficient.

657.3.07 Contractor Warranty and Maintenance

A. Warranties

Transfer all warranties or guarantees normally furnished by the manufacturer to the Department. Include a provision that warranties are subject to transfer. Warrant Type PB and Type PB-WR Plastic Markings to adhere to the pavement and to provide a minimum (ASTM E 1710) dry coefficient of retroreflection of 100 mcd/lux/m² when measured using a 30-meter geometry retro-reflectometer for a period of at least 6 years for longitudinal markings and at least 2 years for intersection markings and symbols under normal traffic conditions.

B. Maintenance

Use the following according to manufacturer’s instructions to ensure effective marking performance:

- Solvents or adhesives
- Appropriate equipment
- Recommendations for application

657.4 Measurement

Preformed plastic pavement markings complete in place and accepted are measured as follows:

A. Solid Traffic Stripe

Solid stripe is measured by the linear foot (meter) or linear mile (kilometer) as specified. Breaks or omissions in solid lines and stripes at street or road intersections are not measured for payment.

B. Skip Traffic Stripe

Skip stripe is measured by the gross linear foot (meter) or gross linear mile (kilometer) as specified. The unpainted spaces between the stripes are included in the overall measurement, if the plan ratio is not interrupted. Measurement begins and ends on a stripe.
Section 657 — Preformed Plastic Pavement Markings

C. Payment by Square Yard (Meter)
When preformed pavement markings are paid for by the square yard (meter), the number of square yards (meters) covered is measured. The space between the markings is included in the overall measurement. The color, width, and type are according to the plans.

D. Preformed Plastic Word or Symbol
Each preformed plastic word or symbol, complete according to plan dimensions, is measured by the unit. The code for each word or symbol is stated in the plans.

E. Removing Existing Pavement Markings
Measurement and payment for removing pavement markings will be according to Section 656 when shown in the proposal as a payment Item. Otherwise, removal will not be paid for separately, but will be included in the payment for other work under this Section.

657.4.01 Limits
General Provisions 101 through 150.

657.5 Payment
Payment in each case is full compensation for applying markings, including adhesives, cleaning, application, and traffic control necessary to complete the Item.

Payment will be made under:

Section 657 — Preformed Plastic Pavement Markings

657.5.01 Adjustments
General Provisions 101 through 150.
658.1 General Description
This work includes furnishing and applying reflectorized standard and wet weather polyurea traffic stripe according to the plans and these specifications.
This Item also includes applying words and symbols according to plan details, specifications, and the current Manual on Uniform Traffic Control Devices.

658.1.01 Definitions
Painted Stripes: Solid or broken (skip) lines. The location and color are designated on the plans.
Skip Traffic Stripes: Painted segments between unpainted gaps on a designated sequence with a ratio of 1:3 [10 ft. (3 m) segment and 30 ft. (9 m) gap] as specified on the plans. The location and color are designated on the plans.

658.2 Materials

A. General Requirements

- Use polyurea material that has been evaluated (2 year field evaluation) by the National Transportation Product Evaluation Panel (NTPEP) test facility or other approved test facility.
- Use polyurea material produced from an approved source listed on QPL 46.
- Use a polyurea composition that is specifically formulated for use as a durable pavement marking material and for application at elevated temperatures not exceeding 170 °F (77 °C).
- Ensure the liquid markings consist of a two-component (Part A and Part B), 100% solids polyurea film formulated and designed to provide a simple volumetric mixing ratio as recommended by the manufacturer.
- Use white or yellow films for the markings. Ensure that these films are manufactured without the use of lead chromate pigments or other similar, lead-containing chemicals.
- Ensure that the white polyurea contains not less than 13% by weight rutile titanium dioxide pigment to insure adequate opacity, hiding power, and reflective properties.

B. Glass Spheres and Reflective Composite Optics

Use glass spheres and/or reflective composite optics for the reflective media system that ensures the polyurea pavement markings meet the reflectance performance requirements in Subsection 658.3.04. Do not use beads and/or optics containing greater then 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to US EPA Methods 3052 and 6010C, or other approved methods.

Ensure glass spheres meet the requirements of AASHTO M 247. Use glass spheres produced from an approved source listed on QPL 71. Glass spheres conforming to an alternative gradation may be used provided all other requirements of AASHTO M 247 and this specification are met. Obtain approval from the Office of Materials and Research to use alternate gradations.

C. Finished Product Requirements:

1. Composition

Ensure that the retroreflective pavement markings consist of a mixture of high-quality resins, curing agent and pigments, with a reflective layer bonded to the top surface consisting of glass spheres and/or reflective composite optics.

2. Color

Meet these color requirements:

- White markings are pure white and free from dirt or tint.
- Yellow markings are “Federal Yellow” in color.
- The material does not change its color and brightness characteristics after prolonged exposure to sunlight.

3. Skid Resistance

Ensure the surface of the retroreflective marking provides an initial average skid resistance value of 45 BPN when tested according to ASTM E303.

4. Color and Weathering Resistance

Ensure that the mixed polyurea compound, both white and yellow, when applied to 3 in. (75 mm) x 6 in. (150 mm) aluminum panels at 15 ± 1 mils (0.381 mm ± 0.025 mm) wet thickness without glass beads and exposed in a Q.U.V. Environmental Testing Chamber, as described in ASTM G-53-77, conforms to the following minimum requirements:

- The color of the white polyurea compound is not darker than Federal Standard No. 595A-17778.
- The color of the yellow polyurea compound meets the requirements of the “Federal Yellow” color chart.
Section 658 — Standard and Wet Weather Polyurea Traffic Stripe

5. Drying Time (Laboratory)
   When tested in accordance with ASTM D-711 the polyurea marking material shall reach a no-pick-up condition in 10 minutes or less. Perform this test with AASHTO M247 Type 1 beads applied at a rate of 0.099 pounds per sq. ft. (0.483 kg/m²). Ensure that the drying time does not increase substantially with decreasing temperature.

6. Drying Time (Field)
   When installed at 77 °F (25 °C) and rising, at a thickness 25 ± 2 mils (0.635 mm ± 0.051 mm) on all concrete pavement types and reflectorized with glass spheres and/or reflective composite optics, ensure that the polyurea markings reach a no-track condition in less than 10 minutes. Dry to “no-tracking” will be considered as the condition where no visual deposition of the polyurea marking to the pavement surface is observed when viewed from a distance of 50 ft. (15 m), after a traveling vehicle’s tires have passed over the marking.

   *Note – Polyurea will not be used as a pavement marking material on any asphalt pavement types.

7. Abrasion Resistance
   Ensure that the wear index of the polyurea compound does not exceed 0.00026 lbs. (120 mg) when tested in accordance with ASTM C4060 using a CS-17 wheel and under a load of 2.2 lbs. (1000 g) for 1000 cycles.

8. Adhesion to Concrete
   Ensure that the polyurea pavement marking materials, when tested according to ACI Method 503, have such a high degree of adhesion to the specified concrete surface that there is a 100% concrete failure in the performance of this test. Condition the prepared specimens at room temperature 75 °F ± 2 °F (24 °C ± 1 °C) for a minimum of 24 hours and maximum of 72 hours prior to the performance of this test.

658.3 Construction Requirements

658.3.01 Equipment

A. Traveling Traffic Stripe Painter
   To apply the traffic marking material, use a mobile, truck mounted and self contained pavement marking machine, specifically designed to apply two-component liquid materials, and glass beads, in a continuous and skip-line pattern.

   Apply the two-component liquid materials through airless impingement mixing guns. The guns must accommodate a plural component material system at the manufacturer’s recommended volumetric mixing ratio. The guns must have the capacity to deliver materials from approximately 1.5 gal (5.7 L) to 3 gal (11.4 L) per minute to compensate for a typical range of application speeds of 3 mph (5 km/h) to 6 mph (10 km/h). Ensure that the machine travels at a uniform rate of speed both uphill and downhill.

   Select the necessary accessories such as spray tip, mix chamber or static tube, and rod diameter to ensure proper mixing.

   Ensure that the machine meets the following:
   • The machine is capable of applying three separate stripes, either solid or skip, in any specified pattern by utilizing three adjacent spray nozzles at the same time.
   • Each nozzle is equipped with satisfactory cutoff valves that will apply skip lines automatically.
   • The application equipment is maneuverable to the extent that straight lines can be followed and normal curves can be made in a true arc.
   • The truck-mounted unit is provided with accessories to allow for the marking of symbols and legends.
Ensure that the mobile applicator also includes the following features:

- The mobile applicator provides individual material reservoirs for the storage of Part A and Part B of the resin composition.
- The applicator is equipped with heating equipment of sufficient capacity to maintain the individual resin components at the manufacturer’s recommended temperature for spray application.
- The applicator is equipped with separate temperature controls for each component.
- The applicator is equipped with glass spheres dispensing equipment and capable of applying the glass spheres at a uniform rate.
- The application equipment is equipped with metering devices or pressure gauges on the proportioning pumps as well as stroke counters to monitor volumetric usage. Ensure that the metering devices or pressure gauges and stroke counters are visible.
- The applicator is equipped with all the necessary spray equipment, mixers, compressors, and other appurtenances to allow for the placement of reflectorized pavement markings in a simultaneous sequence of operations.

**B. Cleaning Equipment**

Use brushes, brooms, scrapers, grinders, high-pressure water jets, or air blasters to remove dirt, dust, grease, oil, and other foreign matter from painting surfaces without damaging the underlying pavement.

**658.3.02 Preparation**

Notify the Engineer prior to the placement of the polyurea materials. Furnish the Engineer with the manufacturer’s name and batch numbers of the polyurea materials and glass spheres to be used. Ensure that the approved batch numbers appear on the polyurea materials and glass spheres packages.

Before painting, thoroughly clean pavement surfaces of dust, dirt, grease, oil, and all other foreign matter. Remove concrete curing compounds on new Portland cement concrete surfaces and existing pavement markings on concrete surfaces.

**658.3.03 Construction**

**A. Atmospheric Conditions**

Apply pavement markings only during conditions of dry weather and subsequently dry pavement surfaces. Ensure that the pavement surface temperature and the ambient temperature at the time of installation are both greater than 40 °F (4 °C) and that the relative humidity is not greater than 85 percent.

**B. Alignment**

Ensure that the traffic stripe is the specified length, width, and placement. On sections where no previously applied markings are present, ensure accurate stripe location by establishing control points at spaced intervals. The Engineer will approve control points.

**C. Application**

Apply the pavement markings as follows:

1. Apply the liquid marking material by spray method and according to the manufacturer’s installation instructions.
2. Ensure marking configurations are in accordance with the “Manual on Uniform Traffic Control Devices.”
3. Place the reflectorized pavement markings only on properly prepared surfaces and at the widths and patterns designated on the plans. Do not begin marking operations until applicable surface preparation work is completed and approved by the Engineer.
4. Air-blast the surface first, to remove any dirt and residues from the pavement. Then apply the pavement markings as a continuous operation.
5. Heat Component A and Component B to the manufacturer’s recommended temperatures.

6. Ensure that mixing of the two components occurs in a static tube or impingement chamber prior to reaching the application spray nozzle.

7. Spray the mixed resin onto the pavement at a rate to obtain a minimum uniform dry thickness of 25 mils ± 2 mils (0.635 mm ± 0.051 mm) above the surface of the concrete pavement.

8. Immediately following application, drop the glass spheres and/or reflective composite optics onto the liquid marking at the application rates recommended by the binder manufacture.

9. The work will be subject to application rate checks for both paint, spheres and/or reflective composite optics. Following an application of glass spheres and/or reflective composite optics, and upon curing, ensure that the resulting marking is an adherent reflectorized stripe of the specified thickness and width that is capable of resisting deformation by traffic.

D. Protective Measures

Protect newly applied paint as follows:

1. Traffic

Control and protect traffic with warning and directional signs during painting. Set up warning signs before beginning each operation and place signs well ahead of the painting equipment. When necessary, use a pilot car to protect both the traffic and the painting operation.

2. Fresh Paint

Protect the freshly painted stripe using cones or other satisfactory devices. Repair stripe damage or pavement smudges caused by traffic according to Subsection 658.3.04.

E. Appearance and Tolerance of Variance

Continually deviating from stated dimensions is cause for stopping the work and removing the nonconforming stripe. (See Section 656.) Adhere to the following measurements:

1. Width

Do not lay stripe less than the specified width. Do not lay stripe more than 1/2 in. (13 mm) over the specified width.

2. Length

Ensure that the 10 ft. (3 m) painted skip stripe and the 30 ft. (10 m) gap between painted segments vary no more than ± 1 ft (300 mm) each.

3. Alignment

a. Ensure that the stripe does not deviate from the intended alignment by more than 1 in. (25 mm) on straight lines or curves of 1 degree or less.

b. Ensure that the stripe does not deviate by more than 2 in. (50 mm) on curves exceeding 1 degree.

658.3.04 Quality Acceptance

A. General

For a minimum of 30 days from the time of placement, ensure the polyurea traffic pavement marking material shows no signs of failure due to blistering, excessive cracking, chipping, bleeding, staining, discoloration, oil content of the pavement materials, smearing or spreading under heat, deterioration due to contact with grease deposits, oil, diesel fuel, or gasoline drippings, spilling, poor adhesion to the pavement material, vehicular damage, and normal wear. In the event that failures mentioned above occur, ensure corrective work is completed at no additional cost to the Department.

Ensure that stripes and segments of stripes are clean-cut and uniform. Markings that do not appear uniform or satisfactory, either during the day or night, or do not meet specifications or become marred or damaged by traffic or from other causes, will be corrected at the Contractor’s expense.
Sections of painted stripe, words, and symbols placed according to the plans and specifications and have dried so that paint will not be picked up or marred by vehicle tires will be accepted.

Obtain pavement marking retroreflectivity values with a 30 meter geometry retro-reflectometer.

1. Correction of Alignment
   When correcting a deviation that exceeds the permissible tolerance in alignment, do the following:
   a. Remove the affected portion of stripe, plus an additional 25 ft. (8 m) in each direction in accordance with Section 656.
   b. Paint a new stripe according to these specifications.

2. Removal of Excess Paint
   Remove misted, dripped, or spattered paint to the Engineer’s satisfaction. Do not damage the underlying pavement during removal.
   Refer to the applicable portions of Section 656.

B. Initial Retroreflectivity

1. Longitudinal Lines
   Within 30 days of installation, ensure the in-place markings meet the following minimum reflectance values:
   a. Standard Polyurea Traffic Material
   
<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>

   b. Wet Weather Polyurea Traffic Material
   
<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>125 mcd/lux/m²</td>
</tr>
</tbody>
</table>

   For each center line, edge line, and skip line, measure retro-reflectivity 9 times for each mile (1.61 km); 3 times within the first 500 ft. (152 m), 3 times in the middle, and 3 times within the last 500 ft. (152 m). For projects less than one mile (1.61 km) in length, measure retro-reflectivity 9 times as above.
   Record all retro reflectivity measurements on the form OMR CVP 66 in SOP 39.

2. Messages, Symbols, and Transverse Lines
   Within 30 days of installation, ensure the in-place markings when tested according to ASTM E 1710 meet the following minimum reflectance value of 275 mcd/lux/m².
   Perform at a minimum, one retro-reflectivity measurement at one message, one symbol and one transverse line per intersection. Take one measurement per mile (1.61 km) for locations other than intersections (i.e. school messages, railroad messages, bike symbols etc.)

C. Six Month Retro-reflectivity (Longitudinal Lines)

Maintain the following minimum reflectance values for 180 days after installation:

1. Standard Polyurea Traffic Material
   
<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>
Section 658 — Standard and Wet Weather Polyurea Traffic Stripe

2. Wet Weather Polyurea Traffic Material

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m2</td>
<td>300 mcd/lux/m2</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m2</td>
<td>125 mcd/lux/m2</td>
</tr>
</tbody>
</table>

Retest the in-place markings according to Subsection 658.3.04.B.1 180 days after installation to ensure these minimum retro-reflectance values are maintained.

Note: The Contractor is responsible for retro-reflectivity testing. Furnish initial test results to the Engineer within 30 days of application. Furnish 6-month test results to the Engineer within 180 days of application or prior to final acceptance, whichever comes first.

D. Thickness

Check the thicknesses on all skip lines, edge lines and center lines by placing durable tape, film, or metal plate of known and uniform thickness on an area to be striped. After the stripper has passed over, remove the sample and measure the thickness with calipers or a micrometer.

For each center line, edge line, and skip line, measure thickness above the pavement 3 times for each mile (1.61 km); once within the first 500 ft. (152 m), once in the middle, and once within the last 500 ft. (152 m). For projects less than one mile (1.61 km) in length, measure the thickness above the pavement 3 times.

Record thickness measurements on the form OMR CVP 66 in SOP 39.

Submit results to Engineer.

E. Corrective Work

For each mile section, if polyurea traffic stripe fails to meet plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, perform it according to Section 656 and place it according to this specification. No additional payment will be made for removal and replacement of unsatisfactory striping. Ensure corrective work is completed at no additional cost to the Department. Perform testing according to this specification. Any retest due to failures will be performed at no additional cost to the Department. Furnish all test reports to the Department.

Retro-reflectivity and Thickness Longitudinal Line Deficiency: A deficiency will ensure when two or more Location Average results as recorded on form OMR CVP 66 within a One-Mile Section do not meet the performance criteria herein. The entire line within this one-mile (1.61 km) section will be determined to be deficient. If the evaluated section is less than 1.0 mile (1.61 km), a single Location Average result not meeting the performance criteria herein will result in the entire line to be determined to be deficient.

Retro-reflectivity Transverse Markings and Symbol Deficiency: A single Location Average result on the marking or symbol not meeting the performance criteria herein will result in the marking or symbol to be determined to be deficient.

658.3.05 Verification

See SOP 39.

658.4 Measurement

When traffic stripe is paid for by the square yard (meter), the number of square yards (meters) painted is measured and the space between stripes is included in the overall measurement.

Linear measurements are made on the painted surface by an electronic measuring device attached to a vehicle. On curves, chord measurements, not exceeding 100 linear feet (30 linear meters), are used.

Traffic stripe and markings, complete in place, are measured and accepted for payment as follows:
Section 658 — Standard and Wet Weather Polyurea Traffic Stripe

A. Solid Traffic Stripe
Solid traffic stripe is measured by the linear foot (meter), linear mile (kilometer), or square yard (meter). Breaks or omissions in solid lines or stripes at street or road intersections are not measured.

B. Skip Traffic Stripe
Skip traffic stripe is measured by the gross linear foot (meter) or gross linear mile (kilometer). Unpainted spaces between the stripes are included in the overall measurements if the Plan ratio of 1 to 3 remains uninterrupted. Measurement begins and ends on a stripe.

C. Pavement Markings
Pavement markings, words and symbols completed according to plan dimensions are measured by the unit.

658.5 Payment
Payment will be full compensation for the work under this Section, including the following:

- Cleaning and preparing surfaces
- Furnishing materials, including paints, beads, and thinners
- Applying, curing, and protecting paints
- Protecting traffic, including providing and placing necessary warning signs
- Furnishing tools, machines, and other equipment necessary to complete the Item

Payment will be made under:

Section 659 — Hot Applied Preformed Plastic Pavement Markings

659.1 General Description
This work includes furnishing and placing hot applied preformed plastic pavement markings according to these specifications and at locations shown in the plans or as otherwise directed. Use applied markings that are very durable, impervious to oil and grease, and provide immediate and continuing retro-reflectivity. Use hot applied preformed plastic pavement markings compatible with existing alkyd and hydrocarbon thermoplastic material.

659.1.01 Definitions
General Provisions 101 through 150.

659.1.02 Related References

   Manual on Uniform Traffic Control Devices for Streets and Highways
   AASHTO M 247
   AASHTO M 249
   ASTM E 274
   ASTM E 303
   ASTM D 476
   QPL 74

659.1.03 Submittals
Transfer to the Department all manufacturer warranties or guarantees for heat-applied preformed plastic marking materials. Ensure warranties or guarantees can be transferred.

659.2 Materials
Select one of the following types of preformed marking material according to the plans and proposal.
Type HA – Hot Applied Preformed Thermoplastic Marking
Type HA-BLM – Hot Applied Preformed Thermoplastic Marking - Bike Lane Marking
Type HA-CBL - Hot Applied Preformed Thermoplastic Marking – Colorized Bike Lane
For a list of sources, see QPL-74.

A. Marking Characteristics
   Ensure markings have the following characteristics:
   1. Composition
      Use pavement marking material consisting of a homogeneous mixture of high-quality hydrocarbon resin, alkyd resin, or modified ester rosin solution in conjunction with aggregates, pigments, binders, and glass beads.
      Use thermoplastic material conforming to AASHTO M 249, except for relevant differences due to the material being supplied in a preformed state.
      a. Ensure Type HA-CBL pavement marking material contains no glass beads.
Section 659 — Hot Applied Preformed Plastic Pavement Markings

b. Ensure Type HA and Type HA-BLM pavement marking materials contain at least 30% glass beads conforming to AASHTO M 247, Type 1. Use clear and transparent glass beads with a minimum index of refraction of 1.50 and at least 80% being true spheres.

2. Color
   a. White

   Use white markings containing at least 8% by weight of titanium dioxide pigment meeting ASTM D 476, Type II, Rutile. Ensure color meets Federal Highway White, Color 17886, as per Federal Standard 595. Use white markings with a minimum daylight reflectance (Y value) at 45°/0° of 80%.

   b. Yellow

   Use yellow markings containing sufficient yellow pigment to ensure the color meets Federal Highway Yellow, Color 13538, as per Federal Standard 595. Use yellow markings with a minimum daylight reflectance (Y value) at 45°/0° of 45%.

   c. Colorized Bike Lane (Type HA-CBL)

   Ensure colorized bike lane material meet the color requirements of the Manual on Uniform Traffic Control Devices.

3. Shapes and Sizes

   Ensure prefabricated legends and symbols conform to the applicable shapes and sizes outlined in the “Manual on Uniform Traffic Control Devices for Streets and Highways.” As an option, turn arrows and combination arrows may come without pre-applied surface glass beads to allow reversibility.

4. Thickness

   Ensure Type HA pavement marking material is at least 0.125 in. (3.175 mm) thick.

   Ensure Type HA-CBL and Type HA-BLM pavement marking materials are at least 0.090 in. (2.286 mm) thick.

5. Retro-reflectivity

   Obtain pavement marking retro-reflectivity values with a 30 meter geometry retro-reflectometer.

   Use preformed markings meeting the following initial minimum reflectivity values:

   a. Non-Bike Lane Markings (Type HA)

      |         | White | Yellow |
      |---------|-------|--------|
      | Dry (ASTM E 1710) | mcd/lux/m2 | d/lux/m2 |

   b. Colorized Bike Lanes (Type HA-CBL)

   Colorized bike lanes do not contain glass beads or reflective elements. Thus, colorized bike lanes are non-reflective.

   c. Markings inside the Bike Lane (Type HA-BLM)

      |         | White | Yellow |
      |---------|-------|--------|
      | Dry (ASTM E 1710) | mcd/lux/m2 | -- |

6. Skid Resistance

   Ensure the surface of Type HA preformed markings provides a minimum skid resistance of 45 BPN when tested according to ASTM E 303.

   Ensure the surface of Type HA-BLM preformed markings provides a minimum skid resistance of 55 BPN when tested according to ASTM E 303.

   Ensure the surface of Type HA-CBL preformed markings maintains a minimum level of friction of 32 when tested according to ASTM E 274 after one year in place.
Section 659 — Hot Applied Preformed Plastic Pavement Markings

B. Heating Characteristics
   Use preformed markings capable of being affixed to bituminous or Portland cement concrete pavements by the use of the normal heat of a torch recommended by the manufacturer and according to the manufacturer’s installation guidelines. Ensure preformed markings resealing characteristics allow it to fuse with itself and with previously applied marking material of the same composition under normal conditions of use.

659.2.01 Delivery, Storage, and Handling
Manufacture and package preformed markings permitting storage at normal shelf temperatures for up to one year after purchase.

659.3 Construction Requirements

659.3.01 Personnel
General Provisions 101 through 150.

659.3.02 Equipment
General Provisions 101 through 150.

659.3.03 Preparation
General Provisions 101 through 150.

659.3.04 Fabrication
General Provisions 101 through 150.

659.3.05 Construction

A. Pre-Conditions for Applying Markings with Heat
   Apply markings under the following conditions:
   1. Ambient temperature is 35 °F (2 °C) or above.
   2. Pavement is clean, dry, and free of debris.
   3. Prior to installation, follow manufacturer’s recommendations for preheating road surface.

B. Applying Drop-On Glass Beads
   1. Apply drop-on glass beads to the entire surface of preformed markings not having factory pre-applied surface beads.
   2. Apply the drop-on glass beads to the preformed marking material while still in a liquid state. Use beads meeting the requirements specified in Subsection 659.2.A.
   3. Do not apply drop-on glass beads to colorized bike lanes.

659.3.06 Quality Acceptance
Use material evaluated by the National Transportation Product Evaluation Program (NTPEP), the Georgia Department of Transportation or other State DOT test facilities.

Hot applied preformed plastic pavement markings meeting the laboratory test and field test requirements will be placed on the Georgia Department of Transportation Qualified Products List. Provide certification from the manufacturer certifying the Hot Applied Preformed Plastic Pavement Markings supplied to construction and maintenance projects is formulated of the same material as when tested by NTPEP and will conform to the requirements of this Specification. Products meeting all the requirements in this Section but fail to perform adequately in actual use will be removed from the Qualified Products List.

659.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.
659.4 Measurement
Heat-applied preformed plastic pavement markings, complete in-place and accepted, are measured as follows:

A. Solid Traffic Stripe
Solid traffic stripe of the color, width, and type shown on the plans or in the proposal will be measured by the linear foot (meter) or linear mile (kilometer) as specified. Breaks or omissions in solid lines or stripes at street or road intersections will not be measured for payment.

B. Skip Traffic Stripe
Skip traffic stripe of the color, width, and type shown on the plans or in the proposal will be measured by the gross linear foot (meter) or gross linear mile (kilometer) as specified. The unpainted spaces between the stripes will be included in the overall measurement if the plan ratio remains uninterrupted. Measurement will begin and end on a stripe.

C. Payment by Square Yard (Meter)
When hot applied preformed plastic pavement markings are paid for by the square yard (meter), the actual number of square yards (meters) covered will be measured in the overall measurement, including the space between the markings. The color, width, and type shall be indicated on the plans.

D. Heat Applied Preformed Plastic
Each heat-applied preformed plastic word or symbol, complete according to plan dimensions, is measured by the unit. The code for each word or symbol is stated in the plan.

659.4.01 Limits
General Provisions 101 through 150.

659.5 Payment
Payment in each case will be full compensation for all aspects of heat-applied markings, including adhesives, cleaning, application, and traffic control necessary to complete the Item.

Payment will be made under:

659.5.01 Adjustments
General Provisions 101 through 150.

Office of Materials & Testing
660.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 661—Standard and Wet Weather Epoxy Traffic Stripe

661.1 General Description
This work includes furnishing and applying reflectorized standard and wet weather epoxy traffic stripe according to the plans and these specifications.
This Item also includes applying words and symbols according to plan details, specifications, and the current Manual on Uniform Traffic Control Devices.

661.1.01 Definitions
Painted Stripes: Solid or broken (skip) lines. The location and color are designated on the plans.
Skip Traffic Stripes: Painted segments between unpainted gaps on a designated sequence with a ratio of 1:3 [10 ft. (3 m) segment and 30 ft. (9 m) gap] as specified on the plans. The location and color are designated on the plans.

Federal Standard No. 595A-17778
SOP 39
US EPA Method 3052
US EPA Method 6010

661.2 Materials
A. General Requirements
   - Use epoxy material that has been evaluated (2-year field evaluation) by the National Transportation Product Evaluation Panel (NTPEP) test facility or other approved test facility.
   - Use epoxy material produced from an approved source listed on QPL 46.
   - Use an epoxy composition that is specifically formulated for use as a durable pavement marking material.
   - Ensure the liquid markings consist of a two-component (Part A and Part B), 100% solids epoxy film formulated and designed to provide a simple volumetric mixing ratio as recommended by the manufacturer.
• Use white or yellow films for the markings, and use colors for bike lanes as required on the plans. Ensure that these films are manufactured without the use of lead chromate pigments or other similar, lead-containing chemicals.
• Ensure that the mixed white epoxy contains not less than 13% by weight ASTM D 476 rutile titanium dioxide pigment to insure adequate opacity, hiding power, and reflective properties.

B. Glass Spheres and Reflective Composite Optics

Use glass spheres and/or reflective composite optics for the reflective media system that ensures the epoxy pavement markings meet the reflectance performance requirements in Subsection 661.3.04. Do not use beads and/or optics containing greater than 200 ppm total arsenic, 200 ppm total antimony, or 200 ppm total lead when tested according to the most recent US EPA Methods 3052 and 6010, or other approved methods.

Ensure glass spheres meet the requirements of AASHTO M 247. Use glass spheres produced from an approved source listed on QPL 71. Glass spheres conforming to an alternative gradation may be used provided all other requirements of AASHTO M 247 and this specification are met.

C. Finished Product Requirements:

1. Composition

Ensure that the retroreflective pavement markings consist of a mixture of high-quality resins, curing agent and pigments, with a reflective layer bonded to the top surface consisting of glass spheres and/or reflective composite optics.

2. Color

Meet these color requirements:
• White markings are pure white and free from dirt or tint.
• Yellow markings are “Federal Yellow” in color.
• Colors for bike lanes match the colors as shown on the Plans.
• The material does not change its color and brightness characteristics after prolonged exposure to sunlight.

3. Skid Resistance

Ensure the surface of the retroreflective marking provides an initial average skid resistance value of 45 BPN when tested according to ASTM E 303.

4. Color and Weathering Resistance

Ensure that the mixed epoxy compound, both white and yellow, when applied to 3 in (75 mm) x 6 in (150 mm) aluminum panels at 15 ± 1 mils (0.381 mm ± 0.025 mm) thick without glass beads and exposed in a Q.U.V. Environmental Testing Chamber, as described in ASTM G 53-77, conforms to the following minimum requirements:
• The color of the white epoxy compound is not darker than Federal Standard No. 595A-17778, as measured by the Luminance factor Y according to ASTM D 6628.
• The color of the yellow epoxy compound meets the requirements of the “Federal Yellow” color chart.

5. Drying Time (Laboratory)

When tested in accordance with ASTM D 711 the epoxy marking material shall reach a no-pick-up condition in 30 minutes or less. Perform this test with AASHTO M247 Type 1 beads applied at a rate of 0.099 pounds per square foot (0.483 kg/m²). Ensure that the drying time does not increase substantially with decreasing temperature.

6. Drying Time (Field)

When installed at 77 °F (25 °C), at a thickness of 25 ± 2 mils (0.635 mm ± 0.051 mm) above the surface of the pavement on open graded asphalt concrete friction courses and 20 ± 2 mils (0.508 mm ± 0.051 mm) on all other pavement types, and reflectorized with glass spheres and/or reflective composite optics, ensure that the epoxy markings reach a no-track condition in less than 30 minutes. Dry to “no-tracking” will be considered as the condition where no visual deposition of the epoxy marking to the pavement surface is observed when viewed from a distance of 50 ft. (15 m), after a traveling vehicle’s tires have passed over the marking.
Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

7. Adhesion to Concrete

Ensure that the epoxy pavement marking materials, when tested according to ACI Method 503, have such a high degree of adhesion to the specified concrete surface that there is a 100% concrete failure in the performance of this test. Condition the prepared specimens at room temperature 75 ° ± 2 °F (24 °C) for a minimum of 24 hours and maximum of 72 hours prior to the performance of this test.

8. Adhesion to Asphalt

Ensure that the epoxy pavement marking materials, when tested according to ACI Method 503, have such a high degree of adhesion to the specified asphalt surface that there is a 100% asphalt failure in the performance of this test. Condition the prepared specimens at room temperature 75 ° ± 2 °F (24 °C) for a minimum of 24 hours and maximum of 72 hours prior to the performance of this test.

661.3 Construction Requirements

661.3.01 Equipment

A. Traveling Traffic Striping Machine

To apply the traffic marking material, use a mobile, truck mounted and self contained pavement marking machine, specifically designed to apply two-component liquid materials, and glass beads, in a continuous and skip-line pattern.

Apply the two-component liquid materials through airless impingement mixing guns or static mix tubes. The guns must accommodate a plural component material system at the manufacturer’s recommended volumetric mixing ratio. The guns must have the capacity to deliver materials from approximately 1.5 gal (5.7 L) to 3 gal (11.4 L) per minute to compensate for a typical range of application speeds of 3 mph (5 km/h) to 6 mph (10 km/h). Ensure that the machine travels at a uniform rate of speed both uphill and downhill.

Select the necessary accessories such as spray tip, mix chamber or static tube, and rod diameter to ensure proper mixing.

Ensure that the machine meets the following:

- The machine is capable of applying three separate stripes, either solid or skip, in any specified pattern by utilizing two adjacent spray nozzles at the same time.
- Each nozzle is equipped with satisfactory cutoff valves that will apply skip lines automatically.
- The application equipment is maneuverable to the extent that straight lines can be followed and normal curves can be made in a true arc.
- The truck-mounted unit is provided with accessories to allow for the marking of symbols and legends.

Ensure that the mobile applicator also includes the following features:

- The mobile applicator provides individual material reservoirs for the storage of Part A and Part B of the resin composition.
- The applicator is equipped with glass spheres dispensing equipment and capable of applying the glass spheres at a uniform rate.
- The application equipment is equipped with metering devices or pressure gauges on the proportioning pumps as well as stroke counters to monitor volumetric usage. Ensure that the metering devices or pressure gauges and stroke counters are visible.
- The applicator is equipped with all the necessary spray equipment, mixers, compressors, and other appurtenances to allow for the placement of reflectorized pavement markings in a simultaneous sequence of operations.

B. Hand Equipment

Use hand equipment for projects with small quantities of bike lanes, lane lines, edge lines, and center lines, or for conditions that require the equipment. Use hand equipment approved by the Engineer.
Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

C. **Cleaning Equipment**

Use brushes, brooms, scrapers, grinders, high-pressure water jets, or air blasters to remove dirt, dust, grease, oil, and other foreign matter without damaging the underlying pavement.

**661.3.02 Preparation**

Notify the Engineer prior to the placement of the epoxy materials. Furnish the Engineer with the manufacturer’s name and batch numbers of the epoxy materials and glass spheres to be used. Ensure that the approved batch numbers appear on the epoxy materials and glass spheres packages.

Before striping, thoroughly clean pavement surfaces of dust, dirt, grease, oil, and all other foreign matter.

Remove concrete curing compounds on new Portland cement concrete surfaces and existing pavement markings on both concrete and asphalt surfaces.

**661.3.03 Construction**

A. **Atmospheric Conditions**

1. Apply pavement markings only during conditions of dry weather and subsequently dry pavement surfaces. Ensure that the pavement surface temperature and the ambient temperature at the time of installation are both greater than 40 ºF (4 ºC) and that the relative humidity is not greater than 85%.

2. **Moisture**

   Do not apply when the surface is moist. When directed by the Engineer, perform a moisture test on the Portland cement concrete pavement surface. Perform the test as follows:
   
   a. Place approximately 1 yd² (1m²) of roofing felt on the pavement surface.
   
   b. Pour approximately 1/2 gallon (2 L) of mixed epoxy onto the roofing felt.
   
   c. After 2 minutes, lift the roofing felt and inspect to see if moisture is present on the pavement surface or underside of the roofing felt.
   
   d. If moisture is present, do not proceed with the striping operation until the surface has dried sufficiently to be moisture free.

B. **Alignment**

Ensure that the traffic stripe is the specified length, width, and placement. On sections where no previously applied markings are present, ensure accurate stripe location by establishing control points at spaced intervals. The Engineer will approve control points.

C. **Application**

Apply the pavement markings as follows:

1. Apply the liquid marking material by spray method and according to the manufacturer’s installation instructions.

2. Ensure marking configurations are in accordance with the “Manual on Uniform Traffic Control Devices.”

3. Place the reflectorized pavement markings only on properly prepared surfaces and at the widths and patterns designated on the Plans. Do not begin marking operations until applicable surface preparation work is completed and approved by the Engineer.

4. Air-blast the surface first, to remove any dirt and residues from the pavement. Then apply the pavement markings as a continuous operation.

5. Ensure that mixing of the two components occurs in a static tube or impingement chamber prior to reaching the application spray nozzle.

6. Spray the mixed resin onto the pavement at a rate to obtain a minimum uniform dry thickness of 25 mils ± 2 mils (0.635 mm ± 0.051 mm) above the surface of the pavement on open graded asphalt concrete friction courses and 20 mils ± 2 mils (0.508 mm ± 0.051 mm) above the surface of the pavement on all other pavement types.
Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

7. Glass Spheres and Reflective Composite Optics
   a. Apply glass spheres and/or reflective composite optics to installed stripe surface above the minimum rate recommended by the epoxy material manufacturer to produce the required retro-reflectivity value in accordance with Subsection 661.3.04.
   b. Apply the glass sphere and/or reflective composite optics top-coating with a pressure-type gun specifically designed for applying glass spheres and/or reflective composite optics that will embed at least one-half of the sphere’s and optic’s diameter into the epoxy immediately after the material has been applied to the pavement.
   c. Do not apply glass spheres or reflective composite optics to bike lanes.
      Following an application of glass spheres and/or reflective composite optics, and upon curing, ensure that the resulting marking is an adherent reflectorized stripe of the specified thickness and width that is capable of resisting deformation by traffic.

D. Protective Measures
   Protect newly applied striping as follows:
   1. Traffic
      Control and protect traffic with warning and directional signs during application. Set up warning signs before beginning each operation and place signs well ahead of the equipment. When necessary, use a pilot car to protect both the traffic and the striping operation.
   2. Fresh Striping
      Protect the freshly applied stripe using cones or other satisfactory devices. Repair stripe damage or pavement smudges caused by traffic according to Subsection 661.3.04.

E. Appearance and Tolerance of Variance
   Continually deviating from stated dimensions is cause for stopping the work and removing the nonconforming stripe. (See Section 666.) Adhere to the following measurements:
   1. Width
      Do not lay stripe less than the specified width. Do not lay stripe more than 1/2 in. (13 mm) over the specified width.
   2. Length
      Ensure that the 10 ft. (3 m) skip stripe and the 30 ft. (10 m) gap between skip segments vary no more than ± 1 ft. (300 mm) each.
   3. Alignment
      a. Ensure that the stripe does not deviate from the intended alignment by more than 1 in. (25 m) on straight lines or curves of 1 degree or less.
      b. Ensure that the stripe does not deviate by more than 2 in. (50 mm) on curves exceeding 1 degree.

661.3.04 Quality Acceptance
A. General
   For a minimum of 30 days from the time of placement, ensure the epoxy traffic pavement marking material shows no signs of failure due to blistering, excessive cracking, chipping, bleeding, staining, discoloration, oil content of the pavement materials, smearing or spreading under heat, deterioration due to contact with grease deposits, oil, diesel fuel, or gasoline drippings, spilling, poor adhesion to the pavement material, vehicular damage, and normal wear. In the event that failures mentioned above occur, ensure corrective work is completed at no additional cost to the Department.

   Ensure that stripes and segments of stripes are clean-cut and uniform. Markings that do not appear uniform or satisfactory, either during the day or night, or do not meet specifications or become marred or damaged by traffic or from other causes, will be corrected at the Contractor’s expense.
Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

Obtain pavement marking retroreflectivity values with a 30 meter geometry retro-reflectometer.

1. Correction of Alignment
   When correcting a deviation that exceeds the permissible tolerance in alignment, do the following:
   a. Remove the affected portion of stripe, plus an additional 25 ft. (8 m) in each direction in accordance with Section 656.
   b. Apply a new stripe according to these specifications.

2. Removal of Excess Marking Material
   Remove misted, dripped, or spattered markings to the Engineer’s satisfaction. Do not damage the underlying pavement during removal.
   Refer to the applicable portions of Section 656.

B. Initial Retroreflectivity
   1. Longitudinal Lines
      Within 30 days of installation, ensure the in-place markings meet the following minimum reflectance values:
      a. Standard Epoxy Traffic Material

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>

b. Wet Weather Epoxy Traffic Material

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>125 mcd/lux/m²</td>
</tr>
</tbody>
</table>

For each center line, edge line, and skip line, measure retro-reflectivity 9 times for each mile; 3 times within the first 500 ft. (152 m), 3 times in the middle, and 3 times within the last 500 ft. (152 m). For projects less than one mile in length, measure retro-reflectivity 9 times as above.

Record all retro-reflectivity measurements on the form OMR CVP 66 in SOP 39.

2. Messages, Symbols, Transverse Lines, and Bike Lanes
   Within 30 days of installation, ensure the in-place markings when tested according to ASTM E 1710 meet the following minimum reflectance value of 275 mcd/lux/m².
   Perform at a minimum, one retro-reflectivity measurement at one message, one symbol and one transverse line per intersection. Take one measurement per mile for locations other than intersections (i.e. school messages, railroad messages, etc.) Do not measure retro-reflectivity of bike lanes.

C. Six Month Retro-reflectivity (Longitudinal Lines)
   Maintain the following minimum reflectance values for 180 days after installation:

1. Standard Epoxy Traffic Material

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
</tbody>
</table>
## Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

### 2. Wet Weather Epoxy Traffic Material

<table>
<thead>
<tr>
<th></th>
<th>White</th>
<th>Yellow</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dry (ASTM E 1710)</td>
<td>400 mcd/lux/m²</td>
<td>300 mcd/lux/m²</td>
</tr>
<tr>
<td>Wet recovery (ASTM E 2177)</td>
<td>150 mcd/lux/m²</td>
<td>125 mcd/lux/m²</td>
</tr>
</tbody>
</table>

Retest the in-place markings 180 days after installation to ensure these minimum retro-reflectance values are maintained.

**Note:** The Contractor is responsible for retro-reflectivity testing. Furnish initial test results to the Engineer within 30 days of application. Furnish 6-month test results to the Engineer within 180 days of application or prior to final acceptance, whichever comes first.

### D. Thickness

Check the thicknesses on all skip lines, edge lines and center lines by placing durable tape, film, or metal plate of known and uniform thickness on an area to be striped. After the striper has passed over, remove the sample and measure the thickness with calipers or a micrometer.

For each center line, edge line, and skip line, measure thickness above the pavement 3 times for each mile; once within the first 500 ft. (152 m), once in the middle, and once within the last 500 ft. (152 m). For projects less than one mile in length, measure the thickness above the pavement 3 times.

Record thickness measurements on the form OMR CVP 66 in SOP 39.

Submit results to Engineer.

### E. Corrective Work

For each mile section, if epoxy traffic stripe fails to meet plan details or specifications or deviates from stated dimensions, correct it at no additional cost to the Department. If removal of pavement markings is necessary, remove it according to Section 656 and replace it according to this specification. No additional payment will be made for removal and replacement of unsatisfactory striping. Ensure corrective work is completed at no additional cost to the Department. Perform testing according to this specification. Any retest due to failures will be performed at no additional cost to the Department. Furnish all test reports to the Department.

Retro-reflectivity and Thickness Longitudinal Line Deficiency: A deficiency will ensue when two or more Location Average results as recorded on form OMR CVP 66 within a One-Mile Section do not meet the performance criteria herein. The entire line within this one-mile section will be determined to be deficient. If the evaluated section is less than 1.0 mile, a single Location Average result not meeting the performance criteria herein will result in the entire line to be determined to be deficient.

Retro-reflectivity Transverse Markings and Symbol Deficiency: A single Location Average result on the marking or symbol not meeting the performance criteria herein will result in the marking or symbol to be determined to be deficient.

### 661.3.05 Verification

See SOP 39.

### 661.4 Measurement

When traffic stripe is paid for by the square yard (meter), the number of square yards (meters) striped is measured and the space between stripes is included in the overall measurement.

Linear measurements are made on the striped surface by an electronic measuring device attached to a vehicle. On curves, chord measurements, not exceeding 100 linear feet (30 linear meters), are used.

Traffic stripe and markings, complete in place, are measured and accepted for payment as follows:
Section 661 — Standard and Wet Weather Epoxy Traffic Stripe

A. Solid Traffic Stripe
   Solid traffic stripe is measured by the linear foot (meter), linear mile (kilometer), or square yard (meter). Breaks or omissions in solid lines or stripes at street or road intersections are not measured.

B. Skip Traffic Stripe
   Skip traffic stripe is measured by the gross linear foot (meter) or gross linear mile (kilometer). Unstriped spaces between the skips are included in the overall measurements if the plan ratio of 1 to 3 remains uninterrupted. Measurement begins and ends on a skip.

C. Pavement Markings
   Pavement markings, words and symbols completed according to plan dimensions are measured by the unit.

661.5 Payment
Payment will be full compensation for the work under this Section, including the following:

- Cleaning and preparing surfaces
- Furnishing materials, including epoxy, beads, and thinners
- Applying, curing, and protecting epoxy
- Protecting traffic, including providing and placing necessary warning signs
- Furnishing tools, machines, and other equipment necessary to complete the Item

Payment will be made under:

<table>

Section 663 — Electric Transmittal System

663.1 General Description
Specifications for this work will be included elsewhere in the contract.
Section 664—Electric Distribution Systems

664.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 665—Gas Distribution System

665.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 666—Vertical Drainage Wicks

666.1 General Description
This work includes furnishing and installing vertical drainage wicks according to locations and depths shown on the plans, or as directed by the Engineer.

666.1.01 Definitions
General Provisions 101 through 150.

666.1.02 Related References
A. Standard Specifications
   Section 106—Control of Materials

B. Referenced Documents
   ASTM D 4632
   ASTM D 751
   ASTM D 1424

666.1.03 Submittals
A. Materials Certification
   Furnish the Engineer with materials certification, in duplicate, according to Subsection 106.05, Materials Certification.

B. Installation Sequence and Method Details
   Submit installation sequence and method details to the Engineer for review at least two weeks before installing the drainage wick.

   The Engineer’s approval of the installation sequence and method does not constitute acceptance of the installation method.

   If at any time the Engineer feels the installation method does not produce a satisfactory drainage wick, alter the method or equipment to comply with these specifications.

666.2 Materials
A. Drain Fabrication
   Ensure the following:
   • Use drainage wicks consisting of a band-shaped plastic case, permitting continuous vertical drainage, wrapped in a filter jacket, installed in the ground by displacement methods, and spaced and arranged as shown on the plans. Ensure drainage wicks are a prefabricated type consisting of a plastic drainage core encased in or integrated with a nonwoven polyester filter jacket. Use a band-shaped drain with an aspect ratio (width divided by thickness) not exceeding 50. Ensure the jacket allows free passage of pore water to the core without loss of soil material or piping. Ensure the core provides continuous vertical drainage.
   • Ensure the assembled drains are resistant to wet rot, mildew, bacterial action, insects, salts, acids, alkalis, solvents, or any other ingredients in the site groundwater harmful to the drains. Use drains free from defects, rips, holes or flaws.
   • Ensure the filter jacket is capable of resisting all bending, puncturing, and tensile forces imposed during installation and during the design life of the drain. Use a jacket material resistant to localized damage (e.g., punching through the filter by sand or gravel particles) and sufficiently rigid to withstand lateral earth pressures due to embedment and surcharge so the vertical flow capacity through the core will not be adversely affected.
Section 666 — Vertical Drainage Wicks

Ensure the jacket material is sufficiently flexible to bend smoothly during installation and induced consolidation settlement without damage, and will not undergo cracking or peeling during installation of the drain.

- Ensure the core is a continuous plastic material fabricated to promote drainage along the axis of the vertical drain.

B. Physical Properties

Ensure that the drain meets minimum requirements according to the following:

<table>
<thead>
<tr>
<th></th>
<th>Filter</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Breaking Load</strong></td>
<td>ASTM D 4632</td>
</tr>
<tr>
<td><strong>Mullenburst</strong></td>

</tr>
<tr>
<td><strong>Elmendorf Tear</strong></td>
<td>ASTM D 1424</td>
</tr>
<tr>
<td><strong>Permeability Coefficient</strong></td>
<td>$1 \times 10^{-4}$ in/sec ($3 \times 10^{-3}$ mm/s)</td>
</tr>
</tbody>
</table>

666.2.01 Delivery, Storage, and Handling

A. Drain Protection

Ensure that the drain is wrapped in burlap or a similar heavy-duty covering during shipment and storage.

B. Storage Protection

Protect the storage area from sunlight, mud, dirt, dust, debris, and detrimental substances.

666.3 Construction Requirements

666.3.01 Personnel

General Provisions 101 through 150.

666.3.02 Equipment

The Contractor is responsible for selecting the proper size and amount of equipment.

A. Approval of Equipment

Adhere to the following requirements for equipment:

1. Secure approval of all equipment before beginning work.
2. Promptly replace or supplement unsatisfactory equipment.
3. Note that equipment is approved for use on a trial basis.
4. Remove, replace, or supplement equipment that proves unsatisfactory after a short test section is complete.

B. Required Equipment

Choose a type of carrier depending upon the desired installation force, and then ensure the following:

- The carrier is equipped with a mandrel or sleeve to protect the wick from tears, cuts, and abrasions during installation.
- The protective mandrel or sleeve has at least a 10 in.$^2$ (6450 mm$^2$) cross sectional area.

C. Precautions

Take precautions to protect instrumentation devices.

Replace, at no additional cost to the Department, any equipment that is damaged or becomes unreliable during construction due to construction operations.
Section 666 — Vertical Drainage Wicks

666.3.03 Preparation

A. Location Stakes

Prior to drain installation, the Engineer will stake the proposed drain locations. Take reasonable precautions to preserve the stakes.

Ensure that drain locations do not vary by more than 6 in. (150 mm) from locations indicated on the plans, or as directed by the Engineer.

B. Trial Drain

Install a trial drain at a location designated by the Engineer to demonstrate that the equipment, method, and materials will provide a satisfactory installation according to this specification.

666.3.04 Fabrication

General Provisions 101 through 150.

666.3.05 Construction

A. Installation Depth

1. Install drainage wicks to the depth shown on the plans or to a depth where reasonable efforts at further penetration fail.

   The Engineer may vary the wick depths, spacings, or numbers installed, and may revise plan limits for this work.

2. Provide a means of determining the wick depth and quantity of wick used at each drain location and at any time.

B. Installation of Drains

1. Normal Installation
   
   Use a mandrel or sleeve to install the drainage wick, as follows:
   
   a. Ensure that the mandrel or sleeve completely encloses and protects the drainage wick during installation.
   
   b. Force the mandrel containing the wick vertically into the ground to the required depth.
   
   c. Cut the mandrel neatly at its upper end after installation.
   
   d. Ensure that a 4 in. to 8 in. (100 mm to 200 mm) length of wick protrudes from the ground.

2. Drilling Upper Soils

   If necessary, drill through the dense upper soils before installing the prefabricated drains. Do not drill more than 2 ft. (600 mm) into the underlying compressible soils, as determined by the Engineer.

3. Obstruction of Depth

   If obstructions cannot be penetrated using normal and accepted procedures, do the following:
   
   a. Complete the drain from the point of obstruction to the surface.
   
   b. Notify the Engineer.
   
   c. At the direction of the Engineer, install a new drain within 18 in. (450 mm) of the obstructed drain.

4. Wick

   Make splices or connections in the drainage wick to ensure continuity.

C. Wick Alignment

1. Carefully check equipment for plumbness before advancing each wick.

2. Ensure that wicks do not deviate more than 1 in./ft. (85 mm/m) from the vertical.
666.3.06 Quality Acceptance
No compensation will be allowed for materials, work performed, or drilling if wicks are unsatisfactory. The Engineer will reject wicks that are:

- Out of location by more than 6 in. (150 mm)
- Damaged in construction
- Improperly completed

666.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

666.4 Measurement
This work is measured according to the following:

- Drill holes are measured in linear feet (meters), to the nearest 0.1 ft. (0.03 m).
- Vertical drainage wicks are measured in linear feet (meters), to the nearest 0.1 ft. (0.03 m).

666.4.01 Limits
General Provisions 101 through 150.

666.5 Payment
This work will be paid for at the Contract Price for the accepted quantity of drill holes and vertical drainage wicks, complete and in-place. Payment is full compensation for:

- Drilling holes
- Furnishing materials
- Placing materials
- Providing labor, equipment, tools, and incidentals necessary to complete the work

The Contract Price will be for the number of drains at the spacing shown on the plans.

Payment will be made under:

<table>
<thead>

666.5.01 Adjustments
General Provisions 101 through 150.
Section 667—Horizontal Drain

667.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 668—Miscellaneous Drainage Structures

668.1 General Description
This work includes constructing catch basins, drop inlets, manholes, junction boxes, spring boxes, drain inlets, special inlets with safety grates, and vertical tee sections.
Construct according to these specifications and the lines and grades shown on the plans, or as established by the Engineer.

668.1.01 Definitions
General Provisions 101 through 150.

B. Referenced Documents
   General Provisions 101 through 150.

668.1.03 Submittals
General Provisions 101 through 150.
668.2 Materials
The structures in this section may be constructed of brick, cast-in-place concrete, or pre-cast concrete, unless the plans or proposal specifies a specific type of construction.

Use rubble masonry only when specified on the plans. Ensure that materials meet the following specifications:

<table>
<thead>
<tr>
<th>Material</th>
<th>Section</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class “A” or “B” Concrete</td>
<td>500</td>

</tr>
<tr>
<td>Precast Reinforced Concrete Catch Basin, Drop Inlet, and Manhole Units</td>
<td>866</td>
</tr>
</tbody>
</table>

Ensure that the materials for fabricating special inlets and their safety grates are according to plan details.

Construct the following manholes and drainage structures from pre-cast or cast-in-place concrete:
- Structures within the backfill limits of mechanically stabilized embankment retaining walls
- Structures within 5 ft. (1.5 m) of the wall foundation’s front.

668.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

668.3 Construction Requirements

668.3.01 Personnel
General Provisions 101 through 150.

668.3.02 Equipment
General Provisions 101 through 150.

668.3.03 Preparation
General Provisions 101 through 150.

668.3.04 Fabrication
General Provisions 101 through 150.
668.3.05 Construction

A. Excavation and Backfill

Excavate and prepare foundations for the structures included in this section; place pipe through the structures according to Section 207.

B. Concrete

Concrete units may be either poured-in-place or precast. Construct units as follows:

1. Poured-in-Place Units
   The throat or other nonreinforced portions of catch basins may be Class B concrete. Use Class A concrete for the top slab. Construct units according to Section 500.

2. Pre-Cast Reinforced Concrete Units
   Construct pre-cast reinforced concrete units as follows:
   a. Holes for Pipe
      Cast each unit with the number and dimensions of pipe holes necessary to incorporate the unit into the drainage system according to plan details.
      Installation conditions may require additional pipe for which no holes have been cast. If so, make the holes and repair or replace, to the Engineer’s satisfaction, pipe damaged during the process.
   b. Pipe Connections
      Use mortar or Class A concrete to connect pipe to units.
   c. Installation of Pre-cast Concrete
      1) Pre-cast Reinforced Units: Set these units to within 1/2 in. (± 13 mm) of grade on a bed of compacted sand 2 in. to 3 in. (50 mm to 75 mm) thick.
      2) Sectional Precast Reinforced Units: When using these units to build-up extra-depth catch basins or drop inlets, fill the joints between sections with mortar and wipe smooth.

C. Brick Masonry

Construct brick masonry structures according to Section 608.

D. Mortar Rubble Masonry

Construct rubble masonry structures according to Section 607.

E. Castings

Hold frame castings securely in place to proper line and grade. Make castings an integral part of the complete structure. After completion, ensure that castings subject to traffic use are firm and stable under traffic.

F. Maintenance

Thoroughly clean fallen masonry, silt, debris, and other foreign matter from structures.

G. Safety Grates

Fabricate safety grates according to plan details.
Section 668 — Miscellaneous Drainage Structures

H. Sanitary Sewer Manholes

Ensure that sanitary and combination sanitary and storm sewer manholes conform to the following requirements and the related specifications.

1. Form Invert Channels
   Shape invert channels to the lines and grades shown on the plans, or as established by the Engineer. Ensure that channel surfaces are smooth.
   Form invert channels by one of the following methods:
   - Directly form the invert channel in the concrete base of the manhole.
   - Construct the invert channel of brick and mortar.
   - Lay half-round tile in the concrete base of the manhole.
   - Lay round sewer pipe through the manhole and cut out the top half of the pipe after the concrete base has set. Do not use this method if the plans provide for an offset drop in the invert.

2. Plaster Outside Walls
   Plaster outside walls as follows:
   a. Saturate the outside wall of each brick manhole with water.
   b. Plaster the wall smooth with a mortar coat at least 1/2 in. (13 mm) thick. Manufacture the mortar according to Section 834 with the following exceptions:
      - Manufacture the mortar with one-part cement to two parts mortar sand.
      - Do not add hydrated lime.

3. Connections to Manholes
   Complete manhole connections to the Engineer’s satisfaction and as follows:
   a. Carefully connect existing sewer lines to new manholes to prevent infiltration of foreign substances.
   b. Construct manholes in or adjacent to existing sewer lines according to Section 660 to maintain continuous sewage flow in existing lines.

668.3.06 Quality Acceptance
General Provisions 101 through 150.

668.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

668.4 Measurement
Catch basins, drop inlets, manholes, junction boxes, drain inlets, special inlets, and safety grates, complete in place and accepted, are measured for payment according to the following:

A. Catch Basins and Drop Inlets
   Each catch basin or drop inlet is grouped for measurement as follows:
   - Group 1: Structures connected to pipe 36 in. (900 mm) or less in diameter, regardless of the pipe skew
   - Group 2: Structures connected to pipe over 36 in. (900 mm) diameter regardless of the pipe skew
   Catch basins or drop inlets, complete in place and accepted, are measured by the unit.
   In addition, each catch basin or drop inlet deeper than 6 ft. (1.8 m) is measured for additional payment. The extra depth is measured in linear feet (meters).
B. Manholes

Manholes are measured for payment as follows:

1. Sanitary and Storm Sewer Manholes

Sanitary sewer manholes and storm sewer manholes are measured separately and divided into two types:

- Type 1: Structures connected to pipe 42 in. (1050 mm) or less in diameter regardless of the pipe skew
- Type 2: Structures connected to pipe 48 in. to 84 in. (1200 mm to 2100 mm) diameter regardless of the pipe skew

Each manhole is measured by the unit.

2. Manhole Additional Depth

In addition to Types 1 and 2 above, each Manhole deeper than 6 ft. (1.8 m) is measured for additional payment, termed “manhole additional depth.” This additional depth is measured in linear feet (meters) and does not include the upper 6 ft. (1.8 m). Manhole additional depth is classed as follows:

- Manhole Additional Depth, Class 1: Applies to each manhole deeper than 6 ft. (1.8 m), but not deeper than 10 ft. (3.0 m). Class 1 payment is for the manhole depth between 6 ft. and 10 ft. (1.8 m and 3.0 m).
- Manhole Additional Depth, Class 2: Applies to each manhole deeper than 10 ft. (3.0 m), but not deeper than 20 ft. (6.1 m). Class 2 payment is for the manhole depth between 6 ft. and 20 ft. (1.8 m and 6.1 m).
- Manhole Additional Depth, Class 3: Applies to each manhole deeper than 20 ft. (6.1 m), but not deeper than 30 ft. (9 m). Class 3 payment is for the manhole depth between 6 ft. and 30 ft. (1.8 m and 9.1 m).
- Manhole Additional Depth, Class 4: Applies to each manhole deeper than 30 ft. (9.1 m), but not deeper than 45 ft. (13.7 m). Class 4 payment is the manhole depth between 6 ft. and 45 ft. (1.8 m and 13.7 m).

Manhole additional depth is measured for payment at the class that includes the greatest depth below the original 6 ft. (1.8 m).

For example, a manhole 32 ft. (9.8 m) deep would be measured and paid for as follows:

<table>
<thead>
<tr>
<th>Storm (or sanitary) sewer manhole, type_____</th>
<th>Per each</th>
</tr>
</thead>
<tbody>
<tr>
<td>Storm (or sanitary) sewer manhole, type_____ , additional Depth Class 4</td>
<td>26 linear feet (9 linear meters)</td>
</tr>
</tbody>
</table>

C. Junction Boxes, Spring Boxes, and Drain Inlets

Junction boxes, spring boxes, and drain inlets are measured by the unit.

1. Each junction box will be complete according to plan details.
2. Each drain inlet will consist of a pipe elbow or tee, concrete collar, and casting of the required diameter.
3. Each spring box will be complete according to plan details.

D. Safety Grates

Safety grates fabricated and installed according to plan details are measured by the square foot (meter), computed from the overall surface dimensions of each grate.

E. Special Inlets for Safety Grates

Special inlets, complete in place, are measured for payment in cubic yards (meters) according to Section 500.

F. Vertical Tee Sections (or Saddles)

Vertical tee sections are not measured for separate payment.

668.4.01 Limits

General Provisions 101 through 150.
Section 668 — Miscellaneous Drainage Structures

668.5 Payment
Payment for the various structures under this Section will be made as follows:

A. Catch Basins and Drop Inlets
Catch basins or drop inlets will be paid for at the Contract Price per each.
Depth in excess of 6 ft. (1.8 m) will be paid for at the Contract Price per linear foot (meter).
Payment is full compensation for the following:
- Furnishing castings
- Making pipe connections regardless of skew
- Providing materials, making forms, and disposing of surplus material

B. Manholes
Sanitary sewer and storm sewer manholes, complete in place, will be paid for at the Contract Price per each.
Manhole additional depth of the appropriate class will be paid for at the Contract Price per linear foot (meter).
Payment is full compensation for the following:
- Furnishing castings, fittings, and other appurtenances called for on the plans to complete the Item
- Making pipe connections regardless of skew
- Providing materials, making forms, and disposing of surplus material

NOTE: No additional payment will be made for connecting manholes to existing or new sewer lines. Include costs related to connections in the Contract Price for the structure.

C. Junction Boxes, Spring Boxes, and Drain Inlets
Junction boxes, spring boxes, or drain inlets will be paid for at the Contract Price per each. Payment is full compensation for the following:
- Furnishing castings, fittings, and other appurtenances called for on the plans to complete the Item
- Making pipe connections regardless of skew
- Providing materials, making forms, and disposing of surplus material

D. Pipe
Pipe entering or exiting catch basins, drop inlets, manholes, junction boxes, spring boxes, or drain inlets, will be paid for under the section of the specifications governing the pipe.

E. Sand Bedding Material for Precast Structures
No separate payment will be made for this material. Its cost is included in the Contract Price for the structure under which it is used.

F. Excavation and Normal Backfill
No separate payment will be made for excavation and normal backfill. Their cost is included in the Contract Price for the structure being excavated.

G. Safety Grates
Safety grates will be paid for at the Contract Price per square foot (meter).

H. Inlets for Safety Grates
Inlets for safety grates will be paid for at the Contract Price per cubic yard (meter) of Class “A” concrete, including reinforcing steel.

I. Vertical Tee Sections (or Saddles)
Vertical tee sections will be included in payment for the section of structure they are incorporated in.
Section 668 — Miscellaneous Drainage Structures

No separate payment will be made for excavation, backfill, and disposal of surplus material.

Payment will be made under:

680.1.03 Submittals
A. Purchase List
   Before purchasing materials, electronically submit the complete materials and structures list, including Shop Drawings, to the Engineer for approval. Include the manufacturer’s name, catalog number(s), and other descriptive data needed to clearly define each Item.
Section 680 — Highway Lighting

B. Manufacturer’s Certifications

1. Certification of Construction Items
   Secure supplier or manufacturer certifications, including mill certificates, guaranteeing the construction items were manufactured according to the specifications.
   Ensure that the certificate shows that representative samples were tested, and test results conform to the specifications.
   Shall be in accordance with FHWA 23 USC 313 Buy America Act.

2. Certification of Quantity
   Attach a copy of the bill of lading, sales order, or list showing the quantity of materials furnished for a specific project. Make this part of the certification by reference.

C. Manufacturer’s Guarantees

After the work is complete and accepted, obtain manufacturer’s guarantees for the mechanical and electrical equipment used.

Give these to the Engineer who will pass them to the agency responsible for continued equipment maintenance.

680.2 Materials

Furnish only new materials for this work. Ensure that materials meet the following requirements unless otherwise indicated:

<table>
<thead>
<tr>

Section 680 — Highway Lighting

A. Codes and Standards

Ensure that all materials and work performed meet the latest revisions of the following standards, codes and regulations:

- The American Association of State Highway Transportation Officials (AASHTO)
- Federal Highway Administration (FHWA)
- National Electrical Code (NEC)
- National Electrical Safety Code (NESC)
- Illuminating Engineering Society (IES)
- Insulated Cable Engineers Association (ICEA)
- American National Standards Institute (ANSI)
- Occupational Safety and Health Administration (OSHA)
- Nationally Recognized Testing Laboratories (NRTL)
- Power company regulations and standards
- Codes, regulations, and rules in the work area or municipality

In addition to the above, ensure that electrical materials meet the following standards, provided a standard exists for that material:

- American Society for Testing and Materials (ASTM)
- Underwriter’s Laboratories, Inc. (UL)
- Institute of Electrical and Electronics Engineers (IEEE)
- National Electrical Manufacturer’s Association (NEMA)
- National Electrical Contractors Association (NECA)
- National Electrical Testing Association (NETA)

The Contractor shall furnish a letter to the engineer certifying that all electrical materials used for the project comply with the plans and have been listed by an OSHA approved NRTL to the appropriate UL Standard and bear the Mark of the NRTL. If any materials used in the project are found to be deficient, the Contractor will replace them at their own expense at no cost to the Department.

680.2.01 Delivery, Storage, and Handling

Contractor to ensure materials are delivered to project site undamaged and stored properly while outside off the ground. Any damage due to shipment, storage, installation prior to acceptance will be replaced by the Contractor at no additional cost.

Dispose of excess or unsuitable material according to Section 205.

680.3 Construction Requirements

680.3.01 Personnel

Refer to Section 682.3.01.

680.3.02 Material

Ensure that material is at the project site and approved before construction begins.

680.3.03 Preparation

Before beginning work, pay applicable fees and obtain needed permits from power companies or governmental agencies.

680.3.04 Fabrication

General Provisions 101 through 150.
Section 680 — Highway Lighting

680.3.05 Construction

A. Installing Conduit

Conduit shall be installed as directed in Section 682.6.01 A-I.

B. Constructing Pull and Junction Boxes

Pull and junction boxes shall be installed as directed in Section 682.6.01 I.

C. Installing Underground Cable for Lighting Circuits

Cable shall be installed as directed in Section 682.6.01 L-N.

D. Installing Light Standard and Towers

Grounding of all circuitry shall be installed as directed in Section 682.6.01 P.

Install the specified design, kind, and size of light standards or towers at plan-specified locations. Install these structures, complete with specified supporting assembly and luminaires, to the mounting heights shown on the plans.

Consider transformer bases and breakaway devices to be an integral part of the lighting standard unless otherwise specified.

Install light standards and towers as follows:

1. Installing Foundations

   a. Foundations for Bolt-Down Base Standards with Anchor or Transformer Bases

      Install these as follows:

      1) Excavate a hole the size and depth shown on the plans.
         Remove and dispose of excavated material as directed by the Engineer.

      2) Place the specified type and size anchor bolts according to the pole manufacturer’s recommendations. Hold these securely by a template to ensure proper position in the completed foundation.

      NOTE: Never attempt to realign the anchor bolts after pouring the foundation.

      3) Place conduits in foundations, orient them to accommodate branch circuit cables, and securely hold them to avoid displacement.

      4) Pour Class A concrete into the excavated area to the following depths:
         a. First pour against undisturbed earth up to 4 in. (100 mm) below the finished ground line.
         b. Then, using an approved form, continue to pour to the finished top of the foundation elevation, as specified.

      5) Foundation form to remain in place at least 24 hours or until concrete cures.

      6) Chamfer the top and formed portions of the foundation edges.

      7) Give a Type III finish to all portions of the foundation above finished grade down to at least 2 in. (50 mm) below finished grade, according to Subsection 500.3.05. AB.4, Type III—Special Surface Coating Finish.

      8) When obstructions are encountered, the Contractor shall request to relocate the foundation. Any abandoned holes shall be backfilled in accordance with Subsection 207.3.5.C.

      9) When rock is encountered, the design foundation depth may be reduced 6 in. for every 12 in. of embedment in rock. The minimum depth of any foundation shall be determined by the Engineer.

     10) Where breakaway bases are required according to AASHTO Specifications for Structural Supports for Highway Signs, do not allow any portion of the base or anchor bolts to protrude more than 2 in. (50 mm) above the ground line.

       b. Tower Foundations and Standard Foundations on Structures must be constructed according to details within the plans.
c. Foundations for Pre-stressed Concrete Butt Base Standards

Excavate for pre-stressed concrete butt base lighting standard foundations either manually or mechanically. When excavating:

1) Dig or drill holes to the depths and diameters shown on the plans.
2) Place and compact 6 in. (150 mm) of crushed stone in the bottom of the hole. Use crushed stone according to Subsection 800.2.01, with stone size 57.

2. Installing Light Standards and Towers on Foundations

Erect the standards or towers as recommended by the manufacturer and approved by the Engineer. Erect carefully to avoid marring the finish or damaging the standard.

Ground the lighting supports according to the plans and as directed within Section 682.6.01 P.

d. Installing Bolt-Down Base Standards with Anchor or Transformer Bases

After installing foundations according to Subsection 680.3.05.E.1, install lighting standards as follows:

1) When using bracket arm type, use metal shims or double nuts supplied with the poles to plumb the pole about its center axis.
2) When using the single arm type, unless otherwise specified, install the luminaire and hardware, then plumb the back side of the standard, providing a slight rake or lean away from the traveled way.
3) Handhole shall be oriented such that workers accessing the handhole shall face oncoming traffic directly or located on the back side of the pole, facing the roadway.

e. Installing Pre-stressed Concrete Butt Base Standards

After installing foundations according to Subsection 680.3.05.E.1, install pre-stressed concrete-butt base (direct burial) standards as follows:

1) Position the pole in the center of the hole at grade and hold it in place, as follows.
   a) Set two bracket arm lighting standards to plumb.
   b) Rake single bracket arm lighting standards according to Subsection 680.3.05.G
2) Fill the space surrounding the pole butt base as follows:
   a) Fill with crushed stone, applied in 6 in. (150 mm) layers. Use crushed stone according to Subsection 800.2.01, with stone size 57.
   b) Compact each layer with mechanical tamping equipment.
   c) Moisten the stone backfill as necessary.
   d) Fill the area to the bottom edge of the cable entrance in the butt base.
3) Install the cable.
4) Continue to fill and compact the area with 6 in. (150 mm) layers of crushed stone to 12 in. (300 mm) below grade.
5) Backfill the remaining 12 in. (300 mm) with soil in 2 equal layers, thoroughly compacting each layer.

3. Installing Frangible or Breakaway Standards

a. Ensure that frangible or breakaway lighting standards meet the breakaway requirements according to plan details and AASHTO Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals.

b. If breakaway devices are used, quick disconnect breakaway connectors must be used.

c. All entryway points created by the use of breakaway devices shall be permanently and completely sealed against rodent entry.

d. Breakaway devices are not to be used on bridge parapets, barrier walls and not required behind guardrail.

e. Contractor shall verify that the loading of the standard, arm(s), luminaire(s), and appurtenances does not exceed the capacity of the breakaway device.
Section 680 — Highway Lighting

E. Bridge Lighting Installations

When installing lighting on a bridge, examine the bridge plans or the completed structure, whichever applies, to determine the proposed or existing details that affect the lighting standards. Do this before ordering the standards.

Immediately report to the Engineer discrepancies between the highway lighting plans, the existing bridge structure, or the proposed bridge plans so that these differences can be reconciled.

Handhole shall be oriented such that workers accessing the handhole shall face oncoming traffic directly unless directed by the Engineer.

F. Bracket Arms

Install the specified type, design, kind, dimensions, and number of bracket arms on the lighting standards according to the plans.

Attach bracket arms to light standard in accordance with manufacturer’s recommendations.

Unless otherwise indicated on the plans, all arms are to be installed perpendicular to the roadway’s centerline.

G. Luminaires

Mount or install the specified design and size of luminaire shown on the plans. Ensure luminaire meets requirements as set forth within Spec 927, as applicable. Level according to the manufacturer’s recommendations and plan details, and as approved by the Engineer.

4. Position the Luminaires

Position luminaires to illuminate the roadway as follows:

a. Where a lighting unit illuminates a roadway portion on a grade, rotate the luminaire on its major axis to bring the minor axis parallel to the roadway.

b. Ensure the luminaires major axes are parallel to grade within 0° to plus 3°.

c. Provide glare shields on luminaires if required by the plans in accordance with manufacturer’s recommendations.

5. Install Pole and Bracket Cable

Install the pole and bracket cable per the applicable NEC requirements and as follows:

a. Provide a strain relief for the conductors at the top of the pole or at the end of the arm where the luminaire is attached suitable to support their weight and any motion due to pole vibration.

b. Clamp cables into the proper terminals on the luminaire’s terminal board.

c. Splice cables to the proper phase and neutral conductors outside the handhole in the pole base.

d. Ensure that cables contain specified size and type in-the-line fuses and waterproof holders within each phase conductor.

e. Leave enough slack in cables to check or replace the fuse outside of the handhole.

f. Leave slack in cables for future maintenance.

6. Finish the Installation

a. Make sure that all spliced connections are watertight, properly dress all wiring, and make sure that all cable insulation is not damaged.

b. After making the required circuit splices outside the handhole, place wires inside the handhole.

c. Properly secure the handhole cover, covering the hand hole completely.

d. Attach a suitable identification tag to each phase cable, using white for the neutral grounding wire.

e. Clean the light control surfaces and glassware or light transmitting surfaces after installation. Clean according to the luminaire manufacturer’s recommendations.

H. Electrical Service Equipment

Service point equipment shall be provided and installed in accordance with Section 682.6.01 O.
Section 680 — Highway Lighting

I. Field Painting

After erecting non-galvanized steel standards, thoroughly clean and touch up the standards, as required, with 1B Orange or original type primer.

Apply remaining coats according to System V (Heavy Exposure) in Section 535, unless otherwise indicated on the plans.

J. Seed and Sod Repair

If areas previously seeded or sodded are disturbed during this work, restore final grade, sprig, reseed (with mulch), or re-sod those areas according to Section 700.

K. Final Cleanup

Perform final clean-up according to Subsection 104.07 as it applies. Before final inspection, touch up finishes, clean surfaces to the satisfaction of the Engineer.

680.3.06 Quality Acceptance

A. Field Painting

If the finish on galvanized steel material is scratched, chipped, or otherwise damaged, the material will be rejected. Repair the finish only with the Engineer’s approval, according to Section 645.

B. Testing

Testing shall be completed and comply with Section 682.7.

C. Final Acceptance

Final Acceptance of the lighting system will be contingent on a 30-day testing period of continuous nightly automatic operation or until all other items have been accepted, whichever occurs later. The Contractor is responsible for energy costs until acceptance from the Department.

1. Test and Acceptance Time

2. Begin the test period after completion of the lighting work Correction of Defects

Correct defects in material or workmanship at no expense to the Department if they occur before maintenance acceptance or Final Acceptance.

If defects are identified during the 30-day test, correct the defects, then continue the test for another 30 days. Run the test each time a defect is identified and corrected until achieving uninterrupted, continuous nightly automatic operation for 30 days.

3. Final Voltage Test

After the testing period and at Final Acceptance, provide an electrician, a voltmeter, and an ammeter to perform this test as in Subsection 680.3.06.B.2, above. Perform the test in the presence of the Department’s Inspector(s) for each lighting circuit. Make this test data part of project records.

680.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.
680.4 Measurement
Highway lighting Items complete in place and accepted are measured as follows:

A. Lighting Standards and Towers
   Each lighting standard, with or without a base, or each lighting tower of the specified kind, design, and mounting height (M.H.) is measured by the unit, complete in place.
   Appurtenances for lighting standards and towers are measured as follows:
   1. Lowering device power supply units are to be integral to the cost of the tower and shall not be measured for payment separately unless shown on the plans as a separate payment Item.
   2. Foundations for lighting standards are not measured separately for payment and considered incidental to the cost of the lighting standard.
   3. Foundations for towers are measured separately, per each tower foundation
   4. Each tower foundation shall consist of Class A concrete and reinforcement steel as indicated on the plans or Detail Drawing.

B. Bracket Arm
   Luminaire bracket arm are to be of the specified length and type and measure per each.

C. Luminaires
   Luminaires of the specified size, type, and design are measured per each.

680.4.01 Limits
General Provisions 101 through 150.

680.5 Payment
Payment for highway lighting will be made as follows:

A. Lighting Standards and Towers
   Each light standard or lighting tower will be paid for at the Contract Unit Price per each.
   Payment is full compensation for furnishing and installing the complete lighting standard or tower, including the bracket arm(s) or high mast luminaire support and lowering assembly, and associated hardware and connections; furnishing grounding material; installing the foundation; furnishing backfill materials; backfilling; reshaping to proper contours; and repairing seeded or sodded areas.
   1. Luminaires
      Luminaires will be paid for at the Contract Unit Price per each. Payment is full compensation for furnishing and installing the complete luminaire. Installation includes ballast(s) or LED drivers, lamp(s) or LED modules, surge protection devices (SPD), glare shields where required, and associated hardware and wiring.
   2. Seed and Sod Repair
      Include the costs incurred in reseeding, re-sodding, and otherwise restoring the areas to their original condition in the Contract Price for other Items. These will not be paid for separately.
   3. Energy Cost During Testing
      The Contractor is responsible for the energy cost of each circuit or part of a circuit during the test period. The cost of energy consumed after the successful completion of the 30-day test period will be borne by others.
Section 680 — Highway Lighting

680.5.01 Adjustments

General Provisions 101 through 150.
Section 682 — Electrical Wire, Cable, and Conduit

682.1 General Description
This work includes furnishing and installing wire, cable, conduit, junction boxes and grounding for electrical power for roadway electrical systems, such as roadway lighting, traffic signals, ramp meters, and intelligent transportation systems (ITS), among others, as indicated in the Contract. See Section 647 for traffic signal installations.

682.1.01 Definitions, Acronyms, and Abbreviations
Refer to General Provisions 101 through 150.

A. Definitions
1. Cable - a bundle of insulated electrical current conducting wires covered with a protective sheath relevant to the environment in which it is installed.
2. Conduit - a pipe, trough, or channel used for protecting electrical cable. Conduit can be metallic or non-metallic; rigid or flexible, depending on the application. Conduit trade sizes are commercially available based on diameter. See NEC for trade sizes.
3. Wire - metal that has been drawn into a thin strand or rod, usually having a round cross section. Wire is to meet the requirements within Section 922.

682.1.03 Submittals

A. Purchase List

Before purchasing materials, electronically submit (in PDF format) the complete materials and structures list, including Shop Drawings, to the Engineer for approval. Include the manufacturer’s name, catalog number(s), and other descriptive data needed to clearly define each Item. Acceptable conduit products are contained within QPL-5.

B. Manufacturer’s Certifications

Certification of Construction Items

Secure supplier or manufacturer certifications, including mill certificates, guaranteeing the construction items were manufactured according to the Specifications.

Ensure that the certificate shows that representative samples were tested, and test results conform to the specifications.

Certification of Quantity

Attach a copy of the bill of lading, sales order, or list showing the quantity of materials furnished for a specific project. Make this part of the certification by reference.

C. Manufacturer’s Guarantees

After the work is complete and accepted, obtain manufacturer’s guarantees for the mechanical and electrical equipment used.

Provide these to the Engineer and the agency responsible for continued equipment maintenance.
682.2 Materials
Furnish only new materials and equipment for this work. Ensure that materials meet the following requirements unless otherwise indicated:

<table>

The Contractor shall furnish a letter to the Engineer certifying that all electrical materials used for the project comply with the Contract and have been listed by an OSHA approved NRTL to the appropriate UL Standard and bear the Mark of the NRTL. If any materials used in the project are found to be deficient, the Contractor will replace them at their own expense at no cost to the Department.

682.2.01 Delivery, Storage and Handling
Refer to General Provisions 101 through 150.

682.3 Construction Requirements
Ensure that construction and installation of specified equipment, materials, components, and assemblies comply with the manufacturer’s requirements and recommendations and meet Standard Detail Drawings. General work practices for electrical construction shall be in accordance with NECA 1-2010, Standard for Good Workmanship in Electrical Construction (ANSI).

682.3.01 Personnel

A. Qualified Electricians

Refer to Subsection 755.1.01 for the definition of a qualified electrician. Contractors and Sub-Contractors shall be approved by the Department to install roadway lighting, traffic signals, ramp meters, and ITS devices. Ensure that the Contractor performing this work is on the Department’s list of approved electrical contractors or electrical subcontractors.
Section 682 — Electrical Wire, Cable, And Conduit

682.4 Preparation
Before beginning work, pay applicable fees and obtain needed permits from power companies or governmental agencies.

Before beginning any mechanized boring, trenching or digging call 811, GDOT and any other local agencies which may be in GDOT ROW for instructions and clearance. This must be done at least 72 hours in advance excluding weekends and holidays. Calls made after 4:30 PM count as the next day.

Outline the areas to be excavated with white paint or flags before the utility location service is performed. Follow the Best Practice Guidelines published by the Common Ground Alliance (CGA), of which Georgia 811 is a member.

682.5 Fabrication
Refer to General Provisions 101 through 150.

682.6 Construction

682.6.01 Conduit, Pull and Junction Box and Cable Installation Requirements

A. General Requirements for Conduit

1. Install the specified size, type (rigid galvanized steel [RGS], HDPE, PVC) and quantity of conduit at the locations according to the Contract. Refer to the NEC for maximum allowable conduit fill percentages. Obtain written approval from the Engineer prior to installing conduit other than the size, type or quantity specified in the Contract.

2. Cut and ream conduit as follows:
   a. Cut metallic conduit threads and then ream the ends.
   b. Ream other conduit as necessary to ensure pull ropes or cables can be properly pulled through.
   c. Cut conduit ends square.
   d. Ensure that conduit ends butt solidly in the joints to form a smooth raceway for cables.
   e. Ensure that all chips, burrs, and sharp edges have been removed.

3. Ensure conduit joints form a watertight seal by doing the following:
   a. Coat metallic conduit threads with a suitable corrosion resistant thread sealant that is UL Listed to UL1356 such as Rector-Seal T plus 2, or thermoplastic seal approved by the Engineer, and then securely connect them per ANSI/NECA/IESNA 501-2006 Standard for Installing Exterior Lighting Systems, or ANSI/NECA 101-2013, Standard for Installing Steel Conduit (Rigid, IMC, EMT).
      1) Form fiber cement conduit joints with hot tar, asphalt, or bitumen paint, then drive tightly per NEMA FB 2.10-2013 Selection and Installation Guidelines for Fittings for Use With Non-Flexible Metallic Conduit or Tubing (Rigid Metal Conduit, Intermediate Metal Conduit, and Electrical Metallic Tubing). See “other threaded connections” in Table 2-2 for tightening torque values.
      2) Use a suitable sealant on conduit joints as recommended by the conduit manufacturer and as approved by the Engineer.

4. Install bushings in conduit to protect the conductors.

5. Build conduit runs in straight lines where possible.

6. Separate power cables from fiber cables except inside poles.

7. Use flexible conduit only where shown in the Standard Detail Drawings or in the Contract.
8. Clear all water from the conduit and debris before installing any cabling.

9. Conduit Couplings
   a. Make every effort to minimize the use of couplings. There shall be no more than three (3) couplings in a 20 foot linear section of a conduit run.
   b. Couplings shall be airtight and watertight. All couplings shall be installed in accordance with the conduit and coupling manufacturer’s recommendations.
   c. Use an approved HDPE to polyvinyl chloride conduit (PVC) coupling or an underground-type conduit adhesive where joining conduit or conduit bodies of dissimilar materials, such as HDPE-to-PVC sweeps into pull boxes or installing into pull box conduit terminators.
   d. Coupling of metallic conduit shall be accomplished only by hydraulic press-on or electro-fusion coupling methods unless otherwise approved by the Engineer.
   e. For metallic aluminum conduit, use compression couplings of seamless tool-grade tubular aluminum with sealing barbs and center stop.
   f. Use hydraulic compression duct coupling tools and follow all manufacturer’s installation procedures, fully inserting both conduit sections to the coupling center stop.
   g. Use pre-fabricated electro-fusion couplings that are field-installed using the coupling manufacturer’s recommended automatic self-monitoring fusing machine and installation procedures.
   h. In constricted spaces, it is acceptable to use alternate coupling methods and elbow geometry with approval by the Engineer, such as band clamp/locking ring solutions or mechanical bolt-on solutions.

10. Install insulated grounding/bonding bushings to protect conductors. If sweeps are necessary, use long sweep bends with a radius of at least 6 times the conduit’s nominal diameter, unless otherwise specified.

11. Ensure that empty conduit for future wire or cable and conduit with existing wires and cables has a pull tape as described in Section 682.6.01.J installed. Secure pull tape at each open end and at each pull box.

12. Continuous conduit runs shall not exceed 360° in bends without a junction box or cabinet.

13. Provide four (4) copies of the as-built documentation for underground conduit boring from the Contractor to include conduit quantity, size, location, depth, and pull box information. One copy will stay at the installation; one copy goes to the Engineer; one copy goes to the Office of Design Policy & Support Roadway Lighting Group and the last copy goes to the maintaining agency.

B. Installing Conduit and Fittings on Poles
   1. Install a weather head at the end of exterior conduit runs on a pole or other structure to prevent moisture or other matter from entering the conduit. All weather heads shall have the proper plastic or neoprene insert for the wires to pass through.
   2. Ream the ends of the conduit after cutting or creating threads as necessary. Make sure that there are no burrs or sharp edges to damage wire insulation.
   3. Cut ends square, and butt solidly in the joints to form a smooth raceway for cables.
   4. Ensure a watertight seal at joints.
   5. Ensure that conduit on pole exteriors are mounted with galvanized, two-hole straps or clamps. Place clamps no more than 3 feet from junction boxes, condulets, or weather heads. Place at 3-foot maximum intervals elsewhere.
   6. Fasten the clamps to wood poles with galvanized screws or lag bolts at 3-foot maximum intervals.
   7. Do not install conduit risers on concrete, steel, or mast arm poles unless approved by the Engineer.
   8. After installation, ensure that the conduit or fitting placement has not warped or distorted any condulet, terminal, control, or junction box.
Section 682 — Electrical Wire, Cable, And Conduit

9. Ensure that RGS conduit terminated at poles is grounded to the pole ground rod using an insulated grounding/bonding bushing and bonded in the pull box to the supply source via an effective ground-fault current path per the NEC.

C. Installing Conduit on Structures

1. Install conduits, condulets, hangers, expansion fittings, and accessories on structures according to the Contract and the following, unless otherwise specified.

2. Provide proper support hardware for all conduit attached to structure in accordance with the manufacturer’s recommendations. Support hardware shall be installed as specified by the NEC.

3. Run conduit parallel to beams, trusses, supports, pier caps, etc., as directly as possible.

4. Install horizontal runs in a slight grade (0.25%) without forming low spots that may prevent proper drainage.

5. Run conduits with smooth, easy bends to ensure cables can be easily pulled through. Hold the conduit ends in boxes with locknuts and insulated grounding/bonding bushings to protect the conductors. Use a minimum bend radius of 36 in. (900 mm) and maximum bend angle of 90°.

6. When not specified in the Contract, submit the type and method for attachment to structures to the Engineer for approval.

7. Do not clamp or attach conduit to bridge beam flanges.

D. Installing Conduit Underground

1. Conduit installed underground must be Type II conduit as described in Section 923, unless otherwise approved by the Engineer.

2. Use direct burial conduit, encased conduit or conduit duct banks installed in a trench excavated according to the Contract dimensions and lines. Unless specified in the Contract, do not excavate trenches in existing pavement or surfaced shoulders to install conduit.

3. Install the conduit by directional boring, trenching and backfilling, or other approved means. When placing conduit under existing pavement; bore at least 36 inches beneath the base of the pavement. Obtain the Engineer’s approval prior to installing conduit by means of boring method.

4. Provide at least 18 inches finished cover, unless otherwise specified.

5. Determine the location of electrical lines, drainage, or utility facilities in the area before excavation. Digging or excavation within 18 in. of existing utilities must be performed by hand.

6. Place conduit where it will not conflict with proposed guardrail, sign posts, etc.

7. Where possible, provide at least 12 in. between the finished lines of the conduit runs and utility facilities such as gas lines, water mains, and other underground facilities not associated with the electrical system.

8. When the conduit run is adjacent to concrete walls, piers, footings, etc., or when the conduit is encased between the encasement and the adjacent concrete, maintain at least 4 in. of undisturbed earth or firmly compacted soil between the conduit and adjacent concrete.

9. Unless specified in the Contract, do not excavate conduit trenches through existing pavement or surfaced shoulders. Install the conduit under the existing pavement by jacking, boring, or using other approved means.

10. When the Contract specifically allows a trench through an existing pavement or surfaced shoulder, restore the pavement, surface, base, and subgrade to the Engineer’s satisfaction. All costs associated with this restoration shall be included in the conduit installation price.

11. Excavate trenches as follows:
   
a. Cut trenches on a slight longitudinal grade (0.25% minimum) for drainage, unless otherwise specified.

b. When the grade cannot be maintained all one way, grade the duct lines from the center in both directions, down to the ends. Avoid pockets or traps where moisture may accumulate.
d. Tamp the trench bottom as necessary for a firm conduit foundation. It should be compacted to the density of the surrounding undisturbed soil. Ensure the trench bottom is smooth and free of bricks, rock or other material that could damage the conduit or cable before the trench is backfilled.

e. Support pipe and other structures at least every 10 ft. to prevent damage with approved support mechanisms. Furnishing, installing, and removing sheeting, bracing, and supports will not be paid for separately. Cost of these items shall be included in the overall bid price.

12. Before excavating, follow the instructions in Section 682.4 (above).

13. If necessary due to obstructions, slightly change the locations of conduit runs, pull boxes, etc., as approved by the Engineer.

14. Obstructions to Excavation

Make the following allowances around obstructions:

a. Where possible, provide at least 12 in. (300 mm) between the finished conduit runs and utility facilities, such as gas lines, water mains, and other underground facilities not related to the electrical system.

b. Where the conduit run is adjacent to concrete walls, piers, footings, etc., maintain at least 4 in. (100 mm) of undisturbed earth or firmly compacted soil between the conduit and the adjacent concrete.

c. When rock is in the bottom of the trench, install the conduit on a bed of compacted, fine-grain soil at least 4 in. thick.

15. Conduit installed for fiber optic cable installation shall have a detectable tone or locator wire No. 14 (AWG) minimum with insulation suitable for direct burial applications. The locator wire shall have no splices.

E. Installing Encased Conduit

Place in locations shown in the Contract unless otherwise specified by Engineer. Construct as follows:

1. Conduit shall be Type II, as described in Section 923, unless otherwise approved by the Engineer.

2. Construct encasement using Class A concrete that meets requirements in Section 500.

3. Use precast concrete encasement only if approved by the Engineer.

4. Excavate trenches as follows:

a. Cut trenches on a slight longitudinal grade (0.25% minimum) for drainage, unless otherwise specified. When the grade cannot be maintained all one way, grade the duct lines from the determined high point in both directions down to the ends. Avoid pockets or traps where moisture may accumulate.

b. Tamp the trench bottom as necessary for a firm conduit foundation. It should be compacted to the density of the surrounding undisturbed soil.

c. Support pipe and other structures at least every 10 ft. to prevent damage with approved support mechanisms. Furnishing, installing, and removing sheeting, bracing, and supports will not be paid for separately. Cost of these items shall be included in the overall bid price.

5. Before excavating, follow the instructions in Section 682.4 above.

6. If necessary due to obstructions, slightly change the locations of conduit runs, pull boxes, etc., as approved by the Engineer.

7. Obstructions to Excavation

Make the following allowances around obstructions:

a. Where possible, provide at least 12 in. (300 mm) between the finished conduit runs and utility facilities, such as gas lines, water mains, and other underground facilities not related to the electrical system.

b. Where the conduit run is adjacent to concrete walls, piers, footings, etc., maintain at least 4 in. (100 mm) of undisturbed earth or firmly compacted soil between the conduit and the adjacent concrete.
c. When the conduit is encased, maintain at least 4 in. (100 mm) of undisturbed earth or firmly compacted soil between the encasement and adjacent concrete.

8. Construct encasement under pavements or surfaces so that it extends at least 12 in. (300 mm) beyond the outside edges of pavement, paved shoulders, sidewalks, or curbs, when no shoulder or sidewalk is indicated.

9. Ensure that the end of installed conduit extends at least 6 in. (150 mm) beyond the encasement.

10. Place 3 in. (75 mm) of concrete in the trench bottom to support the conduit.

11. Plug the conduit ends temporarily to keep concrete or foreign material out, then place the conduit in the trench.

12. Do not encase conduit in concrete until tested, inspected, and approved by the Engineer.

13. Cure concrete encasement according to Subsection 500.3.05.Z, with a curing period of 24 hours.

14. Cover the conduit with at least 3 in. of concrete.

F. Backfilling Over Underground Conduit

1. When applicable, do not backfill encased conduit until the concrete encasement has cured at least 24 hours.

2. Once the Engineer has inspected and approved the installation, promptly backfill to the required grade. Use soil without rocks or other foreign matter. Backfill with approved material in layers no deeper than 6 in. loose depth up to the original ground level.

3. Compact each layer to one hundred percent (100%) of the maximum laboratory dry density as determined by GDT 7, GDT 24a, GDT 24b, or GDT 67, whichever applies.

G. Directionally Boring Conduit

1. Conduit used for directional boring shall be as specified within Section 923.2.03

2. Suitable pits or trenches shall be excavated for the boring operation and for placing end joints or termination connectors of conduit when required. Pits or trenches shall be securely sheeted and braced where necessary to prevent caving.

3. Bore width shall not exceed 125 percent of the conduit diameter specified within the Contract.

4. Contractor shall produce documentation showing the directional bore location, path, and depth of each section of conduit. The documentation shall be provided to the Engineer and have an accuracy within 2 percent.

5. Where directional boring is required under railroads, highways, streets, or other facilities, construction shall be done in the manner that will not interfere with the facility operation and shall not weaken the roadbed or structure. Roadway pavement, subgrade, roadbed, paved shoulder, or unpaved median shall not be disturbed or excavated without written authorization by the Engineer. In these areas, any broken or damaged boring rod/stem, boring head (including transmitter/transponder locating heads and cutter heads), couplings (including back reaming, swivel or connector couplings), or any other material that cannot be retrieved as part of the pullback operation shall become the property of the Department and shall be abandoned in place unless otherwise authorized in writing by the Engineer. There shall be no additional payment for abandoned material.

6. Continuously monitor the location and alignment of the pilot drill progress to ensure compliance with the proposed installation alignment and to verify depth of the bore. Monitor by manual plotting based on location and depth readings provided by the locating/tracking system or by computer-generated bore logs. Readings or plots shall be obtained on every drill rod and provided to the Engineer on a daily basis for as-builts electronically in PDF format.

7. Monitoring drilling fluids, such as the pumping rate, pressures, viscosity, and density, during the pilot bore, back reaming, and/or pipe installation stages shall be undertaken to ensure adequate removal of soil cuttings and to ensure that the stability of the borehole is maintained.
a. Drilling fluid pressures should not exceed that which can be supported by the overburden (soil) pressure to prevent heaving or a hydraulic fracture of the soils.

1) At no time, shall the flow pressure exceed 500 psi and should normally not exceed 200 psi.

2) Excess drilling fluids shall be contained at the entry and exit points until recycled or removed from the site.

3) Ensure that all drilling fluids are disposed of in a manner acceptable to the appropriate local, state, and federal regulations.

4) The Contractor’s work will be immediately suspended whenever drilling fluids seep to the surface other than in the boring entrance or exit pit. The Contractor must propose a method to prevent further seepage and must remove and dispose of any drilling fluid on the surface prior to resuming the boring operation.

8. The pullback rate should be determined to maximize removal of soil cuttings and minimize discomposure of the ground surrounding the borehole. The pullback rate shall also minimize over cutting of the borehole during the back-reaming operation to ensure that excessive voids are not created resulting in post installation settlement. Any surfaces damaged by the work shall be restored to their preconstruction conditions. The Contractor shall be responsible for all costs associated with the restoration.

9. The distance that the excavation extends beyond the end of the bore will depend upon the character of the excavated material but shall not exceed 2 feet in any case. This distance shall be decreased on instructions from the Engineer if the character of the material being excavated makes it desirable.

10. Once the directional boring is begun, the operation shall be carried on without interruption, insofar as practical.

11. The pits or trenches excavated to facilitate boring operations shall be backfilled immediately after the boring has been completed.

12. The boring shall proceed from a surface staging area provided for the boring equipment and workers and approved by the Engineer. The holes shall be bored mechanically. Excavated material shall be placed near the top of the working pit and disposed of as required. The use of water or other fluids in connection with the boring operation will be permitted only to the extent necessary to lubricate cutting. Jetting will not be permitted.

13. Excavation will not be paid for separately, according to the provisions in Sections 205 and 208.

14. In unconsolidated soil formations, a gel-forming colloidal drilling fluid consisting of at least 10 percent high-grade, carefully processed bentonite may be used to consolidate excavated material, seal the walls, and furnish lubrication for subsequent removal of material and immediate back reaming/installation of conduit.

15. Allowable variation from line and grade established by the Engineer shall be a maximum of 2 percent. Any voids that develop during the installation operation and are determined by the Engineer to be detrimental to the work shall be pressure grouted with an approved mix.

16. Directional boring operations inherently include the risk of encountering under grade obstructions that begin to alter the bore direction. The Engineer shall be notified immediately if an obstruction occurs.

a. Attempts at corrective measures to restore the proper bore alignment should include but are not limited to boring deeper or shallower (if minimum pipe depth can be maintained), moving the boring head to the right or left of the obstruction, or attempting to bore through the obstruction (if other than solid rock).

b. To restore the bore alignment, a minimum of three attempts shall be made to the Engineer’s satisfaction at each encountered obstruction with different corrective measures. If a suitable bore alignment cannot be restored, the Engineer may authorize a relocation of the bore.

c. Unsuccessful boring attempts shall be paid in accordance with Sections 682.6 and 682.7, using the obstruction location as one end of the measured length of directional boring.
H. Jacking Conduit

1. Refer to the requirements of Section 615.

I. Constructing Pull and Junction Boxes

1. Ground Mounted Pull Boxes
   a. Install pull boxes according to the type, design, dimensions, and locations shown in the Contract.
   b. For pull box construction and material details, see Section 924.2.02
   c. Pull boxes shall be installed at least 12 feet away from active lanes. Pull boxes for traffic signals may be
      less than 12 ft. from active lanes but must have appropriate traffic rated covers.
   d. Ground mounted pull boxes shall be installed per Article 300.5 of the NEC. Trenching, cover, and back fill
      requirements of Table 300.5 shall apply.
   e. Orient pull boxes with the longest dimension parallel to the roadway.
   f. Include provisions for drains in pull box excavations as specified.
   g. When applicable, do not locate pull boxes on the curb side of the signal pole in the intersection
      radius return.
   h. Install the pull box at a location that is level with the surrounding ground or pavement. Do not place a pull
      box in a ditch or depression. Unless otherwise shown in the Contract Documents, when installed either in
      a sidewalk or in the ground, the top of the pullbox shall be level with the sidewalk or ground surface.

2. Above Grade Junction Boxes
   a. Construct pull boxes according to the design, dimensions, and locations shown in the Contract.
   b. For junction box construction and material details, see Section 924.2.02
   c. Junction boxes are to be installed in the locations as indicated within the Contract, unless otherwise
      directed by the Engineer.
   d. Junction and pull boxes should be used where necessary to facilitate the pulling of wire or cable. Article
      314 of the NEC provides minimum sizing and installation requirements for junction and pull boxes used in
      wiring systems.
   e. Position the box and secure it to a structural or rigidly supported member. Members may be made of
      metal or fiberglass suitable for the application.
   f. Attach conduit or cable fittings to the box per the manufacturer’s instructions and insure that they
      are watertight.
   g. Feed conductors into the box and make connections.
   h. All connections should be insulated and watertight. Provide adequate strain relief for the conductors in
      accordance with manufacturer’s recommendations.
   i. Secure the box cover to the box using corrosion resistant fasteners and a suitable gasket, making a
      watertight seal.

3. Embedded Junction Boxes
   a. Construct pull boxes according to the design, dimensions, and locations shown in the Contract.
   b. For junction box construction and material details, see Section 924.2.02
   c. Use the proper size box per the Contract (ref. Article 314 in the NEC which provides minimum sizing and
      installation requirements for junction and pull boxes used in wiring systems).
Section 682 — Electrical Wire, Cable, And Conduit

**d.** Position the box and secure it to a rigidly supported member in the hole. Members shall be made of metal or fiberglass suitable for the application. The top lip of the box should be flush with the finish height of the concrete fill.

**e.** Attach conduit or cable fittings to the box per the manufacturer’s instructions and ensure that they are watertight.

**f.** Feed conductors into the box and make connections.

**g.** All connections shall be insulated and watertight. Provide adequate strain relief for the conductors.

**h.** Secure the box cover to the box using a suitable gasket and making a watertight seal.

**i.** Make sure that all conduit or cable entering the box is properly supported in accordance with NEC Article 314.23.

4. **Conduit Termination in Pull and Junction Boxes**
   
   **a.** Conduit shall be terminated in junction and pull boxes as shown in the Contract.
   
   **b.** Conduits terminated in concrete pull boxes shall be installed into factory-installed knockout windows only, which shall be fully grouted and sealed around all conduits and to the full thickness of the box wall.
   
   **c.** Conduits terminated in metallic junction boxes shall be installed into factory-installed knockout windows only and fitted with properly sized couplings.
   
   **d.** Conduits terminated in polymer pull boxes shall be installed into factory-installed conduit terminators; conduit adhesive sealants recommended by the terminator and conduit manufacturers shall be used.
   
   **e.** After installing conduit, seal the conduit entrance holes in pull or junction boxes per the manufacturer’s recommendations and to the Engineer’s satisfaction.
   
   **f.** Plug unused entrance holes and openings that may be used in the future. Use suitable plastic, bituminous fiber, or other approved plugs that keep foreign matter out.

5. **Drainage in Pull and Junction Boxes**
   
   **a.** Provide non-metallic pull and junction boxes with a drainage hole unless the application or the Engineer dictate otherwise.
   
   **b.** Provide a drainage system for each ground-mounted box to ensure that no water accumulates inside the box.

J. **Pull Tape**

1. Install pull tape, by hand pulling, blowing, or via vacuum method, into each empty conduit during conduit installation.

2. Install the pull tape after conduit testing has been completed.

3. Install and secure 5 feet of slacked pull tape in each empty conduit or cell at each vault.

4. Install and secure 5 extra feet of pull tape inside conduit being used and secured on each end for future use.

5. Secure the pull tape by tying it to the duct plug for the conduit in which it is installed.
K. Conduit Detection (Tracer) Wire

1. Install conduit detection wire in conduit used for fiber optic communications and where specified within the Contract.

2. If more than one conduit is being installed in a single bore, only one conduit detection wire is required.

3. The conduit detection wire shall be continuous and un-spliced between pull boxes or vaults and shall enter the pull boxes or vaults at the same location as the conduit for which it is installed. Coil and secure 5 extra feet of conduit detection wire in each pull box or vault.

4. Bonding wire suitable for direct burial may be used in place of conduit detection wire but shall be approved by the Engineer.

L. Direct Buried Conductors

1. Direct buried conductor packages used shall be as described in Section 922.2.01

2. Do not unreel and pull package into the trench from one end. Unreel and lay them alongside the trench, then lay them in the trench as follows:
   a. Serpentine the cables slightly in the trench to allow for settling of earth.
   b. Do not allow cable to crossover in the trench.

3. Excavate trenches as follows:
   a. Cut trenches on a slight longitudinal grade (0.25% minimum) for drainage, unless otherwise specified. When the grade cannot be maintained all one way, grade the duct lines from the determined high point in both directions down to the ends. Avoid pockets or traps where moisture may accumulate.
   b. Cut the trench walls vertical.
   c. Tamp the trench bottom as necessary for a firm foundation.
   d. Sheet and brace the trenches when required.
   e. Adequately support conductor package and any other support material exposed in trenches if support is necessary to prevent damage. Include furnishing, installing, and removing sheeting, bracing, and supports in the Contract Prices for other items, as they pertain.

4. Before excavating, follow the instructions in Section 682.4 above.

5. If necessary due to obstructions, slightly change the locations of conductor package, as approved by the Engineer.

6. Obstructions to Excavation

   Make the following allowances around obstructions:
   a. Where possible, provide at least 12 in. (300 mm) between the finished package runs and utility facilities, such as gas lines, water mains, and other underground facilities not related to the electrical system.
   b. Where the package run is adjacent to concrete walls, piers, footings, etc., maintain at least 4 in. (100 mm) of undisturbed earth or firmly compacted soil between the package and the adjacent concrete.
M. Installing Cable in Conduit

1. Cable used shall be as described in Section 922.2.01
2. Use cable with conduit as specified within the Contract.
3. When cable is brought through the base of the lighting standard or junction box, leave enough slack to allow the connections to be made outside the standard or box. The cable shall extend a minimum of 12 in. into the standard from the base plate before the outer covering is removed to minimize moisture and contaminants.
4. Carefully pull cables into place in conduits using approved methods so that the cable is installed without electrical or mechanical damage. Install as follows:
   a. Use powdered soapstone, talc, or other inert lubricants when placing conductors in conduit.
   b. Handle and install conductors carefully to prevent kinks, bends, or other distortions that could damage the conductor or outer covering.
   c. Pull all cables within a single conduit at the same time.
   d. When pulling cables through hand holes in pole shafts, etc., place a pad of firm rubber or other suitable material between the cable and the opening edges to prevent cable damage.

N. Splicing Cable

1. Make splices only in above grade junction boxes and pole bases unless otherwise shown in the Contract. Underground splicing is not allowed without specific approval from the Engineer.
2. Splice conductors according to the National Electrical Code and the splice manufacturer’s recommendations. Splices are subject to the Engineer’s approval.
3. Make splices watertight.
4. When making straight or line splices in the same-sized conductors, use tin-plated copper compression tubular splices.
5. When making splices in different-sized conductors or conductors with different terminating directions:
   a. Use tin-plated copper compression ring tongue terminals on each conductor.
   b. Bolt the conductors/terminals together with stainless steel or high strength silicone bronze hardware.
6. Use locknuts, pal nuts, or lock washers to keep connections tight. Do not use split bolt connectors.
7. Use an oxidation inhibitor compound on aluminum conductor connections.
8. After making a conductor splice, insulate it with heat-shrinkable tubing, supplied by the manufacturer, with an adhesive coating on the inner wall.
   a. Use shrink tubing with insulation thickness equal to or greater than the insulation thickness of the conductor.
   b. Use UL listed heat-shrinkable tubing that meets ANSI C119.1 (latest edition) requirements for submersible and direct buried splices.
   c. When connections are bolted together, wrap the bolted connection with cloth tape before applying the heat-shrinkable tubing.
   d. Use proper diameter tubing for the conductor and connection and pad sharp points and edges on splices to prevent the heat-shrinkable tubing from splitting during shrinking.
   e. Place the shrink tubing to have at least 3 in. (75 mm) of seal length on the conductor beyond the splice after the tube is fully recovered.
O. Electrical Service Point Installation

1. Electrical service point equipment shall be installed in accordance with the Contract and/or Standard Drawings. This would include any cabinets, disconnect switches, meter bases, service rack equipment and support hardware as well as additional conduit, service entrance heads, wood poles and grounding equipment.

2. Enclosures and cabinets shall be in accordance with Section 924.2.11

3. Disconnect switches shall be in accordance with Section 924.2.12

4. Circuit breakers shall be in accordance with Section 924.2.06

5. All equipment shall be grounded in accordance with Section 682.6.01 P

6. All equipment is to be sized and installed in accordance with NEC.

P. Grounding

1. Ground rods are to be sized as indicated in Section 924.2.01.

2. Connect neutral/grounding conductors to the ground rod at all control points and to the ground wire cast in pole foundations. Use the type and size of continuous neutral/grounding conductors shown in the Contract and all connections shall be done using an exothermic weld.

3. Meet the minimum requirements of the NEC.

4. Use the shortest possible ground lead that leads directly to a grounding source.

5. All components, including mounting hardware, shall be grounded and bonded per manufacturer’s recommendations and NEC. Dress and route grounding conductor separately from all other controller cabinet assembly wiring.

6. Grounding to water or other pipes, such as metallic conduit, is not an acceptable grounding connection means.

7. Install ground rods at locations shown in the Contract. Install ground rods in one of the following ways:

a. Driven Ground Rods

1) Drive single ground rods vertically until the top of the rod is at least 12 in. (300 mm) below the finished v.

2) Attach a length of No. 6 AWG, bare solid, soft drawn, or medium-hard drawn copper ground wire to the ground rod. Use suitable ground rod clamps.

3) Connect the wire to the standard base grounding nut.

4) Cutting ground rod short to match grade is not acceptable.

b. Laid Ground Rods

When sufficient penetration cannot be obtained in the above manner, place the following ground rod system:

1) Place 3 parallel ground rods at least 6 ft. (1.8 m) center-to-center horizontally and at least 12 in. (300 mm) below the finished ground.

2) Join and fasten these rods to the grounding nut of the standard base with No. 6 AWG, bare solid, soft drawn or medium hard drawn copper ground wire and suitable clamps.
682.7 Quality Acceptance and Testing

682.7.01 Conduit and Conductor Testing

A. Testing Conduit

Test the installed conduit with a mandrel in the Engineer’s presence as follows:

1. Test every conduit after the conduit is installed and before cable or pull tape is installed.

2. Perform testing on all conduit types in this Specification, including but not limited to each conduit in duct banks.

3. Thoroughly clean the conduits so they are free of any dirt, metal particles, water or other liquids or debris before performing the mandrel test.

4. Use a mandrel 2 in. long and 0.25 in. smaller in diameter than the conduit.

5. Ream the duct opening to remove burrs or foreign matter.

6. Thoroughly clean the duct in accordance to manufacturer’s recommendations.

7. Provide and install a weatherproof cap at each open end after test is completed.

8. Repair conduits that the mandrel will not pass through. If repairs cannot be made to the Engineer’s satisfaction, remove and replace the conduit at no additional cost to the Department.

B. Testing Conduit Detection (Tracer) Wire

1. Perform a continuity or tone test after installation to confirm that a continuous run of conduit detection wire was installed between pull boxes or vaults.

2. Prepare a test plan, supplying equipment, conducting the test and documenting the results.

3. Submit a test plan at least 15 working days prior to the desired testing date.

4. Testing shall not begin until the Engineer has approved the test plan, and all tests shall be conducted in the presence of the Engineer.
C. Testing Conductors

Caution: There is a risk of electrical shock when performing this test. This test should only be performed by qualified personnel that have electrical testing safety training compliant with or equivalent to ANSI/NETA ETT, Standard for Certification of Electrical Testing Technicians.

Even though insulation is a dielectric material there will be very small amounts of current that leak through it. The amount of current that leaks depends on the strength of the insulation, its moisture content, and its temperature. Measurements should be taken when the relative humidity is below 50% and the electrical system temperature is below 86°F (30°C), but above the dew point temperature. During each one (1) minute test, if the resistance value decreases it is likely that the conductor or cable is wet or contaminated. The conductors can be dried by passing compressed dry nitrogen through the cable or conduit. If this fails, the system should be evaluated for contamination.

Inspect all insulation for signs of contamination, degradation, and mechanical damage or abrasion. Any defective cable shall be replaced at no additional cost to the Department.

Prior to connecting service to the newly installed system test the insulation resistance per the following procedure:

Before beginning the test, make sure that the following precautions are observed:

1. The cable or wiring assembly should be disconnected from the system and NOT energized.
2. Set or hang the meter. Do not hold the meter in hands in case of transient voltages.
3. Discharge any conductor capacitance before and after each test.
4. Wear insulating rubber gloves when connecting or disconnecting test leads.
5. Don’t use an insulation tester near explosive agents.
6. Follow all of the meter manufacturer’s safety precautions.

The test meter manufacturer will provide the meter connection instructions as well as instructions for operation of the meter.

The following tests must be conducted, and the listed data below recorded on the test form (or Engineer approved equivalent) which must be completed and submitted to the Engineer for approval. Use multiple copies as required.

Using the Step Voltage Test method to measure the insulation resistance, each branch circuit must be tested from the service cabinet through the end of the branch circuit to include all contractor installed conductors and splices within the circuit, all in accordance with the meter manufacturer’s instructions. Perform insulation resistance test on each conductor with respect to ground and adjacent conductors and measure insulation resistance of each bus way or conduit assembly, phase-to-phase and phase-to-ground.

Record all relevant data using the format in the table below. Be sure to discharge any line capacitance after each test.

1. Apply 250V DC, test duration shall be one (1) minute and measure resistance and record the required information.
2. Apply 500V DC, test duration shall be one (1) minute and measure resistance and record the required information.

Insulation resistance values shall be within 5 percent of manufacturer’s published data. If the manufacturer’s published data is not available, the measured insulation resistance shall be 100 meg-ohms or greater. Values of insulation resistance less than this or the manufacturer’s recommendations shall be investigated. In the event of failure, individual conductor runs between poles and/or splice locations should be tested to determine the problem and resolve it. The system’s minimum insulation resistance should be 25 meg-ohms.
Electrical Insulation Resistance Verification Tests

1. Measure the service voltage between the phase conductors before turning the circuit breaker on at the service point. Also measure the service voltage between each phase conductor and the neutral or ground.

2. After observing the proper voltage as indicated in the Contract, turn the circuit breaker on and repeat the voltage measurements.

3. After the circuit has been energized for at least 10 minutes, measure the load current in each phase conductor and in the neutral at the service point.

4. Ensure that the current in the phase conductors is balanced and that there is no current in the neutral.

D. Grounding

1. Test electrode to verify that this grounding system produces a resistance of 25 ohms or less. If not, add more ground rods as necessary, connected with No. 6 AWG solid copper wire at 8 ft. (2.4 m) on center and re-test. Up to four (4) total ground rods can be installed if necessary.

2. For extended distances between ramp meter and VDS, additional grounding may be required by the manufacturer.

3. When testing for resistance verify the ground is dry.

4. Submit all ground test results.
Section 682 — Electrical Wire, Cable, And Conduit

E. Final Acceptance

1. After successful completion of the test procedure, each conduit and conductor shall go through a burn-in period for 30 consecutive days of normal operation.

2. During the burn-in period, the Contractor shall ensure that all Contractor-supplied equipment operates without failures of any type. If any equipment component malfunctions or fails to provide the specified functionality during the 30-day burn-in period, the Contractor shall replace or repair the defective equipment.

3. After the malfunctioning component(s) has been repaired or replaced to the satisfaction of the Engineer, the Contractor shall begin a new 30-day burn-in period. The new 30-day burn-in period shall apply only to equipment components supplied by the Contractor.

4. In the event of a failure or malfunctioning of equipment furnished by others that prevents the 30-day burn-in test from continuing, the Engineer will suspend the burn-in test and resume when the other equipment failures are corrected.

F. Contractor Warranty and Maintenance

1. Contractor shall provide a one-year manufacturer support (usual and customary warranties) period for all electrical wire, cable, and conduit materials furnished. This shall include all Contractor or manufacturer activities related to maintenance, removal, and replacement of electrical wire, cable, and conduit materials in warranty during the support period.

2. The manufacturer warranty support period shall begin upon successful completion of acceptance testing.

3. All manufacturer warranties shall be continuous throughout the period and state that they are subject to transfer to the Department.

682.8 Measurement

A. Conduit

Underground conduit, conduit duct banks, encased conduit, conduit on structures, directionally bored conduit, and jacked conduit will be measured for payment by the type and size installed per linear foot, tested and accepted. Unless otherwise specified in the Contract, all installation-related costs shall be included in the overall cost of the specified conduit.

B. Pull Boxes and Junction Boxes

Pull boxes and junction boxes will be measured for payment by the type and size installed per each and accepted. This shall include any excavation and backfill, bushing, couplers or any mounting hardware necessary to complete the installation.

C. Conduit Detection Wire

Conduit detection wire installed in existing conduit will be measured for payment by the linear foot amount installed and accepted. Payment for installing conduit detection wire in existing conduit will be paid for at the Contract unit price per linear foot. Such payment will be full compensation for furnishing, installing, and testing the wire.

D. Cable and Conductors

Cables and conductors will be measured for payment by the linear foot amount installed and accepted. Payment for installing cable and conductors will be paid for at the Contract unit price per linear foot. Such payment will be full compensation for furnishing, installing, and testing the cable and conductors.
Section 682 — Electrical Wire, Cable, And Conduit

E. Electrical Service Equipment

Electrical service equipment shall be measured and paid for at the Contract unit price per each installed service point installed and accepted. This will include all cabinets, enclosures, conduit and connectors, conductors, equipment racks including support beams and cross-bracing, ground rods and grounding conductors within the Contract or Standard Drawings to ensure proper operation.

F. Grounding

Unless specifically stated within the Contract, ground rods and related grounding conductors and equipment outlined within the Contract and Section 682.6.01 P will not be paid for separately.

682.8.1 Limits

Refer to General Provisions 101 through 150.

682.9 Payment

Payment will be made under:

682.9.01 Adjustments

General Provisions 101 through 150.
Section 683—High Level Lighting Systems

683.1 General Description
This work includes furnishing and installing lighting towers and high-level luminaires for roadway lighting systems, complete as indicated in the Contract.

High mast, roadway, and area lighting should be installed and maintained in accordance with NECA 505-2010, Standard for Installing and Maintaining High Mast, Roadway and Area Lighting (ANSI).

683.1.01 Definitions
General Provisions 101 through 150.

683.1.02 Related References
A. Standard Specifications

683.5.01 Adjustments
General Provisions 101 through 150.
Section 685—Blast Cleaning Portland Cement Concrete Structures

685.1 General Description
This work includes blast cleaning Portland cement concrete surfaces and removing blasting residue from roadway and shoulder surfaces.

685.1.01 Definitions
General Provisions 101 through 150.

685.1.02 Related References
A. Standard Specifications
   Section 109—Measurement and Payment
B. Related Documents
   General Provisions 101 through 150.

685.1.03 Submittals
General Provisions 101 through 150.

685.2 Materials
General Provisions 101 through 150.

685.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

685.3 Construction Requirements

685.3.01 Personnel
General Provisions 101 through 150.

685.3.02 Equipment
Maintain and use the following equipment for this work so as not to threaten anyone’s safety or health.

- Blasting/cleaning equipment
- Supporting traffic control devices, such as arrow boards, signs, barricades, cones, etc., according to the Traffic Control Section of the Contract and the MUTCD

A. Environmental Protection
   Provide blasting equipment with either of the following environmental protections:
   - An enclosure to keep dust from escaping into the surrounding area
   - Water spraying equipment that encircles the blast nozzle(s) to suppress the dust created by the blasting operation

B. Protective Devices
   Provide and have personnel use eye and hearing protection devices when working near the blasting operation. Also, provide personnel with respirators (with appropriate filters) or with forced air hoods when working in dust-contaminated areas.
### 685.3.03 Preparation
General Provisions 101 through 150.

### 685.3.04 Fabrication
General Provisions 101 through 150.

### 685.3.05 Construction

#### A. Blast Cleaning Methods
Use any of the following blast cleaning methods:
- Dry abrasive blasting with compressed air, blast nozzles, and abrasive
- Recirculating dry abrasive blasting with compressed air, blast nozzles, abrasive, and a recovery system
- Dry abrasive blasting with centrifugal wheels and abrasive
- Recirculating dry abrasive blasting with centrifugal wheels, abrasive, and a recovery system
- Wet abrasive blasting with compressed air, blast nozzles, abrasive, and a water injection system

#### B. Blast Cleaning Operation
Follow these requirements for blast cleaning operations:

1. When using compressed air in the blasting operation, provide and maintain traps to prevent contaminating the blasted substrate with oil or grease.
2. When blast cleaning within 10 ft. (3 m) of a lane occupied by traffic, immediately remove the residue to prevent a traffic hazard.
3. Control dust to the Engineer’s satisfaction to protect motorists from reduced visibility or damage to passing vehicles.
   The Engineer judges dust control effectiveness. If the Engineer believes that the blasting makes the highway unsafe, stop operations until instituting effective dust control measures.

#### C. Appearance of the Blasted Surface
Blast the surface uniformly, leaving only minute quantities of existing coating remaining in pit surface imperfections.

The remaining existing coating may be no more than one percent of the blast-cleaned surface in each square yard (meter).

Match the structure’s finished appearance to the standard photographs. Copies of these can be found in the District Office, the Office of Materials and Research, or the Office of Maintenance.

### 685.3.06 Quality Acceptance
All work performed under this specification is subject to timely inspection by the Department. Correct defective work by re-blasting at no additional cost to the Department.

### 685.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

### 685.4 Measurement
Blast cleaning of the Portland cement concrete structures is measured by the square foot (meter), according to Section 109. Median barrier walls are measured by the linear mile (kilometer) for variable height. Each face of the blast-cleaned wall is measured separately.

### 685.4.01 Limits
General Provisions 101 through 150.
685.5 Payment
Blast cleaning will be paid for at the Contract Unit Price bid. Payment is full compensation for costs, direct and indirect, incurred in complying with the requirements of this specification.

Payment will be made under:

<table>
<thead>
<tr>
<th>Item No. 685</th>

   Section 108—Prosecution and Progress
   Section 109—Measurement and Payment
   Section 500—Concrete Structures
   Section 511—Reinforcement Steel
   Section 853—Reinforcement and Tensioning Steel

B. Related Documents
   National Institute of Standards and Technology Handbook 44

690.1.03 Submittals
A. Material, Equipment, and Shop Drawings
   After the Contract is awarded, submit the following to the Engineer for approval:
   - Complete materials list
   - Complete Shop Drawings
   - List of equipment with supporting data that will be incorporated into the work
   Identify each item on the material and equipment list with an applicable section and subsection from the specifications.
   Allow the Department 60 days for review of materials, equipment, shop drawings and other manufacturer’s data.

B. Manufacturer’s Data
   Along with the materials and equipment list, submit manufacturer’s catalogs, cuts, diagrams, performance curves, charts, and other data demonstrating that equipment adheres to the specifications and plans. Model numbers alone are not acceptable.

C. Manufacturer’s Guarantees and Instructions
   Submit manufacturer’s guarantees on materials and equipment, as well as manufacturer’s instruction manuals. The Engineer will transmit these to the Department for future operation and maintenance of the truck scale system. Ensure that guarantees are subject to transfer.

D. Contractor Warranty
   Before beginning work, furnish a written warranty for the static scale system according to Subsection 690.3.07.
E. Brand Names or Equal

When materials and equipment are designated in the plans or specifications by “brand names or equal,” the equal materials may be used with the Engineer’s approval. Submit the name and complete description of the equal material or equipment in writing. Also submit supporting data for equipment performance according to Subsection 690.1.03 above.

690.2 Materials

Ensure that materials and equipment conform to the electronic axle load scale plans and these specifications. The Contractor’s attention is directed to Subsection 105.04.A, Specifications of Other Organizations.

Furnish new materials and equipment subject to the Engineer’s approval.

A. Electronic Axle Truck Scale Components

Use the following standard package components and accessories for permanent scale installation according to the plans and this section:

- Three electronic weighing platforms
- Three weight indicating and recording elements with one totalizer
- Reinforced concrete scale pits and approach aprons
- Traffic signal lights and controls
- Conduit and cable with electrical installation for axle scales and traffic signal lights

B. Weighing Platforms and Load Cells

Install each of the 3 weighing platforms in a common pit capable of simultaneously weighing 3 tandem axles that vary from 40 in. to 54 in. (1 m to 1.4 m) center-to-center.

Install each weighing platform with the following capacities:

- At least 40,000 lb. (18 000 kg) capacity
- Capacity to weigh an axle unit up to 12 ft. (3.7 m) wide in one operation
- One-axle maximum capacity
- Capability to withstand 100 percent transit side load

1. Load Cells

Install each weighing platform with electronic load cells with the following capabilities:

- At least 20,000 lb. (9000 kg) capacity
- At least 200 percent overload rating
- One-time static overload capacity of at least 300 percent of normal without structural failure

Environmentally seal each cell against moisture and corrosion under normal pit conditions. (See Subsection 690.3.05.A, Reinforced Concrete Scale Pit Construction.)

2. Axle Scales

Ensure that each weighing platform’s axle load scale has a 0.1 percent test load acceptance tolerance according to the National Institute of Standards and Technology Handbook 44.

3. Axle Weigh Bridges

Equip each weighing platform’s axle weigh bridge with appropriate check devices designed to prevent the reinforced concrete platform from moving horizontally.

C. Weight Indicating and Recording Elements

Use easily replaced and repaired plug-in weight indicators, printers, interfacing, and memory storage units.

Power the weight indicating and recording elements using a 115-volt AC, 60 hertz, single phase electricity.

Furnish one spare weight indicator and one spare electronic printer in case of electronic equipment interruptions.
Section 690 — Static Scale System

4. Digital Weight Indicator

Provide each weighing platform with an individually housed digital indicator with these features:

- Weight indicating capability of maximum 20 lb. (10 kg) increments
- Measuring capability of up to 99,980 lbs. (45 350 kg)
- Five-digit illuminated displays using at least ½ in. (13 mm) high digits
- Easily replaced snap-in snap-out type printed circuit boards for the indicator electronics
- Push-button zero that can eventually take an additional outside digital indicator for driver viewing

5. Printer Recorder

Provide an individually housed dot-matrix programmable printer-totalizer capable of printing letters and numbers on paper tape with the following format:

Georgia Department of Transportation
_______________ County Weigh Station
_______________ Bound Lane
_______________ (Date/Time)

(The following chart is a format example only.)

<table>
<thead>
<tr>
<th>Axle</th>
<th>Load</th>
</tr>
</thead>
<tbody>

<td>18,500 lbs. (8391 kg)</td>
</tr>
<tr>
<td>Gross</td>
<td>105,060 lbs. (47 654 kg)</td>
</tr>
</tbody>
</table>

a. Install printer systems with the following:

- Print control switches on each individual weighing platform
- Totalizer memory bank status indicators capable of 0.1 percent accuracy for each of the 3-axle load scales
- Twenty-four-hour clocks

D. Reinforced Concrete Scale Pits

See Subsection 690.3.05.A, Reinforced Concrete Scale Pit Construction.

E. Traffic Signal Lights and Controls

Use three traffic signals, equipped as follows:

- Two 8 in. (203 mm) diameter lenses
- Two 150-watt signal bulbs
- Visors over each lens

F. Conduit and Cable

Furnish and install according to the National Electrical Code conduit, cable and pull boxes, junction boxes, shielding, grounding, surge voltage lightning protection between the weight indicating and recording element and the scale, the weight platforms, pit light, receptacle, and appurtenances.

See Subsection 690.3.05.D for installation.
Section 690 — Static Scale System

690.2.01 Delivery, Storage, and Handling
Do not use the interstate Right-of-Way outside the truck weighing station to store equipment or supplies.

690.3 Construction Requirements

690.3.01 Personnel

A. Training
During the Acceptance Performance Test (APT) period following installation, train at least 10 Department-designated people to operate and maintain the truck weighing station systems. Furnish two operations and maintenance manual(s) for each set of platforms.

1. Provide one day of on-the-job-instruction in weighing trucks and using controls for weighing, recording, and traffic signal.
2. Provide one day of training in routine maintenance and trouble-shooting to determine probable causes of malfunctions.

B. Assistance During APT
Provide a trained static scale system specialist to assist in system operation for approximately one week during the APT.

690.3.02 Equipment
General Provisions 101 through 150.

690.3.03 Preparation
Truck weighing station construction may already be in progress. Coordinate operations with utility companies and other Contractors to complete the work quickly.

690.3.04 Fabrication
General Provisions 101 through 150.

690.3.05 Construction
Maintain limit of access to the truck weighing station. Enter and exit the station by ramps only.

A. Reinforced Concrete Scale Pit Construction
Furnish the reinforced concrete scale pits complete, including the structural design. Ensure the structural design supports the maximum compression load cell overload capacity without structural failure (see Subsection 690.2.B).

1. Concrete Work
   Install scale pit concrete including sleeves, piping, conduits, anchors, frames, other Items to be built-in, and other required Work and appurtenances.
   Do concrete Work according to Section 500 and Section 511.
   Use deformed billet steel bars for bar reinforcement steel according to Subsection 853.2.

2. Scale Pit Construction
   Construct scale pits and aprons at locations designated on the plans and as follows:
   a. Make the top of the pit and aprons flush and level with the adjoining pavement.
   b. Furnish and install a pit drain connected to a 4 in. (100 mm) drain line, provided by the Department, to a point below and near the center of the scale pit unless otherwise noted on the plans.
   c. Provide a float-controlled high-water alarm system in the scale pits that automatically activates a red warning light within the operator’s tower when water in the scale pit reaches 6 in. (150 mm) deep.
Section 690 — Static Scale System

d. Install an alarm buzzer with the high-water alarm system in the operator’s tower. Equip the buzzer with a volume control.

e. Provide scale pits with an access cover and manhole with at least 3 ft. (1 m) of vertical crawl space for equipment inspection and maintenance.

f. Enclose each scale platform and pit with steel coping.

B. Traffic Lights and Controls
Install and wire three red (stop)–green (go) traffic signal lights and controls as indicated on the plans. and as follows:

1. Place two of these traffic lights in the bypass lane. Operate these using one common three-position (red-off-green) toggle switch located on the counter in the operations tower.

2. Place the third traffic light at the axle load scales area. Operate this at the scales console in the operations tower.

C. Span and Calibration Adjustments
Place span and calibration adjustments for the entire weighing system inside the weighing station building at the indicators. Install the adjustments so that replacing the circuit board does not require recalibration of the scales.

D. Cable and Conduit Connections
Install cable connections in conduit between the elements and the platform scales.

Follow these requirements for cable and installation:

- Conform to Section XV of the Scale Manufacturer’s Association’s Specification Recommendations.
- Use armored flexible cable between scale pits and load cells.
- Use Schedule 40 PVC for the buried conduit between the scale pits and the operations building.
- Environmentally seal the load cell and underground connector cable connections.

690.3.06 Quality Acceptance

Time is of the essence in this Contract. Complete installation and testing on or before the project completion date and be ready for the Department’s acceptance performance test.

Test with weights certified and calibrated according to Georgia Department of Agriculture standards.

Measure the acceptance tolerance of the weighing system according to Subsection 690.2.B.

A. Acceptance Performance Test (APT)

The APT shall demonstrate to the Department’s satisfaction that the static scale system consistently meets the performance requirements of the plans and specifications.

At the conclusion of a successful APT, apply 0.2 percent maintenance tolerance to the scales and equipment until they are recalibrated.

1. Testing Procedure

   Submit a test plan to the Department for approval within 30 days after the Notice to Proceed.
   Begin the APT on the first normal working day following completion, calibration, and testing of the installation.
   During the APT period, the Department will operate the static scale system for approximately 8 hours per day, 5 days per week for 8 consecutive weeks.
   Provide a trained static scale system specialist to assist in the operation for approximately 1 week.

2. Failure or Delay in Completing Work on Time

   The Contractor’s attention is directed to Subsection 108.08, Failure or Delay in Completing Work on Time. Liquidated damages will start on the day after the project completion date if the installation is not complete and ready for the APT.
   Deductions for liquidated damages for each day of overrun in contract time will stop when the APT begins.
Section 690 — Static Scale System

690.3.07 Contractor Warranty and Maintenance

A. Static Scale System Warranty

Before beginning construction, warrant the static scale system equipment in writing against defective material and workmanship.

Furnish the written warranty to the Department when submitting Shop Drawings for approval. Include the provision that warranties are subject to transfer to the Department.

Warrant that for 6 months from the beginning date of the APT that equipment will perform according to Subsection 690.2.B and Subsection 690.2.C, continuously serving as intended under conditions required for the equipment.

The written warranty must be accepted and approved by the Department before beginning installation of the static scale system.

The warranty excludes damage caused by fire, flooding, lightning, accidents, vandalism, or natural disasters.

B. Warranty Service

Write the warranty to cover materials, equipment, service, labor, travel, and incidentals necessary for warranty service at no additional cost to the Department.

Provide warranty service including the following:

1. Every 90 days during the period of warranty, calibrate to acceptance tolerance of scales using certified test weights.
2. Make additional warranty calls during regularly scheduled working hours Monday through Friday as requested by the Chief of Permits and Enforcement or a duly authorized representative. Make a maximum of 10 calls during the warranty period without additional charge to the Department.

Perform requested warranty service either the same day or on the first working day following the request.

690.4 Measurement

This work will not be measured separately for payment.

690.4.01 Limits

General Provisions 101 through 150.

690.5 Payment

Electronic axle load truck static scale system will be paid for at the Contract Lump Sum Price. Payment is full compensation for materials, equipment, labor, tools, direction, and incidentals necessary to complete the Item according to the specifications and plans. Payment includes the spare weight indicator and standby printer, calibration and testing, a 6-month warranty, and Department personnel training.

Partial payments will be made on the basis of the following schedule of payments expressed as a percentage of the Contract Lump Sum Price:

<table>

690.5.01 Adjustments

General Provisions 101 through 150.
691.1 General Description
This work includes furnishing and installing weigh-in-motion system in truck weighing stations according to the plans and specifications.
The Department’s objective is to have a system that automatically pre-selects vehicles in motion for weighing, then automatically directs the vehicles to the enforcement scales.

691.1.01 Definitions
General Provisions 101 through 150.

691.1.02 Related References
A. Standard Specifications

   Section 511 — Reinforcement Steel
   Section 680 — Highway Lighting
   Section 923 — Electrical Conduit

B. Referenced Documents
   Scale Manufacturer’s Association Handbook 44
   Insulated Power Cable Engineers’ Association Specifications
   National Bureau of Standard Handbook 44
   Code of Public Transportation, State of Georgia

691.1.03 Submittals
After the Contract is awarded, submit the items listed below to the Engineer for approval.
Allow the Department 60 days for review of materials, equipment, shop drawings and other manufacturer’s data.
When the Department approves the Shop Drawings and other items listed herein, assume responsibility for furnishing material or performing Work as required by the plans and these specifications. Meet the requirements of the acceptance performance test (APT) according to Subsection 691.3.06.

A. Equipment Performance Supporting Data
Furnish documentation according to Subsection 691.3.07 that demonstrates to the Department’s satisfaction that equipment proposed for use in the weigh-in-motion scale system:
   • Is of standard manufacture
   • Has been available for purchase for at least two years
   • Has a proven acceptable performance history under conditions similar to those for the intended use
Include the following information with the equipment documentation:
   • Detailed descriptions of how the system requirements will be met
Section 691 — Weigh-in Motion Scale System

- Drawings showing control and display panels with descriptions
- Description of a similar installation with the standard package components described in Subsection 691.2.A that has been in use for at least 1 year or has satisfactorily completed one project for the Department, including:
  - The owner’s name
  - Owner’s address
  - A contact name
  - A contact telephone number

B. Demonstration

Demonstrate to the Department, by means of a pre-existing weigh-in-motion system which has been fabricated with the component equipment to be used on this project, that the Contractor has successfully provided and installed a weigh-in-motion system which is fully operative and has been in use for not less than one year, and is meeting the weighing performance requirements in Subsection 691.3.06 Quality Acceptance.

Upon request by the Engineer, arrange the pre-existing system demonstration and furnish operations performance data to the Department within 10 days after the request.

The Department will, at its option and expense, provide selected persons to view the demonstration.

C. Manufacturer’s Data

Along with the materials and equipment list, submit manufacturer’s catalogs, cuts, diagrams, performance curves, charts, and other data demonstrating that equipment complies with the specifications and plans. Model numbers alone are not acceptable.

D. Warranty

Before beginning work, furnish a written warranty for the static scale system according to Subsection 691.3.07.

E. Manufacturer’s Guarantees and Instructions

Submit manufacturer’s guarantees on materials and equipment as well as manufacturer’s instruction manuals. The Engineer will transmit these to the Department for future operation and maintenance of the truck scale system. Ensure guarantees are subject to transfer.

F. Brand Names or Equal

Materials and equipment designated on the plans or specifications as “brand names or equal,” may be substituted for equal materials with the Engineer’s approval. Submit the name and complete description of the equal material or equipment in writing. Also submit supporting data for equipment performance.

691.2 Materials

A. Weigh-in-Motion Scale Components

The work includes, but is not limited to, the following standard package components. Construct accessories as shown on the Plans and as described in these specifications.

- Electronic weighing platform(s)
- Speed-presence detectors, inductive loop type with:
  - Presence detector loops
  - Speed detector loops
Section 691 — Weigh-in Motion Scale System

- Weight indicator, recording elements, and control unit with digital processor
- Over-height detector
- Traffic control subsystems

Components will automatically pre-select vehicles with one of the following conditions for legal static weighing or over-dimension measuring:
- Exceeds manually entered threshold axle or gross weight
- Exceeds bridge formula weight and axle spacing limitations according to Subsection 691.3.06.A
- Is within 6 in. (150 mm) or above of the maximum height limitation as set forth herein

B. Electronic Axle Load Scale Plans

Ensure that materials and equipment for this work conform to the electronic axle load scale plans and these specifications. The Contractor's attention is directed to Subsection 105.04.A, Specifications of Other Organizations.

C. Scale Pits and Weighing Platforms

Use scale pits and weighing platforms as follows:

1. Scale Pits
   Furnish the structural design of and install scale pits. Ensure that the one-time overload capacity without structural failure is at least 300 percent of the legal axle load limit.

2. Weighing Platforms
   Furnish and install weighing platforms with a minimum load capacity of at least 200 percent of the legal axle load limit.

D. Inductive Loops

Furnish and install inductive loops in existing concrete pavement according to Subsection 691.3.05.B.

E. Weight Indicator, Recording Elements, and Control Unit with Digital Processor

Refer to Subsection 691.3.05.C.

F. Traffic Control Subsystem

Furnish and install the traffic control subsystem according to the plans, these specifications, and Subsection 691.3.05.D.

G. Conduit and Cable with Electrical Wiring

Furnish and install cables according to the NEC, Section XV of the National Bureau of Standards Handbook 44, the plans, Subsection 691.3.05.E, and the following:

1. Rigid Steel Conduit: Use according to Subsection 923.2.01.A.2.

2. Non-metallic conduit: Use according to Subsection 923.2.02.

3. Flexible conduit: Use flexible conduit with these features:
   - Galvanized steel core
   - Liquid tight jacket of polyvinyl chloride (PVC)
   - Continuous copper bonding conductor wound spirally between the convolutions
   - UL approved flexible conduit

4. Use wire and cable that conforms to the applicable sections of the IPCEA (Insulated Power Cable Engineers’ Association) Specifications S-19-81.
   Use pull and junction boxes according to Subsection 680.3.05.B.

691.2.01 Delivery, Storage, and Handling

Do not use the interstate Right-of-Way outside the truck weighing station to store equipment or supplies.
691.3 Construction Requirements

691.3.01 Personnel
A. Training
   During the acceptance testing period following installation, train at least 10 Department-designated people to operate and maintain truck weighing station systems.
B. Assistance During APT
   Provide a trained static scale system specialist to assist in system operation for approximately one week during the APT. (See Subsection 691.3.06.D.)

691.3.02 Equipment
General Provisions 101 through 150.

691.3.03 Preparation
Truck weighing station construction may be in progress. Coordinate operations with utility companies and other contractors to complete the work quickly.

691.3.04 Fabrication
General Provisions 101 through 150.

691.3.05 Construction
A. Scale Pit(s) and Weighing Platform(s)
   Construct the scale pits in existing pavement and base material as shown on a typical section according to Section 500 and Section 511 and as follows. Closely coordinate efforts with other contractors.
   1. Install a drain line to an outlet beyond the shoulder pavement.
   2. Make the entire weigh-in-motion scales flush with the pavement. Ensure that the completed scales do not rock or hammer.
   3. Hermetically seal and treat the load cells to prevent moisture penetration and corrosion under normal pit conditions.
B. Inductive Loops
   Saw cut pavement, install the loop wires, and seal the saw cuts to the Engineer’s satisfaction.
   Provide a loop detector in the bypass lane that detects a vehicle that was directed by the automatic sorting system to proceed to the static axle scales but has incorrectly proceeded to the bypass lane.
   Equip the loop detector to activate a buzzer at the operator’s console to alert the operator.
C. Weight Indicator, Recording Elements, and Control Unit with Digital Processor
   Furnish and install the weight indicator, recording elements, and control unit with a digital processor in the operations office that will be provided by others.
   Others will install the heating and air conditioning system in the operations office environment where the equipment will perform.
   1. Electrical Service
      Electrical service provided by others in the operations office will be 115-volt, 60 hertz (plus or minus 2 hertz), single phase service. Provide for power connections from panel board “A” to the equipment in the operations office.
Section 691 — Weigh-in Motion Scale System

2. Threshold Indicators
   Furnish and install detection devices that use overhead traffic control signs to automatically direct vehicles to 
   the static system under the following conditions:
     • The vehicle exceeds an operator-entered threshold speed when passing over scales.
     • The vehicle is out of position so that all wheels do not pass over the scales.
   Provide thumb wheel switches or a keyboard on the operator’s console so that threshold weights for axle and 
   gross weights can be entered into the instrumentation.
   When the operator-entered threshold weights are exceeded, have the instrumentation automatically activate 
   the overhead traffic control sign and eye level, pole-mounted sign directing the pre-selected vehicle to the 
   static scale system.

3. Control Signs and Indicators
   Provide a high-intensity light on the back of each overhead signal head that will illuminate at the same time 
   the green arrow is illuminated. Install two repeater pin lights at the weigh-in-motion console that indicate the 
   vehicle has been directed to the static scales or the bypass lane.
   Provide a manual switch in the operations office to override the automatic mode of the overhead signs.

4. Statistical Data Printer
   Equip the operator’s console with a microprocessor with changeable program that stores, recalls, and 
   provides statistical data in hard copy via a printer.
   The printer shall print at the operator’s discretion the weight indicator video display identifying axle weights, 
   axle spacing, length of vehicle, and gross weights to include data/time and velocity for each vehicle weighed 
   in motion.
   Equip the printer to print axle and gross weight data in no more than three seconds.

5. Selection Distance
   Program the instrumentation to pre-select successive vehicles one second or more apart from tail to head.

6. Automatic Zero
   Provide automatic zero tracking along with an adapter connection for “field changing” the indicating and 
   recording weight units from pounds to kilograms.

D. Traffic Control Subsystem
   Furnish and install the following components:

   1. Lamps
      Furnish and install reflector lamps using International Traffic Engineers colors in red for the “X” and green for 
      the arrow.
      • Use signals capable of the number of indications shown on the plans and clearly visible at 1/4 mile (400 
        m) under normal atmospheric conditions.
      • Use lamp sockets and lamps that are UL approved for outdoor service.
      • Use lamps rated at 120 volts with a manufacturer’s life expectancy of no less than 1,500 hours.
      Ensure that if two lamp bulbs fail, the lamp continues to indicate the proper signal.

   2. Lighting Effects
      Provide control signals with hinged and ventilated protective sun screens to eliminate “phantom” effects from 
      unlighted lamps. Screens also protect the signal lamps from damage from thrown objects and birds.

   3. Other
      Furnish and install poles, cables, guys and anchors, and appurtenances including controls and electrical 
      connections between the operations office and the overhead signs and cable.
Section 691 — Weigh-in Motion Scale System

E. Conduit and Cable with Electrical Wiring

Install cables in rigid galvanized steel or schedule 40 polyvinyl chloride (PVC) conduit between load cells, junction boxes, and electronic instrumentation. Install only smooth, standard dimension conduit according to the following:

- In exposed outside areas, install rigid galvanized steel conduit unless otherwise indicated.
- In underground areas, install rigid galvanized steel or schedule 40 PVC conduit.
- For inside areas other than installations in concrete slabs, install electrical metallic tubing (EMT) conduit, if desired.

Make conduit connections to moveable or vibrating equipment with the correct length of flexible conduit.

1. Installation Procedures

Install conduit as follows:

a. Use at least four 1 in. (25 mm) rigid galvanized steel conduits to attach the electrical junction box at the operator’s console to a ground-mounted junction box 5 ft. (1.5 m) from the building. The junction box is provided by the Building Contractor.

b. Shield the electronic cable connecting the transducers and instrumentation. Interconnect and carry shields to a single common ground.

c. Use a ground separate from the power source ground. Provide it for the transducer/ instrumentation only.

d. Environmentally seal transducer and underground connector cable connections.

2. Grounding System

Furnish and install surge voltage lightning protection consisting of 8 ft. (2.4 m) grounding rods at each transducer load cell location, at the balance box(s), and at the instrumentation input. Ensure that the grounding system meets National Electric Code requirements.

Ground the scale platforms at 4 locations with 5/8 in. (16 mm) diameter grounding rods 8 ft. (2.4 m) long and a continuous length of ground bus. Ground each platform at least once.

3. Instrument Input

Provide the instrument input, balance box(s), and each pair of transducer load cells with fast acting, two-stage shunting circuitry and surge capacity that are compatible with the transducers and electronic components.

Ensure that the surge voltage lightning protection system is electrically passive at normal circuit operating voltage and returns to a passive state after the surge voltage has been shunted. The shunted circuitry shall be capable of being tested and repaired independently of the scale operating parts and circuitry.

691.3.06 Quality Acceptance

A. Scale Performance Requirements

Ensure that the weigh-in-motion scale system automatically and accurately weighs each axle of a multi-axle vehicle (up to 11 axles) within the tolerances given in this subsection. Ensure that the system establishes the gross weight of the vehicle by totaling the individual axle weights.

Vehicle weight is defined as the vehicle weight established by static weighing on axle load scales with an acceptance tolerance of 0.1 percent of test load according to the National Bureau of Standard Handbook 44. Use the axle load truck scales regularly used for enforcement weighing within the truck weighing station.

Ensure that the system’s measurement of the distance in feet (meters) between two or more consecutive axles on 65,000 lbs. (29 483 kg) vehicles (gross weight) is within 5 percent of a distance measured by permits and enforcement officers using standard measuring equipment and techniques.

Ensure that 90 percent of the vehicles checked for compliance with the bridge formula outlined below are measured to this accuracy.

1. Bridge Formula

Have operators confirm that the system checks vehicles with a gross weight of 39,000 lbs. (17 690 kg) or more for compliance with the “Bridge Formula” provisions of Chapter 32-6, Article 2, Section 32-6-26 of the Code of Public Transportation, State of Georgia.
Section 691 — Weigh-in Motion Scale System

2. Speed and Rate of Vehicles
   Build the weighing system to perform the above functions while up to 12 vehicles per minute pass in motion over the scales.
   Ensure that weights are accurate as a variety of multiple axle trucks pass over the scales at speeds from 10 mph to 55 mph (15 to 90 kph)

3. Gross Weight
   Ensure that the scales accurately establish the vehicle gross weight as follows:
   - At speeds above 10 mph (15 kph), within plus or minus 5 percent of the actual vehicle gross weight and within a 90 percent confidence level
   - At speeds below 10 mph (15 kph), within plus or minus 2 percent of actual vehicle gross weight within a 95 percent confidence level

4. Axle Weight
   Ensure that the scales establish vehicle axle weights as follows:
   - At speeds above 10 mph (15 kph), within plus or minus 10 percent of the vehicle axle weight and within a 75 percent confidence level
   - At speeds below 10 mph (15 kph), within plus or minus 5 percent of the vehicle axle weight and within a 75 percent confidence level

5. Accuracy Limits
   Ensure 75 to 100 percent of load limits up to 20,340 lbs. (9226 kg) for a single axle weight and 80,000 lbs. (36 287 kg) for gross vehicle weight.

6. Environmental Conditions
   Ensure that the weigh-in-motion system operates under typical environmental conditions experienced in the state of Georgia.

7. Over-Height Detection Device
   Include the following over-height detection devices with the scale system:
   a. In the Vicinity
      Install an over-height detection device near the scales to detect vehicles 13 ft. (4 m) high or more (adjustable to 13 ft., 6 in. [4.1 m]). Ensure that this detector operates under the same conditions of vehicle speeds, numbers of vehicles per minute, and environmental conditions required for other components of the system. Have the system automatically direct vehicles at or above the present height limit to the static scales.
   b. At the Approach
      At the approach to the static scales used for enforcement weighing, where indicated on the plans, install another over-height detection device that will detect a vehicle 13 ft., 6 in. (4.1 m) high or more. Install a momentary adjustable volume audible alarm and a red light set to blink for 5 seconds in the operator’s office to alert the operator of a possible over-height violation.

B. Time is of the Essence
   Time is of the essence in this Contract. Complete installation and testing on or before the project completion date and be ready for the Department’s acceptance performance test.

1. Failure or Delay in Completing Work on Time
   The Contractor’s attention is directed to Subsection 108.08, Failure or Delay in Completing Work on Time. Liquidated damages for each day of project overrun will start on the day after the project completion date if the installation is not complete and ready for the APT. Liquidated damages will stop when the APT begins.
   At the end of the APT period, if the weigh-in-motion scale system as described on the plans and these specifications does not perform to the satisfaction of the Department, the Department reserves the right to continue testing or reject the entire system.
2. Removal of Equipment

If the Department rejects the entire weigh-in-motion scale system, the Contractor may remove the electronic weighing platform(s), weight indicator, recording elements, and control unit with digital processor. The Contractor may not remove inductive loops, traffic control subsystem overhead signs, conduit, and cable with electrical wiring. These will become the Department’s property.

C. Testing

Before the APT begins, run calibration and performance tests on the weigh-in-motion scale system with weights certified and calibrated according to Georgia Department of Agriculture standards.

The weigh-in-motion scale platforms will be statically calibrated to plus or minus 1 percent (between 1,000 lbs. and 6,000 lbs. [454 kg and 2724 kg]) when the weights are uniformly distributed over two 100 in.$^2$ (0.065 m$^2$) areas anywhere on the scale platforms.

Measure for acceptance tolerances according to Subsection 691.3.06.A.

D. Acceptance Performance Test (APT)

The APT shall demonstrate to the Department’s satisfaction that the weigh-in-motion scale system consistently meets the performance requirements of the plans and specifications.

Submit a test plan to the Department for approval within thirty 30 days after Notice to Proceed.

The APT period shall begin on the first normal working day following completion, calibration, and testing of the installation.

During the APT period:

1. The Department will operate the weigh-in-motion pre-selection system for approximately 8 hours per day, 5 days per week for 8 consecutive weeks.
2. Department personnel will check the calibrated performance by obtaining actual vehicle weight samples.
3. Provide a trained static scale system specialist to assist in the APT operation for approximately one week.

691.3.07 Contractor Warranty and Maintenance

A. Weigh-in-Motion Scale System Warranty

Before beginning construction, warrant the weigh-in-motion scale system equipment in writing against defective material and workmanship.

Furnish the written warranty to the Department when submitting Shop Drawings for approval. Include the provision that warranties are subject to transfer to the Department.

Warrant that for 6 months from the beginning date of the APT the equipment will perform according to Subsection 691.3.06.A, operating as intended under conditions required for the equipment.

Have the written warranty accepted and approved by the Department before beginning installation of the weigh-in-motion scale system.

The warranty excludes damage caused by fire, flooding, lightning, accidents, vandalism, or natural disasters.

Provide warranty service within 48 hours of notice that warranty work is required, excluding weekends.

691.4 Measurement

This work will not be measured separately for payment

691.4.01 Limits

General Provisions 101 through 150.
691.5 Payment
The weigh-in-motion scale system as described above will be paid for at the Contract Lump Sum Price. Payment is full compensation for all materials, equipment, labor, tools, superintendence, and incidentals necessary to complete the Item according to the plans and specifications. Payment also includes calibration and testing, acceptance performance testing, a 6-month warranty, and Department personnel training.

A percentage of the Contract Lump Sum Price will be paid according to the following cost schedule:

| Completion of installation, calibration, and testing of the entire weigh-in-motion scale system | 35% |
| Completion of the acceptance performance test to the satisfaction of the Department. | 65% |

Payment will be made under:

| Item No. 691 | Weigh-in-motion scale system truck weighing station | Per lump sum |

691.5.01 Adjustments
If the APT does not demonstrate that the performance requirements of the plans and specifications have been successfully accomplished to the satisfaction of the Department, and the Department rejects the entire weigh-in-motion scale system, payment to the Contractor will be limited to 35 percent of the Contract Lump Sum Price.
Section 692 — Automatic Vehicle Identification System, Tws

692.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 693—Truck Weigh Station Operations System

693.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 694—Weather Monitoring and Reporting System

694.1 General Description
Furnish, install, test, and provide warranty and training for a weather monitoring and reporting system comprised of equipment and materials as specified herein and shown in the Contract documents.

694.1.01 Definitions, Acronyms, and Abbreviations
A. Definitions
1. **ESS, Type 1**: a stationary ESS with RPU and environmental sensors mounted on an existing or new structure or pole and/or installed on the surface.
2. **ESS, Type 2**: same as Type 1 except with solar power system.
3. **ESS, Type 3**: a mobile ESS with sensors mounted on vehicle and wireless communications.
4. **RPU**: a processor that collects, pre-processes, and archives ESS sensor and device data.
5. **Watch-Dog**: built-in circuitry and capability for a system or equipment to monitor and detect failures or issues.

B. Acronyms and Abbreviations
Refer to Sections 101.01 and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

694.1.02 Related References
A. **GDOT Standard Specifications**
1. Section 639 – Strain Poles for Overhead Sign and Signal Assemblies
2. Section 682 – Electrical Wire, Cable, and Conduit
3. Section 926 – Wireless Communications Equipment
4. Section 939 – Communications and Electronic Equipment
5. Section 942 – ITS General Requirements

B. **Referenced Documents**
1. Refer to Section 942.1.02.B for a list of standards and documents referenced in this section.

694.1.03 Submittals
Refer to Section 942.1.04 for submittal requirements. Requirements for ESS equipment, components, and materials are specified herein.

694.2 Materials

694.2.01 Weather Monitoring and Reporting System Requirements
A. **General**
1. Comply with ISO 9001 or Six Sigma quality manufacturing requirements.
2. Provide only equipment and materials that are new and of like kind and function provided by one manufacturer, using the same model, part number, revision, and firmware for each type of sensor as shown and specified in the Contract documents.

3. Provide weather monitoring and reporting system components that are capable of interoperability and connectivity with the existing statewide ESS system and GDOT Central Software.

B. ESS Sensor

1. Provide ESS sensors that collect, store, and transmit the following atmospheric, pavement condition, and subsurface data:
   a. Atmospheric sensors installed along the roadway or on bridges (mounted on existing or new structure or pole and/or installed on the surface):
      i. Air temperature data
      ii. Relative humidity data
      iii. Ultrasonic Wind data
      iv. Barometric pressure data
      v. Precipitation data
      vi. Visibility data
   b. Pavement sensors (located in, above, or under the pavement):
      i. Pavement condition data
      ii. Surface condition data
   c. Subsurface (subsoil) sensor (located in the first travel lane or paved shoulder as approved by the Department).

2. Provide ESS sensors that send their respective data as specified herein to the RPU.

3. Provide ESS sensors and other field equipment that are made of UV, heat, and corrosion-resistant materials.

4. Provide shielded, outdoor-rated cabling with UV stable jacket from the RPU to each sensor in compliance with the ESS manufacturer requirements.

5. It is acceptable to provide sensors that can support multiple measurements of different types.

6. Provide ultrasonic anemometers and other ESS sensors having no moving parts, unless otherwise specified in the Contract documents.

7. Provide ancillary equipment, including aspirated radiation shields, needed for sensors to meet performance requirements defined in this section.

8. Provide weathertight molded cables capable of operating at extended cabling lengths up to 1,000 ft from the sensor to the RPU.

9. Provide atmospheric sensors that meet the minimum performance requirements identified below and in Table 1.
   a. Air Temperature and Humidity Sensor
      i. Provide a sensor that measures air temperature using a resistive sensor.
      ii. Provide a sensor that measures relative humidity using a capacitive sensor.
b. Ultrasonic Wind Sensor
   i. Provide a sensor that continuously measures wind speed and wind direction.
   ii. Provide a sensor that sends wind data to the RPU, including average wind speed, average wind
direction, and peak gust and gust wind direction, determined over a 10 to 60-minute time interval as
defined by the user, unless otherwise specified in the Contract documents.

c. Barometric Pressure Sensor
   i. Provide a sensor that obtains absolute atmospheric pressure.
   ii. Provide a sensor that can be calibrated for different altitudes.

d. Precipitation Sensor
   i. Provide a sensor that measures the accumulation and rate or intensity of precipitation.
   ii. Provide a sensor that detects visible precipitation in liquid and frozen form.
   iii. Provide a sensor that provides a yes/no indicator until a classification has been determined.
   iv. Provide a sensor that adds a classification for the following types of precipitation:
       a) Rain (light, moderate, and heavy)
       b) Freezing rain (light, moderate, and heavy)
       c) Snow (light, moderate, and heavy)
       d) Precipitation, not categorized (light, moderate, and heavy)

e. Visibility Sensor
   i. Provide a sensor that detects fog, smoke, or a combination thereof.
   ii. Provide a sensor with transmitter hood and the capability to minimize dew build-up on the window
of the sensor.
   iii. Provide a sensor that minimizes the amount and effects of dirt contamination and ice formation on
the sensor window.
   iv. Provide a sensor that uses the forward scatter principle for the determination of optical visibility in the
range designated in Table 1.

10. Provide a non-invasive (no physical impact to the pavement) pavement or surface sensor that meets the minimum performance requirements identified below and in Table 2.
   a. Provide a sensor that measures the temperature using IR technology.
   b. Provide a sensor that takes a surface or pavement temperature reading at no more than three-minute intervals.
   c. Provide a sensor that determines pavement or surface status as follows:
      i. Dry – Absence of moisture on the surface sensor.
      ii. Damp – Trace pavement moisture above freezing (no precipitation).
      iii. Wet – Precipitation has occurred and there is a continuous layer of water or moisture on the pavement.
      iv. Ice – Detection of ice layer formation on the pavement.

11. Provide an in-pavement sensor that meets the minimum performance requirements identified below and in Table 2.
   a. Provide a sensor that measures surface temperature.
   b. Provide a sensor that measures pavement friction or a grip level (critical to dry).

C. RPU

1. Provide RPU that can collect, store, and process sensor data to describe current weather conditions.
2. Provide RPU that accepts a minimum of 10 sensors concurrently and can be expanded to accept up to five additional sensors.
3. Provide RPU that allows for interoperability and connectivity to multiple vendors’ sensor products.
5. Provide RPU that uses “watch-dog” circuitry and monitors its’ own operation and resets itself if the RPU software enters an indeterminate state by itself or by a user administrator.
6. Provide RPU that can be reset from a centralized control location.
7. Provide RPU circuitry, including voltage inputs, sensor inputs, and communications ports, with transient and surge protection.
8. Provide RPU that uses SNMP traps to alert a system operator of alarm conditions.
Section 694 — Weather Monitoring and Reporting System

a. Provide RPU that issues an alert if its power supply is low or if there has been a complete power loss.

b. Provide RPU that sends a message to the system operator when the unit returns to normal operation.

9. Provide RPU that connects a dry contact solid state relay to open or closed based on any weather condition parameter sensed by the ESS sensor.

10. Provide RPU that uses sensor data to calculate the precipitation (any type) start and end time, time since last precipitation, forecasted snow or rain accumulation (equal to previous time interval), and probability of precipitation.

11. Provide RPU that uses non-invasive sensor data to calculate or determine the depth of precipitation including water and ice, percent of ice, snow/ice warning, snow/ice watch, wet below freezing, and frost condition.

12. Provide RPU that uses in-pavement sensor data to calculate or determine the average surface temperature and average grip level.

13. Provide RPU that uses subsurface sensor data to calculate or determine the average subsurface temperature to display temperature data incrementally by depth of reading.

14. Provide RPU with the capability to record and archive automated ESS sensor observations for a minimum period of three calendar days and provides user-selectable interval of archived observations between 1 and 20 minutes.

15. Provide RPU with software that has a user interface on the RPU (either through web or an external display) for troubleshooting, sensor configuration, and routine maintenance.

16. Provide RPU that supports remote firmware upgrades and sensor calibrations without the need for personnel to be on-site.

D. Mobile ESS (Type 3 Only)

1. Provide mobile ESS sensors that meet the minimum performance requirements identified below and in Table 4.

2. Provide mobile ESS with new, corrosion-resistant sensors.

3. Provide mobile ESS that operates with different surface materials (asphalt, concrete) without special calibration.

4. Provide mobile ESS that maintains continuous performance even with pavement damage and potholes in the road.

5. Provide mobile ESS sensor on the exterior front of the vehicle that measures surface temperature, air temperature, and humidity in real time.

6. Provide mobile ESS sensor on the exterior rear of the vehicle that measures pavement conditions (dry, moist, wet, ice), provides the thickness of any water or ice detected on the pavement, and calculates the friction of the pavement.

7. Provide mobile ESS that operates within a DC power range of 12 to 24 VDC.

8. Provide mobile ESS that integrates with automated vehicle location units.
Section 694 — Weather Monitoring and Reporting System

E. Communications and Network

1. Support direct fiber-based 10/100 Ethernet connections, Ethernet-based broadband cellular, or IEEE 802.11 wireless connectivity for transport of ESS data to the TMC as specified in the Contract documents.

2. For sites utilizing broadband cellular service for providing network connectivity to the TMC, utilize the Department’s current cellular telecommunication service provider. Refer to Section 926.2.01.F for broadband cellular router requirements.

3. Comply with NTCIP 1204 v03 or later.

4. Provide NTCIP conformance documentation with PRL with the materials submittal package.

5. Provide support to the Department in making the weather monitoring and reporting system data from the ESSs available to the National Weather Service for use by the Meteorological Assimilation Data Ingest System or successor program software. The data shall be pushed at regular intervals from a central ESS server to a known site, such as a hosted FTP server. RPU communication with the hosted server shall utilize NTCIP-ESS protocol. The RPU shall allow the server to poll the RPU via Ethernet communications. The data shall be formatted in a common data format (e.g., .csv or .xml) for exporting into other system(s).

F. Mechanical

1. Provide equipment that is permanently marked with manufacturer name or trademark, part number, and serial number.

2. Provide conductive contact surfaces or pins that are made of a noncorrosive, nonrusting, conductive metal.

3. Do not use self-tapping screws on the exterior of the assembly.

4. Provide parts that are made of corrosion and UV-resistant materials, such as plastic, stainless steel, anodized aluminum, brass, or gold-plated metal.

5. Provide assembly and mounting hardware, including nuts, bolts, external screws, and locking washers ≤5/8 in. (15.8 mm) in diameter, that are made of Type 304 or 316, stainless steel meeting the requirements of ASTM F593 and ASTM F594.

6. Provide assembly hardware ≥5/8 in. (15.8 mm) in diameter that are galvanized meeting the requirements of ASTM F3125.

G. Electrical

1. Provide DC conversion for any equipment requiring DC power.

2. Supply DC-to-DC or AC-to-DC conversion as required and voltage converter for devices that require operating voltages <120 VAC.

3. When required in the Contract documents, connect to a field UPS as specified in Section 939.2.07.

4. ESS Type 1 only: Provide the capability to operate using 120 VAC (±10%) 50/60 Hz (±5%).

5. ESS Type 2 only: Provide the capability to operate using 12 VDC (±10%) power provided from a solar power system meeting the minimum solar power system requirements specified in Section 939.2.08.

6. ESS Type 3 only: Provide the capability to operate using 12 VDC (±10%) as provided from a standard vehicle DC connector outlet.
H. Field Cabinet

Provide system components that are compatible with the field cabinet as shown in the Contract documents. The field cabinet is not included in the pay items defined in Section 694.5.

I. Mounting and Support Structure

1. Mount ESS atmospheric sensors, ESS field cabinet, and other required components on a single existing or new Department support structure or pole unless otherwise specified in the Contract documents.

2. Provide new support brackets, mounting hardware, and ancillary materials to mount ESS sensors and components.

J. Environmental

1. Provide ESS equipment and components capable of operating in the following minimum temperature range and humidity levels:
   a. -40°F (-40°C) through 140°F (60°C) for outside the vehicle and -13°F (-25°C) through 122°F (50°C) for inside the vehicle
   b. Up to 95% relative humidity (non-condensing)

2. Comply with NEMA 250, Type 4X corrosion requirements when installed within 5 miles (8 km) of the coast line.

3. Comply with IEC EN 60068-2, NEMA TS-2 Sections 2.1.9 and 2.1.10, or approved equivalent vibration and shock testing requirements.

4. Comply with IEC EN 61000-4-5 surge immunity testing requirements.

5. Provide ESS system that can withstand wind speeds of 100 mph (161 kph) with a 20% gust factor.
Section 694 — Weather Monitoring and Reporting System

6. Comply with the following EMC emission standards:
   b. IEC EN 61326-1

694.3 Construction

The construction and installation of the ESS equipment, materials, components, and assemblies as specified herein shall meet the requirements in this section and the ESS manufacturers’ installation requirements and recommendations.

694.3.01 Construction Requirements

A. General Construction

1. The Department may require the Contractor to demonstrate the proposed ESS prior to deployment in regard to providing interoperability and connectivity with the existing statewide ESS system.

2. Install ESS sensors, RPUs, associated ESS field cabinets, and equipment at the locations specified in the Contract documents and per ESS manufacturer recommendations.

3. Coordinate with and support the Department in the installation of mobile ESS onto selected state vehicles as required by the Contract documents.

4. Mount ESS components and sensors on new or existing structures or poles or install on the surface unless otherwise stated in the Contract documents.

5. Unless detailed otherwise in the Contract documents, mount atmospheric sensors except anemometers at ESS cabinet-top height, approximately 10 ft. (3 m) above pavement surface grade.

6. Mount anemometers at the top of the tower or pole. If local restrictions prevent installing the anemometers at the top, install the anemometers at a minimum height of 16 ft. (4.9 m) above pavement surface grade.

7. Mount sensors and devices on a mounting bracket such that the height and position provide a clear view of the lanes.

8. Mount the device such that it is rigid and not subject to vibration. The mounting bracket assembly shall include a sensor mounting bracket, pipe, and all associated hardware and materials.

9. Install ESS power supply or transformer on a standard DIN rail using standard mounting hardware and power conductors wired to terminal blocks in the ESS field cabinet.

10. Install primary power that is fused for 15A with surge protection that is compliant with UL 497B to protect the power and control and return conductors along with site equipment, and in compliance with the ESS manufacturer’s recommendations.

11. Install surge protection and cabling that comply with manufacturer’s recommendations at a minimum, or as specified in the Contract documents.

12. Install cabling and wiring internal to a pole, in conduit attached to truss members, or in underground conduit.

13. Provide cable connections that are manufacturer-rated and protected from outside elements.

14. Coordinate with the Department to establish electrical utility service as specified in Section 682.
   a. Verify with the local power service provider to ensure that the provided equipment is compatible with the installed equipment.
Section 694 — Weather Monitoring and Reporting System

b. Contractor shall be responsible for paying for electrical service as required from the time of testing up to the issuance of the MAL by the Department at which time the service provider account shall be transferred to the Department.

15. Provide exposed cabling and connections that are outdoor-rated or wrapped with self-sealing tape for weathertight and moisture seal.

16. For in-pavement and subsurface sensors:
   a. Locate sensors as specified in the Contract documents.
   b. Install buried lead-in cable in conduit at subsurface elevation in unpaved locations (i.e., from pole or tower to roadway edge of pavement).
   c. Install lead-in cable in the pavement in compliance with the manufacturer’s recommendations.
   d. Install surface sensors flush with the roadway surface or as directed by the Department.
   e. Provide wiring and cables that are continuous (without splices); except for surge protection connections between sensor and ESS field cabinet, so that ESSs are protected from lightning-induced surges.

17. Install cables for all sensors through the bottom of the ESS field cabinet that houses the RPU.

18. Tape ends of unused and spare conductors to prevent accidental contact to other circuits. Label all conductors inside the ESS field cabinet.

19. Establish power service as required and pay for electrical service from deployment set-up to the issuance of the MAL at which time the Contractor shall arrange and schedule for the transfer of service to the Department.

B. ESS Commissioning

1. Upon completion of the ESS equipment installation, the following shall be performed by personnel certified by the ESS manufacturer, if applicable:
   a. Make final sensor connections to the RPU.
   b. Perform final system checks, sensor alignments, software setup, and software configuration to provide a fully operational ESS.
   c. Provide test support for the entire system.

2. Commissioning shall include the following items:
   a. Verification that the installed ESS equipment is powered up, online, and communicating with the host server.
   b. Verification that the ESS is fully calibrated, properly installed, safely mounted, and ready for use.

694.3.02 Equipment Configuration and Integration Requirements
Refer to Section 942.3.03 for ESS RPU and component configuration and integration requirements.

694.3.03 Testing Requirements
Refer to Section 942.3.04 for testing requirements.

694.3.04 Training Requirements
Refer to Section 942.3.05 for training requirements.
694.3.05 Warranty and Maintenance Support Services

A. Warranty Requirements
   1. Provide a minimum warranty length of five years for ESS and associated components. If the manufacturer’s warranties for the components are for a longer period, those longer period warranties shall apply.
   2. Refer to Section 942.3.02 for general warranty requirements.

B. Maintenance Support Services
   Refer to Section 942.3.02 for maintenance support services requirements.

694.4 Measurement

The ESS and training that are complete, in place, accepted, and of the kind, size, and type specified will be measured as follows:

A. ESS, Type 1
   The Type 1 ESS will be measured for payment by the number installed, completed, functional, and accepted. Unless otherwise specified in the Contract documents, furnish, install, test, and provide warranty for the following minimum items as part of an ESS stationary system: atmospheric sensors, pavement condition sensors, and ancillary equipment or incidental items, including wiring and cabling, mounting hardware, power supplies, grounding, surge protection devices, and power connections, and power service to make a complete and fully operational ESS.

B. ESS, Type 2
   Same as ESS Type 1 except with solar power system.

C. ESS, Type 3
   The Type 3 ESS will be measured for payment by the number installed within vehicles, completed, functional, and accepted. Unless otherwise specified in the Contract documents, furnish, install, test, and provide warranty for the following minimum items as part of an ESS mobile system: atmospheric sensors, surface condition sensors, interface unit and processor, and ancillary equipment or incidental items, including wiring and cabling, mounting hardware, and power supplies, to make a complete and fully operational mobile ESS.

D. ESS Sensors
   The ESS sensors including 1) pavement sensor, non-invasive: 2) atmospheric sensor, visibility: 3) atmospheric sensor, air temperature and relative humidity: 4) atmospheric sensor, ultrasonic wind: 5) atmospheric sensor, barometric pressure: 6) atmospheric sensor, precipitation: and 7) subsoil sensor will be measured for payment by the number installed, completed, functional, tested, and accepted. Unless otherwise specified in the Contract documents, furnish, install, and provide warranty for ESS sensors and ancillary equipment or incidental items, including wiring and cabling, and mounting hardware, to make a complete and fully operational mobile ESS.

E. RPU
   The RPU will be measured for payment by the number installed, completed, functional, tested, and accepted. Unless otherwise specified in the Contract documents, furnish, install, and provide warranty for RPU and ancillary equipment or incidental items, including wiring and cabling, and rack mounting hardware, to make a complete and fully operational RPU.

F. Training
   Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the training.
694.5 Payment

694.5.01 Weather Monitoring and Reporting System

ESSs of the types specified in the Contract documents will be paid for at the Contract unit price. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty, necessary to complete the weather monitoring and reporting system.

Payment Notes:

Submittal

Submittal requirements are included in Section 942.1.04 and will not be paid for separately. It will be considered incidental to the ESS pay item.

Testing

Testing is defined in Section 942.3.04 and will not be paid for separately. It will be considered incidental to the ESS pay item.

ESS Field Cabinets

New ESS field cabinets will be paid for separately under Section 939.5 pay items.

ESS Support Structure

ESS support structure including poles and towers will be paid for separately under Section 639.5 pay items.

GDOT Central Software Integration

GDOT Central Software integration is included in Section 942.3.03 and will be paid for under the Section 942.5 pay item.

Broadband Wireless Routers

Broadband wireless routers will be paid for separately under the Section 926 pay item.

Payment for the weather monitoring and reporting system will be made under:

695.1 General Description
Specifications for this work will be included elsewhere in the Contract.
700.1 General Description

This work includes preparing the ground, furnishing, planting, seeding, fertilizing, sodding, and mulching disturbed areas within the Right-of-Way limits and easement areas adjacent to the right-of-way as shown on the plans except as designated by the Engineer to remain natural.

700.1.01 Definitions

A. Seeds
Whenever seeds are specified by their common names, use the strains indicated by their botanical names.

B. Water
Obtain the water for grassing from an approved source. Use water free of harmful chemicals, acids, alkalies, and other substances that may harm plant growth or emit odors. Do not use salt or brackish water.

C. Agricultural Lime
Agricultural lime rates will be based on a laboratory soil test report. The Contractor is responsible for ensuring the tests are performed by an approved laboratory. Provide a copy of test results to the Engineer. Refer to Section 882 Lime and GSP 18 of the Sampling and Testing Inspection manual for additional information on rates, use, handling and sampling procedures.

D. Fertilizer Mixed Grade
Fertilizer analysis and rates will be based on a laboratory soil test report. The Contractor is responsible for ensuring the tests are performed by an approved laboratory. Provide a copy of test results to the Engineer. Refer to Section 891 Fertilizer and GSP 18 of the Sampling and Testing Inspection manual for additional information on rates, use, handling and sampling procedures.

E. Mulch
Use straw or hay mulch according to Subsection 700.3.05.G.
Use wood fiber mulch in hydroseeding according to Subsection 700.3.05.F.1.

700.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

700.3 Construction Requirements

700.3.01 Personnel
General Provisions 101 through 150.

700.3.02 Equipment
Use grassing equipment able to produce the required results.
Never allow the grading (height of cut) to exceed the grassing equipment’s operating range.

A. Mulch Material Equipment
Use mulching equipment that uniformly cuts the specified materials into the soil to the required control depth.

B. Hydroseeding Equipment
For hydroseeding equipment, see Subsection 700.3.05.F.

700.3.03 Preparation
General Provisions 101 through 150.

700.3.04 Fabrication
General Provisions 101 through 150.
Section 700 — Grassing

700.3.05 Construction

Follow the planting zones, planting dates, types of seed, seed mixtures, and application rates described throughout this Section. The Engineer has the authority to alter the planting dates as set forth by a period of 2 weeks. This 2-week period may be applied to either the beginning of the specified planting and/or to the end of the specified planting season.

In general:

- Obtain the Engineer’s approval before changing the ground cover type.
- Do not use annual rye grass seeds with permanent grassing.
- Follow the planting zones indicated on the Georgia State Planting Zone Map, below.
- Sod may be installed throughout the year, weather permitting.
- For permanent grassing, apply the combined amounts of all seeds for each time period within each planting zone and roadway location listed in the Seeding Table, below. Do not exceed the amounts of specified seed.

</table>

See plan sheets/plant lists for detailed native restoration and riparian mitigation seed mix combinations to be applied at a minimum rate total of 10 (11) lbs. per acre (kg/hectare) for each combined mix. If the mix is not provided in the plan sheets, use a minimum of 3 species based on planting dates shown above.
## HERBACEOUS PLANT SEEDING TABLE 4
(Approved for Riparian Mitigation or for Seed Mixes on Slopes Steeper than 3:1-Requiring Permanent Planting)

</tbody>
</table>
For native restoration and riparian mitigation seed mix combinations, use Table 4 for approved native herbaceous seed types in combination with Table 3 of native grass seeds. Native restoration and riparian seed mixes should incorporate a mix of 60% native grass types (see Table 3) and 40% native herbaceous types (see Table 4) applied at a minimum rate total of 10 (11) lbs. per acre (kg/hectare) for each combined mix.

### TABLE 5: TEMPORARY GRASS - SPECIES, SEEDING RATES AND PLANTING DATES

When stage construction or other conditions prevent completing a roadway section continuously, apply temporary grassing to control erosion. Temporary grassing is used to stabilize disturbed areas for more than sixty (60) calendar days. Temporary grass may be applied any time of the year, utilizing the appropriate seed species and application rate as shown in the chart above. Apply mulch to areas planted in temporary grass at the rate of \( \frac{3}{8} \) inch to 1.5 inches. Do not place slope mats on areas planted in temporary grass.

</tbody>
</table>

For native restoration and riparian mitigation seed mix combinations, use Table 4 for approved native herbaceous seed types in combination with Table 3 of native grass seeds. Native restoration and riparian seed mixes should incorporate a mix of 60% native grass types (see Table 3) and 40% native herbaceous types (see Table 4) applied at a minimum rate total of 10 (11) lbs. per acre (kg/hectare) for each combined mix.
A. Ground Preparation

Prepare the ground by plowing under any temporary grass areas and preparing the soil as follows:

1. Slopes 3:1 or Flatter
   On slopes 3:1 or flatter, plow shoulders and embankment slopes to between 4 in. and 6 in. (100 mm and 150 mm) deep.
   Plow front and back slopes in cuts to no less than 6 in. (150 mm) deep. After plowing, thoroughly disk the area until pulverized to the plowed depth.

2. Slopes Steeper Than 3:1
   Serrate slopes steeper than 3:1 according to plan details when required.
   On embankment slopes and cut slopes not requiring serration (sufficient as determined by the Engineer), prepare the ground to develop an adequate seed bed using any of the following methods as directed by the Engineer:
   - Plow to a depth whatever depth is practicable.
   - Use a spiked chain.
   - Walk with a cleated track dozer.
   - Scarify.
   Disking cut slopes and fill slopes is not required.

3. All Slopes
   a. Obstructions
      Remove boulders, stumps, large roots, large clods, and other objects that interfere with grassing or may slide into the ditch.
   b. Topsoil
      Spread topsoil stockpiled during grading evenly over cut and fill slopes after preparing the ground.
      Push topsoil from the top over serrated slopes. Do not operate equipment on the face of completed serrated cuts.

   For Permanent Grassing in native restoration areas, multitrophic native planting areas, riparian areas, stream restoration areas, and wetland and stream mitigation areas, provide the minimum ground preparation necessary to provide seed to soil contact. Riparian areas may also be seeded using the no-till method. The no-till method is defined by planting permanent grass seeds using a drill-type seeder over existing vegetation without plowing or tilling soil. Ensure that existing vegetation is less than 3 inches in height (this may be achieved by mowing or using a mechanical string trimmer).

B. Grassing Adjacent to Existing Lawns

When grassing areas adjacent to residential or commercial lawns, the Engineer shall change the plant material to match the type of grass growing on the adjacent lawn. The Contract Unit Price will not be modified for this substitution.

C. Temporary Grassing

Apply temporary grassing according to Subsection 163.3.05.F. Determine lime requirements by a laboratory soil test. Refer to seeding Table 5 for species, amounts of seed and planting dates.

In March or April of the year following planting and as soon as the weather is suitable, replace all areas of temporary grass with permanent grass by plowing or overseeding using the no-till method. If the no-till method is used, ensure that temporary grass is less than 3 in. in height (this may be achieved by mowing). Additional mulch will be required only if the temporary grass does not provide adequate mulch to meet the requirements of Subsection 700.3.05.G, Mulching.

Temporary grass, when required, will be paid for according to Section 163.

Projects that consist of asphalt resurfacing with shoulder reconstruction and/or shoulder widening: Type II Wood Fiber Blanket is used to stabilize disturbed areas, no till seeding will be used when permanent grassing is applied and the areas will not be re-disturbed.
D. Applying Agricultural Lime and Fertilizer Mixed Grade

Apply and mix lime and fertilizer as follows:

1. Agricultural Lime
   Uniformly spread agricultural lime on the ground at the approximate rate determined by the laboratory soil test.
   a. Agricultural Lime may be used as filler material in mixed grade fertilizer in lieu of inert material. The use of agricultural lime as filler material is to be shown on the fertilizer bag or invoice from the supplier. Do not deduct any amount of fertilizer when lime is used as filler.

2. Fertilizer Mixed Grade
   Uniformly spread the fertilizer selected according to Subsection 700.2.D over the ground or by use of hydroseeding.
   For bid purposes base estimated quantities on an initial application of 400 lb./acre of 19-19-19.

3. Mixing
   Before proceeding, uniformly work the lime and fertilizer into the top 4 in. (100 mm) of soil using harrows, rotary tillers, or other equipment acceptable to the Engineer.
   On cut slopes steeper than 3:1, other than serrated slopes, reduce the mixing depth to the maximum practical depth as determined by the Engineer.
   Omit mixing on serrated slopes.

4. Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas
   Omit the application of lime and fertilizer within riparian areas.

E. Seeding

Prepare seed and sow as follows:

1. Inoculation of Seed
   Inoculate each kind of leguminous seed separately with the appropriate commercial culture according to the manufacturer’s instructions for the culture.
   When hydroseeding, double the inoculation rate.
   Protect inoculated seed from the sun and plant it the same day it is inoculated.

2. Sowing
   Weather permitting, sow seed within 24 hours after preparing the seed bed and applying the fertilizer and lime.
   Sow seed uniformly at the rates specified in the seeding tables. Use approved mechanical seed drills, rotary hand seeders, hydroseeding equipment, or other equipment to uniformly apply the seed. Do not distribute by hand.
   To distribute the seeds evenly sow seed types separately, except for similarly sized and weighted seeds. They may be mixed and sown together.
   Do not sow during windy weather, when the prepared surface is crusted, or when the ground is frozen, wet, or otherwise non-tillable.

3. Overseeding
   Temporary grass areas that were prepared in accordance with Subsection 700.3.05.A, may be overseeded using the no-till method. The no-till method is defined by planting permanent grass seeds using a drill-type seeder over existing temporary grass without plowing or tilling soil and in accordance with Subsection 700.3.05.C.

4. Riparian Seed Mix shall be used when specified in the plans. A mix of at least three (3) species from Seeding Table 3 (Native Grasses) and at least two (2) species from Seeding Table 4 (Approved Riparian Mitigation - Herbaceous Plants). The seed, shall be applied as Permanent Grassing within those areas designated on the plans. The kinds of seed, shall be used according to the appropriate Planting Dates given in the tables.
F. Hydroseeding

Hydroseeding may be used on any grassing area. Under this method, spread the seed, fertilizer, and wood fiber mulch in the form of a slurry. Seeds of all sizes may be mixed together. Apply hydroseeding as follows:

1. Use wood fiber mulch as a metering agent and seed bed regardless of which mulching method is chosen. Apply wood fiber mulch at approximately 500 lbs./acre (560 kg/ha).
2. Prepare the ground for hydroseeding as for conventional seeding in Subsection 700.3.05.A.
3. Use specially designed equipment to mix and apply the slurry uniformly over the entire seeding area.
4. Agitate the slurry mixture during application.
5. Discharge slurry within one hour after being combined in the hydroseeder. Do not hydroseed when winds prevent an even application.
6. Closely follow the equipment manufacturer’s directions unless the Engineer modifies the application methods.
7. Mulch the entire hydroseeded area according to Subsection 700.3.05.F.1, above, and Subsection 700.3.05.G, below. Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas may be hydroseeded. When hydroseeding in these areas only use water, seed and wood fiber mulch.

G. Mulching

Except as noted in Subsection 700.3.05.B and Subsection 700.3.05.C, apply mulch immediately after seeding areas as follows:

Areas with permanent grass seed and covered with slope mats or blankets will not require mulch.

Evenly apply straw or hay mulch between 3/4 in. and 1-1/2 in. (20 mm and 40 mm) deep, according to the texture and moisture content of the mulch material.

Mulch shall allow sunlight to penetrate and air to circulate as well as shade the ground, reduce erosion, and conserve soil moisture. If the type of mulch is not specified on the plans or in the Proposal, use any of the following as specified.

1. Mulch with Tackifier
   - Apply mulch with tackifier regardless of whether using ground or hydroseeding equipment for seeding.
   - Mulch uniformly applied manually or with special blower equipment designed for the purpose. When using a blower, thoroughly loosen baled material before feeding it into the machine so that it is broken up.
   - After distributing the mulch initially, redistribute it to bare or inadequately covered areas in clumps dense enough to prevent new grass from emerging (if required).
   - Do not apply mulch on windy days.
   - Apply enough tackifier to the mulch to hold it in place. Immediately replace mulch that blows away.
      - If distributing the mulch by hand, immediately apply the tackifier uniformly over the mulched areas.
      - Tackifier: Use a tackifier listed in the Laboratory Qualified Products Manual and apply at the manufacturer’s recommended rates.

2. Walked-in-Mulch
   - Apply walked-in-mulch on slopes ranging in steepness from 5:1 to 2:1 and treat as follows:
     - Immediately walk it into the soil with a cleated track dozer. Make dozer passes vertically up and down the slope.
     - Where walked-in-mulch is used, do not roll or cover the seeds as specified in Subsection 700.3.05.E.3.
3. Apply only wheat straw mulch on Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas after they have been seeded. The wheat straw mulch is to be applied with a maximum thickness of 1 in.
Section 700 — Grassing

H. Sod

Furnish and install sod in all areas shown on the plans or designated by the Engineer.

1. Kinds of Sod
   Use only Common Bermudagrass (Cynodon dactylon) or one of the following Bermudagrass varieties:
   - Tifway 419
   - Tifway II
   - Tift 94
   - Tifton 10
   - Midlawn
   - Midiron
   - GN-1
   - Vamont

   No dwarf Bermuda types shall be used. Sod shall be nursery-grown and be accompanied with a Georgia Department of Agriculture Live Plant License Certificate or Stamp. Sod shall consist of live, dense, well-rooted material free of weeds and insects as described by the Georgia Live Plant Act.

2. Type and Size Of Sod:
   Furnish either big roll or block sod. Ensure that big roll sod is a minimum of 21 in. wide by 52 ft. long. Minimum dimensions for block sod are 12 in. wide by 22 in. long. Ensure all sod consists of a uniform soil thickness of not less than 1 in.

3. Ground Preparation
   Excavate the ground deep enough and prepare it according to Subsection 700.3.05.A to allow placing of sod. Spread soil, meeting the requirements of Subsection 893.2.01, on prepared area to a depth of 4 in.

4. Application of Lime and Fertilizer
   Apply lime and fertilizer according to Subsection 700.3.05.D within 24 hours prior to installing sod.

5. Weather Limitation
   Do not place sod on frozen ground or where snow may hinder establishment.

6. Install Sod
   Install Sod as follows:
   - Place sod by hand or by mechanical means so that joints are tightly abutted with no overlaps or gaps. Use soil to fill cracks between sod pieces, but do not smother the grass.
   - Stake sod placed in ditches or slopes steeper than 2:1 or any other areas where sod slipping can occur.
   - Use wood stakes that are at least 8 in (200 mm) in length and not more than 1 in. (25 mm) wide.
   - Drive the stakes flush with the top of the sod. Use a minimum of 8 stakes per square yard (meter) to hold sod in place.
   - Once sod is placed and staked as necessary, tamp or roll it using adequate equipment to provide good contact with soil.
   - Use caution to prevent tearing or displacement of sod during this process. Leave the finished surface of sodded areas smooth and uniform.

7. Watering Sod
   After the sod has been placed and rolled or tamped, water it to promote satisfactory growth. Additional watering will be needed in the absence of rainfall and during the hot dry summer months. Water may be applied by Hydro Seeder, Water Truck or by other means approved by the Engineer.

8. Dormant Sod
   Dormant Bermuda grass sod can be installed. However, assume responsibility for all sod through establishment and until final acceptance.

9. Establishment
Section 700 — Grassing

I. Application of Nitrogen

Apply nitrogen at approximately 50 lbs./acre (56 kg/ha) when specified by the Engineer after plants have grown to 2 in. (50 mm) in height.

One application is mandatory and must be applied before Final Acceptance.

Apply nitrogen with mechanical hand spreaders or other approved spreaders capable of uniformly covering the grassed areas. Do not apply nitrogen on windy days or when foliage is damp.

Do not apply nitrogen between October 15 and March 15 except in Zone 4.

1. Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas

Do not apply nitrogen to these areas.

J. Application of Polyacrylamide (PAM)

1. Prepare soil according to project plans and specifications prior to applying PAM.

2. Apply PAM according to manufacturer’s recommendations and the requirements listed herein.

3. Apply Polyacrylamide (PAM) to all areas that receive permanent grassing.

4. Apply PAM (powder) before grassing or PAM (emulsion) to the hydroseeding operation.

5. Use only anionic PAM.

6. Ensure that the application method provides uniform coverage to the target and avoids drift to non-target areas including waters of the state.

7. Achieve > 80% reduction in soil loss as measured by a rainfall simulator test performed by a certified laboratory (1-hour storm duration, 3 in. (75 mm) rainfall per hour).

8. Ensure uniform coverage to the target area and minimize drift to non-target areas. Apply anionic PAM to all cut and fill slopes, permanently grassed or temporarily grassed, either prior to grassing or in conjunction with hydroseeding operations. Mulch will not be eliminated.

9. Use application rates in accordance with manufacturer’s instructions.

10. Do not exceed 200 lbs./acre/year (224 kg/ha/year).

11. Do not include polyacrylamide when planting in Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas

700.3.06 Quality Acceptance

The Engineer may require replanting of an area that shows unsatisfactory growth for any reason at any time.

Except as otherwise specified or permitted by the Engineer, prepare replanting areas according to the specifications as if they were the initial planting areas. Use a soil test or the Engineer’s guidance to determine the fertilizer type and application rate, then furnish and apply the fertilizer.

700.3.07 Contractor Warranty and Maintenance

A. Plant Establishment

Before Final Acceptance, provide plant establishment of the specified vegetation as follows:

1. Plant Establishment

   Preserve, protect, water, reseed or replant, and perform other work as necessary to keep the grassed areas in satisfactory condition.

2. Watering

   Water the areas during this period as necessary to promote maximum growth.

3. Mowing

   Mow seeded areas of medians, shoulders, and front slopes at least every 6 months. Avoid damaging desirable vegetation.
Section 700 — Grassing

In addition, mow as necessary to prevent tall grass from obstructing signs, delineation, traffic movements, sight distance, or otherwise becoming a hazard to motorists.

Do not mow lespedezas or tall fescue until after the plants have gone to seed.

4. Do not mow riparian areas, stream restoration areas, or wetland and stream mitigation areas after planting.

B. Additional Fertilizer Mixed Grade

Apply fertilizer based on the initial soil test report at half the recommended rate each spring after initial plant establishment. For bid purposes apply 200 lbs./acre of 19-19-19. Continue annual applications until Final Acceptance. This additional fertilizer will be measured and paid for at the Contract Unit Price for fertilizer mixed grade.

Do not apply additional fertilizer to Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas.

C. Growth and Coverage

Provide satisfactory growth and coverage, ensuring that vegetation growth is satisfactory with no bare spots larger than 1 ft.² (0.1 m²). Bare spots shall comprise no more than 1 percent of any given area. An exception is given for seed not expected to have germinated and shown growth at that time.

D. Permissible Modifications

When all Items of the work are ready for Final Acceptance except for newly planted repaired areas or other areas with insufficient grass, the Contractor may fill the eroded areas or treat bare areas with sod obtained, placed, and handled according to Subsection 700.3.05.H.

Carefully maintain the line and grade established for shoulders, front slopes, medians, and other critical areas.

Sod as described above will not be paid for separately but will be an acceptable substitute for the satisfactory growth and coverage required under this specification. These areas treated with sod are measured for payment under the Item for which the sod is substituted.

700.4 Measurement

A. Permanent Grassing

Permanent Grassing will be measured for payment by the acre (hectare).

B. Mulches

Straw or hay mulch applied to permanent grassing areas will be measured by the ton (megagram). Wood fiber mulch furnished by the Contractor for permanent grassing is not measured for separate payment.

C. Quantity of Sod

Sod is measured for payment by the number of square yards (meters), surface measure, completed and accepted.

D. Water

Water furnished and applied to promote a satisfactory growth is not measured for payment.

E. Quantity of Lime and Fertilizer Mixed Grade

Lime and fertilizer are measured by the ton (megagram). Lime used as a filler in fertilizer is measured by the ton (megagram).

F. Quantity of Nitrogen Used for Permanent Grassing

Nitrogen is measured in pounds (kilograms) based on the weight of fertilizer used and its nitrogen content.

G. Replanting and Plant Establishments

No measurement for payment is made for any materials or work required under Subsection 700.3.06 and Subsection 700.3.07.
Section 700 — Grassing

H. Temporary Grass
Temporary grass is measured for payment by the acre (hectare) according to Section 163.

I. Seeded Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas
Seeded Native Restoration Areas, Multitropic Native Planting Areas, Riparian areas, Stream Restoration area, and Wetland and Stream Mitigation areas will be measured by the acre (hectare) and included under the pay item Native Restoration and Riparian Seeding.

700.4.01 Limits
General Provisions 101 through 150.

700.5 Payment
As grassing and planting progress, the Contractor will receive full measurement and payment on regular monthly estimates provided the work complies with the specifications.

A. Permanent Grassing
Permanent grassing will be paid for at the Contract Price per acre (hectare), complete and in place. Payment is full compensation for preparing the ground, seeding, wood fiber mulch, polyacrylamide, and providing plant establishment, soil tests and other incidentals.

B. Straw or Hay Mulch
Straw or hay mulch required for Permanent Grassing will be paid for according to Section 163.

C. Fertilizer Mixed Grade
Fertilizer mixed grade will be paid for at the Contract Price per ton (megagram). Payment is full compensation for furnishing and applying the material.

D. Lime
Lime will be paid for at the Contract Price per ton (megagram). Lime used as filler in fertilizer will be paid for per ton (megagram). Payment is full compensation for furnishing and applying the material.

E. Nitrogen
Nitrogen will be paid for at the Contract Price per pound (kilogram) of nitrogen content. Payment is full compensation for furnishing and applying the material.

F. Sod
1. Sod will be paid by the square yard (meter) in accordance with the following schedule of payments. Payment is full compensation for ground preparation, including addition of topsoil, furnishing and installing live sod, and for Plant Establishment.
2. 70 percent of the Contract Price per square yard will be paid at the satisfactory completion of the installation.
3. 20 percent of the Contract Price will be paid upon satisfactory review of sod which is healthy, weed free and viable at the inspection made at the end of the first spring after installation.
4. 10 percent of the contract price will be paid upon satisfactory review of sod that is healthy, weed free and viable at the Final Acceptance.

G. Temporary Grass
Temporary Grass will be paid for under Section 163.
Section 700 — Grassing

H. Seeded Native Restoration Areas, Multitropic Native Planting Areas, Riparian Areas, Stream Restoration Areas, and Wetland and Stream Mitigation Areas

Seeded Native Restoration Areas, Multitropic Native Planting Areas, Riparian areas, Stream Restoration area, and Wetland and Stream Mitigation areas will be paid for at the Contract Price per acre (hectare), complete and in place. Payment is full compensation for preparing the ground, seeding, and providing plant establishment and other incidentals. and included under the pay item “Native Restoration and Riparian Seeding”.

Payment will be made under:

700.5.01 Adjustments

General Provisions 101 through 150.
Section 701—Wildflower Seeding

701.1 General Description
This work includes preparing the ground, furnishing and planting wildflower and companion grass seeds, applying fertilizer, and applying lime, if necessary, to areas designated on the plans.

701.1.01 Definitions
General Provisions 101 through 150.

701.1.02 Related References

</tr>
</tbody>
</table>

**D. Fertilizer Mixed Grade**
Select fertilizer mixed grade such as 10-10-10, 6-12-12, 5-10-15, or any other analysis within the following limits:
- Nitrogen 5 to 10 percent, phosphorus 10 to 15 percent, and potassium 10 to 15 percent

**701.2.01 Storage, Delivery, and Handling**
Use seed delivered in original sealed packages bearing the producer’s guaranteed analysis for percentages of species mixture, minimum germination rates, and purity of seed.

**701.3 Construction Requirements**

**701.3.01 Personnel**
General Provisions 101 through 150.

**701.3.02 Equipment**
Use approved mechanical seed drills, drop spreaders, and rotary spreaders to distribute seed.
Section 701 — Wildflower Seeding

701.3.03 Preparation

A. Planting Limits
   Before preparing the ground, stake planting limits according to the plans and as approved by the Engineer.

701.3.04 Fabrication
   General Provisions 101 through 150.

701.3.05 Construction

A. Ground Preparation
   Prepare the ground as follows:
   1. Plow between 4 in. to 6 in. (100 mm to 150 mm) deep.
   2. After plowing, thoroughly disk the area until pulverized, then smooth the surface.
   3. Remove large clods, boulders, stumps, rocks, and other foreign particles that will interfere with the work and seedling growth.
   4. Wait 2 weeks after preparation, then spray new growth with 1 gal per acre (9 L per hectare) of Roundup™ herbicide.
   5. Wait at least 10 days before proceeding.

B. Application of Lime and Fertilizer Mixed Grade
   Apply lime and fertilizer as follows:
   1. Lime
      Uniformly spread agricultural lime on the ground at the approximate rate determined by the Engineer. If the pH is 6.0 or higher, no lime is required.
   2. Fertilizer Mixed Grade
      Spread the fertilizer, mixed according to Subsection 701.2.D, uniformly over the ground at approximately 200 lbs./acre (225 kg/ha).
   3. Mixing
      Before doing further work on the area, blend the lime and fertilizer uniformly into the top 4 in. (100 mm) of soil using harrows, rotary tillers, and other equipment approved by the Engineer.

C. Seeding
   Weather permitting, sow seed within 24 hours of applying the fertilizer and lime to the seed bed as follows:
   1. Sow seed uniformly according to the rate specified in Subsection 701.2.B. Use approved mechanical seed drills or mix seed with dry sand and spread it with either a drop spreader or rotary spreader.
   2. Cover the seed to no more than 1/8 in. (3 mm) deep.
   3. After seeding, roll the area with a cultipacker or similar equipment to ensure good soil contact for seedling germination.

D. Mulching
   After rolling the seed bed, apply 1 ton per acre (2 Mg per hectare) of wood fiber mulch.

701.3.06 Quality Acceptance

A. Replanting
   The Engineer may require replanting an area that shows unsatisfactory growth.
   Except as otherwise specified by the Engineer, prepare replanting areas the same as the initial planting with the following exception:
   • Use a soil test or the Engineer’s guidance to determine the fertilizer type and application rate, then furnish and apply the fertilizer.
Section 701 — Wildflower Seeding

B. Providing Growth and Coverage

Ensure that wildflower growth and coverage conforms with the intent of the Contract for the vegetation, except for seed not expected to germinate and show growth at that time.

Ensure that vegetation shows a satisfactory visible growth with no bare spots larger than 1 ft.² (0.1 m²). Bare spots shall be infrequent, comprising no more than 1 percent of a given area.

701.3.07 Contractor Warranty and Maintenance

A. Plant Establishment

Preserve, protect, water, reseed or replant, and perform other work as necessary to keep the wildflower areas in satisfactory condition.

B. Watering

Keep planted areas moist for 4 to 6 weeks during seedling germination and development.

Following initial growth, water the wildflower areas enough to promote maximum growth.

C. Mowing

Mow once a year in late fall after seedheads have matured. Avoid damaging desirable vegetation.

701.4 Measurement

A. Wildflower Seeding

The number of acres (hectares) completed according to the above requirements and accepted by the Engineer is measured for payment.

B. Wood Fiber Mulch

Mulch furnished and applied is not measured separately.

C. Water

Water furnished and applied to promote a satisfactory growth is not measured for payment.

D. Agricultural Lime

Lime is measured by the ton (megagram).

E. Mixed Grade Fertilizer

Fertilizer is measured by the pound (kilogram).

701.4.01 Limits

Work required under Subsection 701.3.06 and Subsection 701.3.07 is not measured for payment.

701.5 Payment

Wildflower seeded areas will be paid for as follows:

A. Wildflower Seeding

When plants are satisfactorily planted, 80 percent of the Contract Unit Price bid per acre (hectare) will be paid on the next estimate.

Until Final Acceptance, perform required maintenance according to Subsection 701.3.07 when necessary or as ordered by the Engineer.

At Final Acceptance, the remaining 20 percent will be paid. Payment is full compensation for preparing ground, providing wildflower and companion grass seed, applying seed, watering, mulching, and establishing plants.
B. Mixed Grade Fertilizer

Fertilizer will be paid for at the Contract Price per pound (kilogram). Payment is full compensation for furnishing and applying the material.

C. Lime

Lime will be paid for at the Contract Price per ton (megagram). Payment is full compensation for furnishing and applying the material.

Payment will be made under:

701.5.01 Adjustments

General Provisions 101 through 150.
Section 702 — Vine, Shrub, and Tree Planting

702.1 General Description
This work includes furnishing and planting vines, shrubs, trees and plants, treating regenerated areas, and environmental mitigation planting for riparian buffers and tidal marsh areas.

702.1.01 Definitions
General Provisions 101 through 150.

702.1.02 Related References

702.1.03 Submittals
A. Certificates of Inspection
   Submit certificates of inspection with the invoice for each shipment of plants as required by law for transportation.
   File certificates with the Engineer before the material is accepted. Plants may be rejected at the site regardless of Federal or State government inspections at the place of growth.

B. Substitutions
   When both primary and alternate plants are specified, use the alternate only after providing written proof that the primary plants specified are not available. In this case a Supplemental Agreement is not required to use the alternate plants.
   When a primary or an alternate plant cannot be furnished, provide the Engineer written proof that neither is available. A Supplemental Agreement is required for substitute plants in this case.
   Use approved substitute plants, as designated by the Engineer, equal in value to specified plants. Request substitutions at least thirty (30) days before the end of the planting season in the area.

702.2 Materials
Ensure that materials meet the requirements of the following specifications:

A. Plant Specifications

Furnish plants according to the plant name and specifications included on the plan sheets.

1. Plant Names
   Ensure that the botanical and common names of plants specified conform to the most current edition of Standardized Plant Names, as adopted by the American Joint Committee on Horticultural Nomenclature.

2. Plants should be clearly labeled at the nursery. Labels should remain on the plants until inspected by the engineer.

3. Grades
   Ensure that plants meet the grade requirements of the most current American Nursery and Landscape Association ANSI Z60.1 and any other requirements.

   Caliper used for establishing plant grades or trunk sizes is measured according to the American Nursery and Landscape Association ANSI Z60.1. Plant trees with straight stems and symmetrical branches according to their natural growth. Trees with broken or damaged terminal or main stems will be rejected. There shall be a single dominant leader to the top of the all large canopy shade trees. There can be a double leader in the top 10% of the tree height.

   Trees should be rooting into the root ball so that soil or media remains intact and trunk and root ball move as one when lifted, but not root bound. The trunk should bend when gently pushed and should not be loose so it pivots at or below the soil line.

   There shall be no roots greater than 1/10 diameter of the trunk circling more than one-third the way around in the top half of the root ball. Roots larger than this may be cut provided they are smaller than one-third the trunk diameter.

   The leaf-bearing crown should be full and uniform. Leaves should show no evidence of chlorosis, necrosis, disease or insect infestation.

B. Bare root seedlings

Use nursery-grown bare root seedlings which are a minimum of three (3) ft. (1 meter) in height above the ground with a 1/4 in. (6.35mm) caliper, and a minimum primary root length of five in. (5) unless specified differently on the plan drawings.

Use approved substitute plants, as designated by the Engineer, equal in value to specified plants. Request substitutions at least 30 calendar days before the end of the planting season in the area. Wet swale bare root *Juncus effuses* shall be fresh divisions with a full, dense root base.

C. Nursery Plants

Unless otherwise specified, use plants stock-grown in a licensed nursery under intensive care and cultivation for at least one year. The largest branches of shade trees should be spaced at least 6 inches apart. The branch system shall be normally developed and free of disease, injurious insects, disfiguring knots, sun-scald, injuries, bark abrasions, dead or dry wood, broken terminal growth, or other disfigurements. Stems should show no evidence of die-back. Ensure that proper certificates of inspection and a complete list of the nursery growers accompany nursery grown plants. See Subsection 893.2.03.
D. Approval and Selection of Materials and Work

Select materials and execute operations required under the specifications and drawings with the approval of the Engineer. Remove rejected materials from the site promptly.

702.2.01 Delivery, Storage, and Handling

A. Bare-Rooted Plants

Protect bare root plants from drying out until planted. Uncovered roots without moisture-loss gel coating shall be exposed to air no longer than 15 minutes.

B. Balled and Burlapped Plants (B&B)

1. Burlap shall be a natural biodegradable material. Do not use synthetic burlap.
2. Replace plants rejected because of broken or loose balls, or balls of less diameter than that specified.
3. Protect the roots of balled and burlapped plants from moisture loss, unless they are planted immediately after they are delivered.
4. Plants shall be harvested with the ball of earth in which they are growing intact.

C. Container-Grown Plants

Keep container-grown plants moist but well drained until planted. Handle plants by the container or soil ball and not by the top growth.

D. Heeled-in Plants

Properly maintain heeled-in plants until they are planted. Do not allow plants to remain heeled-in over the summer or for over 30 days without the Engineer's consent.

E. Injury Prevention

Injured plants will be rejected. Protect tops of shrubs and trees while in transit to prevent windburn.

F. Live Willow Stake Material

Live stakes shall be moistened, capable of rooting, without injury and stripped of all stems and leaves with a minimum of scarring. The stakes shall be from 5 to 8 ft. (1.5m to 2.4m) in length with a basal end of 0.5 to 1.5 in. (1.27cm to 3.8cm) in diameter. The top ends shall be blunt and cut square and the butt ends angled.

702.3 Construction Requirements

702.3.01 Personnel

General Provisions 101 through 150.

702.3.02 Equipment

General Provisions 101 through 150.

702.3.03 Preparation

A. Inspect Plant Material before Digging

The Engineer will inspect trees or plants from the bidder’s source for acceptability and conformity to specification requirements for approval by the Engineer. When rejecting the trees or plants, the Engineer reserves the right to pursue and examine other sources of plants to find acceptable specimens. This change will not constitute an increase in cost to the State.

B. Clear and Grub

Clear and grub the planting area before planting or beginning to prepare the plant bed, unless noted differently on the plans. See Section 201.
Section 702 — Vine, Shrub, and Tree Planting

C. Prepare Plant Bed

Prepare for planting as follows:

1. Planting Limits

   Stake planting limits according to plan details and the Engineer. Have the Engineer approve the method of
   plant identification before planting.

   For median plantings, keep any woody plant a minimum of 3 ft. (1m) from the edge of the plant bed to avoid
   vegetative growth into the roadway.

   For stream buffers identified as “Stream Buffer” or “wet swales”, on plans, the plant species shall be planted
   in a random, intermixed manner throughout the entire planting area. At the edges of the planting zone, keep
   new plants a minimum of 8 ft. (2.4m) from existing trees or permanent structures.

2. Applications of Soil Additives

   a. Apply fertilizer and lime to the plant bed according to the soil test report.

   b. Spread an organic soil additive, (See Subsection 893.2.09), evenly throughout the designated area to at
      least 2 in. (50 mm) deep. Thoroughly dig it into the soil to at least 6 in. (150 mm) deep using a rotary hoe
      type tiller or other equipment that evenly mixes the soil, lime, fertilizer, and organic soil additive.

   c. Till the area until the surface is smooth and free of weeds, roots, rocks, and other debris, to the
      satisfaction of the Engineer.

   d. If the planting area lies within a multitrophic native planting area, stream buffer, wetland, wet swale, or
      marsh the addition of fertilizer or lime is prohibited.

702.3.04 Fabrication

General Provisions 101 through 150.

702.3.05 Construction

A. Seasonal Limitations for Planting

For geographic seasonal limitations, refer to the Planting Zones Map found in Subsection 700.3.05. Plant in Zones
1 and 2 between October 15 and March 15. Plant in Zones 3 and 4 between November 1 and January 1.

B. Planting Operations

   Plant using the method called for on the details and plan sheets. Before beginning planting of each area, have
   available the necessary materials including prepared plant topsoil (see Subsection 893.2.07), water, stakes, and
   mulch. Plants shall be installed as straight/upright as possible. Any plants found to be leaning or broken will not be
   accepted or paid for by the engineer.

   When seasonal limitations and weather conditions permit, continuously water, mulch, guy, provide tree guards,
   and stake as indicated on the plans and details until completing the last operation.

   After completing planting, provide a method for retaining water adjacent to the plant according to the details
   shown on the plans or as directed by the Engineer.

   Protect marsh restoration areas from vehicles and machinery. Typical protective barriers are not to be used in tidal
   areas. Stakes that remain secure and are taller than the highest tide, flagged with highly visible flagging tape, are
   required to mark the area to be protected and off-limits for vehicles and machinery.

3. Planting by the Pit Method

   a. Placing Bare-Rooted Plants

      Plant bare-rooted plants delivered to the pit area. Protect roots from drying out until placing them in the pit.

      1) Center plants in pits and spread roots as they originally grew.

      2) Cover and prepare the topsoil according to details shown on the plans.

   b. Placing Balled and Burlapped Plants

      Immediately plant these plants after they are delivered to the pit site.
1) The pit diameter shall be a minimum of 3 times the diameter of the rootball. Center the ball in the prepared pit, leaving the top of the ball 1 in. (25 mm) above the top of the ground for settlement.

2) Cut away and remove the top 1/3 of burlap from the rootball. Cut all ropes and twine, pull the nails, and drop the remaining burlap to the bottom of the hole. Cut away and remove all wire from the root ball.

3) Partially fill the pit with prepared plant topsoil and compact the soil enough to hold the ball firmly. Add mycorrhizal inoculant to plant topsoil if specified in plans.

c. Placing Container-Grown Plants

1) When the container is delivered to the pit site, split the container from top to bottom and carefully remove the plant.

2) The pit diameter shall be a minimum of 3 times the diameter of the rootball. Spread into the hole any major roots growing around the container or prune them to remove any circular growth.

3) Place the ball in the center of the prepared pit, leaving the top of the ball 1 in. (25 mm) above the top of the ground for settlement.

4) Partially fill the pit with prepared plant topsoil and compact the soil enough to hold the ball firmly. Add mycorrhizal inoculant to plant topsoil if specified in plans.

d. Completing Pit Plantings

After placing pit plantings, water plants thoroughly the same day regardless of weather or soil moisture conditions.

1) After the water has soaked in, add prepared plant topsoil and compact firmly up to 2 in. (50mm) below the adjacent ground.

2) Stop compacting when the compacted prepared topsoil is 2 in (50 mm) below the adjacent ground.

3) Fill the remainder of each pit with loose, prepared plant topsoil according to the details shown on the plans.

4) Prepare the loose topsoil to retain water adjacent to the plant according to the Plans or as directed by the Engineer.

e. Live Stake Plantings

1) Plant live willow stakes at four (4) ft. (1.2m) intervals or as indicated on the drawings with the buds facing upward.

2) Eighty (80) percent of the stake shall be installed below ground, leaving twenty (20) percent extending above ground.

3) Stakes shall be placed deep enough to reach the water table during the dry season at an angle perpendicular to the slope.

4) Pack soil firmly around the hole after installation.

5) Install live willow (Salix spp.) stakes only in the dormant season, according to the planting details and landscape plan notes.

6) Replace any live stakes that split during installation.

4. Planting using a Dibble, Hoedad, or Reinforced Planting Shovel for Wet Swale and Bare Root Seedlings.

Planting shall only be done when there is adequate moisture in the ground and when the ground is not frozen. Provide proper root positioning and contact with the soil and eliminate all air pockets around roots. Roots of seedlings shall not be pinched or bent in a sideways or upturned direction.

Each tree, division, or seedling shall be inserted into the hole such that the root collar of the tree will be at ground level after backfilling is complete. Allowance for burying the root collar below ground level shall not exceed one-half inch in depth. In no case shall planting result in the root collar remaining above ground level. The soil back-filled around the root system shall be compacted sufficiently to support the plant. Mow or use a
string trimmer to a height of 1 in. (25 mm) in the area designated for restoration. Do not trim wet swales or retention basins where standing water is present.

Grass the area designated for restoration with a native restoration or riparian seed mix and apply wheat straw mulch to the area before planting seedlings.

Plant within 48 hours after mowing or string trimming the site.

5. Restoration and enhancement of tidal marsh areas are subject to possible wave energy, requiring the use of a plant anchor for each plant. See planting plan sheets and details for plant anchor and anchoring descriptions.

C. Landscape Mulching

1. For Pit Plantings

Follow these requirements when mulching for pit plantings:

a. Where the distance between plants is 8 ft. (2.4 m) or less, spread mulch throughout and 3 ft. (900 mm) beyond the outermost plants. Where plants are more than 8 ft. (2.4 m) apart, apply mulch in a circular fashion around each plant, forming a ring 5 ft. (1.5 m) in the outside diameter.

b. If plant pits are greater than 5 ft. (1.5 m) in diameter, ensure that the mulch extends out to cover the berm as shown in the planting details on the plans.

c. Apply mulch within 3 days of planting at least 4 in. (100 mm) in depth to obtain a compacted depth of at least 3 in. (75 mm).

d. Compaction occurs naturally. Check compaction at least two months after spreading and exposing the mulch to the elements.

e. If the compacted depth is less than 3 in. (75 mm), apply additional mulch to deficient areas within 1 month following notification.

f. Apply mulch to a uniform depth and remove lumps for a neat appearance. Tuck mulch neatly against all paving edges, drainage structures, and where planting beds meet grassed areas.

g. Leave a 1 in. (25 mm) to 2 in. (50 mm) ring of non-mulched area directly around all tree trunks.

h. Do not mulch with Cypress Mulch.

2. For Plantings using a Dibble, Hoedad, or Reinforced Shovel

Apply landscape mulch according to Subsection 702.3.05.C.1 with the following exceptions:

a. Apply mulch before planting.

b. Use only wheat straw mulch in restoration areas.

c. Ensure that the mulch coverage is open enough to allow seed germination to take place and dense enough to conserve moisture in the seed bed.

3. For Native Multitrophic or Stream Buffer Restoration Planting Areas, wheat straw shall be the only types of mulch used.

4. Do not use mulch in a tidal marsh area. Do not mulch wet swale or retention ponds where standing water is present.

D. Wrapping

Do not wrap the trucks of tree unless specified in the plans. When wrapping is specified, tightly wrap the trunks of deciduous trees over 1.25 in. (32 mm) in caliper. Wrap in strip burlap or waterproof crepe tree wrapping paper or other approved materials.

1. Begin wrapping at the ground and extend spirally up and beyond the first rosette of branches with an overlap of one half the width of the wrapping material.

2. Tie the wrapping material securely with binder twine spaced every 12 in. (300 mm) for the full length of the wrapping. Wrap immediately after planting.
Section 702 — Vine, Shrub, and Tree Planting

E. Staking and Guying

1. Do not use staking and guying unless specified in the plans or details.
2. Perimeter Staking
3. Place perimeter stakes 2 in. x 2 in. x 36 in. (50 mm x 50 mm x 900 mm). Stake the perimeter of indicated regenerated areas within specified planting dates according to the Plans or as directed by the Engineer. Keep staking for tidal marsh areas secured with supports taller than the highest tide with highly visible flagging tape to mark the area as off-limits for vehicles and machinery.
4. Vine, Shrub, and Miscellaneous Plant Staking
5. Use stakes to identify isolated vines, shrubs, and miscellaneous plants outside of solid mulched beds according to plan details.
6. Tree Staking and Guying
7. Stake trees using a system that will prevent trees from leaning or tilting and keep the root ball stable until the roots become anchored. The system should allow the top some movement and flexibility without damaging the tree.

F. Pruning

1. Prune plants on the site before planting and after initial inspection by the Engineer as needed for the health of the plant. Never prune severely to get plants to meet specifications.
   a. Follow ANSI A300 Part 1 standards and use approved tools designed for pruning.
   b. Lopping, topping, or shearing trees or shrubs is not permitted.
   c. Prune back damaged, scarred, frayed, split, and skinned branches, limbs, and roots to live wood nearest to the next sound, outside lateral bud, branch, limb, or root.
   d. Leave the terminal leaders or buds in trees intact.
   e. Prune roots, when necessary, as directed by the Engineer.
   f. Prune Crape Myrtles to maintain natural form only. Severely cutting back or stump pruning crape myrtles is not permitted. Remove sucker growth from Crape Myrtles.
   g. Damaged, scarred, frayed, split and skinned branches, limbs and roots shall be pruned back to live wood nearest to the next viable outside lateral bud, branch, limb or root.

G. Watering

1. Apply water in a manner to prevent erosion. Water plants deeply and thoroughly at the time of planting. Water after applying fertilizer called for in Subsection 702.3.05.H and as necessary to maintain enough moisture to promote plant growth. Use water reservoir bags if specified in plans or details.
   a. Apply enough water to wet the soil to a depth slightly below the roots. Direct the water to the ground around the plant, not the tops.
   b. Do not allow plant foliage to dry out or plants to defoliate from lack of water. Remove plants in such condition from the site immediately. Apply supplemental watering to maintain vigorous growth and to keep plants moist and as directed by the Engineer.
   c. Apply water once per week throughout the planting season in which the plants are installed. Follow Subsection 702.3.07.B and 702.3.07.C for shrub and tree watering requirements throughout the life of the project.
Section 702 — Vine, Shrub, and Tree Planting

H. Spring Application of Fertilizer

1. Method and Rate of Application

Follow these requirements when applying fertilizer in the spring:

a. Trees

Apply a slow-release fertilizer according to soil test results. Assume 8-12-12 with a rate of 1 cup (0.25 L) per caliper inch of tree for bidding purposes.

2. Shrubs and vines

Fertilize shrubs according to soil test results with a slow release fertilizer by spreading fertilizer around the base of the plant and working it into the soil by hand. Assume 6-12-12 with a rate of 0.5 cup (0.12 L) per foot of shrub height for bidding purposes.

Bed Areas

Spread fertilizer on bed areas (defined by method of planting in Subsection 702.3.05.B), over the mulch according to soil test results. Assume 3 lbs./100ft² of 6-12-12 for bidding purposes. Thoroughly water in the plants.

3. Native Restoration or Stream Buffer Areas

The addition of fertilizer or lime is prohibited within the native restoration or stream buffer planting areas.

4. Tidal March Areas

The addition of fertilizer or lime is prohibited within marsh areas.

5. Time of Spring Fertilizer Application

Apply fertilizer in the spring in Zones 1 and 2 (with reference to the Planting Zones specified in Subsection 702.3.05.A) between April 1 and April 15. Apply between March 15 and April 1 for Zones 3 and 4. For late plantings, do not apply fertilizer less than 30 days after the plantings.

6. Additional Fertilizer

Approximately one month after the spring fertilizer is applied; the Engineer will inspect planted areas and determine if an additional application of fertilizer is needed for any plant or group of plants. If the Engineer determines additional fertilizer is required, apply fertilizer according to soil test results between June 15 and July 15th.

I. Tree Guards for Stream Buffer Saplings

Each planted bare root, sapling-sized plant shall be fitted with a tree guard to protect the saplings from wildlife browsing. The tree guards shall be at least 36 in. tall, with appropriately sized wooden stakes or bamboo to securely support the tree guard [i.e., a 4 ft. (1.2 meter) stake for a 36 in. (914.4 mm) guard]. Mesh tube-type tree guards are required. Vexar tubes, or equivalent, are to be used. All tree guards shall be removed from the saplings at final inspection.

J. Restoration and Cleanup

Restore areas where existing grass has been damaged or scarred during planting operations at no expense to the Department. Restore the disturbed areas to their original conditions as directed by the Engineer. Clean up debris, spoil piles, and containers and leave the Project area clean.

Clean up and remove all debris, spoil piles, containers, water reservoirs, trash, etc. and leave the project area in an acceptable condition. Inspect all installed erosion control devices weekly and clean out or repair as required. Remove all erosion control devices at final acceptance unless otherwise instructed by the Engineer.

702.3.06 Quality Acceptance

Preserve the plants in a healthy growing condition and keep plants moist, particularly during drought conditions (no rain for any two-week period). The acceptability of the plant material planted and maintained as specified will be determined at the end of an establishment period.

The plant establishment period is the period from the last planting specified in Subsection 702.3.05.B until the following October 1. Plant all plants in one planting season unless otherwise approved by Engineer.
A. **First Establishment Period**

At the end of the first planting season, the first establishment period begins. The Department will make the first semi-final inspection 30 days before the end of the first establishment period. Replace dead, dying, diseased, unsatisfactory, and missing plants, by January 20 of the next (second) planting season. For stream buffer areas, all replacement plants shall be tagged with 18 in. (457.2 mm) lengths of brightly-colored survey tape. Tree guards shall be placed around all replacement saplings. All costs for replanting, tagging and tree guards for replacement trees shall be included in the contract price bid for the original planting.

B. **Second Establishment Period**

At the end of the second planting season, the second plant establishment period begins. The Department will make the second semi-final inspection 30 days before the end of the second establishment period. Again, replace dead, dying, diseased, unsatisfactory, and missing plants, by January 20 of the next (third) planting season. For stream buffer areas, all replacement plants shall be tagged with 18 in. (457.2 mm) lengths of brightly-colored survey tape. Tree guards shall be placed around all replacement saplings. All costs for replanting, tagging and tree guards for replacement trees shall be included in the contract price bid for the original planting.

C. **Final Inspection**

The Department will make the final inspection of the plants during May, following any needed replacements during the previous planting season. Assume responsibility for the plants until the Final Acceptance of the project or a portion of the project.

702.3.07 **Contractor Warranty and Maintenance**

Project maintenance includes, but is not limited to, watering, cultivating, weeding, pruning, repairing, adjusting guys and stakes, and performing other work as ordered by the Engineer until final acceptance.

Promptly remove from the project area dead plants or those that no longer conform to the requirements of Subsection 702.2.A.2.

Mow the entire right-of-way within the limits of the project up to a maximum of four times per calendar year. Do not mow native restoration areas, wet swales, or riparian mitigation sites.

A. **Leaning Trees**

Straighten leaning trees as directed by the Engineer. Follow Staking and Guying requirements for replacements or repairs as per Subsection 702.3.05.E.

B. **Shrub Maintenance**

1. **Pruning**

Prune dead or diseased limbs to provide for plant health and appearance as directed by the Engineer.

2. **Landscape Mulching**

Continuously maintain shrub and tree beds with a clean, freshly mulched appearance using the mulch originally specified. See Subsection 702.3.05.C. Do not mulch shrub and tree beds within riparian mitigation sites.

   a. Apply a 2 in. (50 mm) loose layer of specified mulch (top-dressing) on top of all areas, including tree pits, initially mulched, at the following times:

      1) In August, during the first plant establishment period.
      2) In April, during the second plant establishment period.
      3) In August, during the second plant establishment period.
      4) In April, prior to the final inspection.

3. **Applying Fertilizer**

   See Subsection 702.3.05.H.
4. Applying Pesticides
   a. Inspect all planted or seeded vegetation for insects, grubs, mites, diseases, etc., once every two weeks. Apply insecticides, fungicides, and herbicides according to the manufacturer’s recommendations to effectively control or eradicate the problem.
   b. Perform all pesticide applications under the direct supervision of a trained licensed commercial pesticide operator whose license includes subcategory 27 – Right of Way Pest Control. Carry the pesticide license/certification on the work site during applications. Carry all labeling associated with the chemical being applied at the work site.
   c. Submit all product information data sheets and EPA approval numbers on all pesticides proposed to be used prior to application for approval.
   d. Notify the Engineer a minimum of 48 hours prior to any and all pesticide applications.
   e. Add a blue dye to all spray applications unless approved otherwise by the Engineer.
   f. Monitor the weather and spray under proper weather conditions. Spraying shall not occur when the weather is greater than 10 miles per hour.
   g. Wear the proper safety attire. Wear long sleeve shirts, long pants, gloves, and safety glasses. Wear or use any additional protective safety attire or gear as recommended by the product’s manufacturer.
   h. Repair any damage that is a result of mishandling or misuse of materials, at no expense to the Department, to the satisfaction of the Engineer.
   i. For stream buffer and marsh restoration areas, pesticides are not to be used unless approved by the Department Ecology Manager.

5. Edging
   a. Edge all shrub pits, shrub beds, and tree pits once a month throughout the life of the project such that the vee-cut edging detail specified on the plans is maintained. Prevent grass and weeds from growing over or into the shrub beds and tree pits.
   b. Use equipment specifically designed for edging. Line trimming equipment shall not be used.

6. Watering
   a. Check all planted material once a week throughout the contract for dryness by removing the mulch from their base and “sampling the soil” approximately 4 in. (100mm) deep. Water if the soil is not moist.
   b. Water all planted material if a drought (no rain for two weeks) occurs. Provide the water required to meet the watering requirements.
   c. Water each plant thoroughly until the ground is saturated to a depth slightly below the root ball. Apply water in a manner to prevent erosion.
Section 702 — Vine, Shrub, and Tree Planting

7. Weed Control
   Perform weed control throughout the project, a minimum of once every two weeks, in all areas within the
   project limits to maintain tree pits, shrub beds, sidewalks, curb and gutter, walkways, ditch paving, concrete
   medians, and other pavement weed free. Meet the following conditions:
   a. Perform weed control to prevent weeds from becoming established, setting seed, or from becoming
      visible in the planting beds.
   b. Completely remove all undesirable plants (weeds) by hand pulling. Removal of weeds may be
      accomplished using herbicides if approved by the Engineer. However, the use of herbicides is prohibited
      in stream buffer areas unless approved by the Department Ecology Manager.
   c. Apply an approved pre-emergent herbicide twice each year, once in the spring and once in the fall,
      throughout the contract. The use of pre-emergent herbicides is prohibited in stream buffer areas. Apply
      pre-emergent to all shrub beds and tree pits. Notify the Engineer 48 hours prior to spraying. Use a blue
      dye in all applications unless approved otherwise by the Engineer.
   d. Eradicate all invasive exotic pest plants found within the project limits throughout the life of the project,
      including stream buffer and marsh areas. Volunteer, non-invasive plant material within stream buffer
      restoration areas is acceptable.
   e. Dispose off site on a daily basis all weed, exotic plants, clippings, litter, and debris generated.

8. Policing
   Remove debris such as paper, broken limbs, bottles, cans, etc., a minimum of the first and third week of each
   month from all areas within the project limits while maintaining the site.

9. Mitigation Areas
   Pruning, mulching, edging, and applying spring fertilizer are not required within wet swales, native restoration
   areas, stream buffers and regenerated forest areas.

C. Tree Maintenance
   1. Watering
      See Subsection 702.3.07.B.6
   2. Landscape Mulch
      See Subsection 702.3.07.B.2
   3. Fertilizer
      See Subsection 702.3.05.H.
   4. Abnormal Conditions
      Periodically (once every two weeks) observe trees and shrubs for abnormal conditions such as insects,
      borers, web worms, red spiders, etc., and immediately treat.
   5. Sucker Growth
      Remove sucker growth once a month. Sucker growth is the shoots that sprout out around the base of the
      tree trunk.
   6. Pruning and Deadwood
      Remove deadwood at least two times a year. Prune dead branches. Paint cuts, and wounds or scars with tree
      paint only when specified in the plans. Do not top Crape Mrytles. See Subsection 702.3.05.F.
   7. Pesticide Control
      NOTE: Apply pesticides as necessary to control harmful insects and diseases. Follow the manufacturer’s
      instructions. See Subsection 702.3.07.B.4. NOTE: Use chemicals according to Federal, State and county
directives on environmental control that carry an EPA approval number.
   8. Weed Control
      See Subsection 702.3.07.B
Section 702 — Vine, Shrub, and Tree Planting

9. Staking and Guying
   Remove all support guy wires, strapping and stakes from plants which have gone through one complete
growing season.

702.4 Measurement

A. Plants
   Plants of the name and size specified are measured for payment according to the number planted that are still
living and viable and in an acceptable condition at the time of Final Acceptance. A viable plant must have a
minimum of 75 percent of the leaf-bearing crown with healthy foliage.

B. Fertilizer
   Spring application fertilizer applied to planted and regenerated areas will be the actual number of pounds
(kilograms) placed and accepted. Fertilizer, lime, and plant topsoil used in prepared plant topsoil or plant bed
preparation are not measured for separate payment. For stream buffer and marsh areas, the addition of fertilizer or
lime is prohibited.

C. Perimeter Stakes
   Perimeter stakes is not measured for payment unless such item is shown as a separate Pay Item in the proposal.

D. Clearing and Grubbing
   Clearing and grubbing is not measured for payment unless the Item is shown as a separate Pay Item in
the proposal.

E. Landscape Mulch
   The quantity of landscape mulch and top-dressing measured for payment will be the actual number of square
yards (meters) completed as specified and accepted. The presence of weeds or other growth, or foreign material,
will be cause for rejection.

702.4.01 Limits
   General Provisions 101 through 150.

702.5 Payment

A. Plants
   Plants measured for payment will be paid for as follows:
1. After planting satisfactorily, the Department will pay 50 percent of the Contract Unit Price bid per each on the
next estimate.
2. Until Final Acceptance, perform all required maintenance according to Subsection 702.3.07 when necessary
or as ordered by the Engineer.
   If the Contractor fails to properly maintain the landscaping, daily charges shall be assessed against any
money due or that may become due to the Contractor in accordance with the schedule of deductions shown in
Subsection 108.08, but not less than $150 per calendar day, and will continue until project maintenance is
approved by the Engineer.
   The charges are in addition to those specified for delay or failure in completing the Work within the
specified time.
3. After the first semi-final inspection, the Department will pay 15 percent of the Contract Unit Price bid per each
of the live, viable plants.
4. After the second semi-final inspection, the Department will pay 15 percent of the Contract Unit Price bid per
each of the live, viable plants.
5. At Final Acceptance, the Department will pay the remaining 20 percent less the Full Contract Unit Price bid per each plant not accepted.

Payments are full compensation for furnishing, planting, replanting as required, pruning, staking, guying, soil conditioning, and preparing plant beds, including applying additives, digging plant pits, preparing plant topsoil and mulch, disposing of waste material, and maintaining the plants during the plant-establishment period.

B. Fertilizer

All grades of fertilizer applied in the spring, measured as specified above, are paid for at the Contract Price per pound (kilogram) or per ton (megagram), whichever is indicated in the proposal. Payment is full compensation for furnishing and applying and for watering regenerated areas.

For native restoration, stream buffer and marsh restoration areas, the addition of fertilizer or lime is prohibited.

C. Perimeter Stakes

Perimeter stakes will not be measured for payment. The cost will be included in the overall contract price.

D. Landscape Mulch

Landscape mulch measured for payment will be paid for as follows:

1. After mulching satisfactorily, the Department will pay 40 percent of the Contract Unit Price bid per square yard (meter).

2. After satisfactorily completing mulch (topdressing) in August of the first plant establishment period, the Department will pay 15 percent of the Contract Unit Price bid per square yard (meter).

3. After satisfactorily completing mulch (topdressing) in April of the second plant establishment period, the Department will pay 15 percent of the Contract Unit Price bid per square yard (meter).

4. After satisfactorily completing mulch (topdressing) in August of the second plant establishment period, the Department will pay 15 percent of the Contract Unit Price bid per square yard (meter).

5. After satisfactorily completing mulch (topdressing) in April of the final planting season, (a month before the Final Inspection), the Department will pay 15 percent of the Contract Unit Price bid per square yard (meter).

Such payment shall be full compensation for furnishing, installing, topdressing, and maintaining mulch as required.

6. Do not mulch marsh restoration areas.

7. Do not apply additional applications of mulch after the initial application in stream buffer restoration areas.

Payment will be made under:

703.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

703.3 Construction Requirements

703.3.01 Personnel
General Provisions 101 through 150.

703.3.02 Equipment
General Provisions 101 through 150.
Section 703 — Tree Wells, Tree Walls, and Root Protection

703.3.03 Preparation
General Provisions 101 through 150.

703.3.04 Fabrication
General Provisions 101 through 150.

703.3.05 Construction
A. Excavating and Filling Foundations
   Avoid unnecessarily injuring root systems when excavating for tree wells and tree walls.
   Excavate and fill foundations to these requirements:
   • To the elevations shown on the plans or as directed
   • To the full widths and lengths of footings shown on the plans
   Where the soil under tree wells or tree walls is unstable, backfill the foundation area with broken stone, coarse gravel, or other approved material and firmly tamp it.
   Ensure that foundations firmly and uniformly support masonry.

B. Constructing Masonry
   Build the tree wells and tree walls from rubble masonry according to Plan details. Use rubble masonry according to Section 607.

C. Providing Drainage
   Provide adequate well drainage using weep holes, pipe drains, drain tile, or porous material as shown on the plans.

D. Protecting Tree Roots
   Where tree root protection is required, spread porous material loosely to the extent and depths indicated on the Plans, or as directed by the Engineer. Before spreading porous material, clean the tree root protection area of vegetation. Before backfilling over a tree or plant that will be preserved, place porous material above its roots.

E. Damaging Plants
   Avoid cutting roots or damaging trees and shrubs while building tree wells and tree walls and placing the porous material to protect the roots.
   When making necessary cuts, use sharp tools and cut cleanly according to the best horticultural practices. Immediately cover with tree paint, all scarred or cut surfaces 1 in. (25 mm) or more in diameter.

703.3.06 Quality Acceptance
General Provisions 101 through 150.

703.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

703.4 Measurement
A. Tree Well and Tree Wall
   Tree well and tree wall masonry completed and accepted is measured for payment in cubic yards (meters).

B. Porous Material
   Porous material for tree root protection, placed and accepted, is measured for payment in cubic yards (meters) as measured loose in the vehicle at the point of dumping.
Section 703 — Tree Wells, Tree Walls, and Root Protection

C. Drain Pipe or Tile
   Drain pipe or drain tile is measured for payment in linear feet (meters) along the center of each line, lateral, or riser from ends-to-center or center-to-center of junctions and fittings.

D. Excavation, Paint, and Replacement or Disposal of Material
   No measurement or payment is made for excavation, tree paint, replacement of unsuitable material, or disposal of surplus material. These are considered a part of the Pay Item to which each pertains.

703.4.01 Limits
   General Provisions 101 through 150.

703.5 Payment
   Rubble masonry for tree wells and walls and porous material for tree root protection will be paid for at the Contract Unit Price per cubic yards (meters).
   Clay drain pipe or drain tile will be paid for by the linear foot (meter).
   Payment will be made under:

<table>

705.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

705.3 Construction Requirements

705.3.01 Personnel
Have skilled workers transplant according to the best horticultural practices.
Section 705 — Transplanting Trees

705.3.02 Equipment
Have tree transplanting equipment as detailed in the plans and specifications on the project site and in satisfactory condition before construction begins.

Excavate trees and tree pits with the Vermeer-type tree spade or tree mover or equivalent approved mechanized equipment.

705.3.03 Preparation
General Provisions 101 through 150.

705.3.04 Fabrication
General Provisions 101 through 150.

705.3.05 Construction
A. Transplanting Operations
   Follow these procedures when transplanting trees:
   1. Trunk and Branch Protection
      Protect trunks and branches from breaks or bruises. Spray trees in leaf with an approved antidesiccant before digging.
   2. Pruning
      Prune trees before transplanting as directed by the Engineer. Remove broken or badly bruised branches with a clean cut.
   3. Securing Roots
      Dig trees to secure as many roots as possible. Maintain a tight, firm ball during the moving operations.
   4. Excavating
      Excavate trees and tree pits. Use the excavated material to backfill the pits from which the existing trees were removed.
   5. Placing Trees in Pits
      Place transplanted trees into new pits. Backfill voids between the ball and the pit with clean, washed sand and tamp. Thoroughly water the sand in with a root feeder or water needle.
   6. Applying Topsoil and Mulch
      Apply plant topsoil to the transplanted tree according to plan details. Mulch a minimum 6 ft. diameter tree pit with 3 in. (75 mm) of mulching material.
   7. Staking and Anchoring Trees
      Stake or anchor trees according to planting details or as directed by the Engineer.

705.3.06 Quality Acceptance
Replace severely damaged or disfigured trees that the Engineer determines were damaged by operations. Replace with trees of approximately the same size, genus, species, variety, and quality at the Contractor’s expense.

705.3.07 Contractor Warranty and Maintenance
A. Watering
   After the initial watering, make four additional waterings at two-week intervals.

B. Guarantee Period
   A guarantee period is not required for the transplanting work.
Section 705 — Transplanting Trees

705.4 Measurement
The quantity of transplanted trees paid for under this Item is the number transplanted. Size is determined by tree caliper (diameter) measurement at a point 12 in. (300 mm) above the natural ground surface. Where tree caliper exactly coincides with a break point in the Pay Item size intervals, that tree is classed in the lower size interval.

705.4.01 Limits
General Provisions 101 through 150.

705.5 Payment
Transplanting trees will be paid for at the Contract Unit Price. Payment is full compensation for the work and materials including plant topsoil, fertilizer, mulch, stakes, staking wire, rubber hose, tree paint, water, and incidentals necessary to complete the Item.

Payment will be made under:

| Item No. 705 | Transplanting trees,_____ in. (mm) to_____ in. (mm) caliper | Per each |

705.5.01 Adjustments
General Provisions 101 through 150.
Section 706 — Turf Establishment

706.1 General Description
This work includes providing a hardy and permanent ground cover at designated locations. The cover is subject to the Engineer’s approval.

706.1.01 Definitions
General Provisions 101 through 150.

706.1.02 Related References
A. Standard Specifications
   Section 700—Grassing
B. Referenced Documents
   General Provisions 101 through 150.

706.1.03 Submittals
General Provisions 101 through 150.

706.2 Materials
Select a viable ground cover according to Section 700.

706.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

706.3 Construction Requirements
706.3.01 Personnel
General Provisions 101 through 150.

706.3.02 Equipment
General Provisions 101 through 150.

706.3.03 Preparation

706.3.04 Fabrication
General Provisions 101 through 150.

706.3.05 Construction
General Provisions 101 through 150.

706.3.06 Quality Acceptance
Refer to Subsection 700.3.06 Quality Acceptance and Subsection 700.3.07 Contractor Warranty and Maintenance for acceptance of a viable ground cover.

706.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.
Section 706 — Turf Establishment

706.4 Measurement
No field measurements are required. Measurement is calculated from known dimensions as follows:

A. Type A—Grading and Drainage Projects

[Project length (PL) minus bridge and exception* length (BL)] times [right-of-way width or Engineer-specified width (RW) minus roadbed width (RBW)] equals _____ square feet divided by 43,560 ft.²/acre equals pay quantity in acres.

[Project length (PL) minus bridge and exception* length (BL)] times [right-of-way width or Engineer-specified width (RW) minus roadbed width (RBW)] equals _____ square meters divided by 10,000 m² equals pay quantity in hectares.

\[(PL – BL) x (RW – RBW) = ____ft² ÷ 43,560 ft.²/acre = \text{pay quantity in acres}\]

\[(PL – BL) x (RW – RBW) = ____m² ÷ 10,000 m² = \text{pay quantity in hectares}\]

B. Type B: Base and Paving Projects

[Project length (PL) minus bridge and exception* length (BL)] times [unpaved shoulder width (SW) plus 6 ft. for each roadway side (RS)] = ___ square feet divided by 43,560 ft.²/acre= pay quantity in acres.

[Project length (PL) minus bridge and exception* length (BL)] times [unpaved shoulder width (SW) plus 1.8 m for each roadway side (RS)] = ___ square meters divided by 10,000 m² = pay quantity in hectares.

\[(PL – BL) x (SW + 6RS) = ___ \text{ ft.²} ÷ 43,560 \text{ ft.²/acre} = \text{pay quantity in acres}\]

\[(PL – BL) x (SW + 1.8RS) = ___ \text{ m²} ÷ 10,000 \text{ m²} = \text{pay quantity in hectares}\]

C. Type C: Complete Project

[Project length (PL) minus (bridge and exception* length (BL)] times [right-of-way width or Engineer-specified width (RW) minus plan paved surface width (PPW)] equals square feet divided by 43,560 ft.²/acre= pay quantity in acres.

[Project length (PL) minus (bridge and exception* length (BL)] times [right-of-way width or Engineer-specified width (RW) minus plan paved surface width (PPW)] equals square meters divided by 10,000 m² = pay quantity in hectares.

\[(PL – BL) x (RW – PPW) = ____\text{ ft.²} ÷ 43,560 \text{ ft.²/acre} = \text{pay quantity in acres}\]

\[(PL – BL) x (RW – PPW) = ____ \text{ m²} ÷ 10,000 \text{ m²} = \text{pay quantity in hectares}\]

*Exception means major road intersections and Plan exceptions, not side roads, drives, etc.

706.4.01 Limits
General Provisions 101 through 150.

706.5 Payment
The turf establishment area will be paid for at the Contract Price per acre (hectare). Payment is full compensation for equipment, labor, seed, fertilizer, and any other materials necessary to complete the Item.

Payment will be made under:

| Item No. 706 | Turf establishment, type______ | Per acre (hectare) |

706.5.01 Adjustment
General Provisions 101 through 150.
Section 708—Plant Topsoil

708.1 General Description
This work includes furnishing and applying approved plant topsoil at the locations shown on the plans or as directed by the Engineer and according to these specifications.

708.1.01 Definitions
General Provisions 101 through 150.

708.1.02 Related References
A. Standard Specifications
   Section 104—Scope of Work
   Section 106—Control of Materials
   Section 107—Legal Regulations and Responsibility to the Public
   Section 893—Miscellaneous Planting Materials

B. Referenced Documents
   General Provisions 101 through 150.

708.1.03 Submittals
General Provisions 101 through 150.

708.2 Materials
A. Plant Topsoil Materials
   Use plant topsoil that meets the requirements of Subsection 893.2.01.

B. Sources of Material
   Except as modified in this Section, furnish plant topsoil material according to Section 106.
   1. Plant Topsoil Obtained from the Work
      The requirements of Subsection 104.06, Right in and Use of Material Found on the Work are in effect for plant topsoil obtained from the work.
      a. Obtain the quantity of plant topsoil called for on the plans.
      b. Use plant topsoil material present on the Project as long as the topsoil meets the specifications applying to the Item.
      c. Excavate for topsoil only within the construction limits of the project. Obtain topsoil from embankment areas, excavation areas, or borrow excavation pits.
      d. When obtaining plant topsoil from borrow excavation pits or the roadway, cross section the excavated areas a second time before beginning regular excavation.
   2. Plant Topsoil Furnished by the Contractor
      When insufficient material is obtainable from the work, obtain additional topsoil offsite.
      The Contract Price will include the costs necessary to locate, purchase, and deliver the required amount of acceptable material to the Work.
Section 708 — Plant Topsoil

708.2.01 Delivery, Storage, and Handling
For the purpose of measurement, the Contractor may haul plant topsoil in any type of vehicle, provided the vehicle when loaded to capacity and traveling over public roads and streets meets the provisions of Subsection 107.14, Load Restrictions.

When using pans or scrapers, the capacity will be the manufacturer’s rated capacity.

708.3 Construction Requirements

708.3.01 Personnel
General Provisions 101 through 150.

708.3.02 Equipment
General Provisions 101 through 150.

708.3.03 Preparation
General Provisions 101 through 150.

708.3.04 Fabrication
General Provisions 101 through 150.

708.3.05 Construction

A. General Requirements
Unless otherwise specified in the plans, uniformly spread plant topsoil to at least 2 in. (50 mm) loose depth.

1. Erosion Control
   Only use plant topsoil on slopes where the gradient is 3:1 or flatter.
   To reduce loss of plant topsoil by erosion, place the soil shortly before and in conjunction with grassing operations.
   Place topsoil and complete grassing within specified seasonal limits.

2. Spreading Procedure
   Before applying plant topsoil, scarify the designated areas 6 in. to 8 in. (150 mm to 200 mm) deep.
   Mix the plant topsoil, lime when required, and the first application fertilizer with the underlying soil when preparing the soil for grassing. Spread and smooth the topsoil uniformly.

B. Plant Topsoil Obtained from The Work

1. Stockpiling
   When obtaining topsoil from the work site, strip and stockpile the topsoil in suitable locations in advance of grading operations.
   Just before grassing, remove the plant topsoil from the stockpile and spread it over the designated areas.
   If grassing is started before grading operations are finished, if feasible, haul the topsoil from undisturbed areas before grading begins directly to the areas designated for the topsoil, eliminating the cost of stockpiling and removing the stockpile.

2. Surplus Material
   When stockpiling more material than specified in the Contract, use the surplus material as additional plant topsoil material if directed by the Engineer.
   After constructing the Item, use the surplus material left in the stockpiles to maintain the Item or to fill washes that occur within a reasonable haul distance.
   Otherwise, remove or dress down the remaining material as directed by the Engineer, without additional compensation.
C. Plant Topsoil Furnished by Contractor

When locating, obtaining, and paying for plant topsoil from pits outside the right-of-way, excavate the topsoil and haul it directly to the designated areas just before the planting begins.

Notify the Engineer, according to Subsection 893.2.01, *Plant Topsoil*, of the source of the material. The Engineer will inspect the topsoil. If the material is suitable, the Engineer will specify the permissible excavation depth. If the permissible excavation depth is exceeded, the material obtained from the areas will be rejected.

708.3.06 Quality Acceptance

After placing the plant topsoil, replace material lost by erosion at no expense to the Department.

708.3.07 Contractor Warranty and Maintenance

General Provisions 101 through 150.

708.4 Measurement

Accepted plant topsoil for this Item is measured by the cubic yard (meter) of material delivered in vehicles to the designated areas for plant topsoil. Only vehicles loaded to full capacity are measured for payment. No payment will be made for material delivered in partially filled vehicles.

Plant topsoil is not measured for payment when it is used for an Item that includes the cost of the plant topsoil in the price bid per Unit for the Item.

708.4.01 Limits

General Provisions 101 through 150.

708.5 Payment

Plant topsoil, eligible for payment, will be paid for at the Contract Unit Price per cubic yard (meter). Payment is full compensation for furnishing the material, removing objectionable matter from the material, loading and unloading, stockpiling and removing from the stockpile, hauling, spreading, preparing the ground, pulverizing, mixing, remixing, and for all maintenance.

Payment will be made under:

708.5.01 Adjustments

General Provisions 101 through 150.
Section 711—Turf Reinforcement Matting

711.1 General Description
This section includes the requirements for furnishing and placing turf reinforcement matting (TRM) over prepared areas according to the plans or as directed by the Engineer.

711.1.01 Definitions
General Provisions 101 through 150.

711.02 Related References
A. Standard Specifications
   Section 700—Grassing
B. Referenced Documents
   QPL 49

711.02 Submittals
General Provisions 101 through 150.

711.2 Materials
Use materials listed on QPL 49. TRM is designated Types 1, 2, 3, 4, 5, and 6 and ranges in allowable hydraulic shear stress from Type 1 to Type 6, Type 6 being the highest. Use a TRM type equal to or higher than the TRM type specified by the designer. All TRM types require permanent grass be sown concurrently with installation.

Alternatively, in special cases dependent upon the soil’s vegetative-support quality and the growing season, the designer may specify only grass and mulch, or grass and a biodegradable rolled erosion control product for 0-3 psf (0-143 N/m²) shear stress conditions.

| ALLOWABLE HYDRAULIC SHEAR STRESS RANGES WITH VEGETATION¹ |
|-----------------|---------------|-----------------|-----------------|-----------------|-----------------|
| Type 1          | Type 2        | Type 3          | Type 4          | Type 5          | Type 6          |
| 0-2 psf (0-96 N/m²) | 0-4 psf (0-191 N/m²) | 0-6 psf (0-287 N/m²) | 0-8 psf (0-382 N/m²) | 0-10 psf (0-478 N/m²) | 0-12 psf (0-574 N/m²) |

¹ Allowable hydraulic shear stress in the unvegetated condition = 2.0 psf (96 N/m²).

Determine the allowable vegetated and unvegetated hydraulic shear stress for the TRM by using either of the independent laboratories of the Texas Transportation Institute (TTI) or the National Transportation Product Evaluation Program (NTPEP). Use the following large-scale test methods:

Ensure materials meet the following requirements.
A. **Preformed TRM**

Use TRM with a web of mechanical or melt-bonded polymer nettings, monofilaments, or entangled fibers to form a dimensionally stable matrix. Bond the TRM with one of the following:

- Polymer welding
- Thermal fusion
- Polymer fusion
- Fibers placed between two high-strength, biaxially oriented nets bound by parallel-lock stitching with polyolefin, nylon, or polyester threads

Use TRM with enough strength and elongation to limit stretching and maintain its shape before, during, and after installation under dry or wet conditions. Provide TRM with stabilized components that avoid ultraviolet degradation and are inert to chemicals normally encountered in a natural soil environment. Ensure the TRM conforms to the following minimum-value physical properties:

<table>
<thead>
<tr>
<th>Category</th>
<th>Grab Tensile Strength</th>
<th>UV Stability(^2)</th>
<th>Allowable Hydraulic Shear Stress(^4)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>lb./ft. (kN/m)(^1,2)</td>

\(^1\) Machine direction, ASTM D6818  
\(^2\) In field conditions requiring high loading and/or high survivability requirements (e.g., the TRM having to bear heavy-equipment loading), tensile strength of 3,000 lb./ft. (44 kN/m) or greater may be required  
\(^3\) Percentage of strength of an unexposed sample retained  
\(^4\) As calculated in accordance with the methods detailed in the FHWA HEC 15, 2005, document  
\(^5\) Exposure in carbon arc light in accordance with ASTM D 822 and ASTM G 152 is required.

B. **Stakes or Staples**

Use 1 in. by 3 in. (25 mm by 75 mm) wooden stakes made from sound stock cut in a triangular shape. Cut stakes 12 in. to 18 in. (300 mm to 450 mm) long depending on soil compaction. Use metal staples with the following characteristics:

- 11- gauge steel  
- U shape  
- Legs at least 8 in. (200 mm) long  
- Crown 2 in. (50 mm) across
When the construction plans specify deep anchors be used along with stakes or staples for zones of shear stress greater than 12 psf (574 N/m²) as an alternative to using riprap, follow the TRM manufacturer’s guidelines for anchor selection and installation procedures and provide the Engineer with the details of the recommended procedure. Use anchors listed on the QPL 49.

**711.2.01 Delivery, Storage, and Handling**
General Provisions 101 through 150.

**711.3 Construction Requirements**

**711.3.01 Personnel**
General Provisions 101 through 150.

**711.3.02 Equipment**
General Provisions 101 through 150.

**711.3.03 Preparation**

A. **Site Preparation**

Before protecting areas with TRM, prepare the area according to Section 700 with the following steps:

1. Bring the area to final grade.
2. Plow the area.
3. Lime the area.
4. Fertilize the area.
5. Grass the area.

Provide a smooth, firm, and stable surface free of rocks, clods, roots, or other obstructions preventing the TRM from fully contacting the soil.

**711.3.04 Fabrication**
General Provisions 101 through 150.

**711.3.05 Construction**

A. **Installing TRM**

Do not use TRM in areas where rock crops out. Install the TRM either in ditches or on slopes according to the manufacturer’s instructions and provide the Engineer with the details of the recommended procedure. In the absence of specific instructions from the manufacturer, install the TRM according to the following requirements:

1. **Ditches**

   To install the TRM in ditches:
   a. Cut a transverse trench 6 in. wide by 9 in. deep (150 mm wide by 225 mm deep) at the ends of the TRM.
   b. Cut longitudinal, 4 in. (100 mm) deep anchor slots along each side of the TRM along the full length of the ditch and bury the TRM edges. The Engineer will require additional or deeper anchor slots or deep anchors for large volumes of water that cause high shear stress.
   c. Roll out the center strip of TRM, starting at the lower end of the ditch.
   d. Roll out each adjacent strip of TRM to overlap the preceding strip at least 3 in. (75 mm).
   e. Overlap the ends of each TRM roll 3 ft. (1 m) with the upslope mat on top. Stretch the TRM to the bottom of the slot, folding it back and staking through two layers of material.
   f. Stake each strip of TRM at 1 ft. (300mm) intervals in each anchor slot, with one stake serving the overlapped edges of adjoining strips.
Section 711 — Turf Reinforcement Matting

g. Backfill and compact the slot.

h. Fold the TRM back over the slot and continue in the upstream direction (closed anchor slot).

i. Stake the TRM snugly in the longitudinal slots and at intervals a maximum of 5 ft. (1.5 m) along the ditch (open anchor slot).

j. Backfill and dress the longitudinal anchor slots.

711.3.06 Quality Acceptance
General Provisions 101 through 150.

711.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

711.4 Measurement
TRM completed and accepted is measured for payment by the square yard (meter) of surface measured.

711.4.01 Limits
Overlaps and anchor slots are incidental to the work and are not measured for payment.

711.5 Payment
This work will be paid for at the Contract Price per square yard (meter) for TRM completed, in place, and accepted. Payment is full compensation for furnishing and installing the TRM according to this Specification.

Preparation of the area and grassing will be paid for according to Section 700.

Payment will be made under:

| Item No. 711 | Turf reinforcement matting, Type ___ | Per square yard (meter) |

710.5.01 Adjustments
General Provisions 101 through 150.
Section 712—Fiberglass Blanket

712.1 General Description
This work includes furnishing and placing fiberglass blankets over previously prepared and grassed areas according to the plans or as directed by the Engineer.

712.1.01 Definitions
General Provisions 101 through 150.

712.1.02 Related References
A. Standard Specifications
   Section 106—Control of Materials
   Section 700—Grassing
   Section 822—Emulsified Asphalt

B. Referenced Documents
   General Provisions 101 through 150.

712.1.03 Submittals
Submit certification according to Subsection 106.05 stating that materials conform to the requirements of this Section.

712.2 Materials
A. Fiberglass Mat or Blanket
   Fiberglass mat is a machine-produced blanket consisting of a uniform layer of continuous, randomly oriented glass fiber strands. Use a mat that is at least 48 in. (1.2 m) wide and weighs the following:
   - At least 0.2 lbs./yd² (105 g/m²) when used on slopes
   - At least 0.4 lbs./yd² (215 g/m²) when used in waterways

B. Anchoring Staples
   Use staples made of cold-drawn wire no smaller than 14 gauge (2 mm) in diameter, formed into a U shape with 6 in. (150 mm) long legs and a 1 in. (25 mm) wide crown.

C. Asphalt
   Use asphalt emulsion for tying down the blanket that is grade SS-1h or SS1, conforming to Section 822.

712.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

712.3 Construction Requirements
712.3.01 Personnel
General Provisions 101 through 150.

712.3.02 Equipment
General Provisions 101 through 150.
Section 712 — Fiberglass Blanket

712.3.03 Preparation
Before placing the fiberglass mat, complete grassing, smooth the area, and clear it of stones, lumps, roots, or other material that would prevent the mat from laying snugly on the underlying soil.

712.3.04 Fabrication
General Provisions 101 through 150.

712.3.05 Construction
A. Placing Mat
Place the fiberglass mat or blanket within 24 hours after the area has been planted but before any rain or watering. Place the mat as follows:
1. Dig a 9 in. (225 mm) deep anchor slot across the upgrade end of the site.
2. Place the initial 12 in. (300 mm) of blanket in the anchor slot.
3. Backfill and solidly tamp the slot.
4. Unroll the blanket in the direction of water flow, keeping the blanket in contact with the soil over the entire area.
5. Overlap adjacent strips at least 2 in. (50 mm). Overlap adjoining ends at least 6 in. (150 mm) with the upstream section on top.

B. Stapling
Drive staples vertically into the ground approximately 1 yd (1 m) apart on each side of the blanket.

Drive one row in the center alternately spaced between each side staple.
Place the edge staples in the 2 in. (50 mm) overlap. At the end of each mat, place staples in a row spaced approximately 12 in. (300 mm) apart.

C. Steep Slopes
The Engineer may specify additional staples or check slots in waterways where slopes are steep or large water volumes or velocities are anticipated.

D. Asphalt Emulsion
The Contractor may apply an asphalt emulsion instead of staples to anchor the blanket.

Apply the bituminous material uniformly over the mat at approximately the following rates:
- 0.12 gal to 0.15 gal/yd² (0.5 L to 0.7 L/m²) for slopes
- 0.24 gal to 0.30 gal/yd² (1 L to 1.4 L/m²) or waterways

After the emulsified asphalt has broken and becomes tacky, apply a light layer of sand or pulverized soil to the treated areas, if directed by the Engineer. This application prevents the treated area from sticking to anything that contacts it. Do not apply sand or soil in quantities that would damage the newly planted areas.

712.3.06 Quality Acceptance
General Provisions 101 through 150.

712.3.07 Contractor Warranty and Maintenance
Maintain treated areas to the Engineer’s satisfaction until Final Acceptance.

712.4 Measurement
The quantity of fiberglass blanket being paid for is the number of square yards (meters), surface measured, completed and accepted. The 2 in (50 mm) side laps and the blanket in the anchor slot are not included in the measurement but are considered incidental to the work. Treated slopes and treated waterways are measured separately.
**Section 712 — Fiberglass Blanket**

**712.4.01 Limits**
General Provisions 101 through 150.

**712.5 Payment**
This work will be paid for at the Contract Price per square yard (meter) for fiberglass blanket, complete in place and accepted. Payment is full compensation for furnishing and installing the blanket according to this specification and maintaining the blanket. Preparing the area and grassing will be paid for according to Section 700.

Payment will be made under:

**712.5.01 Adjustments**
General Provisions 101 through 150.
Section 713—Organic and Synthetic Material Fiber Blankets

713.1 General Description
This work includes furnishing and placing straw, excelsior, coconut fiber, wood fiber, or synthetic blankets over previously prepared and permanently grassed areas as shown on the plans or as directed by the Engineer.

713.1.01 Definitions
- Straw Blanket: A machine-produced blanket of clean, weed-free, consistently thick straw from agricultural crops. The straw is evenly distributed over the entire area of the blanket.
- Excelsior Blanket: A machine-produced mat of curled wood excelsior. Eighty percent consists of 6 in. (150 mm) or longer fiber evenly distributed over the entire blanket.
- Coconut Fiber Blanket: A machine-produced blanket of 100 percent coconut fiber evenly distributed over the entire blanket.
- Wood Fiber Blanket:
  - Type I—A machine-produced blanket manufactured with reprocessed wood fibers to a consistent thickness.
  - Type II—A hydraulically applied bonded fiber matrix which upon drying, adheres to the soil in the form of a continuous 100 percent coverage, biodegradable erosion control blanket
- Synthetic Fiber Blanket—A machine produced uniform blanket of ultraviolet degradable polypropylene staple fibers reinforced with ultraviolet degradable polypropylene netting.

713.1.02 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   General Provisions 101 through 150.

713.1.03 Submittals
Use approved materials from QPL 62 without further testing. Otherwise, submit materials for testing before use.

713.2 Materials
Use blankets that meet the following requirements for placement on both slopes and waterways, except where noted below. For a list of organic material fiber blankets, see QPL 62.

A. Straw Blanket
   Use blankets at least 48 in. (1.2 m) wide and at least 3/8 in. (9 mm) thick with a minimum dry weight of 0.5 lb./yd² (270 g/m²) and a stitch pattern and row spacing of no more than 2 in. (50 mm). Have the top side covered with a photo-degradable plastic mesh having a maximum mesh size of 1/2 by 1/2 in. (25 mm by 25 mm). The mesh will be sewn to the straw with biodegradable thread.

   Use this blanket on slopes only.

B. Excelsior Blanket
   Use a smolder-resistant blanket with the top side clearly marked. Use a blanket at least 48 in. (1.2 m) wide and 1/4 in. (6 mm) thick with a minimum dry weight of 0.8 lb./yd² (430 g/m²) and a stitch pattern and row spacing of no more than 2 in. (50 mm).

   - Slopes: Have the top side covered with a photo-degradable plastic mesh having a maximum mesh size of 1-1/2 by 3 in. (38 by 75 mm).
Section 713 — Organic and Synthetic Material Fiber Blankets

• Waterways: Have the top and bottom sides of the blanket covered with a photodegradable plastic mesh having a maximum mesh size of 1 ½ x 3 in. (38 x 75 mm), sewn to the fiber with biodegradable thread or otherwise bonded as approved by the Engineer.

C. Coconut Fiber Blanket

Use a blanket at least 48 in. (1.2 m) wide and 1/4 in. (6 mm) thick with a minimum dry weight of 0.5 lb./yd² (270 g/m²) and a stitch pattern and row spacing of no more than 2 in. (50 mm).

Ensure that both sides of the blanket are covered with a photo-degradable plastic mesh with a maximum of 5/8 by 5/8 in. (19 by 19 mm). Have the mesh sewn to the fiber with a breakdown-resistant synthetic yarn.

D. Wood Fiber Blanket

Type I

• Use a machine produced blanket manufactured to a consistent thickness using reprocessed wood fibers.

• Use a blanket at least 48 in. (1.2 m) wide with a minimum dry weight of 0.35 lb./yd² (190 g/m²). Use the blanket on slopes only.

• Ensure that the top side of the blanket is covered with a photo-degradable plastic mesh with a maximum mesh size of 5/8 by 3/4 in. (16 by 19 mm) securely bonded to the mat.

• Ensure that the fibers do not contain a growth that inhibits germination.

Type II

• Ensure the bonded fiber matrix is composed of long strand wood fibers or cellulosic-based fibers held together by a bonding agent, which, upon drying, becomes insoluble and non-dispersible.

• Apply the matrix at the following rates:

<table>
<thead>
<tr>
<th>Application Rate</th>
<th>Slope</th>
</tr>
</thead>
<tbody>
<tr>
<td>3,000 lbs./acre (3.4 Mg/ha)</td>
<td>4:1</td>
</tr>
<tr>
<td>3,600 lbs./acre (4.1 Mg/ha)</td>
<td>2:1</td>
</tr>
<tr>
<td>4,000 lbs./acre (4.5 Mg/ha)</td>
<td>1:1</td>
</tr>
</tbody>
</table>

• Do not apply the bonded matrix on saturated soils or immediately before, during or after rainfall. Allow the matrix to dry for at least 24 hours after installation. After drying period, ensure that the bonded fiber matrix does not inhibit the germination or growth of plants beneath and through the formed matrix blanket and that it does not form a water insensitive crust.

• If bonded fiber matrix is to be used, the application of straw mulch for grassing operations is not required.

E. Synthetic Fiber Blanket

Use a blanket having a minimum net size of 5/8 x 3/4 inch (16 x 19 mm). Ensure the netting is securely bonded to the blanket and that the blanket conforms to the following physical properties:

<table>
<thead>
<tr>
<th>PROPERTY</th>
<th>MINIMUM VALUE</th>
<th>TEST METHOD</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>1 oz/sq. yd (34 g/m²)</td>
<td></td>
</tr>
<tr>
<td>Roll Width</td>
<td>48 in. (1.2 m)</td>
<td></td>
</tr>
<tr>
<td>Tensile Strength Length</td>
<td>6 lbs./in.</td>
<td>ASTM D 1682 [6 in. (150 mm strip)]</td>
</tr>
</tbody>
</table>

Use Synthetic fiber blanket on slopes only.
Section 713 — Organic and Synthetic Material Fiber Blankets

F. Anchoring Staples

Use anchoring staples made from minimum 11-gauge wire, formed into a U shape. The legs will be at least 6 in. (150 mm) long and the crown at least 1 in. (25 mm) wide. Use staples rigid enough to penetrate the soil without distortion.

713.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

713.3 Construction Requirements

713.3.01 Personnel
General Provisions 101 through 150.

713.3.02 Equipment
General Provisions 101 through 150.

713.3.03 Preparation
Before placing the blanket, complete the grassing operations, smooth the area, and remove stones, lumps, roots, or other material that would prevent the blanket from laying snugly on the soil.

713.3.04 Fabrication
General Provisions 101 through 150.

713.3.05 Construction

A. Placing Blanket

Place blankets or mats vertically on slopes, beginning at the top of the slope and extending to the bottom of the slope. Horizontal installation of the blankets is not permitted.

Place the blanket within 24 hours after planting and before rain or watering. Place the blanket on slopes and waterways as follows:

1. On Slopes

Unroll the blanket with the netting on top and the fibers contacting the soil over the entire slope. When using two or more blankets to cover an area, overlay the joint 4 in. (100 mm) and staple through the joint. Overlap the ends of the blanket at least 6 in. (150 mm) with the upgrade section on top and staple through the overlap.

2. In Waterways

In waterways, ditches, flumes, and channels unroll the blanket with netting sewn on both sides and place in contact with the soil beginning at the downstream terminal and progressing upstream of the blanket according to the Construction Detail for Permanent Soil Reinforcing Mat.

Allow a longitudinal seam only if the blankets overlap at least 6 in. (150 mm) and are securely stapled. Overlap ends of the blanket at least 6 in. (150 mm) with the upgrade section on top.

Insert 12 in. (300 mm) of the upslope end of the first row of blankets into a 6 in. (150 mm) deep anchor slot. Staple the blanket in the slot bottom, backfill the slot, and solidly tamp.

B. Stapling

Drive staples vertically into the ground to anchor the plastic mesh. Place the staples approximately 2 yd (2 m) apart on each side of the blanket and add one row in the center alternately spaced between each side staple.

Where blankets lay side to side, place each staple so that half of the staple anchors mesh from each blanket.

At the beginning of a blanket, space staples approximately 12 in. (300 mm) apart in a row.
C. Steep Slopes
The Engineer may specify additional staples or check slots in waterways where slopes are steep or large water volumes and/or velocities are anticipated.

713.3.06 Quality Acceptance
General Provisions 101 through 150.

713.3.07 Contractor Warranty and Maintenance
Maintain the blanket installation throughout the life of the Contract. If before Final Acceptance any staples become loose or lift up or if the blanket becomes loose, torn, or undermined, then fix the problem by reshaping, regrassing, refertilizing, or replacing damaged areas. Repairs are done without additional compensation.

713.4 Measurement
Straw blanket excelsior blanket, coconut fiber blanket, wood fiber blanket, or synthetic blanket, installed and accepted is measured for payment by the square yard (meter). Laps and blanket in the anchor slots are not measured. They are considered incidental to the work.

713.4.01 Limits
General Provisions 101 through 150.

713.5 Payment
The preliminary preparation of the areas on which the blanket is to be placed, including seeding or sodding, will be paid for under the appropriate Contract Items.

Straw blanket excelsior blanket, coconut fiber blanket, wood fiber blanket or synthetic fiber blanket will be paid for at the Contract Unit Price per square yard (meter). Payment is full compensation for the construction of the Item including all laps, materials, equipment, tools, labor, incidentals, and maintenance.

Payment will be made under:

713.5.01 Adjustments
General Provisions 101 through 150.
Section 714—Jute Mesh Erosion Control

714.1 General Description
This work includes furnishing and placing jute mesh over previously prepared grassed areas according to the plans or as directed by the Engineer.

714.1.01 Definitions
Jute Mat: A mesh matting made of jute yarn.

714.1.02 Related References
A. Standard Specifications
   Section 106—Control of Materials
B. Referenced Documents
   General Provisions 101 through 150.

714.1.03 Submittals
Provide a materials certification according to Subsection 106.05 that the materials meet the specifications.

714.2 Materials
Ensure that materials conform with Subsection 106.05 and meet the requirements below.
A. Jute Mat
   Use jute mat made of unbleached, undyed, and loosely-twisted yarn. The unit yarn weight shall be from 0.90 to 1.50 lb./yd² (488 to 814 g/m²). A 48 in. (1.2 m) width shall show between 76 and 80 warpings, and a 36 in. (900 mm) length shall show between 39 and 43 weftings. Furnish woven mesh strips of at least 45 in. (1.1 m).
B. Anchoring Staples
   Cold-drawn wire 14 gauge (2 mm) or wider in diameter, formed into a U shape from a wire 12 in. (300 mm) or longer.

714.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

714.3 Construction Requirements
714.3.01 Personnel
General Provisions 101 through 150.

714.3.02 Equipment
General Provisions 101 through 150.

714.3.03 Preparation
Before placing jute mesh, complete grassing and leave the area in the following condition:
- Smooth
- Uniform
- Free of stones, lumps, or roots
- Free of other material that prevents mesh from snugly contacting the underlying soil
If erosion occurs after attaining the required surface area and contour, repair the area before placing mesh.
714.3.04 Fabrication

General Provisions 101 through 150.

714.3.05 Construction

A. Placing Mesh

After grassing, place jute mesh in an area indicated on the plans or as directed by the Engineer.

Place mesh according to the Plans and the following requirements:

1. Roll the mesh out in the direction of flow unless the downstream end section connects to a drainage structure or paved ditch. In this case:
   a. Anchor the mesh in a 6 in. (150 mm) deep trench adjacent to the structure.
   b. Roll the mesh upstream and use a junction slot to connect it to the mesh that has been rolled downstream.

2. Overlap adjacent strips by at least 6 in. (150 mm).

3. Overlap adjoining ends by at least 6 in. (150 mm).

4. For all overlaps, place the upstream section on top.

5. Use a Type 2 check slot at the downstream end of the jute mesh that does not connect to a structure.

6. Apply jute mesh without stretching. Lay it evenly but loosely on the soil surface.

7. To keep the area smooth, do not allow workers to walk directly on the seedbed before or after applying mesh.

8. Bury the up-channel end of each installation in a narrow, 6 in. (150 mm) deep trench.

9. After burying the mesh, backfill, tamp, and staple the trench as shown on the Plans.

10. Where one roll of jute mesh ends and a second begins, use a junction slot to make the connection as shown on the plans.

11. Space between the check or anchor slots is no more than 50 ft. (15 m) on grades of 3 percent or less. On grades of more than 3 percent, ensure that the space between the check or anchor slots is no more than 25 ft. (7.5 m).

B. Stapling

Hold matting strips firmly in place with one row of staples as follows:

1. Staple along each edge.

2. Staple each row along the middle.

3. Space staples no more than 3 ft. (1 m) apart in each row.

4. Space the staples in the middle row alternately with those at the edges.

5. For strips wider than 60 in. (1.5 m), space staples no more than 3 ft. (1 m) apart.

6. At the ends of the covered area and at overlapping joints, space staples no more than 18 in. (450 mm) apart.

7. Ensure that staples remain flush with the ground.

C. Rolling

After placing and stapling the jute mesh:

1. Firmly embed it in the soil by tamping or rolling.

2. Secure mesh that bridges over soil surface irregularities with extra staples to provide overall contact with the soil.

714.3.06 Quality Acceptance

General Provisions 101 through 150.
714.3.07 Contractor Warranty and Maintenance
Maintain jute mesh installation during the life of the Contract. Before acceptance of the project, reshape, regrass, or refertilize if:

- Staples become loose or raised
- Mesh becomes loose, torn, or undermined

Repair or replace jute mesh without additional compensation.

714.4 Measurement
Jute mesh, complete in place and accepted, will be measured for payment by the square yard (meter), surface measure. Laps will not be measured but will be included in the overall area.

714.4.01 Limits
General Provisions 101 through 150.

714.5 Payment
Preparing areas to be meshed, including seeding or sodding, will be paid for under the appropriate Contract Items. Jute mesh will be paid for at the Contract Unit price per square yard (meter), which is full compensation for constructing the Item and providing materials, equipment, tools, labor, maintenance, and incidentals.

Payment will be made under:

| Item No. 714 | Jute mesh | Per square yard (meter) |

714.5.01 Adjustments
General Provisions 101 through 150.
Section 716—Erosion Control Mats (Slopes)

716.1 General Description
This work includes furnishing and placing erosion control mats (blankets) made of fiberglass, excelsior, jute mesh, bituminous treated roving, and straw, synthetic, or coconut over grass areas prepared according to Section 700 for permanent grass. Place according to the plans or as directed by the Engineer. This specification is not applicable for waterways.

716.1.01 Definitions
General Provisions 101 through 150.

716.1.02 Related References
A. Standard Specifications
   Section 712—Fiberglass Blanket
   Section 713—Organic and Synthetic Material Fiber Blanket
   Section 714—Jute Mesh Erosion Control

B. Referenced Documents
   General Provisions 101 through 150.

716.1.03 Submittals
General Provisions 101 through 150.

716.2 Materials
General Provisions 101 through 150.

716.2.01 Delivery, Storage, and Handling
General Provisions 101 through 150.

716.3 Construction Requirements

716.3.01 Personnel
General Provisions 101 through 150.

716.3.02 Equipment
General Provisions 101 through 150.

716.3.03 Preparation
General Provisions 101 through 150.

716.3.04 Fabrication
General Provisions 101 through 150.

716.3.05 Construction
The contractor may elect to use either Section 712 – Fiberglass Blanket, Section 713 – Organic and Synthetic Material Fiber Blanket (except do not use Type II Wood Fiber Blanket), or Section 714 – Jute Mesh Erosion Control on slopes. All of the materials, construction and measurement portions of the noted sections apply to the type mat (blanket) selected for use.
Place blankets or mats vertically on the slopes beginning at the top of the slope and extending to the bottom of the slope. Horizontal installation of the blankets or mats is not permitted.

The application of mulch is not required for permanent grassing when one of the above noted mats or blankets is placed on the previously prepared and grassed slopes with 24 hours.

**716.3.06 Quality Acceptance**
General Provisions 101 through 150.

**716.3.07 Contractor Warranty and Maintenance**
General Provisions 101 through 150.

**716.4 Measurement**
Erosion control mats (Slopes) are measured according to the specification sections referenced in Subsection 716.3.05.

**716.4.01 Limits**
General Provisions 101 through 150.

**716.5 Payment**
Erosion control mats (Slopes), measured as specified in Section 712, Section 713, or Section 714 will be paid for at the Contract Unit Price per square yard (meter).

This payment is full compensation for constructing the mat (blanket) and providing materials, equipment, tools, labor, and incidentals needed to maintain mats (blankets) for the life of the Contract or until a stand of grass has developed enough to prevent erosion.

Payment will be made under:

**716.5.01 Adjustments**
General Provisions 101 through 150.
Section 718—Wood Fiber

718.1 General Description
This work includes furnishing and placing wood cellulose fiber or wood pulp fiber in hydroseeding operations according to the plans and specifications, and as directed by the Engineer.

718.1.01 Definitions
General Provisions 101 through 150.

718.1.02 Related References
A. Standard Specifications
   Section 106—Control of Materials
   Section 700—Grassing
B. Referenced Documents
   QPL 25

718.1.03 Submittals
Provide a materials certification according to Subsection 106.05 that the materials meet the specifications.

718.2 Material
Use wood fibers that do not contain germination or growth-inhibiting factors and that meet the requirements of Subsection 106.05 and the following:

- When mixed with water, they disperse and suspend evenly
- After application, their color contrasts with the soil color to assist in identifying the area to be seeded
- When sprayed uniformly on the soil surface, they form an absorbent cover to distribute water to the underlying soil
- On an equilibrium air-dried basis, they contain a maximum of 15 percent water.
- They maintain a pH range of 4.5 to 8.5.

For a list of sources, see QPL 25.

718.2.01 Delivery, Storage, and Handling
Package wood fibers in moisture-resistant bags. Plainly mark the net weight of the packaged material on each bag.

718.3 Construction Requirements

718.3.01 Personnel
General Provisions 101 through 150.

718.3.02 Equipment
General Provisions 101 through 150.

718.3.03 Preparation
General Provisions 101 through 150.
718.3.04 Fabrication
General Provisions 101 through 150.

718.3.05 Construction
Apply enough materials to cover the ground evenly and thoroughly, as directed by the Engineer. Use hydraulic equipment to apply a homogenous water slurry that includes the proper amounts and kind of seed and fertilizer specified in Section 700. Mix the slurry during application.

718.3.06 Quality Acceptance
General Provisions 101 through 150.

718.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

718.4 Measurement
Wood fiber is not measured for separate payment.

718.4.01 Limits
General Provisions 101 through 150

718.5 Payment
This Work will not be paid for separately but will be included in the payment for Permanent Grassing. (See Subsection 700.5.)

718.5.01 Adjustments
General Provisions 101 through 150.
719.1 General Description
This specification provides the requirements for furnishing and installing a silt filter bag to trap dissolved silt when pumping accumulated water from sediment basins or other areas where water may accumulate.

719.1.01 Definitions
General Provisions 101 through 150.

719.1.02 Related References

   ASTM D 4884

719.1.03 Submittals
General Provisions 101 through 150.
719.2 Materials

Ensure that all materials meet the requirements of the following:

A. Fabric

The silt filter bag fabric shall be a non-woven geotextile conforming to the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Minimum Value</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight</td>
<td>10 oz./yd² (340 g/m²)</td>
<td>ASTM D 3776</td>
</tr>
<tr>
<td>Tensile strength (minimum average of 5 specimens)</td>
<td>270 lb. (1100 N)</td>
<td>ASTM D 4632</td>
</tr>
<tr>
<td>Puncture Resistance,</td>
<td>150 lb. (730 N)</td>
<td>ASTM D 4833</td>
</tr>
<tr>
<td>Initial Flowrate</td>
<td>70 gal/min-ft² (3500 L/min- m²)</td>
<td>ASTM D 4491</td>
</tr>
<tr>
<td>Bursting Strength</td>
<td>550 psi (3800 kPa)</td>
<td>ASTM D 3786</td>
</tr>
<tr>
<td>Permeability</td>
<td>1.3 sec⁻¹</td>
<td>ASTM D 4991</td>

<tr>
<td>UV Stability, 70% of initial Tensile Strength</td>
<td>173 lb. (770 N)</td>
<td>ASTM D 4355</td>
</tr>
<tr>
<td>AOS Retained</td>
<td>100%</td>
<td>ASTM D 4751</td>
</tr>
</tbody>
</table>

B. Seams

All seams shall be sewn with a double needle machine using a high strength thread. The seams shall have a minimum average wide-width strength of 100 lb./in (17.5 N/mm) when tested according to ASTM D 4884.

C. Opening

Provide a silt filter bag with an opening to accommodate a 6 in. (150 mm) hose.

719.2.01 Delivery, Storage, and Handling

General Provisions 101 through 150.

719.3 Construction Requirements

719.3.01 Personnel

General Provisions 101 through 150.

719.3.02 Equipment

General Provisions 101 through 150.

719.3.03 Preparation

General Provisions 101 through 150.

719.3.04 Fabrication

General Provisions 101 through 150.

719.3.05 Construction

1. Place the silt filter bag on a #57 stone gravel bed sloped to ensure that the filtered water will exit at the desired location. Chose the exit location to prevent erosion.

2. Extend the pump hose past the inlet opening to ensure that the silt-laden water will discharge in the center of the bag. Ensure that the seal between the inlet and hose is watertight.
Section 719 — Silt Filter Bag

3. When the filter bag is full of silt and cannot readily pass any more water, use a new filter bag. If approved by the Engineer, bury the full filter bag on site or remove the top section of fabric and seed the exposed filtrate. The size and number of silt filter bags will be shown on the plans or determined by the Engineer.

719.3.06 Quality Acceptance
General Provisions 101 through 150.

719.3.07 Contractor Warranty and Maintenance
Continue water filtration as directed by the Engineer.

719.4 Measurement
Silt filter bags measured for payment will be the actual number of bags used for filtration, complete and accepted.

719.4.01 Limits
General Provisions 101 through 150.

719.5 Payment
Payment will be made under:

| Item No. 719. | Silt filter bag | Per each |

719.5.01 Adjustments
General Provisions 101 through 150.
Section 720—Triangular Silt Barrier

720.1 General Description
The work covered by this section consists of furnishing, installing, and removing water-permeable triangular silt barriers used to remove suspended particles from drainage water.

720.1.01 Definitions
General Provisions 101 through 150.

720.1.02 Related References
A. Standard Specifications
   Section 700
B. Referenced Documents
   General Provisions 101 through 150.

720.1.03 Submittals
General Provisions 101 through 150.

720.2 Materials
A. General
   Triangular silt barriers shall have a water-permeable urethane foam core surrounded by a woven geotextile fabric. The foam core shall have a triangular cross-section with a minimum height of 8 in. (200 mm) in the center and a minimum base length of 16 in. (400 mm). The other two cross-sectional sides shall be of equal length.
   The fabric shall be wrapped around the foam core and shall extend beyond both sides of the triangle at least 24 in. (600 mm).
B. Filter Fabrics
   Filter fabrics shall be composed of strong rot-proof synthetic fibers formed into a woven fabric. The fabric shall be free of treatment or coating that might significantly alter its physical properties after installation.
   The fabric shall contain stabilizers or inhibitors to make the filaments resistant to deterioration from exposure to sunlight or heat. The fabric shall be a pervious sheet of synthetic fibers oriented into a stable network so that the fibers retain their relative position to each other under normal handling, installation, and service conditions. Edges of the fabric shall be finished to prevent the outer yarn from pulling away from the fabric.
   Fabrics shall be free of defects or flaws that would significantly affect its physical or filtering properties.
   The fabric shall not be exposed to temperatures greater than 140 °F (60 °C).
   The fabric shall meet the following physical requirements:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile Strength – Pounds (newtons (Min.) (ASTM D-4632) (1))</td>

</tbody>
</table>

(1) Minimum roll average of five specimens.
(2) Percent of required initial minimum tensile strength.

C. Wire Staples

Fix the triangular silt barriers to the ground with wire staples. The staples shall be made of 11-gage wire with legs at least 6 in. (150 mm) long.

720.2.01 Delivery, Storage, and Handling

During shipment and storage, protect the silt barrier with a heavy-duty covering that will protect the barrier from sunlight, mud, dust, dirt and debris.

720.3 Construction Requirements

720.3.01 Personnel

General Provisions 101 through 150.

720.3.02 Equipment

General Provisions 101 through 150.

720.3.03 Preparation

General Provisions 101 through 150.

720.3.04 Fabrication

General Provisions 101 through 150.

720.3.05 Construction

Install triangular silt barriers according to this specification, as shown on the plans or as directed by the Engineer.

1. Excavate a trench 4 to 6 in. (100 to 150 mm) deep using equipment such as a trenching machine or motor grader; or, if equipment cannot be operated on site, by hand.
2. Secure the edge of the fabric into the trench with wire staples.
3. Install the fabric in the trench so that 4 to 6 in. (100 to 150 mm) of fabric is against the side of the trench with 2 to 4 in. (50 to 100 mm) of fabric across the bottom in the upstream direction.
4. Backfill the trench and compact it so that no flow can pass under the barrier.
5. Where the individual sections of triangular silt barrier meet, fix the fabric to the ground with wire staples at each joint location and at each end of the barrier.

The location and quantity of triangular silt barrier to be installed will be affected by the conditions that occur during the construction of the project.

The Engineer may increase, decrease or eliminate the quantity of triangular silt barrier. Do not consider these variations in quantity as alterations in the details of construction or a change in the character of the Work.

Triangular silt barrier may be substituted for baled straw.
**720.3.06 Quality Acceptance**
The Engineer will reject the barrier at the time of installation if it has defects, rips, holes, flaws, deterioration, or damage incurred during manufacture, transportation, or storage.

**720.3.07 Contractor Warranty and Maintenance**
Maintain the silt barrier until the Project is accepted or until the silt barrier is removed and remove and dispose of silt accumulations. Maintenance and sediment removal are covered in Section 165. Remove and replace triangular silt barrier sections whenever effectiveness is reduced due to deterioration.

Remove triangular silt barrier unless the Engineer directs that it be retained. Barriers that have been removed will remain Contractor property and may be used at other locations if its condition is acceptable to the Engineer. When the silt barrier is removed, dress the area to give a pleasing appearance and seed and mulch the area according to Section 700.

**720.4 Measurement**
The quantity of triangular silt barrier to be paid for will be the actual number of linear feet (meters) of triangular silt barrier, measured in place from end to end of each separate installation, which has been completed and accepted.

**720.4.01 Limits**
General Provisions 101 through 150.

**720.5 Payment**
Triangular silt barrier measured as defined above will be paid for at the Contract Unit Price bid per linear foot (meter). Payment shall be full compensation for furnishing all materials; erecting and maintaining the barrier; removing accumulated silt except as described in Subsection 720.3.07; for all dressing and grassing, and for removing the barrier.

Payment for this Item will be made as follows:

- 75 percent of the Contract Price bid per linear meter will be paid when each barrier is complete in place.
- 25 percent will be paid at removal or acceptance.

Payment will be made under:

<table>

755.3.06 Quality Acceptance
General Provisions 101 through 150.

755.3.07 Contractor Warranty and Maintenance
General Provisions 101 through 150.

755.4 Measurement
This work is not measured separately for payment.
Section 755 — Electrical Work

755.4.01 Limits
General Provisions 101 through 150.

755.5 Payment
This work will not be paid for separately.

755.5.01 Adjustments
General Provisions 101 through 150.
Section 756—Drilled Wells

756.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 757 — Well Pumps

757.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 758—Travel Trailer Sanitary Disposal Station

758.1 General Description
Specifications for this work will be included elsewhere in the Contract.
759.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 760 — Welcome Station Building

760.1 General Description
Specifications for this work will be included elsewhere in the Contract.
761.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 762 — Truck Weighing Station Building

762.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 763—Bus Pavilion

763.1 General Description
Specifications for this work will be included elsewhere in the Contract.
765.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 766—Irrigation System

766.1 General Description
Specifications for this work will be included elsewhere in the Contract.
767.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 768 — Truck Weigh Station Traffic Control Signs

768.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 770—Truck Weigh Station Height Checking Device

770.1 General Description
Specifications for this work will be included elsewhere in the Contract.
772.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 774—Mobile Operations Office

774.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 776—Check Point Shelter

776.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 777—Truck Weigh Station Communications System

777.1 General Description
Specifications for this work will be included elsewhere in the Contract.
778.1 General Description
Specifications for this work will be included elsewhere in the Contract.
791.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 792—Display and Interior Furnishings

792.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 795—Vehicle Maintenance Building

795.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 796—Sewage Pumping Station

796.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 797—Buildings

797.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 798—Building Equipment

798.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 800 — Coarse Aggregate

Section 800—Coarse Aggregate

800.1 General Description
This section includes requirements for coarse aggregate. All aggregate shall be the specified type, class, and grade, and shall meet the requirements for the intended use.

800.2 Materials

800.2.01 Coarse Aggregate
A. Requirements
The Contractor shall use the type, group, class, and grade of coarse aggregate specified. For coarse aggregate sources, see QPL 2.

1. Coarse Aggregate Types

<table>
<thead>
<tr>
<th>Type</th>
<th>Characteristics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Crushed stone</td>
<td>Sound, durable rock particles.</td>
</tr>
<tr>
<td>Gravel</td>
<td>Sound, durable rock without damaging coatings.</td>
</tr>
</tbody>
</table>
| Air-cooled blast furnace slag | Sound, durable particles with uniform density and quality, or other slags that have a good service record.  
     | Dry slag shall weigh at least 70 lb./ft.³ (1120 kg/m³) compacted and shall contain less than 30% glassy particles by weight. Do not use slag as aggregate for Portland cement concrete. |
| Synthetic aggregate       | Sound, durable, expanded clay, shale, or other manufactured product.             |
Section 800 — Coarse Aggregate

2. Coarse Aggregate Groups
   a. **Group I**: Limestone, dolomite, marble, or any combination thereof. Ensure Group I aggregates meet the abrasion requirement for Class A stone when used in Portland cement concrete of any type or class.
   b. **Group II**: Slag, gravel, granitic and gneissic rocks, quartzite, synthetic aggregate, or any combination thereof.

3. Classes
   Aggregates are classified by physical properties that determine how they are used.
   a. Do not blend aggregates that meet abrasion requirements with aggregates that do not meet requirements from different sources as listed on the Qualified Products List.
   b. “Class A” and “Class B” aggregate used in Portland cement concrete, asphaltic concrete, and bituminous surface treatment shall meet these limits:

<table>
<thead>
<tr>
<th>Percent Wear AASHTO T 96 (“B” Grading)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class A</td>
</tr>
<tr>
<td>Group I Aggregates</td>
</tr>
<tr>
<td>Group II Aggregates</td>
</tr>
</tbody>
</table>

   c. “Class B” aggregates used in all applications other than Portland cement concrete, asphaltic concrete, or bituminous surface treatment shall meet these limits:

<table>
<thead>
<tr>
<th>Percent Wear AASHTO T 96 (“B” Grading)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Class B</td>
</tr>
<tr>
<td>Group I Aggregates</td>
</tr>
<tr>
<td>Group II Aggregates</td>
</tr>
</tbody>
</table>

4. Soundness
   Test coarse aggregate used in Portland cement concrete, bituminous surfaces, bituminous bases, aggregate bases, or surface treatment with five alternations of the magnesium sulfate soundness test.
   a. Use aggregate with a weight loss of less than 15 percent.
   b. The 15 percent soundness loss for a Class “CS” concrete is waived if it has a 5-year service record.
   c. If the material meets all the requirements except for the 15 percent soundness requirement, the material may be used in Zones 3 and 4 (see Subsection 424.3.05, Construction Requirements) under the following conditions:
      1) The aggregate in bituminous courses and in all types and classes of Portland cement concrete construction, except as stated in Group I, has a satisfactory five-year service record under similar service and exposure.
      2) The Engineer’s investigation shows that it equals or exceeds the quality of approved aggregate (in cases where the material’s uniformity changes at the source or does not have a five-year service record).

5. Grades
   Use coarse aggregate that is well graded within the limits and sizes specified in Table 800.1.
6. Detrimental Substances

   a. Detrimental substances include shale, weathered or decomposed rock, friable particles, or any substance that may be detrimental for the use intended.

   b. Do not use any aggregate that can cause a deleterious reaction.

   c. Do not use aggregates that contain Chrysotile (defined as fibrous serpentine) as a temporary or permanent unbound surfacing for roads, nor as stabilizer for soil used as subgrade, base, or surface course.

   d. Detrimental substances shall not exceed the following limits:

      1) For Portland Cement Concrete:

      | Substance                                                                 | Max % Allowed |
      |---------------------------------------------------------------------------|--------------|
      | Mica schist—Materials defined in ASTM C 294 as phyllite or schist. Use GDT 104 to analyze these materials. | 5            |
      | Materials that pass the No. 200 (75 µm) sieve.                             | 1.5          |
      | Flat and elongated pieces (with lengths more than five times the average thickness). | 10           |
      | Sulphur content computed as sulfide sulphur (for bridge-type structures)—If the sulphur content exceeds 0.01%, do not use the aggregate unless it passes a petrographic analysis and a weathering test equivalent to 6 months or more of exposure. | 0.01         |
      | Other local detrimental substances. (Any Combination)                      | 2.0          |

      NOTE: Do not use aggregate in Portland Cement concrete that is capable of producing a deleterious reaction when combined with Portland Cement.

      2) For Asphaltic Concrete:

      | Substance                                                                 | Max. % Allowed |
      |---------------------------------------------------------------------------|--------------|
      | Mica schist—Materials defined in ASTM C 294 as phyllite or schist. Use GDT 104 to analyze these materials. (Use this requirement for Interstate Construction, SMA mixes, OGFC mixes and all surface mixes on roadways ≥ 25,000 ADT). | 10           |
      | Flat or elongated particles (with lengths more than five times the average thickness). | 10           |
      | Glassy particles (slag).                                                  | 30           |
      | Other local detrimental substances. (Any combination)                     | 2.0          |
3) For Bituminous Surface Treatment:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Max. % Allowed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mica schist—Materials defined in ASTM C 294 as phyllite or schist. Use GDT 104 to analyze these materials.</td>
<td>10</td>
</tr>
<tr>
<td>Material finer than No. 200 (75 µm) sieve.</td>
<td></td>
</tr>
<tr>
<td>#5 Stone</td>
<td>0.5</td>
</tr>
<tr>
<td>#6 Stone</td>
<td>0.7</td>
</tr>
<tr>
<td>#7 Stone</td>
<td>0.7</td>
</tr>
<tr>
<td>#89 Stone</td>
<td>1.0</td>
</tr>
<tr>
<td>Flat and elongated particles (with lengths more than five times the average thickness).</td>
<td>10</td>
</tr>
<tr>
<td>Glassy particles (slag).</td>
<td>30</td>
</tr>
<tr>
<td>Other local detrimental substances. (Any combination)</td>
<td>2</td>
</tr>
</tbody>
</table>

7. Ensure that gravel used in Asphaltic Concrete and Bituminous Surface Treatment meets the following additional requirements:
   - Consists of siliceous particles.
   - A minimum of 85 percent, by count, of the material retained on the No. 4 (4.75 mm) sieve has one or more fractured faces.
   - The fracture is for the approximate average diameter or thickness of the particle.

8. Ensure that No. 7 stone used in Bituminous Surface Treatment meets the following gradation:

<table>
<thead>
<tr>
<th>Fraction</th>
<th>% Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>¾ in. (19 mm)</td>
<td>100</td>
</tr>
<tr>
<td>½ in. (12.5 mm)</td>

QPL 1
SOP 1

801.2 Materials
801.2.01 Fine Aggregate for Cushion
A. Requirements
   Use the type, class, and grade of fine aggregate specified.
   1. Types
      Use fine aggregate for cushion under granite curb or brick that is natural or manufactured sand with hard, strong, durable particles. Make manufactured sand from crushed gravel or stone meeting the requirements of Section 800. For a list of fine aggregate sources, see QPL 1.
Section 801 — Fine Aggregate

2. Grades
Use fine aggregate for cushion with less than 10 percent total silt and clay. Grade as follows:

<table>
<thead>
<tr>
<th>Size</th>
<th>Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing No. 4 (4.75 mm)</td>
<td>100</td>
</tr>
<tr>
<td>Passing No. 16 (1.18 mm)</td>
<td>25-75</td>
</tr>
<tr>
<td>Passing No. 100 (150 µm)</td>
<td>0-25</td>
</tr>
</tbody>
</table>

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
Test as follows:
  • Sieve analysis—AASHTO T 27

D. Materials Warranty
General Provisions 101 through 150.

801.2.02 Fine Aggregate for Portland Cement Concrete of All Types and for Mortar
A. Requirements

1. Concrete and Mortar
   Use fine aggregate for concrete and mortar that consists of natural sand, manufactured sand, or blends of natural and manufactured sands, having hard, clean, strong, durable, uncoated particles, meeting the requirements of the Specifications.

2. Manufactured Sand
   Use manufactured sand made exclusively from crushed stone or gravel that meets Section 800 requirements. Manufactured sand used in concrete for construction of Portland cement concrete pavement, approach slabs, and bridge decks, shall be made from Group II aggregates as specified in Subsection 800.2.01.A.2.

3. Miscellaneous Concrete
   Sand manufactured from synthetic aggregate meeting the requirements of Section 800 may be blended with natural sands or manufactured sands made from crushed stone or gravel for use in miscellaneous concrete as described in Section 441.
   Blend at least 50 percent natural sand or manufactured sand made from crushed stone or gravel.

4. Concrete Sand
   Concrete sand that passes the No. 10 (2 mm) sieve shall have these characteristics:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Durability index</td>
<td>70 or greater</td>
</tr>
<tr>
<td>Sand equivalent</td>
<td>70 or greater</td>
</tr>
</tbody>
</table>
Section 801 — Fine Aggregate

5. Detrimental Substances
   Keep detrimental substances within these limits:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Maximum Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clay lumps</td>
<td>0.5 maximum in total sample</td>
</tr>
<tr>
<td>Coal and lignite</td>
<td>0.5 maximum in total sample</td>
</tr>
<tr>
<td>All detrimental substances (any combination)</td>
<td>2.0 maximum in total sample</td>
</tr>
</tbody>
</table>

NOTE: Do not use fine aggregate in Portland cement concrete that is capable of producing a deleterious reaction with Portland cement

   a. Provided the material passing the No. 16 (1.18 mm) sieve is petrographically determined to be essentially free of detrimental substances, test results for coal and lignite and other detrimental substances listed will be based upon a petrographic analysis of material retained on the No. 16 (1.18 mm) sieve.
   b. Calculations will be based upon the weighted average for the total sample.
   c. Other detrimental substances include constituents such as shale, weathered or decomposed rock, soft or friable particles, coated grains, or other substances that might be considered detrimental for the use intended.

6. Organic Impurities (natural sands only)
   Ensure all fine aggregate is free from detrimental amounts of organic impurities.
   Do not use materials that have colorimetric test (AASHTO T 21) results darker than the Reference Standard color plate.

7. Grades
   Grade fine aggregates for Portland cement concrete and mortar as follows:

<table>
<thead>
<tr>
<th>Size No.</th>
<th>Description</th>
<th>Total Percent by Weight Passing Each Sieve</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>3/8 in. (9.5 mm)</td>
</tr>
<tr>
<td>10 NS</td>
<td>Natural concrete sand</td>
<td>100</td>
</tr>
<tr>
<td>20 NS</td>
<td>Natural mortar sand</td>
<td>100</td>
</tr>
<tr>
<td>10 SM</td>
<td>Standard manufactured concrete sand</td>
<td>100</td>
</tr>
<tr>
<td>10 FM</td>
<td>Fine manufactured concrete sand</td>
<td>100</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.
### C. Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Petrographic analysis</td>
<td>ASTM C 295</td>
</tr>
<tr>
<td>Material that passes a No. 200 (75 µm) sieve</td>
<td>AASHTO T 11</td>
</tr>
<tr>
<td>Organic impurities</td>
<td>AASHTO T 21</td>
</tr>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Sand equivalent</td>
<td>GDT 63</td>
</tr>
<tr>
<td>Reactivity</td>
<td>AASHTO T 303</td>
</tr>
<tr>
<td>Durability index</td>
<td>GDT 75</td>
</tr>
<tr>
<td>Clay lumps</td>
<td>AASHTO T 112</td>
</tr>
<tr>
<td>Friable Particles</td>
<td>GDT 132</td>
</tr>
</tbody>
</table>

NOTE: The percent passing the No. 200 sieve (75 µm) for size 10FM will be based upon the total percent determined by AASHTO T-11 and AASHTO T-27. The percent passing the No. 200 sieve (75 µm) for sizes 10NS, 20NS and 10SM will be as determined by AASHTO T-11 only.

### D. Materials Warranty

General Provisions 101 through 150.
Section 802—Aggregates for Asphaltic Concrete

802.1 General Description
This section includes the requirements for fine and coarse aggregates used in asphaltic concrete.

802.1.01 Definitions
Fine Aggregate: All aggregate passing a No. 8 (2.36 mm) sieve
Coarse Aggregate: All aggregate retained on a No. 8 (2.36 mm) sieve

802.1.02 Related References
A. Standard Specifications
   Section 800—Coarse Aggregate
   Section 828—Hot Mix Asphaltic Concrete Mixtures
B. Referenced Documents
   AASHTO T 27
   AASHTO T 96
   ASTM C 295
   GDT 63
   SOP 1

802.2 Materials

802.2.01 Fine Aggregate for Asphaltic Concrete
A. Requirements
   Use the appropriate type, group, class, and grade of fine aggregate.
   1. Types
      Use fine aggregate made of sharp, strong, angular material meeting the required performance characteristics when combined into a mixture.
      a. Ensure that the aggregate meets the following requirements:
         • Does not contain any deleterious substances.
         • Natural sand is free of organic matter, roots, or twigs.
         • Aggregate is manufactured from Class A or B crushed stone, gravel, or synthetic aggregate that meets the requirements of Section 800.
         • A combination of natural and manufactured sands meeting the requirements in Subsection 802.2.01.A.3 and Subsection 802.2.01.A.4 after being combined.
      b. Do not use crushed alluvial gravel as virgin aggregate in any mixture.
Section 802 — Aggregates for Asphaltic Concrete

2. Groups
   Fine aggregate groups include:
   a. Group I—Limestone, dolomite, marble, or combination thereof
   b. Group II—Gravel, granitic and gneissic rocks, quartzite, natural sand, or a combination thereof

3. Sand Equivalent
   Use these sand equivalent values:

<table>
<thead>
<tr>
<th>Material</th>
<th>Sand Equivalent Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group I</td>
<td>At least 28</td>
</tr>
<tr>
<td>Group II</td>
<td>At least 40</td>
</tr>
<tr>
<td>Natural sand</td>
<td>At least 25</td>
</tr>
<tr>
<td>Blended sand*</td>
<td>Natural sand at least 20; combined blend at least 25</td>
</tr>
</tbody>
</table>

*Blended natural sands or natural sand blended with stone screenings that meet the Group I or Group II sand equivalent limits.

4. Mica
   a. Use fine aggregate with no more than 35 percent free mica in asphaltic concrete surface mixes.
   b. When approved by the Engineer, use fine aggregate with more than 35 percent mica if blended with natural sand or sand manufactured from Group II aggregates. Ensure the blend has no more than 35 percent free mica and meets all other requirements of this Section, Section 800 and Section 828.

5. Aggregate for Stone Matrix Asphalt
   Manufactured screenings will be considered as fine aggregate and shall contain no more than 20 percent by weight coarser than a No. 4 (4.75 mm) sieve.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test the fine aggregate as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregate gradation</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Sand equivalent</td>
<td>GDT 63</td>
</tr>
<tr>
<td>Mica content</td>
<td>ASTM C 295</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
Section 802 — Aggregates for Asphaltic Concrete

802.2.02 Coarse Aggregate for Asphaltic Concrete

A. Requirements

1. Types
   Ensure coarse aggregate meets the following requirements:
   • Class A or B crushed stone, gravel, or synthetic aggregate as in Subsection 800.2.
   • Have uniform quality throughout without any deleterious substances.
   • Meet the required performance characteristics when combined into a mixture.

   NOTE: Do not use alluvial gravel as virgin aggregate.

2. Groups
   Coarse aggregate shall be one of either group below as specified in the composition Table in Subsection 828.2.A.2:
   • Group I—Limestone, dolomite, marble, or combination thereof
   • Group II—Gravel, granite and gneissic rocks, quartzite, or combination thereof

3. Aggregate for Stone Matrix Asphalt
   Use coarse aggregate that meets requirements of this Section and Section 800 except as follows:
   • Use Class A aggregate only with percent wear of each individual size not to exceed 45 percent based on the B grading of AASHTO T 96
   • Use aggregate that meets Section 828.2.02 (Stone Matrix Asphalt Mixtures)
   • Do not blend aggregates meeting abrasion requirements with aggregates not meeting abrasion requirements

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coarse Aggregate</td>
<td>Subsection 800.2.01.C</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
Section 803—Stabilizer Aggregate

803.1 General Description
This section includes the requirements for stabilizer aggregate, Types I through III, and Type IV stabilizer sand.

803.1.01 Related References
A. Standard Specifications
   Section 800—Coarse Aggregate
B. Referenced Documents
   AASHTO T 27
   AASHTO T 96
   GDT 63
   SOP 1

803.2 Materials
803.2.01 Type I Stabilizer
A. Requirements
   Use the appropriate type, class, and grade of stabilizer aggregate.
   Use material of uniform quality that meets the requirements of Section 800, Class A or B aggregate, and SOP 1.
   Crushed concrete may be used provided it meets the requirements of Section 800 that are applicable to Group 2 aggregates. Ensure the material meets the following gradation:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-1/2 in. (37.5 mm)</td>
<td>100</td>
</tr>
<tr>
<td>1 in. (25 mm)</td>
<td>80-100</td>
</tr>
<tr>
<td>No. 8 (2.36 mm)</td>
<td>0-5</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Use the following test:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
Section 803 — Stabilizer Aggregate

803.2.02 Type II Stabilizer Aggregate

A. Requirements
Use material that meets the requirements of Section 800, Class A or B aggregate, and SOP 1. Crushed concrete may be used provided it meets the requirements of Section 800 that are applicable to Group 2 aggregates.
The aggregate shall:
- Not contain overburden soil or disintegrated rock
- Have a sand equivalent value of at least 20 for material passing the No. 10 (2 mm) sieve
- Meet these gradation requirements:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 in. (50 mm)</td>
<td>100</td>
</tr>
<tr>
<td>1-1/2 in. (37.5 mm)</td>
<td>95-100</td>
</tr>
<tr>
<td>No. 10 (2 mm)</td>
<td>15-45</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>0-12</td>
</tr>
</tbody>
</table>

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
Test type II stabilizer as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Sand equivalent</td>
<td>GDT 63</td>
</tr>
</tbody>
</table>

D. Materials Warranty
General Provisions 101 through 150.

803.2.03 Type III Stabilizer Aggregate

A. Requirements
Use material that meets the requirements of Section 800, Class A or B aggregate, and SOP 1. Crushed concrete may be used provided it meets the requirements of Section 800 that are applicable to Group 2 aggregates.

Ensure the stabilizer aggregate does not contain soil or decomposed rock and that the Sand Equivalent value of the material passing the No. 10 sieve is not less than 20.
The aggregate shall meet these gradation requirements:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 in. (150 mm)</td>
<td>100</td>
</tr>
<tr>
<td>2 in. (50 mm)</td>
<td>25-75</td>
</tr>
<tr>
<td>No. 10 (2 mm)</td>
<td>15-35</td>
</tr>
</tbody>
</table>
Section 803 — Stabilizer Aggregate

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
Test Type III stabilizer as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Percent wear</td>
<td>AASHTO T 96</td>
</tr>
</tbody>
</table>

D. Materials Warranty
General Provisions 101 through 150.

803.2.04 Type IV Stabilizer Sand

A. Requirements
Make Type IV stabilizer sand from either natural sand, manufactured sand, or any combination of natural and manufactured sands.

1. If using manufactured sand, make the sand from Class A or B crushed stone, gravel, slag, or synthetic aggregate that meets Section 800 requirements and conforms to SOP 1.

2. Type IV stabilizer sand shall have a sand equivalent of at least 35 for material passing the No. 10 (2 mm) sieve and shall also meet these gradation requirements.

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 10 (2 mm)</td>
<td>60-100</td>
</tr>
<tr>
<td>No. 60 (250 µm)</td>
<td>5-40</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>0-20</td>
</tr>
</tbody>
</table>

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
Test Type IV stabilizer as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Sand equivalent</td>

</tr>
</tbody>
</table>

D. Materials Warranty
General Provisions 101 through 150.
Section 804—Abrasives for Blast Cleaning

804.1 General Description
This section includes the requirements for abrasives used in blast cleaning.

804.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   TCLP-EPA SWD 846-1311
   AASHTO T 27 Aggregate Gradation
   QPL 68

804.2 Materials
804.2.01 Abrasives
A. Requirements
   1. Types
      a. Make the abrasives of low dusting mineral with a minimum of 10 percent by weight G–80 steel grit added and blended homogeneously throughout the abrasive.
      b. Use a mineral abrasive listed on QPL 68.
      c. If you propose to use an alternative abrasive mixture, submit it to the Office of Materials and Research for approval before use.
   2. Detrimental Substances
      Use abrasives that contain less than 100 ppm of any corrosive compound such as sulfate, chloride, or any EPA characteristic compound such as lead, chromium, or arsenic that can be detected by the EPA Toxicity Characteristic Leaching Procedure (TCLP).
   3. Grades
      Ensure that the mineral abrasive used to blend with steel grit meets the grade for the sizes in the following table (Size A fits coal and copper slag; Size B fits staurolite abrasive)

<table>
<thead>
<tr>
<th>Size</th>
<th>No. 16 (1.18 mm)</th>
<th>No. 20 (850 µm)</th>
<th>No. 30 (600 µm)</th>
<th>No. 40 (425 µm)</th>
<th>No. 50 (300 µm)</th>
<th>No. 60 (250 µm)</th>
<th>No. 100 (150 µm)</th>
<th>PAN</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>0-10</td>
<td>5-35</td>
<td>25-50</td>
<td>20-45</td>
<td>5-35</td>
<td>0-10</td>
<td>0-10</td>
<td></td>
</tr>
<tr>
<td>B</td>
<td>0-2</td>
<td>0-2</td>

<td>0-5</td>
<td>5-25</td>
<td>5-25</td>
<td>30-60</td>
<td>0-20</td>
</tr>
</tbody>
</table>
Section 804 — Abrasives for Blast Cleaning

4. Packaging
   a. Furnish abrasives for blasting in moisture-proof and mildew-resistant bags.
   b. Plainly show the size designation, requisition number, and purchase order number on the bags or on tags firmly affixed to each bag.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will take representative samples of the material sent to the Department, and test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aggregate gradation</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Toxicity Characteristic Leaching Procedure (TCLP)</td>

Section 805—Riprap and Curbing Stone

805.1 General Description
This section includes the requirements for riprap and curbing stone. Construction and material will be covered under the Special Provisions.

805.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO T 96
   AASHTO T 104
   ASTM C 295
   ASTM D 5519

805.2 Materials
805.2.01 Riprap
A. Requirements
   1. Aggregate Quality
      All riprap stone shall be made of sound, durable rock pieces that meet these requirements:

<table>
<thead>
<tr>
<th>Aggregate Quality</th>
<th>Maximum Percent</th>
</tr>
</thead>
<tbody>
<tr>
<td>Abrasion loss “B” grading</td>
<td>65</td>
</tr>
<tr>
<td>Soundness loss</td>
<td>15</td>
</tr>
<tr>
<td>Flat and slabby pieces (length five times more than the average thickness)</td>
<td>5</td>
</tr>
<tr>
<td>Weathered and/or decomposed pieces and shale</td>
<td>5</td>
</tr>
</tbody>
</table>

   2. Gradation for Stone-Dumped riprap Type 1 and Type 3:

<table>
<thead>
<tr>
<th>Severe Drainage Conditions or Moderate Wave Action (Type 1)*</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Size By Volume</td>
<td>Approx. Weight</td>
</tr>
<tr>
<td>4.2 ft.³ (0.12 m³)</td>
<td>700 lbs. (320 kg)</td>
</tr>
<tr>
<td>1.8 ft.³ (0.05 m³)</td>
<td>300 lbs. (135 kg)</td>
</tr>
<tr>
<td>0.8 ft.³ (0.02 m³)</td>
<td>125 lbs. (55 kg)</td>
</tr>
</tbody>
</table>

*Between 0% and 15% of the Type 1 riprap shall pass a 4 in. (100 mm) square opening sieve.
### General Use Normal Drainage Conditions (Type 3)*

<table>
<thead>
<tr>
<th>Size By Volume</th>
<th>Approx. Weight</th>
<th>Percent Smaller Than</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.0 ft.³ (0.03 m³)</td>
<td>165 lbs. (75 kg)</td>
<td>100%</td>
</tr>
<tr>
<td>0.1 ft.³ (0.003 m³)</td>
<td>15 lbs. (7 kg)</td>
<td>10% - 65%</td>
</tr>
</tbody>
</table>

*Between 0% and 15% of the Type 3 rip rap shall pass a 2 in (50 mm) square opening sieve.

### 3. Stone for Plain Riprap

The stones shall be clean and free of rock dust and fines.

- **a.** Process the stone so that the largest pieces have a volume of 2 ft.³ (0.06 m³) or less.
- **b.** Ten percent or less of the total riprap weight can consist of spalls that pass a 5 in. (125 mm) sieve.

### 4. Stone Plain Riprap for Stream Details

Stone Plain Riprap for Stream Details shall be clean and essentially free of rock dust and fines. Stone shall be relatively flat on either side in the same dimension, preferably the long dimension. The material shall be processed such that 90 percent of the particles within the size class shall have all dimensions within the ranges stated in the size classifications listed below:

#### TYPE A:

Stone in this size class shall meet the following gradation requirements:

<table>
<thead>
<tr>
<th>Size</th>
<th>Percent by weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 12 in. Sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing 4 in. Sieve</td>
<td>0-25</td>
</tr>
<tr>
<td>Passing No.4 Sieve (4.75 mm)</td>
<td>0-10</td>
</tr>
</tbody>
</table>

**Test:** Method of Test shall be in accordance with the following:

<table>
<thead>
<tr>
<th>Sieve Analysis</th>
<th>AASHTO: T 27</th>
</tr>
</thead>
<tbody>
<tr>
<td>For use as fill for upstream fill portions of Cross Vanes, Rock Vanes, J-Hook Vanes, and in other structures and areas as indicated on the plans and details, as directed and approved by the Engineer.</td>
<td></td>
</tr>
</tbody>
</table>

#### TYPE B:

Generally, 2-4 cubic feet and weighing 0.16-0.33 tons. Maximum weight for this size class can be 0.52 ton. The dimensions of these stones shall be 2 ft. x 1 ft. x 1 ft. to 2 ft. x 2 ft. x 1 ft. Variability is allowed, however, with 1 ft. being the smallest dimension and 2.5 ft. being the largest dimension along any axis to be accepted within this size class. For use in Root Wad structures, Rock Vanes, Cross Vanes, J-Hook Vanes, and in other in-stream structures as indicated on the plans and details, as directed and approved by the Engineer.

#### TYPE C:

Generally, 4-8 cubic feet and weighing 0.33-0.66 tons. Maximum weight for this size class can be 1 ton. The dimensions of these stones shall be 2 ft. x 2 ft. x 1 ft. to 2 ft. x 2 ft. x 2 ft. Variability is allowed, however, with 1 foot being the smallest dimension and 2.5 feet being the largest dimension along any axis to be accepted within this size class. For use in Root Wad structures, Rock Vanes, Cross Vanes, J-Hook Vanes, and in other in-stream structures as indicated on the plans and details, as directed and approved by the Engineer.
**TYPE D:** Generally, 12-18 cubic feet and weighing 1.0-1.5 Tons. Weight range can vary between 1 ton up to 2 tons. The dimensions of these stones shall be 3 ft. x 2 ft. x 2 ft. to 3 ft. x 3 ft. x 2 ft. Variability is allowed, however, with the smallest dimension being 2 ft and 3.5 ft. being the largest dimension along any axis to be accepted within this size class. For use in in-stream structures such as Cross Vanes, J-Hook Vanes, Rock Vanes and in other structures and areas as indicated on the plans and details, as directed and approved by the Engineer.

**TYPE E:** Generally, 24-72 cubic feet and weighing 2.0-6.0 tons. Weight range can vary between 2 tons up to and exceeding 6 tons with approval by the Engineer. The dimensions of this size class shall be to 6 ft. x 4 ft. x 3 ft. However, variability is allowed in that dimensions for this size class shall fall between the smaller 4 ft. x 3 ft. x 2 ft. and a maximum as determined by the Engineer. For use in large in-stream structures such as Cross Vanes, J-Hook Vanes, Rock Vanes, Step Pools, and in other structures and in areas indicated on the plans and details, as directed and approved by the Engineer.

**B. Fabrication**
General Provisions 101 through 150.

**C. Acceptance**
Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percent wear</td>
<td>AASHTO T 96</td>
</tr>
<tr>
<td>Petrographic analysis</td>
<td>ASTM C 295</td>
</tr>
<tr>
<td>Riprap size</td>
<td>ASTM D5519-07</td>
</tr>
<tr>
<td>Soundness (magnesium sulfate)</td>
<td>AASHTO T 104</td>
</tr>
</tbody>
</table>

**D. Materials Warranty**
General Provisions 101 through 150.

**805.2.02 Curbing Stone**

**A. Requirements**

1. **Type A:**
   - Provide Type A curb that meets these requirements:
     a. Curb thickness and height as shown on the plans
     b. Cut in lengths of not less than 5 ft. (1.5 m) nor more than 10 ft. (3 m)
     c. Tops dressed to an even, smooth surface for the full length
     d. Have straight, even edges
     e. Top sloped ¼ in. (6 mm) from back to front
     f. Have squared ends to permit joints to be constructed not more than ½ in (13 mm) wide for the full depth of the curb.
     g. Backface hand dressed at least 4 in. (100 mm) below that part of the back that will be exposed
     h. Front face hand dressed to a depth of 1 in. (25 mm) below the indicated elevation of the base course, pavement or gutter
     i. Have ends of circular curb sections cut along radial lines to permit joints to be constructed not more than ½ in. (13 mm) wide
j. Circular curb conforms accurately to the required radius
k. Dressed surfaces do not contain projections or depressions more than 3/8 in. (10 mm) from the plane surface of the curb

2. Type B:
   Provide Type B curb that meets these requirements:
   a. Dimensions shall be 5 in. (125 mm) thick, 17 in. (425 mm) deep, and 5 ft. (1.5 m) long, unless otherwise specified.
   b. Front face to have a top margin draught with a smooth face 10 in. (250 mm) deep
   c. Have a smooth face (Note: A quarry face may be considered a smooth face if free from holes and all bumps exceeding allowed tolerances are pointed level
   d. Tops of curbs present even, smooth faces for the full length
   e. Have squared joints that when abutted with adjacent sections, present no crack or joint exceeding ½ in. (13 mm) in width
   f. Have ends of circular curb sections cut along radial lines to permit joints to be constructed not more than ½ in. (13 mm) wide
   g. Circular curb conforms accurately to the required radius
   h. The allowable tolerances for Type B Curb dimensions are as follows:

<table>
<thead>
<tr>
<th>Measurement Item</th>
<th>Dimension &amp; Tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thickness</td>
<td>5 ¼ in. (131 mm) +/- ¼ in. (6 mm)</td>
</tr>
<tr>
<td>Depth</td>
<td>17 in. (425 mm) +/- 1 in. (25 mm)</td>
</tr>
<tr>
<td>Top Surface</td>
<td>¼ in. (6 mm) in 5 ft. (1.5 m)</td>
</tr>
<tr>
<td>Side Surface</td>
<td>½ in. (13 mm) in 5 ft. (1.5 m)</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test for Percent Wear according to AASHTO T 96

D. Materials Warranty
   General Provisions 101 through 150.

   GRI—GG5

809.1.03 Submittals
Supply certification from the manufacturer showing the physical properties of the material used and conformance with the specifications according to Subsection 106.05 of the specifications.

Provide evidence from the manufacturer that the geogrid has been used successfully in installations with similar environmental and project conditions.

Obtain prior approval from the Office of Materials and Research for all materials before use on construction.
Submit product specifications and test results to the Engineer for review and approval at least 45 days prior to intended use.

Do not begin placement of geogrid until the test results have been reviewed and approved by the Engineer.

### 809.2 Materials

**A. Requirements**

Use geogrid that is free of defects, punctures or flaws.

1. Geogrid for Reinforced Slopes

   Use geogrid materials for reinforced slope construction that consist of the following:
   - Either a biaxial or uniaxial grid of polymer tensile elements manufactured into a regular network with apertures of sufficient size to allow for soil interlock.
   - A commercially prepared material of high tenacity polyester, high density polyethylene (HDPE) or polypropylene that is formed by stretching, heat welding, chemical welding, knitting, weaving or combinations of these methods.

   Adhere to the following additional requirements:

   **Long Term Design Strengths**
   1) Use geogrid that meets the minimum long-term design strengths (TLT) in the machine direction as indicated on the plans.
   2) Provide to the Engineer, in writing, the ultimate tensile strength of the grid (TULT) to verify the calculation in obtaining the long-term design loads (TLT).

      These strengths are required for the Project and are determined based on the AASHTO Task Force 27 guidelines, which incorporates reduction factors to the ultimate strength of the geogrid for creep, site damage and durability.

      3) Calculate the long-term design strength using the following formula:

      \[
      TLT = \frac{TULT \times CRC}{FC \times FD}
      \]

      Where:
      - **TLT** = Long-term design load—lb/ft (kg/m)
      - **TULT** = Geogrid ultimate tensile strength—lb./ft. (kg/m)
      - **CRC** = Creep reduction coefficient
      - **FC** = Factor of safety to account for construction damage
      - **FD** = Factor of safety to account for product durability

   a. Determine TULT

      Determine the TULT based on wide strip tensile testing as noted in Subsection 809.2.02.

   b. Determine Reduction Factors

      Determine the reduction factors by the methods described in paragraphs a - e as follows:

      1) Creep

         a) Provide evidence from the manufacturer that the geogrid has been tested in laboratory creep tests according to the following criteria:

            - Conducted for a minimum duration of 10,000 hours
            - Tests were made for a range of load levels, including loads that the geogrid will be subjected to on the project.

         b) Ensure these tests are conducted as specified in Subsection 809.2.02.

         c) Extrapolate the results extrapolated to a minimum design life of 75 years.
Section 809 — Geogrid Materials

d) Determine the tension level at which the total strain of the geogrid is not expected to exceed 10% within the design life of 75 years (designated Tw).

e) Calculate the creep reduction factor as follows:

\[
CRC = \frac{Tw}{TULT}
\]

In the absence of test data, use the following creep reduction factors for different polymers:

<table>
<thead>
<tr>
<th>Polymer Type</th>
<th>Creep Reduction Coefficient</th>
</tr>
</thead>
<tbody>
<tr>
<td>Polyester</td>

</tbody>
</table>

2) Construction Damage

a) Provide evidence from the manufacturer that the geogrid has been subjected to full scale construction damage tests using fill materials and construction procedures which are representative of those on the project.

b) Excavate and test the grid according to Subsection 809.2.02.

c) Calculate the construction damage factor of safety using the following formula:

\[
FC = \frac{TULT}{TC}
\]

Where:
- \( FC \) = The construction damage factor
- \( TC \) = The ultimate strength of the excavated grid that has been subjected to construction damage tests.
- \( TULT \) = Geogrid ultimate tensile strength—lb/ft (kg/m)

d) If construction damage tests have been made, but with fills or construction procedures other than those represented on the Project, use a minimum value of FC of 1.25. Use a lower value of FC only if substantiated with damage tests using fills and construction procedures specific to the project.

e) In the absence of any construction damage tests, use a FC value of 3.0.

3) Product Durability

a) Provide evidence from the manufacturer that the geogrid has been subjected to a series of durability tests to examine the effects of chemical and biological exposure on the grid, as described in the AASHTO Task Force 27 report.

b) Include the following in the durability studies:

- Effect on short-term and long-term mechanical properties.
- Changes to the following:
  - Reinforcement microstructure
  - Dimensions
  - Mass
  - Oxidation
  - Environmental stress cracking
  - Hydrolysis
Section 809 — Geogrid Materials

- Temperature
- Plasticization
- Surface microbiology
- Variations in the infrared spectrum analysis.

- A full investigation into the synergetic effects of different environments, particularly temperature. Subject the reinforcement to a working stress during the environmental test.

c) Ensure that geogrid used in the Work has been subjected to the environmental conditioning as outlined by the following, as a minimum:
   - U.S. Environmental Protection Agency, Method 9090 – Chemical Compatibility.
   - Association of Textile Chemists and Colorists, Method 30 – Soil Burial.
   - American Association of Textile Chemists and Colorists, Method 100 – Preparation of Bacterial Broth.

d) Investigate the full range of soil environments to which the reinforcements may be potentially exposed and shall include as a minimum:
   - pH in the range of 2, 4, 8, 12 – ASTM-D-2165
   - Diesel oil – ASTM-D-975
   - Fungi and Bacteria
   - UV exposure 500 hrs. – ASTM-D-4355
   - Solvents and agents that are site specific.

In the performance of this testing the conditioning temperature is laboratory standard plus 1.5 times laboratory standard for the pH environments.

When no conditioning time period is given, use 30 days. Extrapolate results from short-term tests to the required design life of 75 years.

After the geogrid is subjected to these conditions, test the geogrid according to Subsection 809.2.02, and calculate the durability factor of safety by the following formula:

\[
FD = \frac{TULT}{TD}
\]

Where: TD= The ultimate strength of the geogrid subjected to product durability tests.

The minimum allowable value of FD is 1.10. In the absence of any geogrid durability tests, use a Durability Factor (FD) of 2.0.

4) Pullout Resistance:
   a) Provide evidence from the manufacturer that the geogrid has been subjected to full-scale pullout tests using backfill materials representative of those on the Project, as described in the AASHTO Task Force 27 report.
   b) Base pullout resistance for design on a maximum of elongation of the embedded geogrid of ¾ in. (19 mm) as measured at the leading edge of the compressive zone within the soil mass and not the ultimate pullout capacity.
   c) Where insufficient data exists to evaluate the pullout resistance of geogrid as a function of soil type, conduct pullout tests on a project specific basis until the engineering behavior of the soil-reinforcement system is clearly defined.
   d) Perform pullout using vertical stress variations (Sv) and reinforcement element configurations simulating actual project conditions.
e) Perform pullout tests according to Subsection 809.2.02 on samples with a minimum embedded length of 2 ft. (600 mm). Perform the tests on samples with a minimum width of 1 ft. (300 mm), or a width equal to a 4 longitudinal grid element, whichever is greater. Conduct the tests at 70 °F ±4 °F (21°C ± 2 °C) at constant strain rates of 0.02 in. (0.5mm) per minute.

Evaluate the pullout resistance by the following relation:

\[ T_p = (2 \tan P) \times S_v \times L_s \times f_d \]

Where:

- \( T_p \) = Ultimate pullout capacity of tensile reinforcement—lb./ft. (kg/m)
- \( S_v \) = Vertical stress—lb./ft.² (kg/m²)
- \( L_s \) = Total length of geogrid beyond failure plane—ft. (m)
- \( P \) = Internal angle of friction of select backfill
- \( f_d \) = Equivalent coefficient of direct sliding derived from pullout tests

The equivalent coefficient of direct sliding, \( f_d \), may be related to the open area of the grid. In the absence of product specific data tested with site-specific granular backfill, estimate it from the following preliminary analysis:

<table>
<thead>
<tr>
<th>% Open Area of Grid</th>
<th>Direct Sliding</th>
</tr>
</thead>
<tbody>
<tr>
<td>80% more</td>
<td>0.5</td>
</tr>
<tr>
<td>51 to 79</td>
<td>0.7</td>
</tr>
<tr>
<td>50 or less</td>
<td>0.6</td>
</tr>
</tbody>
</table>

Ensure the pullout resistance, \( T_p \), meets the following minimum strength requirement:

\[ T_p = FPO \times TLT \text{ with a displacement less than or equal to } \frac{3}{4} \text{ in. (19 mm)} \]

Where:

- \( FPO \) = Factor of safety against pullout, equal to 1.5
- \( TLT \) = Long-term design load—lb./ft. (kg/m)
Section 809 — Geogrid Materials

5) Junction Strength:
   a) Ensure that the summation of the shear strength of the joints occurring in a 12 in. (300 mm) length of the grid sample is greater than the ultimate tensile strength of the element to which they are attached.
   b) If this condition is not met, reduce the allowable reinforcement tension, Tw, by the ratio of the shear strengths to the ultimate strength.
   c) Determine the ultimate tensile strength according to Subsection 809.2.02 and translate it into an ultimate strength per element by dividing the number of elements per foot (meter) of width.
   d) Measure the junction strength according to Subsection 809.2.02.

2. MSE Wall Backfill Stabilizing Geogrid

Use geogrid materials for MSE wall construction that meets the following requirements:
- Is a biaxial grid of polymer tensile elements manufactured into a regular network with apertures of sufficient size to allow for soil interlock.
- Is a commercially prepared material of copolymerized high density polyethylene (HDPE) that is formed by stretching, heat welding, chemical welding, or combinations of these methods.
- Has the following physical properties:

<table>

810.2 Materials

810.2.01 Roadway Materials
A. Requirements
Do not use materials containing logs, stumps, sod, weeds, or other perishable matter.

1. Classes
The materials are divided into six major classes. Classes I, II, and III are further subdivided and identified by description and physical property requirements specified in the table below and in Table 1. Classes IV, V, and VI are identified by descriptive requirements.

<table>
<thead>
<tr>
<th>Class I</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IA1 and IA2</td>
<td>Medium- to well-graded sand or clayey sand.</td>
</tr>
<tr>
<td>IA3</td>
<td>Fine-grained, silty, or clayey sand; usually less dense than IA1 or IA2.</td>
</tr>
<tr>
<td></td>
<td>These soils have an excellent bearing capacity.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Class II</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IIB1, IIB2, and IIB3</td>
<td>Medium- to well-graded sandy clays, sandy silts, and clays with some mica. These soils generally have low volume change properties and good densities that serve well as subgrade material.</td>
</tr>
<tr>
<td>IIB4</td>
<td>Similar to IIB1, IIB2, and IIB3, but generally contain more mica and are more sensitive to moisture. The bearing value of these soils is less predictable. The soils may or may not be satisfactory for subgrade material. Analyze file data or run laboratory and/or field tests for Class IIB4 when considering it for a subgrade material.</td>
</tr>
</tbody>
</table>
Section 810 — Roadway Materials

Class III

IIIC1, IIIC2, IIIC3 and IIIC4

Medium- to fine-graded micaceous sandy silts, micaceous clayey silts, chert clays, and shaly clays. Undesirable characteristics are high volume change properties and/or low densities. The bearing values are unpredictable. The Department recommends testing these materials in a laboratory, where possible, before use. One exception is District 6, where chert clay soils are prevalent.

Chert clay soils (IIIC4) with less than 55% passing the No. 10 (2 mm) sieve may be considered suitable for subgrade materials. These soils are found generally in the northwest corner of the state in Dade, Walker, Catoosa, Whitfield, Murray, Chattooga, Gordon, and Floyd counties.

Class IV

Highly organic soils or peat, muck, and other unsatisfactory soils generally found in marshy or swampy areas.

Class V

Shaly materials that are not only finely laminated but have detrimental weathering properties and tend to disintegrate.

Class VI

Rock or boulders that cannot be readily incorporated into the embankment by layer construction, and that contain insufficient material to fill the interstices when they are placed.

Table 1: Physical Properties (Material Passing No. 10 (2.00 mm) Sieve)

<table>

811.2 Materials
811.2.01 Rock Embankment Material
A. Requirements
   1. Use unweathered quarry-run stones, smaller than 4 ft. (1.2 m), in any dimension as rock embankment material.
   2. Include all other quarry stone sizes in the embankment. Limit rock fines to a maximum of 25 percent passing a 2 in. (50 mm) sieve and 10 percent passing a No. 4 (4.75 mm) sieve.
   3. Ensure that the material contains 5 percent or less shaly or flaky particles and meets abrasion requirements for a Class A or B coarse aggregate.
   4. Ensure that the material has 15 percent or less loss in the magnesium sulfate soundness test.
   5. Use the material only when approved by a petrographic rock analysis.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>

</tr>
</tbody>
</table>

D. Materials Warranty
General Provisions 101 through 150.

812.2.02 Foundation Backfill, Type II

A. Requirements
1. Type
   Use material meeting the requirements of Section 800, Class A or B aggregate, and SOP 1. Crushed concrete may be used provided it meets the requirements of Section 800 that are applicable to Group 2 Aggregates.
   Do not use backfill aggregate containing soil or decomposed rock.
2. Gradation
   Use material meeting the following gradation requirements:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>1-1/2 in. (37.5 mm)</td>
<td>100</td>
</tr>
<tr>
<td>1 in. (25 mm)</td>
<td>80-100</td>
</tr>
<tr>
<td>No. 8 (2.36 mm)</td>
<td>0-5</td>
</tr>
</tbody>
</table>

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sieve analysis</td>
<td>AASHTO T 27</td>
</tr>
</tbody>
</table>

D. Materials Warranty
General Provisions 101 through 150.

812.2.03 Imperfect Trench Backfill, Type III

A. Requirements
1. Type
   Use material made from either of the following for Type III backfill:
   - A natural soil with a density of less than 95 lb./ft.³ (1520 kg/m³) when tested with GDT 7
   - An artificial mixture of soil and organic material, such as hay, leaves, or straw
Section 812 — Backfill Materials

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The laboratory will:
   1. Test the soil density with GDT 7.
   2. Review the mixture and the percentages of each material and approve a mixture suitable for the project.

D. Materials Warranty
   General Provisions 101 through 150.

812.2.04 Mechanically Stabilized Embankment Backfill

A. Requirements
   Use material comprised of crushed stone, natural sand, or a blend of crushed stone and natural sand free of soils, organic or any other deleterious substances meeting the following additional requirements:

   1. Crushed Stone
      Use a material manufactured from Class A or B stone that is free of soil overburden, has a soundness loss of not more than 15 percent, and conforms to the requirements of SOP 1.

   2. Natural Sand
      May be used in conjunction with an approved, non-corrodible, extensible reinforcement. Use non-plastic material consisting of strong, hard, durable particles having a durability index of at least 70. Use Natural Sand from an approved source on Qualified Products List – 1 or from a source approved by the Office of Materials and Testing. Requirements for approval will be provided by the Geotechnical Bureau.

   3. Gradation

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>% Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>4 in. (100 mm)</td>
<td>100</td>
</tr>
<tr>
<td>2 in. (50 mm)</td>
<td>80 -100</td>
</tr>
<tr>
<td>No. 10 (2 mm)</td>
<td>20 - 90*</td>
</tr>
<tr>
<td>No 200 (75 µm)</td>
<td>0 - 15</td>
</tr>
</tbody>
</table>

* Natural Sand may be 20 - 100
4. Chemical

Ensure the material meets the following chemical requirements:

<table>
<thead>
<tr>
<th>Test Method</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>pH</td>
<td>*5.0 – 9.5</td>
</tr>
<tr>
<td>Resistivity</td>
<td>&gt;3000 ohms/cm</td>
</tr>
<tr>
<td>Chlorides</td>
<td>&lt;100 ppm</td>
</tr>
<tr>
<td>Sulfates</td>
<td>&lt;200 ppm</td>
</tr>
</tbody>
</table>

Note: These chemical requirements are not applicable to MSE walls stabilized with an approved, non-corrodible, extensible reinforcement.

*Sources of select backfill material having a pH between 4.5 and 5.0 may be used provided the interior face of the MSE wall panels have 3 inches of concrete cover over the reinforcement and the concrete used in the panels contains the following ingredients and proportions:

<table>
<thead>
<tr>
<th>Material</th>
<th>% by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Minimum</td>
</tr>
<tr>
<td>Cement</td>
<td>30</td>

<tr>
<td>Type F Fly Ash</td>
<td>10</td>
</tr>
<tr>
<td>Slag</td>
<td>50</td>
</tr>
<tr>
<td>Type F Fly Ash and Slag</td>
<td>--</td>
</tr>
</tbody>
</table>

5. Maximum Dry Density

Use backfill material with a maximum dry density equal to or greater than the design unit weight shown on the plans.

B. Fabrication

General Provisions 101 through 150.
C. Acceptance

Test the material as follows:

<table>
<thead>
<tr>
<th>Test Method</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percent Wear</td>
<td>AASHTO T96 (&quot;A” Grading)</td>
</tr>
<tr>

814.2 Materials
814.2.01 Topsoil or Sand-Clay
A. Requirements
   1. Use topsoil or sand-clay that is a natural or artificial mixture of clay or soil binder with sand or other aggregate.
      • Do not use a mixture that contains substances detrimental to the material.
      • Obtain the materials from sources approved by the Engineer.
      • Ensure that the aggregate retained on No. 10 (2 mm) sieve (coarse aggregate) is of hard, durable particles.
   2. Sand and Binder
      Use hard, sharp, durable, siliceous particles. Use binder made from quality clay.
   3. Oversize
      Remove particles with diameters greater than 2 in. (50 mm) before depositing the topsoil or sand-clay on the road. Remove particles with screens or grizzlies, or by hand if few oversized pieces exist. You may crush the oversized pieces and use them.
4. Topsoil
   Use a topsoil that is a natural, generally pebbly material occurring in shallow surface deposits on usually elevated areas.

5. Natural Sand-Clay
   Use a natural sand-clay that is a mixture of natural material, largely sand and clay in proper proportions, occurring in deposits of considerable depth.

6. Artificial Sand-Clay
   Use an artificial sand-clay that is largely a mixture of artificial sand and clay. You may make the mixture by combining clay or soil binder and sand or aggregate in the proper proportions.

7. Topsoil and Sand-Clay
   Use topsoil and sand-clay with the following properties:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 2 in. (50 mm)</td>
<td>100% by weight</td>
</tr>
<tr>
<td>Passing 1-1/2 in. (37.5 mm)</td>
<td>80-100% by weight</td>
</tr>
<tr>
<td>Passing No. 40 (425 µm)</td>
<td>Liquid Limit (LL) of 25 or less</td>
</tr>
<tr>
<td></td>
<td>Plasticity Index (Pl) of 9 or less</td>
</tr>
</tbody>
</table>

8. Ensure that material passing the No. 10 (2 mm) sieve meets the following requirements:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing No. 10 (2 mm) sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing No. 60 (250 µm) sieve</td>
<td>15-85</td>
</tr>
<tr>
<td>Passing No. 200 (75 µm) sieve</td>
<td>9-35</td>
</tr>
<tr>
<td>Clay</td>
<td>9-25</td>
</tr>
<tr>
<td>Volume change, max. percent</td>
<td>12</td>
</tr>
<tr>
<td>Maximum density, lb./ft.³ (kg/m³)</td>
<td>110+ (1760+)</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department or Producer will test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil gradation</td>
<td>GDT 4</td>
</tr>
<tr>
<td>Volume change</td>
<td>GDT 6</td>
</tr>
<tr>
<td>Maximum density</td>
<td>GDT 7 or GDT 67</td>
</tr>
<tr>
<td>Liquid Limit</td>
<td>AASHTO T 89</td>
</tr>
<tr>
<td>Plastic Limit and Plasticity Index</td>
<td>AASHTO T 90</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
814.2.02 Soil-Cement Material

A. Requirements
   1. Ensure that the material for soil-cement base will:
      a. Meet the requirements of Subsection 810.2.01 for Classes IA1, IA2, IA3, or IIB1 with the following modifications:

<table>
<thead>
<tr>
<th>Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Clay content</td>
<td>5 to 25%</td>
</tr>
<tr>
<td>Volume change</td>
<td>18% maximum</td>
</tr>
<tr>
<td>Liquid Limit</td>
<td>25% maximum</td>
</tr>
<tr>
<td>Plasticity Index</td>
<td>10% maximum</td>
</tr>
<tr>
<td>Maximum dry density</td>
<td>95 lb./ft.³ (1520 kg/m³) minimum</td>
</tr>
<tr>
<td>Sulfates</td>
<td>4000 ppm maximum</td>
</tr>
<tr>
<td>pH</td>
<td>4.0 minimum</td>
</tr>
</tbody>
</table>

   b. Be friable and not contain large amounts of heavy or plastic clay lumps, organic material, roots, or other substances that would interfere with how the Portland cement sets, plant production, or the finished surface of the base and meet the requirements of Subsection 301.3.05.A.2, Pulverization or Subsection 301.3.05.B.1, Soil.

   c. Produce a laboratory unconfined compressive strength of at least 450 psi (3.1 MPa). To make the sample, mix in a minimum of 5% to a maximum of 9 percent Type I Portland cement, moist-cure for 7 days, and test with GDT 65.

   2. Analyze the soil-cement design and create a Job Mix Formula for each Project where soil-cement base or subbase is specified. Have the Job Mix Formula approved by the Engineer before starting base or subbase construction.

   3. You may use fly ash or slag that meets the requirements of Subsection 831.2.03 as admixtures for poorly reacting soils when the blend of soil and fly ash, or slag, meets the design requirements in this Subsection.

   4. Ensure that subgrade material used underneath the soil-cement base meets the sulfate and pH requirements of this subsection (See Subsection 209.3.05.A.7).

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil gradation</td>
<td>GDT 4</td>
</tr>
<tr>
<td>Volume Change</td>
<td>GDT 6</td>
</tr>
<tr>
<td>Maximum density</td>
<td>GDT 7 or GDT 67</td>
</tr>
<tr>
<td>Soil-Cement Design</td>
<td>GDT 65</td>
</tr>
<tr>
<td>pH</td>
<td>GDT 98</td>
</tr>
<tr>
<td>Sulfates</td>
<td>ASTM D 516</td>
</tr>
</tbody>
</table>

#### D. Materials Warranty

General Provisions 101 through 150.

**814.2.03 Sand for Bituminous Stabilization**

#### A. Requirements

1. Submit the bituminous stabilization sand materials to the laboratory in advance. If the laboratory approves the material, use it in constructing the sand-bituminous base course.

2. Use hard, durable particles without organic impurities such as roots or trash that may prevent the bituminous material from bonding with the individual particles.

3. Grade the material as follows:

<table>
<thead>
<tr>
<th>Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 1 in. (25 mm) sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing No. 10 (2.00 mm) sieve</td>
<td>80-100</td>
</tr>
<tr>
<td>Passing No. 200 (75 µm) sieve</td>
<td>0-25</td>
</tr>
<tr>
<td>Clay</td>
<td>0-16</td>
</tr>
</tbody>
</table>

#### B. Fabrication

General Provisions 101 through 150.

#### C. Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil gradation</td>
<td>GDT 4</td>
</tr>
</tbody>
</table>

#### D. Materials Warranty

General Provisions 101 through 150.

**814.2.04 Chert**

#### A. Requirements

Use materials that are natural mixtures of binder and chert rock with the following characteristics:

- Ensure that the aggregate retained on the No. 10 (2 mm) sieve (coarse aggregate) is a hard, durable chert rock meeting requirement for Class A or B coarse aggregate (see Subsection 800.2.01). Use aggregate sizes in the final mix that can be properly placed, compacted, and finished.

- Ensure that the portion of material passing the No. 10 (2 mm) sieve is sand and clay or another satisfactory bonding material.
Gradation

Grade the material as follows:

<table>
<thead>
<tr>
<th>Size</th>
<th>Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 1-1/2 in (37.5 mm) sieve</td>
<td>80-100</td>
</tr>
<tr>
<td>Passing No. 10 (2 mm) sieve</td>
<td>30-60</td>
</tr>
<tr>
<td>Material Passing No. 10 (2 mm) Sieve</td>
<td></td>
</tr>
<tr>
<td>Passing No. 10 (2 mm) sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing No. 60 (250 µm) sieve</td>
<td>20-85</td>
</tr>
<tr>
<td>Passing No. 200 (75 µm) sieve (silt less clay)</td>
<td>5-25</td>
</tr>
<tr>
<td>Clay</td>
<td>15-50</td>
</tr>
</tbody>
</table>

Ensure that the material passing the No. 40 (425 µm) sieve has a Liquid Limit (LL) of 35 or less and a Plasticity Index (PI) of 10 or less.

Stockpiles

In all cases, stockpile the end product so that the material will be blended before any of it is loaded and delivered to the job.

a. Make a stockpile big enough to uniformly blend the workable strata in the pit.

b. The Engineer will determine the minimum volume of the stockpile. The Engineer will also be the sole authority as to the quality and workability of the various strata occurring in the pit.

c. Maintain the minimum volume of the stockpile until the suitable material in the pit has all been stockpiled or until the material remaining in the stockpile is enough to complete the operation, as governed by haul limitations.

Equipment for Delivery

Use equipment that will mix the material again while the material is being loaded for delivery.

Fabrication

General Provisions 101 through 150.

Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil gradation</td>
<td>GDT 4</td>
</tr>
<tr>
<td>Liquid Limit</td>
<td>AASHTO T 89</td>
</tr>
<tr>
<td>Plastic Limit and Plastic Index</td>
<td>AASHTO T 90</td>
</tr>
</tbody>
</table>

Materials Warranty

General Provisions 101 through 150.
Section 815 — Graded Aggregate

815.1 General Description

This section includes the requirements for material to be used for base, subbase, or shoulder course material, and includes graded aggregate, unconsolidated limerock base, and recycled concrete base.

815.1.01 Related References

A. Standard Specifications
   Section 800—Coarse Aggregate

B. Referenced Documents

   - EPA Transmission Electron Microscopy Method

815.2 Materials

815.2.01 Graded Aggregate

A. Requirements
   1. Type
      Use graded aggregate base, subbase, or shoulder course material of uniform quality.
      a. Obtain the graded aggregate from an approved source or deposit that will yield a satisfactory mixture meeting all requirements of this specification.
      b. Use material that is crushed or processed as a part of the mining operations, or, mix two grades of material so that when combined in the central mix plant, the mixture meets the specifications.
      c. May use material that is a blend of not more than 20 percent (max) recycled crushed concrete from known sources (see 815.2.03.A.1.a) and virgin aggregate if approved by the Office of Materials and Testing.
   2. Retained on the No. 10 (2 mm) sieve
      Ensure the material retained on the No. 10 (2 mm) sieve is Class A or B aggregate that meets the requirements of Section 800.
Section 815 — Graded Aggregate

3. Passing the No. 10 (2 mm) sieve
   Ensure material passing the No. 10 (2 mm) sieve is relatively free of detrimental substances, such as soil overburden, decomposed rock, and/or swelling silts.

4. Stabilized Mixtures
   Ensure mixtures to be stabilized react satisfactorily when mixed with Portland cement. The Engineer will specify the percentage of Portland cement to use.

5. Gradation
   Grade the graded aggregate base, subbase, or shoulder material as follows:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing By Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Group I Aggregates</strong></td>
<td></td>
</tr>
<tr>
<td>2 in. (50 mm)</td>
<td>100</td>
</tr>
<tr>
<td>1-1/2 in. (37.5 mm)</td>
<td>95-100</td>
</tr>
<tr>
<td>3/4 in. (19.0 mm)</td>
<td>60-95</td>
</tr>
<tr>
<td>No. 10 (2 mm)</td>
<td>25-50 (Note 1, 2 and 3)</td>
</tr>
<tr>
<td>No. 60 (250 µm)</td>
<td>10-35</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>7-15</td>
</tr>
</tbody>
</table>

| **Group II Aggregates** |                         |
| 2 in. (50 mm)           | 100                      |
| 1-1/2 in. (37.5 mm)     | 95-100                   |
| 3/4 in. (19 mm)         | 60-90                    |
| No. 10 (2 mm)           | 25-45 (Note 2 and 4)     |
| No. 60 (250 µm)         | 5-30                     |
| No. 200 (75 µm)         | 4-11                     |

NOTE 1: Group I aggregates having less than 37% passing the No. 10 (2 mm) sieve, shall have at least 9 percent passing the No. 200 (75 µm) sieve.

NOTE 2: For graded aggregate stabilized with Portland Cement, 30-50 percent by weight shall pass the No. 10 (2 mm) sieve. All other requirements remain the same.

NOTE 3: Material passing the No. 10 (2 mm) sieve shall have a sand equivalent of at least 20 for Group I aggregates.

NOTE 4: Material passing the No. 10 (2 mm) sieve shall have a sand equivalent of at least 28 for Group II aggregates. Sand Equivalent values as low as 20 will be acceptable provided they are attributed exclusively to rock flour and the percent passing the No. 10 (2 mm) sieve does not exceed 40.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:
815 — Graded Aggregate

### Test and Method

<table>

<td>GDT 63</td>
</tr>
</tbody>
</table>

### D. Materials Warranty

General Provisions 101 through 150.

#### 815.2.02 Unconsolidated Limerock Base

#### A. Requirements

1. **Type**
   - Use limerock base, subbase, or shoulder course material of uniform quality.
   - To ensure uniform quality, the Department may restrict approved sources to specific mining areas, mining processes at a specific mining site, or both.
   - Use a limerock base that yields a mixture to meet these specifications.
   - Use material that is crushed or processed as a part of the mining operations, or mix two grades of material so that when combined in the central mix plant the mixture meets the specifications.
   - Use limerock base, subbase, or shoulder material that has the following characteristics:
     - **Limerock bearing ratio**: At least 100.
     - **Deleterious substances**: Do not allow chert or other extremely hard pieces that will not pass the 2 in. (50 mm) sieve. Do not allow clay, sand, organics, or other materials in quantities that may damage bonding, finishing, or strength. All material passing the No. 40 (425 µm) sieve shall be non-plastic.
     - **Carbonate content (magnesium or calcium)**: At least 80%.

2. **Gradation**
   - Grade the limerock base so at least 97 percent by weight passes the 3-1/2 in. (90 mm) sieve.
   - Grade the material uniformly to dust. The fine portion passing the No. 10 (2 mm) sieve shall all be dust of fracture.
   - Crush or break the limerock base, if necessary to meet size requirements before placing the material on the road.
   - Ensure materials having soundness losses of 20 percent or less, comply with the following gradation requirements:
**Section 815 — Graded Aggregate**

### GRADATION REQUIREMENTS

<table>
<thead>
<tr>

<tr>
<td>Total carbonates (insoluble residue)</td>
<td>ASTM D 3042</td>
</tr>
</tbody>
</table>

**D. Materials Warranty**

General Provisions 101 through 150.

**815.2.03 Recycled Concrete Base**

**A. Requirements**

1. **Sources**

   Use recycled concrete materials from sources approved by the Office of Materials and Testing and listed on Qualified Products List 2. The criteria for approval will be as outlined in Standard Operating Procedure No. 1, “Monitoring the Quality of Coarse and Fine Aggregates” except the raw material will be recyclable concrete as specified herein rather than a geological deposit of aggregate.

2. **Type**

   a. **Recycled Concrete Base from Known Sources**

      Use recycled concrete derived exclusively from Portland cement concrete pavement or structural concrete as a base, subbase, or shoulder course.
Section 815 — Graded Aggregate

b. Recycled Concrete Base from Unknown Sources
   Use recycled concrete derived from sources of demolition materials that comply with the following requirements as a base, subbase or shoulder course. Due to the condition and type of raw material used to produce this base and the resulting difficulty in producing a consistent product, refer to SOP-1 for environmental requirements and preferred production procedures.
   Ensure the finished product does not exceed the regulatory limit for asbestos of 1 percent (based on microscopy) and the regulatory limit for lead of 0.5 ppm. These determinations must be made prior to shipping.
   Ensure the California Bearing Ratio (CBR) of the finished product is not less than 140.

3. Gradation and Load-Bearing Capacity
   Ensure the finished product meets the quality and gradation requirements of Subsection 815.2.01 for Group II aggregates, except the material finer than a #200 (75µm) sieve shall be 2 – 11 percent.

   Ensure the California Bearing Ratio (CBR) of the finished product is not less than 140.

4. Contaminants
   Ensure the recycled concrete is substantially free of foreign materials such as steel reinforcement, wood, clay balls, soils, epoxy expansion material and non-construction materials.

   Note – Substantially free, in the context of this specification, shall mean concentrations of the above-mentioned foreign materials individually shall not exceed 0.1 percent by weight, nor shall the total concentration of these materials exceed 0.5 percent by weight.

   Ensure the finished product does not exceed the regulatory limit for asbestos of 1% (based on microscopy) and the regulatory limit for lead of 5 ppm.

   Keep the following ancillary materials within these limits:

<table>
<thead>
<tr>
<th>Substance</th>
<th>Maximum Percent by Weight</th>

816.2 Materials
816.2.01 Soil Aggregate
A. Requirements
   1. Type
      Use a soil aggregate base, subbase, or shoulder base course material that is of uniform quality.
   2. Material Retained on No. 10 (2 mm) sieve
      Ensure the material retained on the No. 10 (2 mm) sieve meets the requirements of Subsection 815.2.01.A.

   NOTE: You may substitute Group I graded aggregate base that meets the requirements of Subsection 815.2.01.A for soil aggregate base.
3. Gradation

Ensure the soil aggregate base, subbase, or shoulder material meets the following gradation:

<table>
<thead>
<tr>
<th>Size</th>
<th>Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 2 in. (50 mm) sieve</td>
<td>100</td>
</tr>
<tr>
<td>Passing 1-1/2 in. (37.5 mm) sieve</td>
<td>95-100</td>
</tr>
<tr>
<td>Passing 3/4 in. (19 mm) sieve</td>
<td>60-97</td>
</tr>
<tr>
<td>Passing No. 10 (2 mm) sieve</td>
<td>25-55</td>
</tr>
<tr>

   Unless otherwise shown on the plans or in the Special Provisions, use shoulder material that meets the requirements in Subsection 810.2.01.A.1 for Class I soil.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See Subsection 810.2.01.C.

D. Materials Warranty
   General Provisions 101 through 150.
Section 818—Crushed Aggregate Subbase

818.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 819 — Fiber Stabilizing Additives

819.1 General Description
This Section covers the general requirements for fiber stabilizing additives incorporated into asphaltic concrete mixtures. These fibers are used to stabilize the asphalt film surrounding aggregate particles to reduce drain-down of the asphalt cement, use cellulose or mineral fiber stabilizer listed on QPL 77, Fiber Stabilizing Additives.

819.1.01 Related References

A. Standard Specifications
General Provisions 101 through 150.

B. Referenced Documents
AASHTO T 245
ASTM D 128
ASTM C 612
GDT 127
GDT 130
QPL 77

819.2 Materials
Use an approved mineral or cellulose fiber stabilizing additive currently listed in QPL 77. Approved additives shall meet the requirements below. Dosage rates below are typical ranges. Use the dosage rate prescribed in the Job Mix Formula, as approved by the Office of Materials.

A. Requirements for all fiber types
1. Use a fiber stabilizer of the type and properties appropriate to the plant’s metering and delivery system.
2. When tested in a standard mixture according to GDT 127, the fiber stabilizing additive shall limit drain-down to not more than 0.2% of the weight of the mixture. For the purpose of evaluating these additives, the following test conditions apply.
   • The mixture tested shall consist of a standard No. 7 stone and 6.4% asphalt cement.
   • Mixing and compaction temperatures for the test shall be as prescribed in AASHTO T 245, Section 3.3.1.
   • Wet mixing time shall be 60 ± 2 seconds.
   • Un-separated fibers, determined by visual inspection of the mixture after the drain-down test, shall not exceed 5% of total fiber content.

B. Cellulose Fibers
Add cellulose fibers at a dosage rate between 0.2% and 0.4% by weight of the total mix, according to the approved Job Mix Formula. Fiber properties shall be as follows:
   • Ash Content by ASTM D 128: 23% maximum non-volatile content
   • pH: 7.0 to 12.0
   • Moisture Content: 5.0% maximum
C. Cellulose Pellets

Use cellulose fiber stabilizing additive in pellet form that meets the requirements of Subsection 819.2.A and Subsection 819.2.B. Use pellets that disperse sufficiently at mixing temperature to blend uniformly into the asphalt mixture. Use pellets that do not exceed 0.24 in. (6.0 mm) average pellet diameter. Pellets may contain binder ingredients such as asphalt cement, wax, or polymer. Do not use pellets if the binder ingredient exceeds 20.0% of the total weight of the pellets. Use binder that produces no measurable effect on the properties of the asphalt cement. Do not use fiber pellets which soften or clump together when stored at temperatures up to 122 °F (50 °C).

Add approved palletized fiber stabilizing additive at a dosage rate between 0.2% and 0.4% by weight of the total mix, according to the approved Job Mix Formula established by the Office of Materials.

NOTE: If the binder material constitutes more than 3% of the pellet weight, the dosage rate shall be based upon the net fiber content.

D. Mineral Fibers

Use mineral fibers made from virgin basalt, diabase, slag or other silicate rock. Add the fiber at a dosage rate prescribed in the approved Job Mix Formula, between 0.3% and 0.6% by weight of the total mix. Use approved mineral fiber from QPL 77, not exceeding 25 % shot content in accordance with ASTM C 612, as tested according to GDT 130:

E. Materials Warranty

General Provisions 101 through 150.
Section 820 — Asphalt Cement

820.1 General Description
This section includes the requirements for asphalt cements prepared from crude petroleum.

820.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   Standard Operating Procedure (SOP 4)

   AASHTO T 315
   AASHTO T 316
   AASHTO TP70 / ASTM D7405

820.2 Materials

820.2.01 Asphalt Cement
A. Requirements
   1. Type
      Use a material homogenous and water-free and will not foam when heated to 347 °F (175 °C).
      Ensure blend used to produce a specified performance grade meets the following requirements:
      • Is uniform and homogeneous without separation
      • Uses PG 64-22 or PG 67-22 described below for the base asphalt
      • Consists of production materials not being “air-blown”.
      • Contains < 0.5% acid (including Polyphosphoric Acid (PPA) modification, when approved by the Office of Materials.
   2. Grade
      Use the various grades of asphalt cement meeting the requirements shown in the test requirements for Petroleum Asphalt Cements.
      Add Styrene-Butadiene-Styrene (SBS) or Styrene-Butadiene (SB) to neat asphalt to produce a binder meeting requirements for PG 76-22 when roadway ADT is equal to or greater than 100,000 for Stone Matrix Asphalt and Porous European Mix (PEM) or Open Graded Friction Course (OGFC) Mixtures.
      Styrene Butadiene Rubber (SBS) or Crumb rubber modified PG 76-22 is an acceptable alternative to SBS or SB modified asphalt cement at contractor’s discretion, when roadway ADT is less than 100,000, provided the SBR or crumb rubber modified asphalt cement meets the tests’ requirements of PG 76-22. For SBR modified PG 64-22 or PG 67-22 to meet PG 76-22, use only SBR currently approved on QPL-65 “Georgia’s List of
Approved Latex Suppliers”. For crumb rubber modified PG 64-22 or PG 67-22 to meet PG 76-22, use 30 mesh size ambient or cryogenic ground tire rubber at minimum 10% of weight of total asphalt cement content. Ensure Trans-Polyoctenamer is added at 4.5% of the weight of the crumb rubber to achieve better particle distribution. Varying percentage blends of crumb rubber and approved additives may be used, at the discretion of the Office of Materials, provided the end product meets all specified requirements of PG76-22 including Phase Angle. Ensure the end product is homogenous and shows no separation or coagulation. Percentage of ambient or cryogenic ground tire rubber is neat asphalt source dependent to meet specification requirements for PG 76-22.

The maximum Phase Angle requirement is not applicable to the crumb rubber modified PG 76-22 incorporating ≥ 10% crumb rubber with approved additive equivalent to 4.5% of crumb rubber (see notes f, g, i and j).

**Notes:**

- **a.** The Department may waive this requirement if the supplier warrants the asphalt binder can be adequately pumped and mixed at temperatures meeting all applicable safety standards.
- **b.** Heat loss by AASHTO: T 179 may be accepted in lieu of mass loss by AASHTO: T 240.
- **c.** If the creep stiffness is below 300,000 kPa, the direct tension test is not required. If the creep stiffness is ≥300,000 kPa, report the Direct Tension Failure Strain value. Satisfy the m-value requirement in either case.
- **d.** Ensure the maximum Phase Angle measured by DSR is ≤75 degrees.
- **e.** The maximum Mass Loss shall be ≤1%, when used in conjunction with Bituminous Surface Treatment (Section 424).
- **f.** MSCR requirement is applicable to the SBR, Crumb Rubber & TOR (or other OMR approved additive) combination modified PG 76-22 asphalt cement. Additionally, ensure the materials meet all PG 76-22 requirements except for phase angle as detailed in sub-section 820.2.01.A.2.
- **g.** Ensure MSCR requirement for Average Percent Recovery at 3.2 kPa is ≥35% for laboratory or terminally blended PG 64-22 or PG 67-22 modified using SBR or GTR to meet PG 76-22 requirements.
- **h.** Polymer Separation Test is performed by the Department for SBR and crumb rubber modified PG 76-22.
- **i.** PG 64-22 or PG 67-22 modified to meet PG 76-22 using crumb rubber, via dry method, will be evaluated using complete analysis for compliance with PG 76-22 requirements prior to mixture production using laboratory blended materials. PG 64-22 or PG 67-22 modified to meet PG 76-22 using crumb rubber via dry method, will be evaluated for compliance with original DSR testing requirements for PG 76-22 during mixture production using abson recovery in accordance with GDT 119 in compliance with AC sampling frequencies established in GSP 21 sub-section A.9.
- **j.** PG 64-22 or PG 67-22 modified to meet PG 76-22 using crumb rubber, via the dry method, will be evaluated for MSCR (Jnr @ 3.2 kPa) requirements, in accordance with GDT 119, on AC samples obtained for project assurance at frequencies established in GSP 21 sub-section A.9.
Section 820 — Asphalt Cement

Thoroughly blend the composite materials at the supply facility prior to being loaded into the transport vehicle if modification is required in accordance with 820.2.01. Ensure all blending procedures, formulation, and operations are approved by the Office of Materials.

3. Certification:

Provide certified test results from an approved, certified laboratory of blends for proposed PG asphalt for each specification characteristic of the asphalt cement proposed for shipment. Provide the certified results to the State Materials Engineer as required in Standard Operating Procedure (SOP 4).

The State Materials Engineer may interrupt production until test results are known in the event there is reason to suspect a sample will be outside specification limits. Mixture placed incorporating modified binders determined to not meet specification requirements may be subject to removal at the recommendation of the State Materials Engineer.

B. Materials Warranty

General Provisions 101 through 150.

Section 824 — Cationic Asphalt Emulsion

**Note 1:** May be acceptable for limited use in conjunction with OMAT’s recommendation

**Note 2:** Slurry Seal containing CQS-1h must set sufficiently within 2 hours to allow traffic to resume.

**Note 3:** In the laboratory, Slurry Seal containing CQS-1h shall not set while being mixed according to GDT 91 for a minimum of 90 seconds.

**Note 4:** Failure to break within 30 minutes after application and/or other than minor tracking of the tack once it has broken may subject the non-tracking tack product to re-evaluation for QPL 7 “Georgia’s List of Approved Bituminous Materials”.

**Note 5:** The 24-hour storage stability test may be used. However, this test does not predict whether the 5-day settlement test will pass.

**Note 6:** Perform the demulsibility test within 30 days from date of manufacture.

**Note 7:** AASHTO T 59 modified to include a maximum temperature of 350 °F ± 10 °F to be held for 20 minutes.

**Note 8:** Use Residue by Evaporation for all testing on residue material. Residue by Distillation may be used if penetration, softening point and/or ductility test fail on residue by evaporation.

**Note 1:** May be acceptable for limited use in conjunction with OMAT’s recommendation

**Note 2:** Use ECR-1 in cold mix recycling of reclaimed pavements.

**Note 3:** The 24-hour storage stability test may be used. However, this test does not predict whether the 5-day settlement test will pass.

**Note 4:** Perform the demulsibility test within 30 days from date of manufacture.

**Note 5:** Use CMS-1P(R) as a Rejuvenation Seal diluted 1:1. Sample undiluted for testing at the manufacture site. Sample diluted for testing from distributor on project (Minimum Residue 29%).

**Note 6:** Use Residue by Evaporation for all testing on residue material. Residue by Distillation may be used if penetration, softening point and/or ductility test fail on residue by evaporation.

#### 824.2.02 Latex-Modified Cationic Asphalt Emulsion

**A. Requirements**

1. **Latex Rubber Additive (LRA)**
   - Ensure the LRA is a natural latex or an unvulcanized styrene-butadine rubber in an emulsified latex form.
   - Ensure that the LRA comes from an approved source listed in the Department's current QPL 65 for use in cationic asphalt emulsion.
Section 824 — Cationic Asphalt Emulsion

2. Latex-Modified Cationic Asphalt Emulsion
   a. Use PG58-22 as the base asphalt.
   b. Co-mill the LRA and asphalt cement while manufacturing the emulsified asphalt to produce a homogeneous mixture.
   c. Ensure the latex-modified cationic asphalt emulsion, when undisturbed for 24 hours, shows no separation of emulsion and LRA and no color striations, but has a uniform color throughout.
   d. Use a latex-modified cationic asphalt emulsion that meets the requirements in Table 4.

D. Materials Warranty

General Provisions 101 through 150.
Section 825—Asphalt Plank

825.1 General Description
This section includes the requirements for pre-molded asphalt plank.

825.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO M 46

825.2 Materials
825.2.01 Pre-molded Asphalt Plank
A. Requirements
   Use pre-molded asphalt plank that meets the AASHTO M 46 requirements.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   General Provisions 101 through 150.
D. Materials Warranty
   General Provisions 101 through 150.
Section 826—Damp proofing or Waterproofing Material

826.1 General Description
This section includes the requirements for material used as a mopping coat in damp proofing or as mopping cement for a waterproof membrane system.

826.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   AASHTO M 118
   AASHTO M 121

826.2 Materials

826.2.01 Bituminous Material for Damp proofing or Waterproofing
A. Requirements
   Use a bituminous material that contains a primer coat and a sealer or mopping coat.
   1. Primer
      Use a primer coat that meets the requirements of AASHTO M 121.
   2. Sealer or Mopping Coat
      Use a coal-tar pitch that meets the requirements of AASHTO M 118.
   3. Coal-Tar Pitch Types
      Unless otherwise specified, use pitch Type I or Type II, as defined below, only when required by the Contract.
      Use Type I on vertical surfaces and Type II on flat surfaces.
      a. Type I Pitch
         A mopping coat for built-up roofs surfaced with slag or gravel. If the roof has nails, use the coat on inclines not exceeding 3 in./ft. (75 mm/300 mm). If the roof does not have nails, use the coat on inclines not exceeding 1 in./ft. (25 mm/300 mm).
         A mopping coat for damp proofing or a plying cement for building a membrane system of waterproofing above ground level. Do not use this material if it will be exposed to temperatures over 125 °F (52 °C).
         NOTE: This type of coal-tar pitch is suitable on railroad bridges, tanks, retaining walls, culverts, dams, conduit, etc.
      b. Type II Pitch
         A mopping coat for damp proofing or a plying cement in building a membrane system of waterproofing below ground level. Use this material for roofs exposed to moderate temperatures during installation and service.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See the requirements in AASHTO M 118 and M 121.

D. Materials Warranty
   General Provisions 101 through 150.
827.1 General Description
This section includes the requirements for a single component pavement patching mastic material composed of a polymer modified asphalt binder and aggregate. The patching mastic will be used for sealing, filling and repairing distresses in both Asphaltic Concrete and Portland Concrete pavements and bridge deck surfaces that required more extensive repair than typical crack and joint sealing. This patching mastic material is not intended for use on distresses requiring plant produced asphaltic concrete mixture patching.

827.1.01 Related References
A. Standard Specifications
   Section 802 – Aggregates for Asphaltic Concrete
   Section 820–Asphalt Cement
B. Referenced Documents
   AASHTO T 30
   ASTM D 36
   ASTM D 5329 (Modified)

827.2 Materials
827.2.01 Requirements
Pavement Patching Mastic
A. Modified Asphalt Binder
   The modified asphalt binder must meet the requirements established in Table 1.
B. Aggregate
   The aggregate must be factory blended and meet the requirements established in Table 1.
C. Pavement Patching Mastic (Combined Materials)
   The Pavement Patching Mastic must meet the requirements established in Table 1 and provide a well bonded, flexible, durable and traffic resistant repair when properly applied. Ensure packaging consist of cardboard boxes weighing approximately 40 pounds. Boxes must contain a quick melting release film covering that enables easy removal of product from the cardboard box. When purchased by the pallet, the units must be protected from the weather using a plastic pallet cover, with a minimum two layers of six-month U.V. protected stretch wrap. Pallets must be labeled with product name, part number, lot number and net product weight.

</tr>
</tbody>
</table>

**Notes:**

1. The specimen for the tensile adhesion is 75 mm length x 50 mm width x 37.5 mm thickness.
2. The specimen is 150 mm length x 100 mm width x 20 mm thickness. The test is performed at 77 °F (25 °C) and the specimen is bent over a 25.4 mm mandrel to 180 degrees over 10 seconds.
3. The specimen for the flow test is 60 mm length x 40 mm width x 13 mm thickness. Allow the specimen to cool for 1 hour at room temperature before removing from the mold. Allow the specimen to cool overnight prior to seating on the base plate and starting the oven cycle. Seat the cooled specimen on the center of the base plate and mark a reference line around the specimen. Place the specimen in a 140 °F oven on a holding rack at a 75 ± 1-degree angle for 5 hours. Remove the specimen from the oven after 5 hours and measure any movement of the specimen below the reference line in millimeters.
D. Fabrication and Application

1. Ensure the pavement patching mastic component material is combined into a melter/applicator pot, heated, mixed and applied to the area requiring repair as recommended by the manufacturer. Ensure the material is heated no greater than 410 °F.

2. Ensure that the equipment produces and maintains a homogenous mixture of modified asphalt binder and aggregates at a uniform temperature without gradation related or temperature related segregation in the pavement patching mastic.

3. The material must provide a repair that can be opened to traffic once the pavement patching mastic has cooled and solidified.

E. Acceptance

At the request of the Department, pavement patching mastic material may be subject to project related testing for acceptance when field application and and/or actual in-place performance indicates the material does not meet its intended purpose.

F. Materials Warranty

General Provisions 101 through 150.

G. Payment

Pavement Patching Mastic is paid for at the Contract Unit Price per pound. Payment is full compensation for furnishing materials including polymer-modified bituminous materials and aggregate.

Section 828—Hot Mix Asphaltic Concrete Mixtures

828.1 General Description
This specification includes the requirements for hot mix asphaltic concrete mixtures, including:

- Open-graded surface mixtures (OGFC and PEM)
- Stone Matrix Asphalt mixtures (SMA)
- Superpave mixtures
- Fine-graded (4.75 mm) mixtures

828.1.01 Definitions
The Nominal Maximum Sieve Size is one standard sieve size larger than the first sieve to retain more than ten percent of the aggregate, per AASHTO R35. Mixture types in this section are identified according to Nominal Maximum Sieve Size.

828.1.02 Related References

Section 828 — Hot Mix Asphaltic Concrete Mixtures

828.2 Materials

A. Requirements

Use approved hot mix asphalt concrete mixtures that meet the following requirements:

1. Produce each asphalt mixture according to a Department approved Job Mix Formula and Asphalt Mix Design, see Subsection 400.1 for submittal and approval of Job Mix Formulas.

2. Ensure individual acceptance test results meet the Mixture Control Tolerances specified in the appropriate table below, Subsections 828.2.01 through 828.2.04.

3. Ensure the Engineer approves all materials used to prepare and place the mixtures before incorporating them into the Work. Use only the ingredients listed in the approved Asphalt Mix Design and Job Mix Formula. For virgin aggregates use sources meeting the requirements of Section 802 and are listed in QPL 1 or QPL 2; for mixes in which local sand is permitted, use the approved sand source identified in the mix design. For mixtures containing Reclaimed Asphalt Pavement (RAP), use only RAP from the approved stockpile identified in the mix design. Use asphalt cement meeting the requirements of Section 820, from a source listed in QPL 7.

4. Obtain approved SMA mix designs, Superpave mix designs and 4.75 mm mix designs from a mix design laboratory certified by the Department. Obtain approved mix designs for types PEM and OGFC mixtures from the Department's Office of Materials, which produces and furnishes these mix designs.

5. Ensure all SMA mix designs are designed in accordance with GDT-123 (“Determining the Design Proportions of Stone Matrix Asphalt Mixtures”). Ensure SMA mix designs are verified and approved by the Department prior to use. Ensure Superpave and 4.75 mm mix designs are designed in accordance with SOP-2 (“Control of Superpave Bituminous Mixture Designs”) and are approved by the Department as provided therein. Ensure these mixes are designed by a laboratory and technician certified in accordance with SOP-36, (“Certification of Laboratories and Personnel for Design of SMA and Superpave Asphalt Mixtures”).

6. Use only mixtures composed of the aggregate groups and blends indicated in the Proposal and Plans by their pay item designations, defined as follows:
TABLE 1 – AGGREGATE GROUPS

<table>
<thead>
<tr>
<th>Pay Item Designation</th>
<th>Allowable Aggregate Groups</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group I or II</td>
<td>Group I, Group II, or Blend I</td>
</tr>
<tr>
<td>Group II only</td>
<td>Group II only</td>
</tr>
<tr>
<td>Blend I</td>
<td>Either 100% Group II material or a blend of Group I and Group II. Do not use Group I material for more than 60%, by weight, of the total aggregate nor more than 50%, by weight, of the coarse aggregate fraction.</td>
</tr>
</tbody>
</table>

7. For patching or leveling use Group I, Group II, or Blend I. Mix types for patching and leveling are specified in Subsection 400.3.03.B.

8. Include lime (hydrated lime) from an approved source and meeting the requirements of Section 882 in all paving courses except as otherwise provided in the Contract. For a list of approved sources of lime, see QPL 41.
   a. Add lime to each mixture at the rate prescribed in the approved mix design.
   b. Ensure mix designs using only virgin aggregate include lime at a minimum rate of 1.00% of the total dry aggregate weight. Ensure mix designs using RAP include lime at a minimum rate equal to 1.00% of the virgin aggregate fraction plus 0.50% of the aggregate in the RAP fraction.
   c. Add more lime or add lime plus an approved Heat-Stable Anti-Stripping Additive meeting the requirements of Section 831, if necessary to meet requirements for mixture properties, and pursuant to an approved mix design. However, the Department will not make additional payment for these materials. For a list of sources of Heat-Stable Anti-Stripping Additives, see QPL 26.
   d. Where specifically allowed in the contract on LARP, airport, and parking lot projects, an approved Heat-Stable Anti-Stripping Additive meeting the requirements of Section 831 may be substituted for hydrated lime. Ensure the mix gradation is adjusted to replace the lime with an equivalent volume of fines passing the 0.075 mm sieve. Add Heat-Stable Anti-stripping Additive at a minimum rate of 0.5 percent of the asphalt cement portion.

9. Use performance grade PG 64-22 or PG 67-22 asphalt cement in all mix designs and mixtures except as follows:
   a. The State Materials Engineer will determine the performance grade to be used, based on Table 2 – Binders Selection Guideline for Reclaimed Asphalt Pavement (RAP) Mixtures, AASHTO M323 and laboratory testing results as required in Section 828.2.B for mixtures containing ≥ 25% equivalent binder replacement for RAP/RAS mixtures.
   b. Use only grade PG 76-22, excluding shoulder construction in the following mixes: all SMA, 12.5 mm PEM, 9.5 mm and 12.5 mm OGFC, 12.5 mm Superpave, on projects with two-way ADT greater than 25,000; and in all mixtures for which polymer-modified asphalt is specified in the pay item.

10. Use of local sand is restricted as follows:
   a. Do not place mixtures containing local sand on the traveled way of the mainline or ramps of the Interstate System. Mixtures with local sand may be used for shoulder construction on these facilities.
   b. Ensure local sand will not constitute more than 20 % of the total aggregate weight of any mix design or production mix.
   c. Subject to the above limits, 19 mm, 12.5 mm, and 9.5 mm Superpave mix designs and 4.75 mm mix designs containing local sand may be used on projects with a current ADT not exceeding 4,000 VPD providing that all performance testing meets specified requirements.
   d. 25 mm Superpave mix designs containing not more than 20 % local sand may be used on all facilities except the main line and ramps of the Interstate System.
   e. Obtain local sand for use in asphalt mixtures from a source approved by the Department.
f. Approval of local sand sources: The Department will sample, test, and approve sources of local sand. Ensure local sand contains no more than 7.0% clay by weight and is free of foreign substances, roots, twigs, and other organic matter. Ensure sand is free of clay lumps, as determined by AASHTO T 112, and has a sand equivalent value exceeding 25%, as determined by GDT 63.

B. Fabrication

1. Design procedures: For all Superpave and 4.75 mm mixes, ensure conformance with the Superpave System for Volumetric Design (AASHTO T 312 and AASHTO R30), as adapted in SOP-2. Ensure Superpave mixes are designed at a design gyration number \( N_{des} \) of 65 gyrations and initial gyration number \( N_{ini} \) of 6 gyrations. Ensure 4.75 mm mixes, \( N_{des} \) are designed at 50 gyrations, and \( N_{ini} \) at 6 gyrations. Open-graded mix designs will be designed by the Department in accordance with GDT 114. In all cases, the procedure for measuring Maximum Specific Gravity \( G_{mm} \) is AASHTO T 209. In addition to gradation and volumetric analysis, ensure mix designs include the following performance tests, as applicable.

2. Performance Test:
   a. Permeability test: Ensure Superpave and Stone Matrix mix designs include testing according to GDT -1 Measurement of Water Permeability of Compacted Asphalt Paving Mixtures. Ensure specimen air voids for this test are 6.0 ±1.0 %. The average permeability of three specimens may not exceed 3.60 ft per day \((125 \times 10^{-5} \text{cm per sec})\).
   b. Moisture susceptibility test: Fabricate and test specimens in accordance with GDT 66, when required by the Office of Materials and Testing due to visible signs of stripping in laboratory fabricated or plant produced asphaltic concrete mixtures, ensure specimen air voids for this test are 7.0 ±1.0% for all mixes excluding Stone Matrix mixes. Ensure specimen air voids for this test are 6.0 ± 1.0% for Stone Matrix mixes. The minimum tensile splitting ratio is 0.80, except a tensile splitting ratio of no less than 0.70 may be acceptable if all individual strength values exceed 100 psi (690 kPa). Ensure average splitting strength of the three conditioned and three controlled samples are not less than 60 psi (415 kPa) for either group. Ensure retention of coating as determined by GDT 56 is not less than 95%.
   c. Hamburg Wheel-Tracking Test for rutting and moisture susceptibility test: Ensure mix designs of all mix types except Open-graded Surface Mixes (OGFC and PEM), and Open-graded Crack Relief Interlayer (OGI) mix, include testing in accordance with AASHTO T 324. Ensure specimen air voids for this test are 7.0 ± 1.0% for all mix types and at a testing temperature of 50°C \((122°F)\). Use the testing and acceptance criteria established in Table 2.

<table>
<thead>
<tr>
<th>Binder Performance Grade (PG)</th>

</tr>
</tbody>
</table>

Tested specimens shall be inspected for any visible signs of stripping and any mix design’s tested specimens that fail to maintain 95% of asphalt cement coating, as described in GDT 56 section D.2.d, will be required to meet specified requirements for GDT 66 as detailed in 828.2.B.2.b.

d. Fatigue testing: The Department may verify dense-graded mix designs by fatigue testing according to AASHTO T 321 or other procedure approved by the Department.
Section 828 — Hot Mix Asphaltic Concrete Mixtures

C. Acceptance

See Subsection 106.03 and Section 400. Ensure individual test results meet the Mixture Control Tolerances listed in Subsections 828.2, 828.2.01, 828.2.02, 828.2.03, or 828.2.04, whichever applies with the following exception. Ensure field verification results for rutting susceptibility tests performed on laboratory fabricated and/or roadway cores obtained from asphalt plant produced mixtures meet specified requirements for AASHTO T 324 as detailed in Subsection 828.2.B.2.c. All GDOT approved mix designs are required to have full field mix design verifications, using plant produced mixture, sampled by the contractor and submitted to the applicable GDOT laboratory (Central or District) at a minimum of once per two years. Field mix design verification results that fail to comply with performance testing specified in Subsection 828.2.B will require a complete laboratory mix design verification, to be completed by the original mix designer, for continued use of that design. If a mix design has not been produced within two years, a full field mix design verification will be sampled by the contractor and submitted to the applicable GDOT laboratory (Central or District) on the first Lot produced thereafter. Any mix design that fails to meet performance test requirements established in Subsection 828.2.B, using laboratory fabricated specimens due to failing field mix design results, may subject that mix design to invalidation after the field mix design verification results are confirmed with a second field mix design verification. Field mix design verifications as specified in Section 402, Section 400, SOP 2 and GSP 21, are not precluded by the requirements specified herein.

D. Materials Warranty

See General Provisions 101 through 150.

828.2.01 Open-Graded Surface Mixtures

A. Requirements

Produce the mixture according to an approved mix design and Job Mix Formula. Ensure Open-Graded Surface Mixtures meet the following mixture control tolerances and mix design criteria:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Mixture Control Tolerance, %</th>
<th>Design Gradation Limits, % Passing</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Drain-down (AASHTO T305), %</td>
<td>&lt;0.3</td>
<td>&lt;0.3</td>
</tr>
</tbody>
</table>

* Mixture control tolerance is not applicable to this sieve for this mix.

1. In 12.5 mm and 9.5 mm OGFC and 12.5 mm PEM mixes, use only PG 76-22 asphalt cement (specified in Section 820).

2. Ensure all OGFC and PEM mixes include a stabilizing fiber of the type (cellulose or mineral) specified in the mix design and meeting the requirements of Section 819. Ensure the dosage rate is as specified in the mix design and sufficient to prevent drain-down exceeding the above tolerance.

B. Fabrication

See Section 400.
Section 828 — Hot Mix Asphaltic Concrete Mixtures

828.2.02 Stone Matrix Asphalt Mixtures

A. Requirements

Produce the mixture according to an approved mix design and Job Mix Formula. Ensure Stone Matrix Asphalt mixtures meet the following mixture control tolerances and mix design criteria:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Mixture Control Tolerance</th>
<th>Design Gradation Limits, Percent Passing</th>
</tr>

<td>80%</td>
</tr>
<tr>
<td>Drain-down (AASHTO T305), %</td>
<td>&lt;0.3</td>
<td>&lt;0.3</td>
</tr>
</tbody>
</table>

*Mixture control tolerance is not applicable to this sieve for this mix.

**Mixture control tolerance is ± 2.0% for this sieve for 9.5 mm SMA mixes placed at spread rates greater than 135 lb./yd². For 9.5 mm SMA mixes placed at spread rates of 135 lb./yd² or less, 100 % passing is required on this sieve.

Note 1: Range for % AC is Original Optimum AC (OOAC) at 35 gyrations (Gyratory compactor) or 50 blows (Marshall compactor) prior to Corrected Optimum AC (COAC) calculation detailed in GDT 123 (Appendix A)

Note 2: Quality Acceptance Test Results for AC content that deviate > ± 0.3% from the approved Job Mix Formula (JMF) consistently over three lots may subject the mix to a revised AC content on project JMF at the discretion of the State Materials Engineer based on statistical trend.

1. Ensure SMA mixtures are compacted at 35 gyrations with the Superpave Gyratory compactor or 50 blows with the Marshall compactor.

2. Ensure SMA mixtures contain mineral filler and fiber stabilizing additives and meet the following requirements:
   a. Asphalt cement grade PG-76-22 (specified in Section 820) is required in all SMA mixtures.
   b. Aggregates for SMA meet the requirements of Subsection 802.2.02.A.3.
   c. Use the approved mineral filler specified in the mix design and meeting the requirements of Section 883 Approved sources of mineral filler are listed in QPL 81.
   Use the approved Fiber Stabilizing Additive of the type (cellulose or mineral) specified in the mix design and meeting the requirements of Section 819. Approved sources of Fiber Stabilizing Additive are listed in QPL 77.
The dosage rate will be as specified in the mix design and sufficient to prevent drain-down exceeding the above tolerance.

### B. Fabrication

See Section 400.

#### 828.2.03 Superpave Asphalt Concrete Mixtures

**A. Requirements for Superpave Mixtures (except Parking Lot Mixtures)**

Produce the mixture according to an approved mix design and Job Mix Formula. Ensure Superpave Asphalt Concrete mixtures meet the following mixture control tolerances and mix design limits:

1. Gradation limits for Superpave mixtures are as follows:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Mixture Control Tolerance</th>
<th>Design Gradation Limits, Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>9.5 mm Superpave Type I</td>
</tr>
<tr>
<td>1/2 in. (37.5 mm)</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1 in. (25.0 mm)</td>
<td>± 8.0</td>
<td>100*</td>
</tr>
<tr>
<td>3/4 in. (19.0 mm)</td>
<td>±8.0**</td>
<td>100*</td>
</tr>
<tr>
<td>1/2 in. (12.5 mm)</td>
<td>±6.0***</td>
<td>98-100****</td>
</tr>
<tr>
<td>3/8 in. (9.5 mm)</td>
<td>±5.6</td>
<td>90-100</td>
</tr>
<tr>
<td>No. 4 (4.75 mm)</td>
<td>±5.6</td>
<td>65-85</td>
</tr>
<tr>
<td>No. 8 (2.36 mm)</td>
<td>±4.6</td>
<td>48-55</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>±2.0</td>
<td>5.0-7.0</td>
</tr>
<tr>
<td>Range for % AC (Note 3)</td>
<td>± 0.4 (Note 2)</td>
<td>5.50-7.25</td>
</tr>
</tbody>
</table>

* Mixture control tolerance is not applicable to this sieve for this mix.
** Ensure mixture control tolerance is within ± 10.0% for this sieve for 25 mm Superpave.
***Ensure mixture control tolerance is within ± 8.0% for this sieve for 19 mm Superpave.
****Ensure mixture control tolerance is within ± 2.0% for this sieve for 12.5 mm and 9.5 mm mixes.

**Note 1:** Use PG 76-22 in 12.5 mm Superpave, excluding shoulder construction, on all projects with ADT greater than 25,000 as detailed in the Contract Pay Item.

**Note 2:** Quality Acceptance Test Results for AC content deviating > ± 0.3 % from the approved Job Mix Formula (JMF) consistently over three Lots may subject the mix to a revised AC content on the project JMF at the discretion of the State Materials Engineer based on statistical trend.

**Note 3:** Range for % AC is Original Optimum AC (OOAC) at 65 gyrations prior to the Corrected Optimum AC (COAC) calculation detailed in SOP 2 (Appendix D).
2. Volumetric limits are as follows:

<table>
<thead>
<tr>
<th>Design Parameter</th>
<th>Mix Type</th>
<th>Limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>% of Max. Specific Gravity (Gmm) at design gyrations, (Ndes)</td>
<td>All</td>
<td>96%</td>
</tr>
<tr>
<td>% Gmm at the initial number of gyrations, Ni</td>
<td>All</td>
<td>91.5% maximum</td>
</tr>
<tr>
<td>% voids filled with asphalt (VFA) at Ndes</td>
<td>9.5 mm Type I</td>
<td>Min. 72; Max. 80</td>
</tr>
<tr>
<td></td>
<td>9.5 Type II and 12.5 mm</td>
<td>Min. 72; Max. 76</td>
</tr>
<tr>
<td></td>
<td>19 mm</td>
<td>Min. 71; Max 76</td>
</tr>
<tr>
<td></td>
<td>25 mm</td>
<td>Min. 69; Max 76</td>
</tr>
<tr>
<td>Fines to effective asphalt binder ratio (F/Pbe)</td>

<td>0.6 to 1.4</td>
</tr>
<tr>
<td></td>
<td>All other types</td>
<td>0.8 to 1.6</td>
</tr>
<tr>
<td>Minimum Film Thickness (microns)*</td>
<td>All</td>
<td>&gt; 7.00</td>
</tr>
<tr>
<td>Minimum % Voids in Mineral Aggregate (VMA)</td>
<td>25 mm</td>
<td>13.0</td>
</tr>
<tr>
<td>Note: VMA shall be calculated using the effective specific gravity of the aggregate (Gse). See SOP-2SP.</td>
<td>19 mm</td>
<td>14.0</td>
</tr>
<tr>
<td></td>
<td>12.5 mm</td>
<td>15.0</td>
</tr>
<tr>
<td></td>
<td>9.5 Type I</td>
<td>16.0</td>
</tr>
<tr>
<td></td>
<td>9.5 Type II</td>
<td>16.0</td>
</tr>
</tbody>
</table>

*Superpave Mixtures approved prior to January 31, 2012, may be adjusted to meet Minimum Film Thickness requirements by the State Materials Engineer.

B. Requirements for Superpave Parking Lot Mixes (NOT FOR STANDARD HIGHWAY/STREET PAVING)

1. Surface layers for parking facilities:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Mixture Control Tolerance</th>
<th>Design Gradation Limits, Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

All * and notes apply to both 828.2.03.B.1 and 828.2.03.B.2.

*Mixture control tolerance is not applicable to this sieve for this mix.

**Ensure mixture control tolerance is within ±10.0% for this sieve for 25 mm Superpave mixes.

***Ensure mixture control tolerance is within ±8.0% for this sieve for 19 mm Superpave mixes.

****Ensure mixture control tolerance is within ±2.0% for this sieve for 12.5 mm and 9.5 mm Superpave mixes.

**Note 1**: Quality Acceptance Test Results for AC content deviating > ± 0.3 % from the approved Job Mix Formula (JMF) consistently over three Lots may subject the mix to a revised AC content on the project JMF at the discretion of the State Materials Engineer based on statistical trend.

**Note 2**: Range for % AC is Original Optimum AC (OOAC) at 65 gyrations prior to the Corrected Optimum AC (COAC) calculation detailed in SOP 2 (Appendix D).

3. Volumetric limits for parking facilities are as follows:

<table>
<thead>
<tr>

C. Fabrication

See Section 400.

828.2.04 Fine-Graded Mixtures

A. Requirements

Produce the mixture according to an approved mix design and Job Mix Formula. Ensure that fine-graded mixtures meet the following mixture control tolerances and design limits:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Mixture Control Tolerance</th>
<th>Design Gradation Limits, % passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 in. (12.5 mm)</td>
<td>±0.0</td>
<td>100*</td>
</tr>
<tr>
<td>3/8 in. (9.5 mm)</td>
<td>±5.6</td>
<td>90-100</td>
</tr>
<tr>
<td>No. 4 (4.75 mm)</td>
<td>±5.7</td>
<td>75-95</td>
</tr>
<tr>
<td>No. 8 (2.36 mm)</td>
<td>±4.6</td>
<td>60-65</td>
</tr>
<tr>
<td>No. 50 (300 µm)</td>
<td>±3.8</td>
<td>20-50</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>±2.0</td>
<td>4-12</td>
</tr>
<tr>
<td>Range for % AC</td>
<td>±0.4</td>
<td>6.00 – 7.50</td>
</tr>
<tr>
<td>Design optimum air voids (%)</td>
<td></td>
<td>4.0 – 7.0</td>
</tr>
<tr>
<td>% Aggregate voids filled with AC</td>
<td></td>
<td>60 - 80</td>
</tr>
<tr>
<td>Minimum Film Thickness (microns)</td>
<td></td>
<td>&gt; 6.00</td>
</tr>
</tbody>
</table>

* Mixture control tolerance is not applicable to this sieve for this mix.

Note 1: Quality Acceptance Test Results for AC content deviating > ± 0.3 % from the approved Job Mix Formula (JMF) consistently over three Lots may subject the mix to a revised AC content on the project JMF at the discretion of the State Materials Engineer based on statistical trend.

Note 2: Range for % AC is Original Optimum AC (OOAC) at 50 gyrations prior to the Corrected Optimum AC (COAC) calculation detailed in SOP 2 (Appendix D).

B. Fabrication

See Section 400.

C. Acceptance

See Subsection 106.3 and Section 400. Ensure individual test results meet the Mixture Control Tolerances listed in Subsections 828.2, 828.2.01, 828.2.02, 828.2.03, 828.2.04, whichever applies.

D. Materials Warranty

See General Provisions 101 through 150.
Section 829—Ground Tire Rubber

829.1 General Description
This section specifies the requirements for ground tire rubber (GTR).

829.1.01 Definitions
Ground Tire Rubber: Recycled tire rubber which has been ground into very small particles to use as an asphalt cement or asphaltic concrete modifier.

829.1.02 Related References
A. Standard Specifications
Section 820–Asphalt Cement
B. Referenced Documents
ASTM E105
ASTM E122
ASTM D5603
ASTM D5644
ASTM D1509
ASTM M17
ASTM D297

829.2 Material Requirements

829.2.1 General
Ensure the GTR, used in Asphalt Rubber Binder, is produced from tires and is substantially free from contaminates including fabric, metal, mineral and other non-rubber substances. Ensure the GTR is sufficiently dry so that it is free flowing and does not foam when mixed with the asphalt cement.

829.2.2 Physical Requirement
Ensure the physical properties of GTR complies with the specified testing and material requirements in Table 1.

**829.2.4 Delivery, Storage, and Handling**

**A. Packaging and Identification Requirements**

Ensure the GTR is supplied in moisture proof packaging in disposable bags or other appropriate bulk containers. Each bag or container shall be properly labeled with the manufacturer’s designation for the GTR and specific type, mesh size, weight and manufacturer’s batch or Lot designation.

**829.2.5 Submittals**

**A. Invoices**

Furnish formal written invoices from the supplier for all GTR used in the production of Asphalt Rubber Binder. Show the following on the Bill of Lading:

1. Supplier name, location and product name
2. Date shipped
3. Quantities in pounds or tons
4. Included with or without workability additive(s)

**829.2.6 Materials Warranty**

General Provisions 101 through 150.
Section 830—Portland Cement

830.1 General Description
This section includes the requirements for Portland cement, including Portland blast-furnace slag cement and Portland-Pozzolan cement.

830.1.01 Related References
A. Standard Specifications
   Section 831–Admixtures
B. Referenced Documents
   AASHTO M 85
   AASHTO M 240
   QPL 3

830.2 Materials
830.2.01 Portland Cement
A. Requirements
   Use only Portland cements that are listed in QPL 3.
   1. Type
      Use Portland cement that meets the requirements in AASHTO M 85. Portland cement types include:

      | Use          | High Early Strength Concrete | Remaining Portland Cement Concrete |
      |--------------|------------------------------|------------------------------------|
      | *Portland cement | Types I or III              | Types I or II                      |

      *Portland cement – a hydraulic cement produced by pulverizing clinker consisting essentially of hydraulic crystalline calcium silicates, and usually containing one or more of the following: water, calcium sulfate, up to 5% limestone, and processing additions.

   2. Ensure that the Portland cement concrete meets the low alkali and the false set requirements of AASHTO M 85.
   3. Do not use cement that is damaged, partially set, lumpy, or caked.
   4. Mixing and Storing
      5. Do not mix or store different brands or types of cement in the same bin. Do not mix or store the same brand of cement from different mills in the same bin.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See the requirements in AASHTO M 85.

D. Materials Warranty
   General Provisions 101 through 150.
830.2.02 Portland Blast-Furnace Slag Cement

A. Requirements
Use Portland blast-furnace slag cement in cement stabilization that meets the requirements of AASHTO M 240, Type IS.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
See requirements of AASHTO M 240, Type IS.

D. Materials Warranty
General Provisions 101 through 150.

830.2.03 Portland-Pozzolan Cement

A. Requirements
Use Portland-Pozzolan cement that meets the requirements of AASHTO M 240, Type IP, with the following modifications:

1. Limit the fly ash content to a maximum of 25 percent by weight.

2. Limit the Pozzolan to fly ash that meets the requirements of Subsection 831.2.03.

3. If grinding fly ash with Portland cement clinker to produce Portland-Pozzolan cement, do the following:
   Exclude the fineness and the loss-on-ignition requirements of Subsection 831.2.03.
   Ensure that the final blend of Portland-Pozzolan cement meets AASHTO M 240, Type IP requirements.

4. Wherever the Standard Specifications allow or specify Portland cement that meets the requirements of Subsection 830.2.01, you may substitute Portland-Pozzolan cement that meets the requirements of this Subsection.

5. If the substitute cement results in a higher cement factor than required for Type I cement, the cost of the additional cement will be borne by the Contractor.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
See the requirements of AASHTO M 240, Type IP.

D. Materials Warranty
General Provisions 101 through 150.
Section 831—Admixtures

831.1 General Description
This section includes the requirements for the following Portland cement concrete and bituminous concrete admixtures:

- Air-entraining admixtures
- Chemical admixtures
- Fly ash, raw or calcined natural pozzolan, slag, and microsilica
- Heat-stable, anti-stripping additive
- Silicone fluid

831.1.01 Related References

   GDT 66
   QPL 13
   QPL 14
   QPL 26
   QPL 30
   QPL 40
831.2 Materials
Use only admixtures that are listed on the specific Georgia Department of Transportation Qualified Products List (QPL). For a list of Heat Stable Anti-Stripping Additives sources, see QPL 26.

831.2.01 Air-Entraining Admixtures

A. Requirements
   1. Use air-entraining admixtures listed in QPL 13.
   2. Use air-entraining admixture materials meeting AASHTO M 154, Performance and Uniformity requirements.
   3. Test compression and flexure strengths at 7 and 28 days.
   4. Use air-entraining admixtures evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See requirements of AASHTO M 154.

D. Material Warranty
   General Provisions 101 through 150.

831.2.02 Chemical Admixtures for Concrete

A. Requirements
   1. Use chemical admixtures listed in QPL 14.
   2. Use chemical admixture materials meeting AASHTO M 194 Physical requirements and Uniformity and Equivalence requirements for Types A, B, C, D, E, F, or G, unless otherwise specified.
      a. Waive the length change requirements.
      b. Ensure that the admixtures contain no more than 0.8 percent chloride, calculated as calcium chloride.
      c. Ensure that the air content does not exceed 4 percent when prepared in a standard batch without an added air-entraining agent.
   3. Use chemical admixtures evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See the requirements of AASHTO M 194 for chemical admixtures.

D. Material Warranty
   General Provisions 101 through 150.
831.2.03 Fly Ash, Raw or Calcined Natural Pozzolan, Slag, and Microsilica

A. Requirements

1. Fly Ash
   Fly ash is finely divided residue from the combustion of ground or powdered coal that is transported from the boiler by flue gases.
   Use fly ash that meets the requirements of AASHTO M 295, Class F or C and that are listed in QPL 30.

2. Raw or Calcined Natural Pozzolan
   This is a siliceous or siliceous and aluminous material.
   Use Pozzolan that meets the requirements of AASHTO M 295, Class N and that are listed in QPL 30.

3. Granulated Iron Blast-Furnace Slag
   This is a glassy granular material formed when molten blast-furnace slag is rapidly chilled and then finely ground.
   Use slag that meets the requirements of AASHTO M 302, Grade 100 or 120 and that are listed in QPL 30.

4. Microsilica (Silica Fume)
   This is an amorphous material with high silica content and purity, made as a by-product of high purity quartz that is reduced with other ingredients in an electric-arc furnace.
   Use microsilica that meets the requirements of AASHTO M 307.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Engineer will select the laboratory tests for acceptance and project control.

D. Material Warranty
   General Provisions 101 through 150.

831.2.04 Heat-Stable Anti-Stripping Additive

A. Requirements

2. Submit samples of the proposed heat-stable, anti-stripping additive, asphalt cement, and aggregates to the laboratory for approval before use.

3. Ensure that materials meet the requirements of Section 828 for retained coating and tensile strength ratio when tested with GDT 56 and GDT 66, respectively.

4. Do not use an additive that contains harmful ingredients or adversely alters the specified characteristics of the bituminous material when added in the recommended proportions.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Retained coating</td>
<td>GDT 56</td>
</tr>
<tr>
<td>Tensile strength ratio</td>
<td>GDT 66</td>
</tr>
</tbody>
</table>

831.2.05 Silicone Fluid

A. Requirements
   Use silicone fluid that meets Federal Specification VV-D-1078B, Viscosity Grade 1,000. For a list of sources, see QPL 40.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See Federal Specification VV-D-1078B.

D. Material Warranty
   General Provisions 101 through 150.
832.1 General Description
This section includes the requirements for the following curing agents:

- Burlap or cotton fabric
- Sheet materials
- Membrane curing compound

832.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO M 148
   AASHTO M 171
   QPL 16

832.2 Materials
832.2.01 Burlap or Cotton Fabric
A. Requirements
   1. Use burlap or cotton fabric meeting these requirements:
      - Burlap that is 10 to 18 oz./yd² (340 to 610 g/m²) or two layers of 6 or 7 oz./yd² (200 or 235 g/m²)
      - Cotton fabric that is white, loosely woven, and not less than 7 oz./yd² (235 g/m²)
      - Strips of burlap or cotton fabric that are between 3 and 6 ft. (0.9 and 1.8 m) wide and 3 ft. (1 m) longer than the width of the slab to be covered
   2. Use burlap and cotton fabrics that do not contain starch or other material that could stain the concrete. If the fabric is new, soak and dry it before use.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   General Provisions 101 through 150.
D. Materials Warranty
   General Provisions 101 through 150.
Section 832 — Curing Agents

832.2.02 Sheet Materials

A. Requirements

1. Use sheet material for curing concrete that meets AASHTO M 171 requirements.
2. Use waterproof paper that is white.
3. Use polyethylene film that is white opaque.
4. For curing bridge decks, use sheet material that is either a white burlap polyethylene sheet or a white co-polymer material coated over a layer of absorbent, non-woven, synthetic fabric.
   Use sheet material that meets specification reflection and moisture retention requirements.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
See the requirements under AASHTO M 171.

D. Materials Warranty
General Provisions 101 through 150.

832.2.03 Membrane Curing Compound

A. Requirements

1. Use membrane curing compounds listed in QPL 16
2. Use liquid membrane-forming compounds meeting AASHTO M 148 requirements.
3. Use membrane curing compounds evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
See the requirements under AASHTO M 148.

D. Materials Warranty
General Provisions 101 through 150.
Section 833—Joint Fillers and Sealers

833.2 Materials

833.2.01 Preformed Joint Filler

A. Requirements
   General Provisions 101 through 150.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Use preformed joint filler that meets either AASHTO M 153 or AASHTO M 213 requirements. For a list of sources, see QPL 20.

   Ensure that cellulose fiber types meet the requirements of AASHTO M 213 (except for the asphalt content) and contain minimums of 0.2 percent zinc borate as a preservative and 1.5 percent waterproofing wax.

D. Materials Warranty
   General Provisions 101 through 150.

833.2.02 Hot-Poured Joint Sealers

A. Requirements
   1. Type
      Use a hot-poured joint sealer that is a mixture of materials compatible with asphalt, with or without rubber. The sealer shall have the following characteristics:
      - Forms a resilient and adhesive compound
      - Effectively seals joints and cracks in pavements against moisture during repeated cycles of expansion and contraction
      - Does not flow from the joint and cannot be picked up by vehicle tires at an ambient temperature of 125 °F (50 °C)

   2. Compound Characteristics
      Use a compound that has a uniform pouring consistency capable of completely filling joints without forming large air holes or discontinuities.
      a. Do not pour if the compound temperature is above 450 °F (230 °C).
      b. Follow the pouring temperature and safe heating temperature set by the compound manufacturer for each lot or batch.
      c. Be sure the temperatures are shown on the label. The safe heating temperature is defined as the highest temperature to which the sealing compound can be heated and still meet all the requirements.
3. Physical Characteristics

Use a hot-poured joint sealer that has the following properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Required Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Penetration</td>
<td>Less than 0.35 in. (9 mm.)</td>
</tr>
<tr>
<td>Flow</td>
<td>Less than 0.12 in. (3 mm.)</td>
</tr>
<tr>
<td>Resilience</td>
<td>Minimum recovery of 60%.</td>
</tr>
<tr>
<td>Bond to concrete 0 °F, ± 2 °F (−18 °C, ± 1 °C)</td>
<td>The compound does not separate or have gaps within or between the compound and the blocks.</td>
</tr>
<tr>
<td>Compatibility (with asphaltic concrete)</td>
<td>Adhesion does not fail. Oily exudate does not form at the interface between the sealing compound and the asphaltic concrete. The sealant does not soften or have deleterious effects on the asphaltic concrete.</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hot-poured joint sealers</td>
<td>GDT 62</td>
</tr>
</tbody>
</table>

D. Materials Warranty

General Provisions 101 through 150.

833.2.03 Elastomeric Polymer Type Joint Compound

A. Requirements

1. Type

Furnish elastomeric polymer-type joint sealing compound in two components—a base compound and a curing agent.

a. Base compound: A gasoline-resistant elastometric polymer modified with plasticizers, activators, and inert fillers.

b. Curing agent: A blend of accelerators and extenders.

2. Compound Characteristics

Use a sealing compound that can be mixed to a homogenous consistency at the site and applied by an approved mechanical device or poured and troweled manually.

a. If a compound is to be machine-mixed and applied, it shall have a minimum work life of 5 minutes at 80 °F, ± 5 °F (27 °C, ± 3 °C).

b. If a compound is to be manually mixed and applied, it shall have a minimum work life of 30 minutes at 80 °F, ± 5 °F (27 °C, ±3 °C).

c. Use a mixture that completely fills the joints without forming air holes or discontinuities, when mixed according to the manufacturer’s instructions.

d. Use a compound that is self-leveling when placed in the joint, but that does not show appreciable flow or movement along a superelevated joint.
Section 833 — Joint Fillers and Sealers

e. Use material that does not soften or show any apparent defect after being immersed in water for 7 days.

f. Use a material that forms a tack-free, rubber-like compound that seals pavement or bridge joints within 24 hours of application.

3. Physical Properties
   Use material that has the following physical properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Required Measurement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cone penetration</td>
<td>Between 0.1 in. (2.5 mm) and 0.39 in. (10 mm)</td>
</tr>
<tr>
<td>Flow</td>
<td>No appreciable flow</td>
</tr>
<tr>
<td>Resilience (air- and oven-cured samples)</td>
<td>Minimum recovery of 75%</td>
</tr>
<tr>
<td>Bond</td>
<td>No cracks, separation, or other opening over 1/4 in. (6 mm) deep in the sealer or between the sealer and block</td>
</tr>
<tr>
<td>Solubility</td>
<td>Not to exceed 2 percent; no apparent defects that affect the material as a sealant</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elastomeric joint compound</td>
<td>GDT 15</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.

833.2.04 Preformed Elastic Joint Sealer

A. Requirements
   This section also covers adhesives and lubricants for the sealers.

   1. Type
      Use a preformed elastic joint sealer that is a vulcanized elastomeric compound using polymerized chloroprene as the only basic elastomer. The joint sealers include both open and closed cell sealers.

   2. Certification
      a. Submit certified test results of each lot of the joint sealer materials furnished to each Project, either from your tests or from the manufacturer of the preformed joint sealer.
      b. The Department will conduct the joint sealer recovery test on random samples from each shipment received or each manufacturer’s lot.
      c. Submit certified test results of each lot of the lubricant furnished to each Project, either from your tests or from the manufacturer of the joint sealer lubricant/adhesive or adhesive.
3. Preformed Open Cell Joint Sealer
   a. Bridge and Roadway Seals: Use sealer that meets the following physical requirements:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>Min. 2,000 psi (14 MPa)</td>
</tr>
<tr>
<td>Elongation at break</td>
<td>Min. 250%</td>
</tr>
<tr>
<td>Hardness, Type A durometer</td>
<td>55±5</td>
</tr>
<tr>
<td>Oven aging, 70 hours @ 212 °F (100 °C)</td>
<td>Max. -30%</td>
</tr>
<tr>
<td>Tensile strength, change</td>
<td>Max. -40%</td>
</tr>
<tr>
<td>Elongation, change</td>
<td>+10 points</td>
</tr>
<tr>
<td>Hardness, change</td>
<td></td>
</tr>
<tr>
<td>Oil swell, ASTM oil No. 3:</td>
<td>Max. 80%</td>
</tr>
<tr>
<td>Volume change, 70 hrs. @ 212 °F (100 °C)</td>
<td></td>
</tr>
<tr>
<td>Ozone resistance, 20% strain:</td>
<td>No cracks</td>
</tr>
<tr>
<td>300 ppm in air, 70 hrs. @ 100 °F (38 °C)</td>
<td></td>
</tr>
<tr>
<td>(wipe with solvent to remove surface</td>
<td></td>
</tr>
<tr>
<td>contaminants)</td>
<td></td>
</tr>
<tr>
<td>Joint sealer recovery under 50% deflection:</td>
<td></td>
</tr>
<tr>
<td>Recovery after 70 hrs. @ 212 °F (100 °C)</td>
<td>Min. 85%</td>
</tr>
<tr>
<td>Recovery after 72 hrs. @ 14 °F (-10 °C)</td>
<td>Min. 88%</td>
</tr>
<tr>
<td>Recovery after 22 hrs. @ –20 °F (-29 °C)</td>
<td>Min. 83%</td>
</tr>
</tbody>
</table>

   b. Bridge Seals: Use a sealer that meets the following compression/deflection requirements:

<table>
<thead>
<tr>
<th>Nominal Size, In. (mm)</th>
<th>Movement Capability*, In. (mm)</th>
<th>Min. Force 4 lb. per linear inch (18 N per 25 mm) @ Width, In. (mm)</th>
<th>Min. Force–30 lb. per linear inch (133 N per 25 mm)</th>
<th>Max. Force–100 lb. per linear inch (445 N per 25 mm) @ Width, In. (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 (50)</td>
<td>13/16 (20)</td>
<td>1-7/8 (47)</td>
<td>1-1/16 (27)</td>
<td></td>
</tr>
<tr>
<td>2-1/2 (63)</td>
<td>1-1/8 (28)</td>
<td>2-3/8 (60)</td>
<td>1-1/4 (32)</td>
<td></td>
</tr>
<tr>
<td>3 (75)</td>
<td>1-3/8 (34)</td>
<td>2-7/8 (73)</td>
<td>1-1/2 (38)</td>
<td></td>
</tr>
<tr>
<td>3-1/2 (88)</td>
<td>1-5/8 (40)</td>
<td>3-3/8 (86)</td>
<td>1-3/8 (34)</td>
<td></td>
</tr>
<tr>
<td>4 (100)</td>
<td>1-3/4 (43)</td>
<td>3-7/8 (98)</td>
<td>2-1/8 (54)</td>
<td></td>
</tr>
</tbody>
</table>

   *Movement capability is the movement allowed within the widths of the specified maximum and minimum forces. The design maximum and minimum joint width is based on these widths. The installation width depends on the temperature at the time of installation.

   c. Roadway Seals: Use a compression/deflection sealer that accommodates the movement specified on the Plans with a minimum force of 4 lbs. per linear inch (18 N per linear 25 mm), not exceeding 20 lbs. per linear inch (89 N per linear 25 mm), exerted on the joint faces.
Section 833 — Joint Fillers and Sealers

4. Preformed Closed Cell Joint Sealer for Roadways
   a. Use a preclosed cell polychloroprene joint sealer that meets the following physical requirements:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dimensions</td>
<td>Meet Plan requirements for movement and depth</td>
</tr>
<tr>
<td>Surfaces</td>
<td>Smooth and clean</td>
</tr>
<tr>
<td>Compression/deflection</td>
<td>Allow movement specified on the Plans with a minimum force of 4 lbs. per linear inch (18 N per linear 25 mm) exerted on the joint faces and maximum deflection equal to 50% of the original width</td>
</tr>
</tbody>
</table>
| Joint sealer recovery under 50% deflection | 85% recovery (compressed to half original thickness for 22 hours @ 158 °F (70 °C), then compression removed for 48 hours at room temperature)  
                                    | 85% recovery after 22 hours at 0 °F (-18 °C)                                |
| Water absorption                   | Maximum 5% weight increase                                                  |
| Ozone resistance                   | No cracking after exposure of sample at 20% strain to 100 ppm ozone for 70 hours at 100 °F (38 °C) |

5. Joint Sealer Lubricants/Adhesives
   a. Lubricant/Adhesive for Preformed Roadway Seals: Use a lubricant/adhesive with the joint sealer that is a one-component polychloroprene compound, containing only soluble phenolic resins blended with antioxidants and acid acceptors in an aromatic, hydrocarbon solvent mixture. The lubricant shall have the following physical properties:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Average net weight per gallon (liter)</td>
<td>Min. 7.84 lbs. (940 grams)</td>
</tr>
<tr>
<td>Solid content</td>
<td>22-28% by weight</td>
</tr>
<tr>
<td>Film strength</td>
<td></td>
</tr>
<tr>
<td>Tensile strength</td>
<td>Min. 2,300 psi (16 MPa)</td>
</tr>
<tr>
<td>Elongation before breaking</td>

<td>Min. 350%</td>
</tr>
<tr>
<td>Viscosity</td>
<td>Perform suitably with the installation equipment</td>
</tr>
<tr>
<td></td>
<td>Remain fluid from 5 to 120 °F (-15 to 49 °C)</td>
</tr>
</tbody>
</table>

6. Product Delivery
   Deliver each lot of the lubricant/adhesive in containers plainly marked with the manufacturer’s name or trademark, lot number, and date of manufacture.
Section 833 — Joint Fillers and Sealers

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:
   1. Preformed Open Cell Joint Sealer

<table>
<thead>
<tr>

</table>

3. Joint Sealer Lubricants/Adhesives

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Film Strength</td>
<td>ASTM D 412</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   For joint sealer lubricants/adhesives:
   1. Store the lubricant/adhesive at 50 ° to 80 °F (10 ° to 27 °C).
   2. Retest any lubricant/adhesive not used within 270 days of its manufacture.
833.2.05 Water-Blown Urethane Joint Filler

A. Requirements

1. Type
   Furnish water-blown urethane joint filler in two components.
   a. Mix according to the manufacturer’s recommendations and use in pressure relief joints and regular expansion joints.
   b. Mix the material at the site and foam it in the joint. Use closed-cell material.

2. Physical Requirements
   a. Use the material that meets the following requirements after mixing:

<table>
<thead>
<tr>
<th>Times at 80 °F, ± 5 °F (27 °C, ± 3 °C)</th>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cream time (interval after mixing the two components and before the material begins to expand)</td>
<td>1 minute</td>
<td>5 minutes</td>
</tr>
<tr>
<td>Expansion time (interval between when the material starts and stops expanding)</td>
<td></td>
<td>10 minutes</td>
</tr>
<tr>
<td>Tack free time (Determine whether the material is tack free by touching lightly. Begin the time requirement for tack free time when the expansion time ends.)</td>
<td></td>
<td>10 minutes</td>
</tr>
</tbody>
</table>

   b. Use material that meets the following requirements after curing:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight per cubic foot (meter)</td>
<td>4lbs, ± 0.4 lbs. (64 kg, ± 6 kg)</td>
</tr>
<tr>
<td>Compression to 50% thickness</td>
<td>40 to 130 psi (275 to 895 kPa)</td>
</tr>
<tr>
<td>Recovery (compressed to 50% thickness, released, then tested 10 minutes later)</td>
<td>Min. 65%</td>
</tr>
<tr>
<td>Extrusion when compressed 50%</td>
<td>Max. 0.125 In. (3 mm)</td>
</tr>
<tr>
<td>Moisture absorption</td>
<td>Max. 0.10 lb./ft.² (490 g/m²) of exposed area</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight per cubic foot (meter)</td>
<td>AASHTO T 42 [omit drying at 220 °F (104 °C)]</td>
</tr>

<tr>
<td>Recovery after compression</td>
<td>AASHTO M 213</td>
</tr>
<tr>
<td>Extrusion</td>
<td>AASHTO T 42</td>
</tr>
<tr>
<td>Moisture absorption</td>
<td>AASHTO T 42 (calculate absorption based on exposed area)</td>
</tr>
</tbody>
</table>

D. Materials Warranty

General Provisions 101 through 150.
833.2.06 Silicone Sealants and Bond Breakers

Prepare and install silicone and bond breakers according to Section 461.

A. Requirements

1. Silicone

   Furnish silicone sealant in a one-part or two part silicone formulation. Use sealant that is compatible with the surface to which it is applied. Do not use acid-cure sealants on Portland cement concrete.

   a. Use silicone that meets the physical requirements in Table 1. For a list of silicone joint sealant sources, please see QPL 66. Identify silicones as the following types:

      1) Type A—A one part, low modulus, non-sag silicone. Used to seal horizontal and vertical joints in Portland cement concrete pavements and bridges. Tooling is required.

      2) Type B—A one part, very low modulus, self-leveling silicone. Used to seal horizontal joints in Portland cement concrete pavements and bridges. Tooling is not normally required.

      3) Type C—A one part, ultra-low modulus, self-leveling silicone. Used to seal horizontal joints in Portland cement concrete pavements and bridges and joints between Portland cement concrete pavement and asphaltic concrete shoulders. Tooling is not normally required.

      4) Type D—A two part, ultra-low modulus, self-leveling, rapid cure silicone. Used to seal horizontal joints in Portland cement concrete pavements and bridges and joints between Portland cement concrete pavement and asphaltic concrete shoulders. Tooling is not required.

   b. Use silicone sealant evaluated by the National Transportation Product Evaluation Program (NTPEP).

   c. Use sealant that is compatible with the surface to which it is applied. Do not use acid-cure sealants on Portland cement concrete.

   d. Use silicone that meets the following physical requirements:

</tr>
</tbody>
</table>

**Note 1:** The cure time for these specimens shall be 21 days for Type A and 28 days for Type B, C and D. Specimens shall be cured at 77 °F ± 3 °F (25 °C ± 2 °C) and 50±5% relative humidity.

**Note 2:** At conditions of 77 °F ± 3 °F (25 °C ± 2 °C) and 50±5% relative humidity.

**Note 3:** Type C and D silicone shall also meet its bond strength requirement to asphalt concrete.

**Note 4:** Type D extrusion rate shall be within the range specified.

### 2. Bond Breakers

Bond breakers shall be chemically inert and resistant to oils, gasoline, solvents, and primer, if one is required. Install silicone sealants over a bond breaker to prevent the sealant from bonding to the bottom of the joint.

- **a.** Use bond breakers that are chemically inert and resistant to oils, gasoline, solvents, and primer, if one is required.
- **b.** Do not use bond breaker that will stain or adhere to the sealant.
- **c.** Use either a backer rod or tape bond breaker.

1) **Backer Rods**

<table>
<thead>
<tr>
<th>Type L</th>
<th>Closed-cell, expanded polyethylene foam</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type M</td>
<td>Closed-cell, polyolefin foam with a closed-cell skin over an open-cell core</td>
</tr>
</tbody>
</table>

Use backer rods that meet the following physical requirements:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Density</td>
<td>2 lb./ft.³ (30 kg/m³) min.</td>
</tr>
<tr>

</tr>
<tr>
<td>Water absorption</td>
<td>0.02 g/cm³ max.</td>
</tr>
</tbody>
</table>
Section 833 — Joint Fillers and Sealers

2) Bond Breaking Tapes
   Type N bond breaking tapes are made from extruded polyethylene with a pressure-sensitive adhesive on one side.
   Bond breaking tapes may be used with all four types of silicone, but is suitable for bridge joints only.
   Bond breaking tapes shall have a minimum thickness of .005 in. (0.13 mm.).

3. Joint Sealant Certification
   Submit, at no cost to the Department, a minimum of 30 gal (100 L) of material and certified test results on each lot of joint sealant furnished to a Project.
   Submit a certification that verifies the sealant meets all the test requirements of this specification, except the Bond to Concrete Mortar and Shore Durometer Hardness at 0 °F (-18 °C).

B. Fabrication
   Prepare and install silicone and bond breakers according to Section 461.

C. Acceptance
   1. Silicone
      Test the silicone as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile stress</td>
<td>ASTM D 412 (die C)</td>
</tr>
<tr>
<td>Durometer hardness</td>
<td>ASTM D 2240</td>
</tr>
<tr>
<td>Bond to concrete mortar</td>
<td>GDT 106</td>
</tr>
<tr>
<td>Tack free time (skin-over)</td>
<td>GDT 106*</td>
</tr>
<tr>
<td>Extrusion rate</td>
<td>GDT 106</td>
</tr>
<tr>
<td>Non-volatile</td>

</tr>
<tr>
<td>Movement capability and adhesion</td>
<td>GDT 106</td>
</tr>
<tr>
<td>Ozone and UV resistance</td>
<td>ASTM C 793</td>
</tr>
</tbody>
</table>

   *In cases of dispute, use ASTM C 679 as a referee test.

2. Bond Breakers
   Test the bond breaker backer rods as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Density</td>
<td>ASTM D 1622</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>ASTM D 1623</td>
</tr>
<tr>
<td>Water absorption</td>
<td>ASTM C 1016</td>
</tr>
</tbody>
</table>
Section 833 — Joint Fillers and Sealers

3. Department Responsibility
   The Department will:
   a. Evaluate the sealant in the field before accepting any silicone sealants that meet the requirements of this specification.
   b. Install the material submitted by the Contractor in roadway and/or bridge joints. The material shall be in place for two winters without failure before being accepted.
   c. Reject any sealant or bond breaker that is evaluated and approved yet fails in actual use.

D. Materials Warranty
   General Provisions 101 through 150.

833.2.07 Neoprene for Bridge Deck Joint Seals

A. Requirements
   1. Type
      Use a neoprene material for bridge deck joint seals that is a vulcanized elastomeric compound with polymerized chloroprene as the only basic elastomer.
      a. Ensure the neoprene meets the physical requirements in Table 2.

| TABLE 2—PHYSICAL REQUIREMENTS FOR NEOPRENE |
|---------------------------------------------|----------------------------------|--------------------------------|
| Test                                        | Requirements                     | Test Method                   |
| Tensile strength                            | 1500 psi (10 MPa) min.           | ASTM D 412                    |
| Before aging                                |                                 |                                |
| After oven-aging for 70 hrs. @ 212 ºF (100 ºC) | 30% max. loss                   | ASTM D 573                    |
| Elongation at breaks                         | 250% min.                       | ASTM D 412                    |
| Before aging                                |                                 |                                |
| After oven aging for 70 hrs. @ 212 ºF (100 ºC) | 40% max.                        | ASTM D 573                    |
| Hardness Type A Durometer                   | 63 ± 10 points                   | ASTM D 2240                   |
| Before aging                                |                                 |                                |
| After oven-aging for 70 hrs. @ 212 ºF (100 ºC) | 0 to +15 points change          | ASTM D 2240                   |
| After aging for 70 hrs. @ 14 ºF (-10 ºC)    | 0 to +15 points change           | ASTM D 2240                   |
| Ozone Resistance: After 70 hrs. @ 104 ºF (40 ºC), under 20% strain in 300 ppm in air (Wipe specimens with toluene before test to remove surface contaminants) | No cracks                        | ASTM D 1149                    |
| Weight change in oil After 22 hrs. in oil No. 2 [ASTM D 471] | 45% max.                        | AASHTO M 220                   |
| Recover under 50% deflection (type II only)  |                                 |                                |
| After 70 hrs. @ 212 ºF (100 ºC)             | 85% min.                        | AASHTO M 220                   |
| After 72 hrs. @ 14 ºF (-10 ºC)              | 88% min.                        | AASHTO M 220                   |
| After 22 hrs. @ –22 ºF (-30 ºC)             | 85% min.                        | AASHTO M 220                   |

2. Certification
   Submit certified test results on the joint seal system according to Subsection 106.05, Materials Certification.
B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test according to the methods indicated in Table 2.

D. Materials Warranty
   General Provisions 101 through 150.

833.2.08 Ethylene Propylene Diene Monomer for Bridge Deck Joint Seals

A. Submittals
   1. Type
      Use an ethylene propylene diene monomer (EPDM) material for bridge deck joint seals that is 100 percent EPDM compound.
      Ensure the compound shall meet the following physical requirements:

      | Physical Property                        | Requirement                  |
      |-----------------------------------------|------------------------------|
      | Hardness, Type A Durometer              | 80 ± 5                       |
      | Tensile strength                        | Min. 2,000 psi (14 MPa)      |
      | Elongation at break                     | Min. 200%                    |
      | Low temperature                         | Not brittle at –67 ºF (-55 ºC)|
      | Weather resistance                      | No cracks                    |
      | Ozone resistance (70 hours, 100 ºF (38 ºC), under 20% strain, 100 ppm in air) | No cracks                    |

   2. Certification
      Submit certified test results of the joint seal system according to Subsection 106.05, Materials Certification.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test the EPDM as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardness, Type A Durometer</td>
<td>ASTM D 2240</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>ASTM D 412</td>
</tr>
<tr>
<td>Elongation at break</td>
<td>ASTM D 412</td>
</tr>
<tr>
<td>Low temperature</td>
<td>ASTM D 746</td>
</tr>
<tr>
<td>Weather resistance</td>
<td>ASTM D 1171</td>
</tr>
<tr>
<td>Ozone resistance (70 hours, 100 ºF (38 ºC), under 20% strain, 100 ppm in air)</td>
<td>ASTM D 1149</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
833.2.09 Polyurethane Sealant for Inductive Loops

A. Requirements

1. Type
Use polyurethane sealant that is a one component, moisture-curing, flexible sealant formulated to encapsulate inductive detector loop wires and leads embedded in asphaltic or Portland cement concrete. For a list of sources, see QPL 75.

2. Submit, at no cost to the Department, at least 12, 29 oz. (857 mL) cartridges of the material.

3. Physical Characteristics
Use a sealant that will:
- Remain flexible to –20 °F (-30 °C) (necessary to protect the wire from the stress of pavement movement).
- Fully encapsulate the wire but resist flowing out on inclined or crowned roads.
- Be compatible with asphaltic concrete.
- Not soften the asphaltic concrete to a degree that would cause widening of the joint, when installed in a simulated joint in the laboratory.

4. Use a cured polyurethane sealant that meets the following physical requirements:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardness, Type A Durometer</td>
<td>35-85</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>Min. 150 psi (1035 kPa)</td>
</tr>
<tr>
<td>Elongation at break</td>
<td>Min. 200%</td>
</tr>
<tr>
<td>Flexibility 20 °F (30 °C)</td>
<td>No cracks</td>
</tr>
<tr>
<td>Weathering resistance</td>
<td>Slight chalking</td>
</tr>
</tbody>
</table>

5. Furnish certified test results of the loop sealant according to Subsection 106.05, Materials Certification.

B. Fabrication

General Provisions 101 through 150.
C. Acceptance

1. Test the polyurethane sealant for inductive loops as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hardness, Type A Durometer</td>
<td>ASTM D 2240</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>ASTM D 412 [die C pulled at 20 in. (500 mm)/min]</td>
</tr>
<tr>
<td>Elongation at break</td>
<td>ASTM D 412 [die C pulled at 20 in. (500 mm)/min]</td>
</tr>
<tr>
<td>Flexibility –20 °F (-30 °C)</td>
<td>25 mil (0.64 mm) free film bend (180°) over a 1/2 in. (13 mm) mandrel</td>
</tr>
<tr>
<td>Weathering resistance</td>
<td>ASTM D 822; Weatherometer 350 hrs., cured 7 days, 77 °F (25 °C), 50% relative humidity</td>
</tr>
</tbody>
</table>

2. Department Responsibility

   The Department will:

   a. Evaluate the polyurethane sealant for inductive loops in the field before approving it for use. The material also must meet the requirements of this specification.

   b. Install the material in asphaltic inductive loops. The material shall be in place for one winter without failure before being accepted.

   c. Reject any sealant that is evaluated and approved yet fails in actual use.

D. Materials Warranty

General Provisions 101 through 150.
Section 833 — Joint Fillers and Sealers

833.2.10 Preformed Foam Joint Filler

A. Requirements

1. Type

Use a preformed foam joint filler consisting of polyethylene, polypropylene, polyurethane, neoprene, natural rubber, or isomeric polymer closed-cell foam and ultraviolet, stable resistant to oils, chemicals, ozone, and weathering. Ensure the joint filler conforms to the following physical requirements:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cell Structure (Compression—Deflection to 50% of original thickness)</td>
<td>Closed Cell 35 – 50 psi (250 – 350 kPa)</td>
<td>ASTM D545</td>
</tr>
<tr>
<td>Recovery (Compress the specimen to 50% of original thickness)</td>
<td>80% min.</td>
<td>ASTM D545</td>
</tr>
<tr>

<td>3.5 lbs./ft³ (56.1 kg/m³) min</td>
<td>ASTM D545</td>
</tr>
<tr>
<td>Heat Resistance @ 392 °F ± 5 °F (200 °C ± -15 °C)</td>
<td>1% max</td>
<td>ASTM D5249</td>
</tr>
<tr>
<td>UV Weathering (1000 hrs., Cycle A – 340 nm)</td>
<td>No observation change or cracking</td>
<td>ASTM D4329</td>
</tr>
<tr>
<td>Freeze Thaw Resistance (300 cycles)</td>
<td>No visual change, &lt;10% tensile strength change</td>
<td>ASTM C666</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Test according to ASTM D 1752.

D. Materials Warranty

General Provisions 101 through 150.
834.1 General Description
This section includes the requirements for masonry materials, including brick; clay or shale brick; masonry stone; and mortar and grout.

   ASTM C 5
   ASTM C 55
   ASTM C 109 (ASTM C 109M)

834.2 Materials
834.2.01 Brick
A. Requirements
   1. Use bricks of the following sizes for masonry catch basins, inlets, and manholes. Use other sizes only if approved by the Office of Materials and Research.
      • 8 x 3½ x 2¼ in. (190 x 90 x 57 mm)
      • 7½ x 3½ x 3½ in. (178 x 90 x 90 mm)
      • 11½ x 3½ x 3½ in. (273 x 90 x 90 mm)
   2. Use bricks that are relatively straight, sound, and uniform in quality.
   3. Clay or Shale Brick: Use clay or shale bricks that meet the requirements of AASHTO M 91.
      a. Ensure that the maximum absorption of any individual clay or shale brick is less than 16 percent when submersed in cold water for 24 hours.
      b. Use only clay bricks that give a clear ringing sound when struck together.
   4. Concrete Brick: Use concrete bricks that meet the requirements of ASTM C 55.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
834.2.02 Masonry Stone

A. Requirements

1. Type: Use stone for rubble masonry that is sound, durable, and does not contain segregations, seams, cracks, pyrite intrusions, or other structural defects or imperfections that affect weather resistance.
   a. Do not use stone with rounded, worn, or weathered surfaces. Exposed faces cannot show scars caused by quarrying. Weathered stone will be rejected.
   b. Ensure that the stone has no more than 65 percent wear and no more than 15 percent loss after the magnesium sulfate soundness test.
   c. Use stone that can be wrought truly to lines and surfaces (curved or plain).
   d. Ensure that each stone is at least 6 in. (150 mm) thick and 1 ft. (300 mm) wide, except for fill stones used in wall interiors.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percent Wear</td>
<td>AASHTO T 96</td>
</tr>
<tr>
<td>Soundness</td>
<td>AASHTO T 104</td>
</tr>
</tbody>
</table>

D. Materials Warranty

General Provisions 101 through 150.

834.2.03 Mortar and Grout

A. Requirements

1. Use mortar and grout that consists of fresh mixtures of one part Portland or masonry cement and three parts mortar sand and water.
   You may add hydrated lime when using Portland cement in amounts not exceeding 10 percent of the weight of cement.
   a. Cement: Use Portland cement that meets the requirements of Subsection 830.2.01 or masonry cement that meets the requirements of ASTM C 91.
   b. Mortar Sand: Use mortar sand that meets the requirements of Subsection 801.2.02.
   c. Mixing: Mix dry in a mixer or in a clean, tight box, until a uniform mixture is produced. Then add enough water to produce the desired consistency.
      Do not use mortar and grout that has been mixed for more than 45 minutes.
      Retempering of mortar is not permitted.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.
Section 835—Aluminum Powder

835.1 General Description
This section includes the requirements for aluminum powder.

835.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   ASTM D 480

835.2 Materials
835.2.01 Aluminum Powder
A. Requirements
   1. Type
      Use an aluminum powder for expanded mortar that is commercially pure, nonleafing, unpolished, and has a low grease content.
   2. Gradation
      Ensure the gradation of the coarse particles meets the following:
      - Not more than 0.2 percent retained on the No. 100 (150 µm) sieve
      - Not more than 10 percent retained on the No. 325 (150 µm) sieve

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fineness</td>
<td>ASTM D 480</td>
</tr>
</tbody>
</table>

D. Materials Warranty
   General Provisions 101 through 150.
Section 836—Special Surface Coating for Concrete

836.1 General Description
This section includes the requirements for products used to produce a decorative, protective, water-repellent, masonry-like textured finish on specified surfaces.

836.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   Interim Federal Specification TT-P-0035
   Federal Specification TT-C-555B
   GDT 71
   QPL 17

836.2 Materials
836.2.01 Surface Coatings
A. Requirements
   1. Type
      Use a surface coating material that is fine- to heavy-textured and forms a tough adhesive bond to the concrete. For a list of sources, see QPL 17.
      a. Use material that has the following characteristics:

      | Application rate    | 50 (± 10) ft²/gal [1.25 (± 0.25) m²/L] without run or sag on vertical surfaces |
      | Dry film thickness (minimum) | 15 mils (0.38 mm) at application rate of 50 ft²/gal (1.25 m²/L) |
      | Color               | Lusterless gray that matches Federal Standard color No. 36622 (unless specified otherwise on the plans) |
   b. Use grout-type coatings that meet the requirements of Interim Federal Specification TT-P-0035.
   c. Use paint-type coatings that meet the requirements of Federal Specification TT-C-555B.
Section 836 — Special Surface Coating for Concrete

2. Classification
   Classify special surface coatings as either Class A or B with these compositional characteristics.
      Add acrylic polymer modifiers to the cement grout in the form of an emulsion.
      Further classify the coatings by solvent/thinner type and resin type.
      1) Type 1—Acrylic Emulsion: A pigmented, 100 percent acrylic polymer with suitable texturing aggregate additions. Do not use polyvinyl acetate and styrene butadiene polymers as modifying agents.
      2) Type 2—Organic Solvent Thinned Vinyl toluene/acrylate copolymer: Pigmented binder in compatible organic solvents with suitable texturing aggregate additions. Use an emulsion polymerization process to form the resinous binder.

3. Submit certified test reports of coating materials from an approved independent laboratory. Submit the results of tests required in this Section and in the referenced Federal Specification.
   a. If the manufacturer that produces the coating changes the formula, submit new certified test reports.
   b. Certify to the following quantitative characteristics:
      • Total solids, percent by weight of the paint
      • Vehicle, percent by weight of the paint
      • Vehicle solids, percent by weight of the vehicle
      • Unit weight

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Submit to the Engineer the manufacturer’s certified test results meeting the applicable Federal Specification and the following requirements when tested according to GDT 71:
   1. Freeze-Thaw Resistance: No evidence of cracking, checking, pitting, or adhesion loss after 50 freeze-thaw cycles.
   2. Accelerated Weathering: No evidence of cracking, checking, or adhesion loss; no more than slight discoloration after 5000 hours of exposure in a Twin Arc Weatherometer. Use the Weatherometer procedure in GDT 71.
   In addition to the previous requirements, no coating will be approved before it completes a two-year field test installation.

D. Materials Warranty
   General Provisions 101 through 150.
Section 837—Polymer Concrete

837.1 General Description
This section includes the requirements for polymer concrete.

837.1.01 Related References

A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   AASHTO T 97
   ASTM C 109 or C 31
   ASTM C 140
   ASTM C 531
   ASTM C 807

837.2 Materials

837.2.01 Polymer Concrete

A. Requirements
   1. Type
      Use a methyl methacrylate (MMA) or polyester polymer concrete that bonds to the substrate with the manufacturer’s recommended primer.
      a. Use a polymer concrete that combines a two-component, solvent-free resin and selected clean, dry aggregate.
      b. Use a primer that is a two-component system recommended by the polymer concrete manufacturer. After mixing, apply it with brushes or another suitable method.
      c. Use a primer that is tack-free within one hour of mixing.
      d. Before adding dry aggregate at the job site to increase yield, get approval from the Office of Materials and Research.
   2. Physical Characteristics
      Use a polymer concrete similar in color to Portland cement concrete.
      a. Use a polymer that can be mixed and placed like Portland cement concrete.
      b. Ensure that the polymer concrete meets the following requirements:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Initial setting time</td>
<td>12 minutes minimum</td>
</tr>
<tr>
<td>Final setting time</td>
<td>60 minutes maximum</td>

<tr>
<td>Shrinkage</td>
<td>0.13% maximum</td>
</tr>
<tr>
<td>Shear bond strength</td>
<td>200 psi (1.5 MPa) in 24 hrs. minimum</td>
</tr>
</tbody>
</table>

### B. Fabrication

3. **Packaging and Storage**
   a. Package polymer concrete in strong, moisture-proof paper bags or other suitable containers capable of withstanding shipping, normal handling, and storage without breakage.
   b. Clearly label each container of the components of the polymer concrete system with the following information:
      - Component designation
      - Manufacturer’s batch number
      - Mixing instructions
   c. Display potential hazards and precautions according to the Federal Hazardous Products Labeling Act.

### C. Acceptance

The tests below include procedures to create specimens for the shear bond strength test.

1. When performing acceptance tests, follow the mixing instructions of the manufacturer.
2. Air-cure all test specimens except for the 7-day moist-cure compressive strength cubes.
3. Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Setting time</td>
<td>ASTM C 807</td>
</tr>
<tr>
<td>Flexural strength</td>
<td>AASHTO T 97 [3 x 3 x 16 in. (75 x 75 x 400 mm)] specimens</td>
</tr>
<tr>
<td>Compressive strength</td>
<td>ASTM C 109 or C 31, whichever is applicable</td>
</tr>
<tr>

<td>See procedures below</td>
</tr>
<tr>
<td>Absorption</td>
<td>ASTM C 140</td>
</tr>
<tr>
<td>Shrinkage</td>
<td>ASTM C 531</td>
</tr>
</tbody>
</table>
4. Shear Bond Strength Procedures

The shear bond strength in psi (MPa) equals the load in pounds (newtons) divided by the interfacial area of the patch in square inches (square millimeters). Test as follows:

a. Cast a 8 x 2 x ½ in. (200 x 50 x 13 mm) polymer patch on an air-cured 3 x 3 x 8 in. (75 x 75 x 200 mm) concrete mortar base.

b. Saw the base and polymer patch into 2 in. (50 mm) segments for testing.

c. Use a holding device and plunger to apply a load at a rate of 0.05 in. (1.3 mm) per minute to the patch until failure occurs.

D. Materials Warranty

Use a polymer concrete with a minimum storage life of 6 months under storage conditions of 40 ° to 100 °F (4 ° to 38 °C) and a maximum relative humidity of 90 percent.
Section 838 — Graffiti Proof Coating for Concrete

838.1 General Description
This section includes the requirements for products that make graffiti-proof coatings and an effective graffiti removal system over specified surface.

838.1.01 Related References
A. Standard Specifications
   Section 836—Special Surface Coating for Concrete
B. Referenced Documents
   QPL 42

838.2 Materials
838.2.01 Graffiti Proof Coating
A. Requirements
   1. Type
      Select an approved graffiti guard from QPL 42. When using special surface coatings as base coats, ensure the special surface coatings meet Section 836 requirements and the two coatings are compatible.
   2. Certification
      Submit a sample and an annual warranty for evaluation each year, or whenever product formulation changes, whichever comes first.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   1. The Department will evaluate the compatibility of the graffiti-proof coating and the special surface coating as a graffiti guard system.
   2. The manufacturer will submit test results from an Independent Laboratory showing that the coating meets the following requirements:
      a. Freeze-Thaw Resistance
         1) No evidence of cracking or adhesive loss after 100 freeze-thaw cycles
      2) Easy to remove dried paint using a cleaner supplied by the producer or a commercial paint stripper
      b. Accelerated Weathering
         No evidence of cracking or adhesive loss and no discoloration after 1,500 hours of exposure in a Twin Arc Weatherometer.

D. Materials Warranty
   General Provisions 101 through 150.
Section 839—Corrugated Polyethylene Underdrain Pipe

839.1 General Description
This section includes the requirements for corrugated polyethylene underdrain pipe and fittings used primarily as highway underdrain and temporary slope drains.

839.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO M 252

839.2 Materials
839.2.01 Corrugated Polyethylene Underdrain Pipe
A. Requirements
   1. Type
      Use corrugated polyethylene underdrain pipe and fittings that meet the requirements of AASHTO M 252, with the following exceptions:
      • A maximum elongation of 10 percent
      • A gage length to determine percent elongation of 3 ft., ± 1/8 in. (900 mm, ± 3 mm)
   2. Obtain pipe from an approved source or follow the acceptance process described in Subsection 839.2.01.C, Acceptance below.
   3. Unless specified otherwise, pipe must be supplied in individual lengths not shorter than 10 ft. (3 m) Coils are not permitted for pipe 6 in. (150 mm) or larger in diameter.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   1. You may use pipe in construction supplied from plants operating on certified acceptance status without prior evaluation by lots.
   2. Test any approved or untested material prior to use that has been directly exposed to sunlight for more than 6 months.
   3. Pipe lengths that have developed bends that cannot be sufficiently straightened will be rejected.
      a. Straightening of individual pipe lengths by force will be permitted provided that no stress cracking occurs in the process.
      b. Any pipe length that develops stress cracks will be rejected.
4. Certification Process
   a. To qualify as an approved source, the manufacturer must present the following:
      1) Evidence that the manufacturer has an acceptable quality control procedure for raw materials and manufacturing processes
      2) A yearly notarized certification stating that all pipe furnished is manufactured to meet this specification
   b. The Department will conduct random plant inspections and take random samples at the plant or at the project site for testing.
   c. The Department will remove plants from certified acceptance status when, at any time, they demonstrate inadequate quality control or non-compliance of the pipe material specifications.

D. Materials Warranty
   1. Store and use polyethylene tubing properly. It will melt and burn when exposed to flame.
   2. This product is flexible, thin-walled, and will temporarily weaken when heated. Be careful to avoid crushing or stretching the pipe on hot days with bright sunlight.
840.1 General Description
This section includes the requirements for the following types of corrugated aluminum alloy pipe:
- Culvert
- Underdrain
- Slope drain
- Structural plate for pipe, pipe arches, and arches

840.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO M 190M
   AASHTO M 196M
   AASHTO M 219M
   GDT 17

840.2 Materials
840.2.01 Corrugated Aluminum Alloy Culvert and Underdrain Pipe
A. Requirements
   Use corrugated aluminum alloy pipe that meets the requirements of AASHTO M 196M.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   The Department will inspect corrugated aluminum alloy pipe according to GDT 17.
D. Materials Warranty
   General Provisions 101 through 150.

840.2.02 Corrugated Aluminum Alloy Slope Drain Pipe
A. Requirements
   Use corrugated aluminum alloy slope drain pipe that meets AASHTO M 196M requirements, with the exception that the pipe is not perforated.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   The Department will inspect the pipe according to GDT 17.
D. Materials Warranty
   General Provisions 101 through 150.
840.2.03 Bituminous Coated Corrugated Aluminum Alloy Culvert Pipe

A. Requirements
   1. Use bituminous-coated corrugated aluminum culvert pipe that meets AASHTO M 196M requirements.
   2. Use pipe that has a bituminous coat that meets the requirements of AASHTO M 190M for the type of coating specified.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will inspect the pipe according to GDT 17.

D. Materials Warranty
   General Provisions 101 through 150.

840.2.04 Corrugated Aluminum Alloy Structural Plate for Pipe, Pipe Arches, and Arches

A. Requirements
   Use corrugated aluminum alloy structural plate for pipe, pipe arches, and arches that meet the requirements of AASHTO M 219M.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
841.1 General Description
This section includes the requirements for iron pipe, including cast iron soil pipe and fittings, and ductile iron pipe and appurtenances.

841.1.01 Related References
A. Standard Specifications
   Section 106—Control of Materials
   Section 848—Pipe Appurtenances
B. Referenced Documents
   ASTM A 74
   ASTM B 29
   ASTM C 564
   ANSI/AWWA A 21.4
   ANSI/AWWA A 21.10
   ANSI/AWWA A 21.11
   ANSI/AWWA A 21.50
   ANSI/AWWA A 21.51
   ANSI/AWWA A 21.53

841.2 Materials
For each item in this Section, submit a certification from the manufacturer as per the requirements in Subsection 106.05, Materials Certification.
Include the chemical and physical properties of the materials and their conformance with this specification on the certification.

841.2.01 Cast Iron Soil Pipe and Fittings
A. Requirements
   1. Type
      Use cast iron soil pipe and fittings that meet the requirements of ASTM A 74, including the inside and outside coatings.
      a. Rubber Gasket Joints: Use rubber gasket joints for cast iron soil pipes that meet the requirements of ASTM C 564.
      b. Lead Joints: Use refined lead that meets the requirements of ASTM B 29. Do not use reclaimed lead.
      c. Plain End Cast Iron Soil Pipe: Plain end cast iron soil pipe may be joined with steel bolted couplings if they meet the requirements of Subsection 848.2.0.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department accepts material that is properly certified by the manufacturer.
D. **Materials Warranty**
   General Provisions 101 through 150.

**841.2.02 Ductile Iron Pipe and Appurtenances**

A. **Requirements**
   Use ductile iron pipe that meets the requirements of ANSI/AWWA A 21.50 and A 21.51 for the class and joint specified.
   1. **Fittings**
      Use fittings that meet the requirements of ANSI/AWWA A 21.10 or A 21.53 for the class and joint specified.
   2. **Rubber Gasket Joints**
      Use rubber gasket joints that meet the requirements of ANSI/AWWA A 21.11.
   3. **Flanges**
      Use flanges that meet the requirements of ANSI/AWWA A 21.11.
   4. **Plain End Ductile Iron Pipe**
      Plain end ductile iron pipe may be joined with steel-bolted couplings if they meet the requirements of Subsection 848.2.02.
   5. **Cement Mortar Linings**
      Use cement mortar linings that meet the requirements of ANSI/AWWA A 21.4. Line all ductile iron pipe and fittings with cement mortar unless specified otherwise.

B. **Fabrication**
   General Provisions 101 through 150.

C. **Acceptance**
   The Department accepts material that is properly certified by the manufacturer.

D. **Materials Warranty**
   General Provisions 101 through 150.
842.1 General Description
Specifications for this work will be included elsewhere in the Contract.
# Section 843—Concrete Pipe

## 843.1 General Description
This section includes the requirements for reinforced concrete pipe, nonreinforced concrete pipe, and concrete underdrain pipe.

### 843.1.01 Related References

   - SOP-19

## 843.2 Materials

### 843.2.01 Reinforced Concrete Pipe

A. **Requirements**

1. **Type**

   Use reinforced concrete pipe that meets the requirements of AASHTO M 170 (M 170M), with the changes described in the following table. For a list of sources, see QPL 4.

<table>
<thead>
<tr>
<th>Material</th>

**NOTE:** Before manufacture, you may request approval of modified designs that differ from the Specifications Certification

1580
Section 843 — Concrete Pipe

a. File a certificate with the Engineer stating that the concrete pipe manufactured for Department use meets the requirements of reinforcement steel specified in this Section.

A bonded legal authority of the manufacturing company shall endorse the requirements certification.

b. Submit a guarantee with the certificate stating that concrete pipe will be replaced, without cost to the purchaser, if the reinforcement steel does not meet these specifications.

c. Ensure that the guarantee remains in effect as long as the manufacturer furnishes concrete pipe for Department use.

d. This guarantee does not limit the right of the Department to inspect and check the materials in manufactured concrete pipe prior to and during pipeline construction.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will test and inspect using SOP-19.

D. Materials Warranty

See the Certification requirements under Subsection 843.2.01.A.2.

843.2.02 Nonreinforced Concrete Pipe

A. Requirements

1. Type

Use nonreinforced concrete pipe to convey sewage, industrial waste, and storm water that meets the requirements of AASHTO M 86 (M 86M), Class II, with the following changes:

<table>
<thead>
<tr>
<th>Material</th>
<th>Requirements</th>
<th>Other Modifications</th>

<td>Subsection 831.2.03.A</td>
<td>None</td>
</tr>
<tr>
<td>Water</td>
<td>Subsection 880.2.01</td>
<td>None</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will test and inspect using SOP-19.

D. Materials Warranty

General Provisions 101 through 150.
843.2.03 Concrete Underdrain Pipe

A. Requirements

1. Type

Use concrete underdrain pipe that meets the requirements of AASHTO M 175 (M 175M) or AASHTO M 176 (M 176M), with the following changes unless the plans state otherwise:

<table>
<thead>
<tr>
<th>Material</th>
<th>Requirements</th>

<td>Subsection 831.2.03.A</td>
<td>None</td>
</tr>
<tr>
<td>Water</td>
<td>Subsection 880.2.01</td>
<td>None</td>
</tr>
</tbody>
</table>

*Use fine aggregate in standard strength, perforated, nonreinforced concrete underdrain pipe.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will test and inspect using SOP-19.

D. Materials Warranty

General Provisions 101 through 150.
Section 844—Steel Pipe

844.1 General Description

This section includes the requirements for the following types of steel pipe and related materials:

- Corrugated steel culvert pipe and pipe arches
- Bituminous-coated corrugated steel culvert
- Steel structural plate for pipe arches and arches
- Corrugated steel underdrain
- Precoated, galvanized, steel culvert
- Aluminum-coated (Type 2) corrugated steel

844.1.01 Related References

A. Standard Specifications

General Provisions 101 through 150.

B. Referenced Documents

- ASTM A862/A862M

844.2 Materials

Repair any damaged coatings on the steel pipe according to AASHTO M 243M.

844.2.01 Corrugated Steel Culvert Pipe and Pipe Arches

A. Requirements

1. Type

   Use corrugated steel culvert pipe and pipe arches that meet the requirements of AASHTO M 36M, Type I or II culvert pipe for dimensions and thicknesses, except as follows:

   a. Modify AASHTO M 36M, Section 9 to connect all slope drain pipe (except temporary slope drain pipe) with standard one- or two-piece bands. Use bands that completely engage at least one corrugation on each side of the joint or elbow section.

   b. Use connecting bands with projections as described in AASHTO M 36M, Section 9, for temporary slope drain, storm drain, and side drain pipe.

   c. Use special sections for these conduits, such as elbows and flared ends, that are of the same plate thickness as the conduit to which they are joined, and meet the applicable requirements of AASHTO M 36M, as modified.
Section 844 — Steel Pipe

B. Fabrication
Furnish shop-formed elliptical pipe and shop-strutted pipe where specified.

C. Acceptance
See the requirements of AASHTO M 36M.

D. Materials Warranty
General Provisions 101 through 150.

844.2.02 Bituminous Coated Corrugated Steel Culvert Pipe
A. Requirements
1. Type
   Use bituminous-coated corrugated steel pipe that meets the requirements of AASHTO M 190M, ASTM A849, and ASTM A862/A862M for the sectional dimensions, plate thickness, and type of bituminous coating.
   a. Use special sections for these conduits, such as elbows and flared ends, that are the same plate thickness as the conduit to which they are joined and meet the applicable requirements of AASHTO M 190M, ASTM A849, and ASTM A862/A862M.
   b. Provide paved inverts (when required) that conform to the listed specifications.
   c. AASHTO M190M and ASTM A849 both contain bituminous material specifications, coating types and coating thickness requirements. Use the requirements of AASHTO M190M when there are discrepancies between the specification requirements.
   d. Use the ASTM 862/A862M requirements for post application of coatings.

B. Fabrication
1. Fully coat coupling bands and special sections, such as elbows, flared end sections and safety end sections with bituminous material.
2. Furnish shop-formed elliptical pipe and shop-strutted pipe where specified.

C. Acceptance
See the requirements of AASHTO M 190M.

D. Materials Warranty
General Provisions 101 through 150.

844.2.03 Steel Structural Plate for Pipe Arches and Arches
A. Requirements
1. Type
   Use structural plates and galvanized corrugated steel for the corrugated steel plate pipe, pipe arches, and arches that meet the requirements of AASHTO M 167M, AASHTO M 36M, and the following requirements, when applicable:
   a. Bituminous Coating: When bituminous coating is specified, use a coating that meets the requirements of AASHTO M 190M for the type specified.
   b. Galvanized Corrugated Plates for Pipe: Pipe, pipe arch, and arches may be constructed from corrugated galvanized sheets or plates.
B. Fabrication

1. Bituminous Coating
   After erecting the structure, but before placing any backfill, replace any coating that was removed or damaged during erection, either inside or outside, with bituminous material meeting Subsection 844.2.02.

2. Galvanized Corrugated Plates for Pipe
   No further galvanizing is required after fabrication if the spelter coating was not injured during shipping or erection.

C. Acceptance
   See the requirements of AASHTO M 167M and M 36M.

D. Materials Warranty
   General Provisions 101 through 150.

844.2.04 Corrugated Steel Underdrain Pipe

A. Requirements

1. Type
   For underdrains, use full-circle, galvanized, corrugated steel pipe that meets the requirements of AASHTO M 36M, Type III, or IIIA for the specified diameters.
   Determine the metal thickness according to the following table:

<table>
<thead>
<tr>
<th>Nominal Inside Diameter inches (mm)</th>
<th>Thickness inches (mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>6 (150)</td>
<td>.052 (1.320)</td>
</tr>
<tr>
<td>8 (200)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>10 (250)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>12 (300)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>15 (375)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>18 (450)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>21 (525)</td>
<td>.064 (1.630)</td>
</tr>
<tr>
<td>24 (600)</td>
<td>.079 (2.000)</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   See the requirements of AASHTO M 36M.

D. Materials Warranty
   General Provisions 101 through 150.
844.2.05 Precoated, Galvanized Steel Culvert Pipe

A. Requirements
   1. Type
      Use precoated, galvanized steel pipe that meets the requirements of AASHTO M 245M for the specified sectional dimensions, plate thickness, and type of coating.
      a. Use special sections for these conduits, such as elbows and flared ends, that are the same plate thickness as the conduit to which they are joined and that meet the applicable requirements of AASHTO M 190M.
      b. Use the specified coating and invert paving.

B. Fabrication
   1. Fully precoat or coat the coupling bands with bituminous material according to Subsection 844.2.02.
   2. Furnish shop-formed elliptical pipe and shop-strutted pipe where specified.

C. Acceptance
   See the requirements of AASHTO M 190M.

D. Materials Warranty
   General Provisions 101 through 150.

844.2.06 Aluminum-Coated (Type 2) Corrugated Steel Pipe

A. Requirements
   Use steel sheet for corrugated steel pipe that meets AASHTO M 274M requirements.

B. Fabrication
   Fabricate corrugated steel pipe to the requirements of AASHTO M 36M.

C. Acceptance
   See the requirements of AASHTO M 274M.

D. Materials Warranty
   General Provisions 101 through 150.
Section 845 — Thermoplastic Pipe

845.1 General Description
This section includes the requirements for thermoplastic culvert pipe, underdrain pipe and slope drain pipe.

845.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   AASHTO M 252

   AASHTO LRFD Bridge Construction Specifications
   QPL 51

845.2 Materials
845.2.01 Smooth-lined, Corrugated Polyethylene (PE) Culvert Pipe
A. Requirements
   1. Use pipe meeting the requirements of AASHTO M 294, Type S, manufactured with virgin resins only. Post-consumer and post-industrial recycled resins are not allowed.
   2. Use pipe evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.
   3. Ensure pipe is produced from an approved source listed on QPL 51.
   4. Use fittings and couplings as recommended by the manufacturer and approved by the Office of Materials and Testing. The fittings and couplings shall comply with the joint performance criteria of AASHTO LRFD Bridge Construction Specifications. Ensure that the joints are “silt-tight” per the AASHTO LRFD Bridge Construction Specifications.
   5. Ensure joints have elastomeric seals that meet the requirements of ASTM F 477.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.

D. Materials Warranty
   General Provisions 101 through 150.
Section 845—Thermoplastic Pipe

### 845.2.02 Polyvinyl Chloride (PVC) Profile Wall Drain Pipe

**A. Requirements**

1. Use pipe that meets the requirements of AASHTO M 304.
2. Use pipe evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.
3. Ensure pipe is produced from an approved source listed on QPL 51.
4. Use fittings and couplings as recommended by the manufacturer and approved by the Office of Materials and Testing. The fittings and couplings shall comply with the joint performance criteria of AASHTO LRFD Bridge Construction Specifications. Ensure that the joints are “silt-tight” per the AASHTO LRFD Bridge Construction Specifications.
5. Ensure joints have elastomeric seals that meet the requirements of ASTM F 477.

**B. Fabrication**

General Provisions 101 through 150.

**C. Acceptance**

Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.

**D. Materials Warranty**

General Provisions 101 through 150.

### 845.2.03 Polyvinyl Chloride (PVC) Corrugated Smooth Interior Drain Pipe

**A. Requirements**

1. Use pipe that meets the requirements of ASTM F 949.
2. Use pipe evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.
3. Ensure pipe is produced from an approved source listed on QPL 51.
4. Use fittings and couplings as recommended by the manufacturer and approved by the Office of Materials and Testing. The fittings and couplings shall comply with the joint performance criteria of AASHTO LRFD Bridge Construction Specifications. Ensure that the joints are “silt-tight” per the AASHTO LRFD Bridge Construction Specifications.
5. Ensure joints have elastomeric seals that meet the requirements of ASTM F 477.

**B. Fabrication**

General Provisions 101 through 150.

**C. Acceptance**

Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.

**D. Materials Warranty**

General Provisions 101 through 150.

### 845.2.04 Corrugated Polyethylene Underdrain Pipe

**A. Requirements**

1. Use corrugated polyethylene underdrain and temporary slope drain pipe and fittings that meet the requirements of AASHTO M 252.
2. Ensure pipe is produced from an approved source listed on QPL 51.
3. Unless specified otherwise, pipe must be supplied in individual lengths not shorter than 10 ft. (3 m) Coils are not permitted for pipe 6 in. (150 mm) or larger in diameter.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

1. Test any material prior to use that has been directly exposed to sunlight for more than 6 months.
2. Pipe lengths that have developed bends that cannot be sufficiently straightened will be rejected.
   a. Straightening of individual pipe lengths by force will be permitted provided that no stress cracking occurs in the process.
   b. Any pipe length that develops stress cracks will be rejected.

D. Materials Warranty

General Provisions 101 through 150.

845.2.05 Smooth-Lined Corrugated Polypropylene (PP) Pipe

A. Requirements

1. Use pipe meeting the requirements of AASHTO M 330, Type S, manufactured with virgin resins only. Post-consumer and post-industrial recycled resins are not allowed.
2. Use pipe evaluated by the National Transportation Product Evaluation Program (NTPEP) test facility or other approved test facility.
3. Ensure pipe is produced from an approved source listed on QPL 51.
4. Use fittings and couplings as recommended by the manufacturer and approved by the Office of Materials and Testing. The fittings and couplings shall comply with the joint performance criteria of AASHTO LRFD Bridge Construction Specifications. Ensure that the joints are “silt-tight” per the AASHTO LRFD Bridge Construction Specifications.
5. Ensure joints have elastomeric seals that meet the requirements of ASTM F 477.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.

D. Materials Warranty

General Provisions 101 through 150.
846.1 General Description
This section includes the requirements for Polyvinyl Chloride (PVC) Drain Pipe.

846.2 Materials

846.2.01 Polyvinyl Chloride (PVC) Profile Wall Drain Pipe
A. Requirements
   Use pipe that meets the requirements of AASHTO M 304.
   Ensure pipe is produced from an approved source listed on QPL 51.
   Ensure joints are watertight and have elastomeric seals that meet the requirements of ASTM F 477.
   Assemble the joints according to the manufacturer’s recommendations.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   The Department will test and inspect using SOP-28.
   Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.
D. Materials Warranty
   General Provisions 101 through 150.
Section 846 — Polyvinyl Chloride (PVC) Drain Pipe

846.2.02 Polyvinyl Chloride (PVC) Corrugated Smooth Interior Drain Pipe

A. Requirements
   Use pipe that meets the requirements of ASTM F 949.
   Ensure pipe is produced from an approved source listed on QPL 51.
   Ensure joints are watertight and have elastomeric seals that meet the requirements of ASTM F 477.
   Assemble the joints according to the manufacturer’s recommendations.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will test and inspect using SOP-28.
   Have the manufacturer test the joint tightness according to ASTM D 3212 and certify the results according to Subsection 106.05.

D. Materials Warranty
   General Provisions 101 through 150.
847.1 General Description
This section includes the requirements for water, storm drain, and sewer pipes. The pipe types are:

- Galvanized steel pipe and fittings
- Steel water pipe
- Copper pipe tubing
- Steel sewer pipe and casing pipe
- Plastic water pipe
- Plastic truss sewer pipe
- Polyvinyl chloride (PVC) sewer pipe and fittings

847.2 Materials
Each item under this section requires a certification from the manufacturer according to Subsection 106.05, Materials Certification.

847.2.01 Galvanized Steel Pipe and Fittings
A. Requirements
   1. Type
      Use galvanized steel pipe that meets the requirements of ASTM A 53/A 53M. Use standard weight pipe unless otherwise specified.
   2. Use fittings of malleable iron that meets the requirements of ANSI B 16.3, except the nipples and couplings shall be the same material as the pipe.

B. Fabrication
   Hot-dip galvanize all fittings, nipples, and couplings according to ASTM A 53/A 53M.
C. **Acceptance**

   The Department will accept the pipe and fittings based on the certification or on the results of tests conducted by the Department.

D. **Materials Warranty**

   General Provisions 101 through 150.

### 847.2.02 Steel Water Pipe

#### A. **Requirements**

1. **Type**

   Use materials and requirements indicated in the table:

<table>
<thead>
<tr>
<th>Material</th>
<th>Meet Requirements of:</th>
<th>Other Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pipe and fittings</td>
<td>AWWA C 201 or C 202</td>
<td>Use Grade B steel plate. Designate the pipe by operating pressure class.</td>
</tr>
<tr>
<td>Bell and spigot joints</td>
<td>AWWA C 202</td>
<td></td>
</tr>
<tr>
<td>Rubber gasket material</td>
<td>AWWA C 301</td>
<td></td>
</tr>
<tr>
<td>Steel-bolted couplings</td>
<td>Subsection 848.2.02</td>
<td>You may join plain-end steel pipe with steel-bolted couplings.</td>
</tr>
<tr>
<td>Cement mortar linings</td>
<td>AWWA C 205</td>
<td></td>
</tr>
<tr>
<td>Coal-tar enamel lining and coating</td>
<td>AWWA C 203</td>
<td></td>
</tr>
</tbody>
</table>

#### B. **Fabrication**

   General Provisions 101 through 150.

#### C. **Acceptance**

   The Department will accept the pipe based on the certification.

#### D. **Materials Warranty**

   General Provisions 101 through 150.

### 847.2.03 Copper Pipe Tubing

#### A. **Requirements**

   Use pipe or tubing that meets the requirements of ASTM B 88 (B 88M), Type K.

#### B. **Fabrication**

   General Provisions 101 through 150.

#### C. **Acceptance**

   The Department will accept the tubing based on the certification.

#### D. **Materials Warranty**

   General Provisions 101 through 150.
**847.2.04 Steel Sewer Pipe and Casing Pipe**

**A. Requirements**

Type: Use the material and requirements indicated in the table:

<table>
<thead>
<tr>
<th>Material</th>
<th>Meet Requirements of:</th>
<th>Other Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Steel sewer pipe and casing pipe</td>
<td>ASTM A 53/A 53M or ASTM A 139</td>
<td>The hydrostatic test is not required.</td>
</tr>
<tr>
<td>Bell and spigot joints</td>
<td>AWWA C 202</td>
<td></td>
</tr>
<tr>
<td>Rubber gasket material</td>
<td>AWWA C 301</td>
<td></td>
</tr>
<tr>
<td>Steel-bolted couplings</td>
<td>Subsection 848.2.02</td>
<td>You may join plain-end steel pipe with steel-bolted couplings.</td>
</tr>
<tr>
<td>Cement mortar linings</td>
<td>AWWA C 205</td>
<td></td>
</tr>
<tr>
<td>Coal-tar enamel lining and coating</td>
<td>AWWA C 203</td>
<td></td>
</tr>
</tbody>
</table>

Unless the plans specify otherwise, use standard weight pipe.

**B. Fabrication**

General Provisions 101 through 150.

**C. Acceptance**

The Department will accept the pipe based on the certification or on the results of tests conducted by the Department.

**D. Materials Warranty**

General Provisions 101 through 150.

**847.2.05 Plastic Water Pipe**

**A. Requirements**

Type: Use polyethylene (PE) pipe and tubing that meet the requirements of ASTM D 2239 and ASTM F 714, as they apply to PE3408. Use the following pipe sizes and standards:

<table>
<thead>
<tr>
<th>Pipe Size</th>
<th>Pressure Rating</th>
<th>Other Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 to 3 in. (15 to 80 mm) meets ASTM D 2239</td>
<td>200 psi (1.4 MPa) or as specified by Engineer</td>
<td>SIDR (standard thermoplastic pipe dimension ratio) = 7</td>
</tr>
<tr>
<td>3 to 42 in. (*80 to 1050 mm) meets ASTM F 714</td>
<td>As specified by Engineer</td>
<td>SDR (standard dimension ratio) as specified by Engineer. Use the Iron Pipe Size system.</td>
</tr>
</tbody>
</table>

*Use 3 to 42 in. (80 to 1050 mm) pipe for new construction and for replacing old piping systems used to transport water, municipal sewage, industrial process liquids, effluents, slurries, etc., in both pressure and non-pressure systems.
Section 847 — Miscellaneous Pipe

1. Water Service Line Pipe: Use polyvinyl chloride (PVC) pipe that meets the requirements of ASTM D 2241, SDR 21, ASTM D 1785 Schedule 40, or ASTM F 1483, Class 200, (PVCO). Use a PVC compound that meets or exceeds the requirements of ASTM D 1784, Class 12454 B.

2. Water Main Pipe: Use 4 to 12 in. (100 to 300 mm) diameter PVC pipe that meets the requirements of AWWA C 900. See the plans for the designated dimension ratio (DR).

B. Fabrication

Extrude the pipe from resin that meets the requirements of ASTM D 3350 with a cell classification of PE345434 C, and ASTM D 1248 pipe-grade resin Type III, Class C, Category 5, Grade P 34.

C. Acceptance

The Department will accept the pipe based on the certification or on the results of tests conducted by the Department.

D. Materials Warranty

General Provisions 101 through 150.

847.2.06 Plastic Truss Sewer Pipe

A. Requirements

Type: Use plastic truss sewer pipe, couplings, and fittings that meet the requirements of ASTM D 2680, acrylonitrile butadiene-styrene (ABS), and polyvinyl chloride (PVC) composite sewer piping.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will accept the pipe based on the certification.

D. Materials Warranty

General Provisions 101 through 150.

847.2.07 Polyvinyl Chloride (PVC) Sewer Pipe and Fittings

A. Requirements

1. Type

Use PVC sewer pipe, couplings, and fittings that meet the requirements of ASTM D 3034 (SDR 35), ASTM F 949, or ASTM F 794 (min. pipe stiffness series 46). Ensure that the joints have elastomeric seals that meet the requirements of ASTM F 477.

2. Certification

Certify the joint tightness according to ASTM D 3212 and submit a certification according to Subsection 106.05, Materials Certification.

B. Fabrication

Assemble the pipe according to the manufacturer’s recommendations.

C. Acceptance

The Department will accept the pipe based on the certification.

D. Materials Warranty

General Provisions 101 through 150.
Section 848 — Pipe Appurtenances

848.1 General Description
This section includes the requirements for all pipe appurtenances, such as:

- Rubber gaskets
- Steel-bolted couplings
- Gate valves
- Sterilizing agents
- Bituminous plastic cement

848.1.01 Related References
A. Standard Specifications

   AWWA M 11
   QPL 21

848.2 Materials

848.2.01 Rubber Gaskets for Concrete Pipe
A. Requirements
   1. Type
      Use rubber-type gaskets and o-rings meeting the requirements of AASHTO M 315 and ASTM C 1619, Class C. However, pipe used in culvert construction does not need a hydrostatic pressure test.
      a. Use approved gaskets and o-rings listed in QPL 21

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept gaskets from approved QPL sources only.

D. Materials Warranty
   General Provisions 101 through 150.
Section 848 — Pipe Appurtenances

848.2.02 Steel-Bolted Couplings

A. Requirements

1. Coupling Types
   Use steel-bolted couplings for joining all types of plain end pipe. Ensure the couplings have the following characteristics:
   - Wedge gasket and flared sleeve
   - One steel middle ring, two steel followers, two wedge-shaped rubber-compounded gaskets, and steel bolts
   - Dimensions and type for the size and kind of pipe to be joined, including reducers if required

2. Middle Rings
   a. Ensure middle rings size 0.375 in. (10 mm) through 3 in. (80 mm) are fabricated from tubing and cold-formed to provide proper flare at each end and to receive the wedge portion of the gasket.
   b. Ensure middle rings size 4 in. (100 mm) and larger are made from either bar or plate-flash-welded, cold-formed, cold-expanded beyond the yield point of the steel to size the ring and proof-test the weld.
   c. Air-test all welded rings to ensure the weld is porous-free.
   d. Use middle rings that have a bellowed portion between the flares provided for the gaskets to accommodate pipe deflection.

3. Followers
   a. Ensure the followers meet these requirements:

<table>
<thead>
<tr>
<th>Size</th>
<th>Fabrication</th>
</tr>
</thead>
<tbody>
<tr>
<td>0.375 in. (10 mm) through 1.5 in. (40 mm)</td>
<td>One piece steel forgings.</td>
</tr>
<tr>
<td>Above 1.5 in. (40 mm) through 5 ¼ in. (130 mm)</td>
<td>Cold-formed, two-piece construction.</td>
</tr>
<tr>
<td>5 ¼ in. (140 mm) through 20 in. (500 mm)</td>
<td>Hot forged from a single piece circular plate &amp; water quenched after forging for maximum strength.</td>
</tr>
<tr>
<td>Above 20 in. (500 mm)</td>
<td>Use a special contoured mill section - circle-rolled, flash-welded and cold-expanded beyond the yield point of the steel to size the ring and proof-test the weld.</td>
</tr>
<tr>
<td>All followers</td>
<td>Have solid formed gasket recess, free of seams or breaks, to confine the gasket.</td>
</tr>
</tbody>
</table>
4. **Gaskets**
   Use gaskets meeting the requirements of ASTM D 2000 3AA708Z-B-13, with the following exceptions:

<table>
<thead>
<tr>
<th>Color</th>
<th>Jet black</th>
</tr>
</thead>
<tbody>
<tr>
<td>Surface</td>
<td>Nonblooming</td>
</tr>
<tr>
<td>Shore “A” Durometer hardness</td>
<td>75 ± 5</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>800 psi (5.5 MPa) minimum</td>
</tr>
<tr>
<td>Elongation</td>
<td>175% minimum</td>
</tr>
</tbody>
</table>

   a. Use a rubber compound that will not deteriorate from age or exposure to air under normal storage or use conditions. Use natural or synthetic rubber that does not contain reclaimed rubber.

   b. Use gaskets immune to impurities such as odorants, liquid hydrocarbons, carbon dioxide, and water normally found in natural gas.

   c. To electrically bond the pipe ends to the center ring, make a permanent bond from material that cannot corrode or deteriorate and is molded into the tip of the gasket.

5. **Bolts**
   Use bolts that have elliptical necks and track heads. Align the elliptical neck and the elliptical hole in the follower so the bolt will not turn.

   a. Ensure the shanks of the bolts have enough threads to compress the gasket.

   b. Submit to the Engineer the manufacturer’s recommended torque for tightening the bolts.

6. **Coating**
   a. Unless otherwise specified, coat all metal parts in the shop to protect them during shipping and storage.

   b. After installation, apply a coat of coal-tar enamel to the coupling and uncoated ends of the pipe, according to AWWA M 11.

7. **Certification**
   Submit a certification from the pipe, gasket, or joint manufacturer to the Engineer, according to Subsection 106.05, *Materials Certification*. The certificate shall describe the physical properties of the rubber gasket and show the results on hydrostatic tests of the gasket and pipe used in the Work.

**B. Fabrication**
General Provisions 101 through 150.

**C. Acceptance**
The Department will accept the material based on the certification.

**D. Materials Warranty**
General Provisions 101 through 150.

**848.2.03 Gate Valves**

**A. Requirements**
Use gate valves meeting the requirements of AWWA C 500.

**B. Fabrication**
General Provisions 101 through 150.

**C. Acceptance**
The Department will accept the material based on the certification.
D. **Materials Warranty**  
General Provisions 101 through 150.

### 848.2.04 Sterilizing Agents

**A. Requirements**  
Use hypochlorites meeting the requirements of AWWA B 300 for sterilizing water systems.

**B. Fabrication**  
General Provisions 101 through 150.

**C. Acceptance**  
General Provisions 101 through 150.

**D. Materials Warranty**  
General Provisions 101 through 150.

### 848.2.05 Bituminous Plastic Cement

**A. Requirements**

1. **Type**
   
   Use a bituminous compound composed of steam-refined petroleum asphalt or refined coal tar that is dissolved in a suitable solvent and stiffened with a mineral filler with short mineral fibers.
   
   a. Ensure the material is smooth and uniform, not thick, livered, or separating to a degree that it cannot be remixed by stirring.
   
   b. Ensure the material can be applied with a trowel, putty knife, or caulking gun without pulling or drawing and has good adhesive and cohesive properties when applied to joint surfaces.
   
   c. You may apply the material cold to seal the joints of bell-and-spigot or tongue-and-groove storm or culvert pipe.
   
   d. Ensure the bituminous plastic cement sets to a tough, plastic coating, without blistering when applied 1/16 to 1/8 in. (2 to 3 mm) thick on a tinned metal panel and cured at room temperature for 24 hours.
   
   e. Use bituminous plastic cement with these characteristics:

<table>
<thead>
<tr>
<th>Minimum</th>
<th>Maximum</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grease cone penetration</td>
<td>175.00</td>
</tr>
<tr>
<td>Weight, lbs./gal (kg/L)</td>
<td>9.75 (1.2)</td>
</tr>
<tr>
<td>Non-volatile, percent</td>
<td>75.00</td>
</tr>
<tr>
<td>Ash, by ignition, percent by weight</td>
<td>25.00</td>
</tr>
</tbody>
</table>

2. Use approved materials from those listed on QPL 21.

**B. Fabrication**  
General Provisions 101 through 150.
Section 848 — Pipe Appurtenances

C. Acceptance

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grease cone penetration</td>
<td>AASHTO T 187</td>
</tr>
<tr>
<td>Non-Volatile</td>
<td>ASTM D 2939</td>
</tr>
<tr>
<td>Ash</td>
<td>ASTM D 128</td>
</tr>
</tbody>
</table>

D. Materials Warranty

General Provisions 101 through 150.

848.2.06 Preformed Plastic Gaskets

A. Requirements

1. Use cold-applied plastic gaskets meeting the requirements of AASHTO M 198 to seal tongue-and-groove concrete culverts, precast manhole, and sewer pipes. However, do not perform the Flash Point COC and Fire Point COC tests.

2. Use approved materials from those listed in QPL 21.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department will accept materials only from facilities listed in QPL 21.

D. Materials Warranty

General Provisions 101 through 150.
Section 850—Aluminum Alloy Metals

850.1 General Description
This section includes the requirements for all types of aluminum alloy materials, including:

- Sheet and plate
- Bars, rods, shapes, and wire
- Bolts, nuts, and set screws
- Washers
- Rivets
- Shims
- Extruded tubing
- Pipe

   2. ANSI
      - B 18.2
      - B 1.1M
850.2 Materials
Submit a certification from the manufacturer for each item in this Section, according to Subsection 106.05, Materials Certification. 850.2.01 Aluminum Alloy Sheet and Plate

A. Requirements
Use aluminum alloy sheet and plate that meets the requirements of ASTM B 209/B 209M, Alloy 6061, Temper T 6.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
General Provisions 101 through 150.

850.2.02 Aluminum Alloy Bars, Rods, Shapes, and Wire

A. Requirements
Use aluminum alloy extruded bars, rods, shapes, and wire that meet the requirements of ASTM B 221/B 221M, Alloy 6061, Temper T 6.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
General Provisions 101 through 150.

850.2.03 Aluminum Alloy Bolts, Nuts, and Set Screws

A. Requirements
Use aluminum alloy bolts, nuts, and set screws made from rod that meets the requirements of ASTM B 211/B 211M, Alloy 2024, Temper T 4.

1. Use bolt heads and nuts of heavy hexagon that meet the requirements of ANSI B 18.2.
2. Use coarse series, Class 6 fit threads that meet the requirements of ANSI B 1.1M.

B. Fabrication
1. Heat-treat the finished bolts, nuts, and set screws to the T 4 temper.
2. Coat each bolt, nut, or set screw with an anodic coating of at least 0.0002 in. (5 µm).
3. Seal the anodic coating with chromate.

C. Acceptance
The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
General Provisions 101 through 150.
Section 850 — Aluminum Alloy Metals

850.2.04 Aluminum Alloy Washers

A. Requirements
   Use aluminum alloy washers made from aluminum alloy sheet or plate that meet the requirements of ASTM B 209/B 209M, Alclad Alloy 2024, Temper T 4.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.

850.2.05 Aluminum Alloy Rivets

A. Requirements
   Use aluminum alloy rivets that meet the requirements of ASTM B 316/B 316M, Alloy 6061, Temper 6.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.

850.2.06 Aluminum Alloy Shims

A. Requirements
   Use aluminum alloy shims made from aluminum alloy sheet or plate that meets the requirements of ASTM B 209/B209M, Alloy 1100, Temper 0.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.
Section 850 — Aluminum Alloy Metals

850.2.07 Aluminum Alloy Extruded Tubing
A. Requirements
   Use aluminum alloy extruded tubes that meet the requirements of ASTM B 221/B 221M, Alloy 6061, Temper 6.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.

850.2.08 Aluminum Alloy Pipe
A. Requirements
   Use aluminum alloy pipe that meets the requirements of ASTM B 241/B 241M, Alloy 6061, Temper T 6, unless otherwise specified.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based either on the certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.
Section 851—Structural Steel

851.1 General Description
This section includes the requirements for the grade and toughness of structural steel.

851.1.01 Related References
A. Standard Specifications
   Section 106—Control of Materials

B. Referenced Documents
   ASTM A 673/A 673M
   ASTM A 709 (ASTM A 709M)
   ASTM E 23

851.2 Materials
851.2.01 Structural Steel
A. Requirements
   1. Type
      Use the structural steel grade specified in the plans. Ensure the steel meets all requirements of the governing
         ASTM or AASHTO specification, this specification, and plan requirements.
      Ensure that all steel submitted as main load-carrying member components subject to tensile stress meets
      either S83 or S84 of ASTM A 709 (ASTM A 709M).
   2. Certification
      Certify that the steel meets the requirements according to Subsection 106.05, Materials Certification.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   1. Toughness Tests
      Charpy V-Notch tests are mandatory for materials designated on the plans as main load-carrying member
      components subject to tensile stress.
      a. Sample the steel according to ASTM A 673/A 673M.
      b. Perform the Charpy V-Notch test according to ASTM E 23.

D. Materials Warranty
   General Provisions 101 through 150.
852.1 General Description

This section includes the requirements for miscellaneous materials, such as:

- Steel bolts, nuts, and washers
- Anchor bolts, nuts, and washers
- High tensile strength bolts, nuts, and washers
- Corrugated steel plank for bridges
- Steel grid for bridge floors

ANSI B 1.1M
AASHTO M 314

852.2 Materials

852.2.01 Steel Bolts, Nuts, and Washers

A. Requirements

1. Bolts and Nuts
   a. Use bolts and nuts, hex or heavy hex as required, that meet the applicable requirements of ASTM F 568M.
   b. Ensure all threads meet the requirements of the latest issue of ANSI B 1.1(B 1.1M).
   c. Use bolts that have Class 2A (6H) threads.
   d. Use nuts that have Class 2 B (6G) threads.
   e. Ensure bolts that transmit shear are threaded so that no more than one thread will be within the grip of the metal.
   f. Use bolts long enough to extend entirely through the nut but no more than 1/4 in. (6 mm) beyond them.

2. Washers
   Use washers that meet the requirements of ASTM F 844 unless otherwise specified.
B. Fabrication
Galvanizing: When galvanized materials are specified, galvanize all bolts, nuts, and washers by either the hot-dip method in ASTM A 153/A 153M, Class C, or the mechanical deposit method in ASTM B 695, Class 50.

C. Acceptance
General Provisions 101 through 150.

D. Materials Warranty
General Provisions 101 through 150.

852.2.02 Anchor Bolts, Nuts, and Washers

A. Requirements
1. Use anchor bolts, nuts, and washers for structural supports that meet the requirements of AASHTO M 314 Grade 55 (379) unless otherwise shown on the plans. Supports include those for highway signs, street lighting, traffic signals, bridge bearing plates, and other similar applications.
   
   Apply Supplementary Requirement S1 of AASHTO M 314 to these materials.

2. Use the grade, shape, and dimensions designated on the plans.

NOTE: The Department will not accept Grade 105 (724).

B. Fabrication
Galvanizing: Where galvanized materials are specified, galvanize all bolts, nuts, and washers by the hot-dip method in ASTM A 153/A 153M and according to the plans.

C. Acceptance
General Provisions 101 through 150.

D. Materials Warranty
General Provisions 101 through 150.

852.2.03 High Tensile Strength Bolts

A. Requirements

1. Bolt Type
   
   Use high tensile strength bolts that meet the requirements of ASTM A325 (A 325M) or ASTM A 490 (A 490M), as specified on the Plans.

2. Nut Type
   
   Apply these changes to ASTM A 325 (A 325M) and/or ASTM A 490 (A 490M):

   a. Use only the following nuts for the listed high tensile-strength bolts:

<table>
<thead>
<tr>
<th>Bolt Spec., Type and Finish</th>
<th>Nut Spec., Grade and Finish</th>
</tr>
</thead>
<tbody>
<tr>
<td>A 325 (A 325M), 1 or 2, plain</td>
<td>A 563—DH or DH 3, plain, A194, 2H, plain (A 563M—8S or 8S3, plain)</td>
</tr>
<tr>
<td>A 325 (A 325M), 1 or 2, zinc coated</td>
<td>A 563—DH, zinc coated, A194, 2H, zinc coated (A 563M—8S, zinc coated)</td>
</tr>
<tr>
<td>A 325 (A 325M), 3, plain</td>
<td>A 563—DH 3 plain (A 563M—8S3, plain)</td>
</tr>
<tr>
<td>A 490 (A 490M), 1 or 2, plain</td>
<td>A 563—DH or DH3, plain, A 194, 2 H, plain (A 563M—10S or 10S3, plain)</td>
</tr>
<tr>
<td>A 490 (A 490M), 3, plain</td>
<td>A 563—DH 3, plain (A 563M—10S3, plain)</td>
</tr>
</tbody>
</table>
b. Ensure all galvanized nuts meet the Supplementary Requirements of ASTM A 563 (A 563M).

3. Washer Type
   Apply these changes to ASTM A 325 (A 325M) and/or ASTM A 490 (A 490M):
   a. For bolts that meet ASTM A 325 (A 325M) or ASTM A 490 (A 490M), use washers that meet the requirements of ASTM F 436.
   b. Use washers that have the same coating or surface finish as the bolts and nuts.

4. Fastener Assemblies
   Provide the Office of Materials and Research at least three samples per lot of each material type furnished to project.

5. Certification Test Reports
   Supply certifications on each item according to Subsection 106.05, Materials Certification. Include on all certifications the item specification number, type or grade, finish, and manufacturer’s product-marking symbol.

   Also, supply the required Mill Test Reports, Manufacturer Certified Test Reports, and Distributor Certified Test Reports with each shipment, as follows:
   a. Mill Test Reports (MTR): Provide an MTR for all mill steel used to manufacture bolts, nuts, and washers. Indicate where the material was melted and manufactured.
   b. Manufacturer Certified Test Reports (MCTR): Supply the MCTR to the Department from the manufacturer of the bolts, nuts, or washers. Each MCTR shall:
      1) Show relevant information required by ASTM A 325 (A 325M) or ASTM A 490 (A 490M), and this specification, including test results for any required coating.
      2) Include the lot number and location where the bolts, nuts, or washers were manufactured.
      3) If the manufacturer furnished the entire assembly (bolts, nuts, and washers), have the manufacturer perform the rotational capacity tests.
      4) Furnish the results and when and where all testing was performed.
   c. Distributor Certified Test Reports (DCTR): If a distributor purchases the various assembly components from different manufacturers, the distributor may run the rotational-capacity test in lieu of a manufacturer. In this case show test results, manufacturer’s component lot numbers, and assigned rotational capacity lot numbers for each combination on the DCTR.
   d. The distributor is responsible for furnishing the required MTR, MCTR, and DCTR with each shipment.

B. Fabrication

1. Bolts
   a. If coating ASTM A 325 (A 325M) bolts with zinc, use either the hot-dip or mechanically deposited process.
   b. Do not hot-dip or electroplate ASTM A 490 (A 490M) bolts with any metallic coating. The bolts become brittle in hydrogen and subsequently crack due to stress corrosion and delayed brittle failure.
   c. Apply these changes to ASTM A 325 (A 325M) and/or ASTM A 490 (A 490M) for bolts:
      1) Test ASTM A 325 (A 325M) galvanized bolts for embrittlement according to ASTM F 606/F 606M, Section 7.
      2) Perform proof load tests (ASTM F 606/F 606 Method 1) for all ASTM A 325 (A 325M) and ASTM A 490 (A 490M) bolts.

2. Nuts
   a. Lubricate galvanized nuts with a lubricant that is clean and dry to the touch. Use a lubricant that has a color that contrasts with the zinc coating so that you can obviously see the coating at the job site.
   b. Perform proof load tests for all nuts, plain and zinc coated, using the method described in ASTM F 606/F 606M Section 4.2.
   c. If you use the nuts with galvanized bolts, run the proof load test after the nut is galvanized, overtapped, and lubricated.
3. Fastener Assemblies (Bolt, Nut, and Washer)
   a. Unless otherwise approved by the Engineer, coat the assemblies with a zinc coating according to ASTM A 153/A 153M.
   b. Take coating thickness measurements on the wrench flats.
   c. No single spot coating thickness measurement shall be less than the required individual specimen value shown on Table 1 of ASTM A 153/A 153M, when taken according to ASTM Recommended Practice E 376.

C. Acceptance
1. Fastener Assemblies (Bolt, Nut, and Washer)
   a. Take coating thickness measurements on the wrench flats according to ASTM Recommended Practice E 376.
   b. Ensure no single coating thickness measurement is less than the required individual Specimen value shown on Table 1 of ASTM A 153/A 153M.

2. Hardness Test
   Perform hardness tests on galvanized components after galvanizing the item and removing the coating.

3. Rotational Capacity Test
   Rotational capacity tests are required on all black or galvanized (after galvanizing) assemblies prior to shipping. The following directions are for Department personnel:
   a. Test each combination of bolt production lot, nut lot, and washer lot as an assembly.
   b. The Project Engineer may require additional rotational-capacity tests on assemblies covered by Subsections 852.2.03.C.4.b.7 and 852.2.03.C.4.b.9.

4. Rotational Capacity Test: Bolts Too Short to Fit in Tension Calibrator
   a. Equipment Required:
      - Calibrated manual torque wrench and a 1 ft. (300 mm) long wrench.
      - Spacers and/or washers with holes that do not exceed the bolt diameter by 1/16 in. (2 mm) for bolts equal to or less than 1 inch (24 mm) in diameter. The hole size for larger bolts shall not exceed the bolt diameter by 1/8 in. (3 mm).
      - Steel section with holes to match bolt sizes.

   b. Procedure:
      1) Mark off a vertical line and lines one-third of a turn, 120 degrees; half of a turn 180 degrees; and two-thirds of a turn, 240 degrees from vertical in a clockwise direction on the plate.
      2) Measure the bolt length, the distance from the underside of the bolt head to the end of the bolt.
      3) Install a nut on the bolt and measure the stick-out of the bolt when three to five full threads of the bolt are located between the bearing face of the nut and the bolt head.
      4) Install the bolt in the appropriate size hole and, if necessary, install the required number of spacers to produce the thread stick-out measured in step 1 (always use at least one washer under the nut).
      5) Snug the nut with the hand wrench. Snug should be the normal effort applied to a 12 in. (300 mm) long wrench. Do not exceed 20 percent of the torque determined in step 7.
      6) Align the nut with the vertical (0 degree) stripe on the test frame plate. This is for reference after you rotate the nut during testing.

NOTE: Use a plate thick enough to accomplish Step 1 in the procedure without spacers. However, spacers are acceptable.
7) Tighten the bolt by turning the nut with the torque wrench to the rotation in the table.

<table>
<thead>
<tr>
<th>Bolt Length (Step 1)</th>
<th>4 bolt dia. or less</th>
<th>4 to 8 bolt dia.</th>
<th>More than 8 bolt dia.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required rotation</td>
<td>1/3</td>
<td>1/2</td>
<td>2/3</td>
</tr>
</tbody>
</table>

Use a second wrench to prevent the bolt from turning.

8) Measure and record the torque required to reach this rotation. Measure torque with the nut in motion. Ensure the torque in foot-pounds (newton-meters) does not exceed the values in the table. Reject any assemblies that exceed the listed torques.

<table>
<thead>
<tr>
<th>Nominal Bolt Dia., In. (mm)</th>
<th>ASTM A 325(A 325M)</th>
<th>ASTM A 490 (A 490M)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1/2 (M16)</td>
<td>150 (419)</td>
<td>180 (525)</td>
</tr>
<tr>
<td>5/8 (M20)</td>
<td>290 (817)</td>
<td>370 (1026)</td>
</tr>
<tr>
<td>3/4 (M22)</td>
<td>500 (1111)</td>
<td>625 (1395)</td>
</tr>
<tr>
<td>7/8 (M24)</td>
<td>820 (1415)</td>
<td>1020 (1773)</td>
</tr>
<tr>
<td>1 (M27)</td>
<td>1230 (2070)</td>
<td>1540 (2592)</td>
</tr>
<tr>
<td>1-1/8 (M30)</td>
<td>1500 (2813)</td>
<td>2160 (3520)</td>
</tr>
<tr>
<td>1-1/4 (M36)</td>
<td>2140 (4912)</td>
<td>3150 (6158)</td>
</tr>
<tr>
<td>1-3/8</td>
<td>2810</td>
<td>3980</td>
</tr>
<tr>
<td>1-1/2</td>
<td>3690</td>
<td>5310</td>
</tr>
</tbody>
</table>

9) Continue tightening the nut as follows:

<table>
<thead>
<tr>
<th>Bolt Length (Step 1)</th>
<th>4 bolt dia. or less</th>
<th>4 to 8 bolt dia.</th>
<th>More than 8 bolt dia.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Rotation</td>
<td>2/3</td>
<td>1</td>
<td>1-1/3</td>
</tr>
</tbody>
</table>

10) Measure the rotation from the initial marking in Step 6.

11) Loosen and remove the nut and examine the bolt and nut threads. Reject any assembly that shows evidence of thread shear, stripping, or torsional failure.

NOTE: Reject any assemblies that fracture or are stripped before reaching the required rotation.

5. Rotational Capacity Test: Long Bolts in Tension Calibrator

   a. Equipment required:
      - Calibrated, measuring device to measure tension for the bolts. Mark off a vertical line and lines one-third of a turn, 120 degrees; and two-thirds of a turn, 240 degrees, from vertical in a clockwise direction on the face plate of the calibrator.
      - Calibrated manual torque wrench.
      - Spacers and/or washers meeting the requirements of Subsection 852.2.03.C.4.a, bullet 2.
      - Steel section to mount the bolt calibrator.
b. Procedure

1) Measure the bolt length, the distance from the underside of the bolt head to the end of the bolt.

2) Put the nut on the bolt and measure the stick-out of the bolt when three to five full threads of the bolt show between the bearing face of the nut and the bolt head.

3) Install the bolt in the tension calibrator. If necessary, install the required number of spacers to produce the thread stick-out measured in step 1 (always use at least one washer under the nut).

4) Tighten the bolt by turning the nut with a hand wrench to the snug tensions listed below [\(-0 +2\) kips \((-0 +9\) kN)].

<table>
<thead>
<tr>
<th>Nominal Bolt Dia., in. (mm)</th>
<th>Tension, kips (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ASTM A 325 (A 325M)</td>
</tr>
<tr>
<td>1/2 (M16)</td>
<td>1 (9)</td>
</tr>
<tr>
<td>5/8 (M20)</td>
<td>2 (14)</td>
</tr>
<tr>
<td>3/4 (M22)</td>
<td>3 (18)</td>
</tr>
<tr>
<td>7/8 (M24)</td>
<td>4 (21)</td>
</tr>
<tr>
<td>1 (M27)</td>
<td>5 (27)</td>
</tr>
<tr>
<td>1-1/8 (M30)</td>
<td>6 (33)</td>
</tr>
<tr>
<td>1-1/4 (M36)</td>
<td>7 (47)</td>
</tr>
<tr>
<td>1-3/8</td>
<td>9</td>
</tr>
<tr>
<td>1-1/2</td>
<td>10</td>
</tr>
</tbody>
</table>

5) Align the nut to the vertical (0 degree) stripe on the face plate of the bolt calibrator.

6) Use the calibrated manual torque wrench to turn the nut to at least the tension in kips (kN) listed below.

<table>
<thead>
<tr>

</table>
Section 852 — Miscellaneous Steel Materials

7) Record both the torque required to reach the tension and the bolt tension value from the calibrator. Measure torque with the nut in motion. The torque cannot be greater than 0.25 x the developed tension in lbf (newtons) x the bolt diameter in feet (meters).

8) Reject assemblies with torque values that exceed the calculated value.

9) Further tighten the nut as follows.

<table>
<thead>
<tr>
<th>Bolt Length (Step 1)</th>
<th>4 bolt dia. or less</th>
<th>4 to 8 bolt dia.</th>
<th>More than 8 bolt dia.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required Rotation</td>
<td>2/3</td>
<td>1</td>
<td>1-1/3</td>
</tr>
</tbody>
</table>

10) Measure the rotation from the initial marking in step 5.

11) Record the bolt tension. Reject assemblies that fail prior to this rotation either by stripping or fracture.

12) After the required rotation, the bolt tension in kips (kN) must equal or exceed the values shown in the table. Reject assemblies that do not meet the tension.

<table>
<thead>
<tr>
<th>Nominal Bolt Dia., in. (mm)</th>
<th>Tension, kips (kN)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>ASTM A 325 (A 325M)</td>
</tr>
<tr>
<td>1/2 (M16)</td>
<td>14 (105)</td>
</tr>
<tr>
<td>5/8 (M20)</td>
<td>22 (163)</td>
</tr>
<tr>
<td>3/4 (M22)</td>
<td>32 (202)</td>
</tr>
<tr>
<td>7/8 (M24)</td>
<td>45 (236)</td>
</tr>
<tr>
<td>1 (M27)</td>
<td>59 (307)</td>
</tr>
<tr>
<td>1-1/8 (M30)</td>
<td>64 (375)</td>
</tr>
<tr>
<td>1-1/4 (M36)</td>
<td>82 (546)</td>
</tr>
<tr>
<td>1-3/8</td>
<td>98</td>
</tr>
<tr>
<td>1-1/2</td>
<td>118</td>
</tr>
</tbody>
</table>

13) Loosen and remove nut and examine the bolt and nut threads. Reject any assembly with any evidence of thread shear, stripping, or torsional failure.

D. Materials Warranty

1. Ship bolts, nuts, and washers from each rotational-capacity lot in the same container.
   a. If shipping only one production lot number for each size nut and washer, you may ship the nuts and washers in the same container.
   b. Permanently mark each container with the rotational-capacity lot number so that identification will be possible at any stage before installation.

2. Black bolts, nuts and washers must be “oily” to the touch when installed. Clean and re-lubricate weathered or rusted bolts, nuts, and washers before installing them.

3. Improperly stored galvanized assemblies will develop white rust. Clean and re-lubricate as in Subsection 852.2.03.B.2.a any bolts, nuts, and washers that show evidence of white rust.
852.2.04 Corrugated Steel Plank for Bridges

A. Requirements
   1. Type
      Use steel that meets ASTM A 570/A 570M Grade 33/230 or ASTM A 653/A 653M Grade 37/255 and ASTM A 924/A 924M.
   2. Furnish copper steel when specified.
   3. Submit a certification according to Subsection 106.05, *Materials Certification*.

B. Fabrication
   1. Make corrugated steel bridge plank of shop-fabricated steel plate. Use the gauge shown on the plans.
   2. Form the steel into plank at least 13 in. (325 mm) wide and between 2 to 4 in. (50 and 100 mm) deep, with at least two complete corrugations.
   3. Galvanizing
      When galvanized plank is specified, galvanize the plank as in ASTM A 123/A 123M or ASTM A 653/A 653M Class G210.

C. Acceptance
   Acceptance is based on the certification.

D. Materials Warranty
   General Provisions 101 through 150.

852.2.05 Steel Grid for Bridge Floors

A. Requirements
   1. Use steel that meets ASTM A 709/A 709M Grade 36/250 and has the specified copper content.
   2. Submit a certification according to Subsection 106.05, *Materials Certification*.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Acceptance is based on the certification.

D. Materials Warranty
   General Provisions 101 through 150.
Section 853 — Reinforcement and Tensioning Steel

853.1 General Description

This section includes the requirements for reinforcement and tensioning steel, including:

- Steel bars
- Pretensioning steel wire strand
- Post-tensioning steel wire
- Post-tensioning steel bars
- Plain steel bars with threaded ends
- Steel wire
- Steel welded wire reinforcement
- Dowel bars
- Dowel (tie) bars
- Bar supports
- Epoxy coating

QPL 12
QPL 55
QPL 61
CRSI Manual of Standard Practices

853.2 Materials

A. Requirements

NOTE: Notify the Office of Materials and Research at least two weeks before blast cleaning the steel reinforcement bars and applying the epoxy coating. This time will allow the Department to schedule an inspection.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.
853.2.01 Steel Bars for Concrete Reinforcement

A. Requirements
   1. Type
      a. Use deformed billet steel bars from rolling mills listed on QPL 61 and from fabricators listed on QPL 12.
      b. Use deformed billet steel bars that meet the requirements of ASTM A 615/A 615M for bar reinforcement in concrete, unless otherwise designated.
      c. Use deformed billet steel for longitudinal bars in continuously reinforced concrete pavement that meet the requirements of ASTM A 615/A 615M, Grade 60 (420).

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on either QPL approval or on tests conducted by the Department. The Department will not accept bent bars that have been straightened and rebent.

D. Materials Warranty
   General Provisions 101 through 150.

853.2.02 Pretensioning Steel Wire Strand

A. Requirements
   1. Type
      Use steel wire that meets all the requirements of ASTM A 416/A 416M. Use Grade 270 for prestressed concrete bridge members.
      a. If you plan to use strands that differ in size from those covered in ASTM A 416/A 416M submit to the Engineer complete data on the proposed strands, as stated below.
   2. Certification
      Submit a certification from the manufacturer that shows the results of the required tests, including stress-strain curves, and conformance to these specifications.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the steel based on the results of tests made by the Department and the certification from the manufacturer.

D. Materials Warranty
   General Provisions 101 through 150.

853.2.03 Post-tensioning Steel Wire

A. Requirements
   1. Type
      Use steel cable for post-tensioning that meets ASTM A 421/A 421M, Type BA or WA, as specified.
   2. Certification
      Submit a certification from the manufacturer that shows the results of the required tests, including stress-strain curves, and conformance to these specifications.

B. Fabrication
   General Provisions 101 through 150.
Section 853 — Reinforcement and Tensioning Steel

C. Acceptance
The Department will accept the steel based on the results of tests made by the Department and the certification from the manufacturer.

D. Materials Warranty
General Provisions 101 through 150.

853.2.04 Post-tensioning Steel Bars

A. Requirements
1. Type
   Use high-strength steel bars for post-tensioning that meet the requirements of ASTM A 722/ A 722M, Type II.
2. Drawings
   a. Show all appurtenances to be used with the bars on shop drawings.
   b. Show all dimensions and steel requirements on the drawings.
   c. Use the appropriate ASTM designation for the steel, if possible.
3. Certification
   Submit a certification that shows the results of the required tests, including stress-strain curves, and conformance to this specification.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the steel based on the results of the tests made by the Department and on the certification from the manufacturer.

D. Materials Warranty
General Provisions 101 through 150.

853.2.05 Plain Steel Bars—Threaded Ends

A. Requirements
Use plain steel bars with threaded ends that meet the requirements of ASTM A 709/ A 709M, Grade 36 (250), 50(345), or 70W(485W).

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the steel based on the certification from the manufacturer.

D. Materials Warranty
General Provisions 101 through 150.

853.2.06 Steel Wire for Concrete Reinforcement

A. Requirements
Use steel wire that meets the requirements of AASHTO M 32/ M 32M and AASHTO M 225/ M 225M and is the size shown on the plans.

B. Fabrication
General Provisions 101 through 150.
C. Acceptance
The Department will accept the steel based on the results of the tests made by the Department or on the certification from the manufacturer.

D. Materials Warranty
General Provisions 101 through 150.

853.2.07 Steel Welded Wire Fabric Reinforcement
A. Requirements
1. Use steel welded wire reinforcement of the size and dimension shown on the plans and that meets the requirements of AASHTO M 55/ M 55M and AASHTO M 221/ M 221M.
2. Use a vendor listed on QPL 55.
B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the steel based on the results of the tests made by the Department or on a certification from the manufacturer.

D. Materials Warranty
General Provisions 101 through 150.

853.2.08 Dowel Bars
A. Requirements
Type: Use dowel bars for concrete pavement that are plain, round steel bars that meet or exceed the tensile requirements of Table 2–Tensile Requirements for Deformed Bars, ASTM A 615/ A 615M, Grade 40 (300).

B. Fabrication
Coat dowel bars with either high density polyethylene or epoxy, as follows:
1. High Density Polyethylene
   Use polyethylene with the following characteristics
   
<table>
<thead>
<tr>
<th>Thickness</th>
<th>12 to 20 mils (0.30 to 0.51 mm)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Texture</td>
<td>Smooth and dense enough to provide adequate bond-breaking characteristics</td>
</tr>
<tr>
<td>Undercoating (adhesive)</td>
<td>Modified rubber blend; 2 to 7 mils (0.05 to 0.18 mm) thick</td>
</tr>
</tbody>
</table>

   Ensure that the undercoating retains its elasticity and effectively seals small cuts or abrasions from moisture migrating under the polyethylene plastic outer coating.

2. Epoxy
   Prepare the dowels for coating, select the epoxy material, apply the epoxy, and sample and test the properties of coated bars according to the requirements of Section 514.
   a. Apply a uniform, smooth coating to the bars that results in a film 12 mils, ± 2 mils (0.30mm, ± 0.05 mm) thick after curing.
   b. Do not coat the cut ends.
   c. Handle the coated dowels carefully to prevent damage to the coating or bar. However, bars can be welded through the epoxy to one side of the supportive basket.
Section 853 — Reinforcement and Tensioning Steel

C. Acceptance
   The Department will accept the steel based on the results of the tests made by the Department or on the certification of the manufacturer.
   The Department will reject dowel bars with burred or deformed ends.

D. Materials Warranty
   General Provisions 101 through 150.

853.2.09 Dowel (Tie) Bars

A. Requirements
   Use uncoated, plain or deformed billet-steel bars that meet the requirements of ASTM A 615/ M, Grade 40 (300) for dowel bars or tie bars in curbs, concrete medians, and other areas specified on the plans.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the steel based on the results of the tests made by the Department or on the certification of the manufacturer.

D. Materials Warranty
   General Provisions 101 through 150.
Section 854—Castings and Forgings

854.1 General Description
This section includes the requirements for the following castings and forgings:

- Gray iron drainage castings
- Cast aluminum alloy railing posts
- Aluminum alloy sand mold castings
- Steel castings
- Steel forgings
- Cold-finished carbon shafting
- Steel castings for bridges

854.1.01 Related References
A. Standard Specifications

B. Referenced Documents
   AASHTO
   ASTM
   M 102/ M 102M
   M 169
   M 306
   ASTM A 27/ A 27M
   ASTM B 26/ B 26 M, Alloy UNS A03560
   ASTM B 108
   QPL 11
   ANSI 356 Temper T 6

854.2 Materials
854.2.01 Gray Iron Drainage Castings
A. Requirements
   Each foundry shall conform to Standard Operating Procedure 18 (SOP 18), *Inspection of Gray Iron Drainage Castings*.
   1. Type
      Use gray iron drainage castings that meet the requirements of AASHTO M 306, Class 35B.
      a. Use foundries listed on QPL 11.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the castings based on the following:
   - Quality of work and conformance to dimension and shape requirements, including acceptable proof load tests and drawings on file with the Office of Materials and Research-Inspection Services Branch for each casting design supplied.
   - Tension bar test results
Section 854 — Castings and Forgings

D. Materials Warranty
   General Provisions 101 through 150.

854.2.02 Cast Aluminum Alloy Railing Posts

A. Requirements
   1. Type
      Use permanent mold types of cast-aluminum alloy roadway railing post that meet ASTM B 108 requirements.
      Ensure that the finish on the castings meets the specifications on the plans.
   2. Certification
      Submit a report with each shipment of castings that includes test results and certifies compliance with this specification.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the castings based on the following:
   • Quality of work and conformance to dimension and shape requirements
   • Certification that the physical and chemical properties of the material meet these specifications

D. Materials Warranty
   General Provisions 101 through 150.

854.2.03 Aluminum Alloy Sand Mold Castings

A. Requirements
   1. Type
      Use aluminum base alloy and castings that meet the requirements of ASTM B 26/ B 26M, Alloy UNS A03560 or ANSI 356 Temper T 6.
   2. Certification
      Submit a report with each shipment of castings that includes test results and certifies compliance with this specification.

B. Fabrication
   Sandblast or otherwise clean the scale and sand off the castings to produce a smooth and uniform surface.

C. Acceptance
   The Department will accept the castings based on the following:
   • Quality of work and conformance to the dimension and shape requirements, as inspected when received
   • Certification that the physical and chemical properties of the material meet these specifications

D. Materials Warranty
   General Provisions 101 through 150.
Section 854 — Castings and Forgings

854.2.04 Steel Castings

A. Requirements
   1. Type
      Use carbon steel castings that meet the requirements of ASTM A 27/ A 27M, Grade 65-35 (450-240). Ensure that the form and dimensions of the steel castings are true to pattern.
   2. Certification
      Submit a report with each castings shipment that includes test results and certifies compliance with this specification.

B. Fabrication
   1. If the plans require large castings, suspend and hammer them all over. Ensure that no cracks, flaws, or other defects appear after this treatment. The Department will not accept sharp unfilleted angles or corners.
   2. Coat surfaces marked “Finished” as soon as practical after finishing with a corrosion-resistant grease before removing them from the shop.
   3. Apply a shop coat of paint to casting surfaces milled for removing scale, scabs, fins, blisters, or other surface deformations. Ensure that the shop coat of paint meets the requirements of Subsection 501.3.04.D.10, Shop Painting.

C. Acceptance
   The Department will accept the castings based on the following:
   - Quality of work and conformance to the dimension and shape requirements, as inspected when received
   - Certification that the physical and chemical properties of the material meet these specifications

D. Materials Warranty
   General Provisions 101 through 150.

854.2.05 Steel Forgings

A. Requirements
   1. Type
      Use steel forgings that meet the requirements of AASHTO M 102/M 102M for the class shown on the plans.
   2. Certifications
      a. Submit a record to the Engineer of the annealing charges that show the forgings in each charge, the melt or melts from which they were secured, and the treatment they received.
      b. Submit a report with each castings shipment that includes test results and certifies compliance with this specification.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the castings based on the following:
   1. Quality of work and conformance to the dimension and shape requirements, as inspected when received
   2. Certification that the physical and chemical properties of the material meet these specifications

D. Materials Warranty
   General Provisions 101 through 150.
854.2.06 Cold-finished Carbon Shafting

A. Requirements
   1. Type
      Use cold-finished carbon steel bars that meet the requirements of AASHTO M 169 for the grade shown on plans.
   2. Certification
      Submit a certification to the Engineer that shows the chemical properties of the material and conformance to the specifications.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on favorable review of the certification.

D. Materials Warranty
   General Provisions 101 through 150.

854.2.07 Steel Castings for Bridges

A. Requirements
   1. Type
      Use steel castings for bridge components that meet the requirements of ASTM A 27/ A 27M for the class shown on the plans.
   2. Certification
      Submit a certification to the Engineer that shows the physical and chemical properties of the material and conformance to the specifications.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on favorable review of the certification.

D. Materials Warranty
   General Provisions 101 through 150.
Section 855—Steel Pile

855.1 General Description
This section includes the requirements for the following types of steel pile:

- Welded and seamless steel pile
- Fluted steel shell pile
- Steel H-pile

855.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   ASTM A 27/ A 27M
   ASTM A 252
   ASTM A 709/ A 709M
   QPL 37
   QPL 44

855.2 Materials
855.2.01 Welded and Seamless Steel Pile
A. Requirements
   1. Type
      Use welded and seamless steel pile of the specified dimensions that meets ASTM A 252 requirements. However, use a minimum wall thickness of 1/8 in. (3 mm).
      a. Ensure that the pile can be driven to the capacity shown on the plans without crimping, buckling, or otherwise distorting.
      b. Mark each pile with the heat number or a lot number corresponding to a heat.
   2. Certification
      Furnish all certified mill test reports or inspection reports done by an approved testing laboratory to the Engineer. The reports must certify that the pile conforms to these specifications and show the physical and chemical properties of each heat or lot of materials.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on the certifications or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.
Section 855 — Steel Pile

855.2.02 Fluted Steel Shell Pile

A. Requirements

1. Type
   Use fluted steel shells made of basic open hearth steel that meets the specified dimensions. Use one of the suppliers listed on QPL 44.
   a. Use steel with a minimum tensile yield strength of 50,000 psi (345 MPa).
   b. Use shells with a uniformly tapered lower section, with or without extensions of the same diameter.
   c. Reinforce the driving ends of the shells with a collar big enough to withstand being driven without injuring the shell.
   d. Weld cast steel driving points to the tips of the shells.

2. Certification
   Furnish all certified mill test reports or inspection reports done by an approved testing laboratory to the Engineer. The reports must certify that the pile conforms to these specifications and show the physical and chemical properties of each heat or lot of materials.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on the certifications or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.

855.2.03 Steel H-Pile

A. Requirements

1. Type
   Use steel for H-pile that meets the requirements of ASTM A 709/A 709M, Grade 36/250. Use one of the suppliers listed on QPL 44.
   a. Cast Steel H-pile Points
      For each shipment of cast steel H-pile points, submit to the Engineer a report that includes results of tests to certify compliance with ASTM A 27/ A 27M.
      Use only the H-pile points shown on QPL 37.

2. Certification
   Submit certified mill test reports to the Engineer that show the physical and chemical properties of each heat or lot of materials and compliance with these specifications.

B. Fabrication

1. Make cast steel H-pile points from cast steel that meets ASTM A 27/ A 27M Grade 65-35 (450-240).

2. Ensure that the points give the maximum protection to the outer corners of the H-pile and have a wide surface area to support the pile flanges.

3. Ensure that the manufacturer’s name or identification mark, pattern number, and heat number are cast or stamped on all castings.

C. Acceptance

1. The Department will accept the material based on the certifications or on the results of tests conducted by the Department.

2. The Geotechnical Bureau of the Office of Materials and Research will evaluate cast steel pile points.

D. Materials Warranty
   General Provisions 101 through 150.
Section 857—Bronze Bushings, Bearings, and Expansion Plates

857.1 General Description
This section includes the requirements for the following:

- Bronze bearings and expansion plates
- Bronze bushings
- Self-lubricating bronze bearings, expansion plates, and bushings

857.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   ANSI B 46.1
   ASTM B 22, Alloy UNS91100
   ASTM B 100, Alloy UNS 51000
   ASTM B 584 Alloy UNS C86200

857.2 Materials

857.2.01 Bronze Bearings and Expansion Plates
A. Requirements
   1. Type
      Use bearings and expansion plates that meet the following requirements:
      b. Rolled Bronze: ASTM B 100, Alloy UNS 51000.
   2. Certification
      Furnish certification to the Engineer showing physical and chemical properties of the material and conformance to these specifications.

B. Fabrication
   Finish contact surfaces of plates in the direction of motion specified by ANSI B 46.1, No. 125 (No. 3.2 µm).

C. Acceptance
   The Department will accept the material based on the certifications.

D. Materials Warranty
   General Provisions 101 through 150.
Section 857 — Bronze Bushings, Bearings, and Expansion Plates

857.2.02 Bronze Bushings

A. Requirements
   1. Type
      Use bronze bushings that meet ASTM B 584, Alloy UNS C86200 requirements.
   2. Certification
      Furnish a certification to the Engineer showing physical and chemical properties of the material and conformance to these specifications.

B. Fabrication
   Finish contact surfaces of bushings in the direction of motion specified by ANSI B 46.1, Nos. 63 to 125 (1.6 to 3.2 µm).

C. Acceptance
   The Department will accept the material based on the certifications.

D. Materials Warranty
   General Provisions 101 through 150.

857.2.03 Self-lubricating Bronze Bearings, Expansion Plates, and Bushings

A. Requirements
   1. Type
      Use self-lubricating bronze bearings, expansion plates, and bushings that meet Subsection 857.2.01 or 857.2.02.
      a. Ensure that the surfaces of self-lubricating bronze bearings, expansion plates, and bushings are bored in a geometric, recessed pattern. Use a lubricating material in the bearing areas that has a long service life.
      b. Lubricate approximately 25 percent of the bearing face.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on the certifications.

D. Materials Warranty
   General Provisions 101 through 150.
Section 858—Miscellaneous Metals

858.1 General Description
This section includes the requirements for miscellaneous metals, such as lead for plates, pipes, and other uses, and miscellaneous bridge hardware.

858.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   ASTM A 123/ A 123M
   ASTM A 153/ A 153M
   ASTM B 29
   ASTM F 568M

858.2 Materials

858.2.01 Lead for Plates, Pipe, and Other Uses
A. Requirements
   1. Use lead for plates, sheet, pipe, and other uses that meets the requirements of ASTM B 29, pig lead.
   2. Use common, desilverized lead.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.

858.2.02 Miscellaneous Bridge Hardware
A. Requirements
   For miscellaneous hardware, use the design, size, and kind shown on the plans or as directed by the Engineer.
   1. Bolts and Dowels
      Use machine bolts, drift bolts, and dowels that meet the requirements of ASTM F 568M, Class 4.6. Ensure that machine bolts have square heads and nuts and that the screw threads fit closely.
   2. Nails and Spikes
      Use steel wire nails and circular, cross-section spikes without taper.
      Use steel boat spikes with forged heads and wedge-shaped shanks and points.

B. Fabrication
   Galvanize hardware according to ASTM A 123/ A 123M or ASTM A 153/ A 153M, as applicable if the plans specify galvanized hardware.
C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
859.1 General Description
This section includes the requirements for Guardrail components, such as:

- Guardrail elements, terminal sections, and fittings
- Cable end anchor assemblies
- Steel Guardrail posts and offset blocks
- Wood Guardrail posts and offset blocks

1994 SPIB rules, paragraph 402
QPL 8

859.2 Materials

859.2.01 Guardrail Elements, Terminal Sections, and Fittings
A. Requirements
   1. Steel Guardrail
      Use Guardrail parts that meet AASHTO M 180 requirements and are composed of the following elements:

<table>
<thead>
<tr>
<th>Bridge railing</th>
<th>Class B, Type II beams</th>
</tr>
</thead>
<tbody>
<tr>
<td>Roadway Guardrail</td>
<td>Class A, Type II beams</td>
</tr>
</tbody>
</table>

Use Guardrail from suppliers found on QPL 8.
2. **Aluminum Guardrail**

   Use rail elements made from aluminum alloy alclad 2024-T3 sheet that meets ASTM B 209 (B 209M) requirements. Use the following fittings:

<table>
<thead>
<tr>
<th>Fittings</th>
<th>Material Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Aluminum bolts</td>
<td>Alloy 2024-T4 [ASTM B 211(B 211M)] with 30-minute anodize and 30-minute seal</td>
</tr>
<tr>
<td>Hex nuts</td>
<td>Aluminum alloy 6061-T6, not anodized</td>
</tr>
<tr>
<td>Washers</td>
<td>May meet ASTM B 209 (B 209M) Alclad 2024-T4, not anodized</td>
</tr>
</tbody>
</table>

3. **Certification**

   Submit a certification as in Subsection 106.05, *Materials Certification*.

B. **Fabrication**

   1. **General**
      a. Make highway Guardrail elements according to the plans.
      b. Ensure that all Guardrail elements, terminal sections, and fittings are interchangeable with similar parts, regardless of the source or manufacturer.
      c. If constructing Guardrail on curves with a radius of 150 ft. (45 m) or less, curve the rail elements in the shop to the radius on the road side of the rail, either concave or convex, as required.

   2. **Aluminum Guardrail Elements**
      a. Form the rail elements into beams at least 1 ft. (300 mm) wide and 3 in. (75 mm) deep, and at least 0.156 in. (3.96 mm) thick.
      b. Form the terminal ends from the same material as the beams or from Alclad 2024-T42.

C. **Acceptance**

   1. **Steel Guardrail**
      The Department will accept the material based on the provisions of AASHTO M 180 or ASTM B 209 (B 209M).
   2. **Aluminum Guardrail**
      The Department will accept the material based on the manufacturer’s QPL status or on tests conducted by the Department.

D. **Materials Warranty**

   Steel Guardrail: Ensure that the manufacturer’s logo and heat numbers remain legible for at least 5 years after galvanizing.

859.2.02 **Cable and Anchor Assembly**

A. **Requirements**

   1. **Type**
      Ensure that the cable and anchor materials meet the following requirements, unless shown otherwise on the Plans:

<table>
<thead>
<tr>
<th>Material</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anchor and metal plates</td>
<td>Steel, ASTM A 709 (A 709M), Grade 36 (250)</td>
</tr>
<tr>
<td>Anchor rod</td>
<td>Steel, ASTM A 575 or A 576, Grade 1020</td>
</tr>
<tr>
<td>Anchor cable</td>
<td>Preformed, galvanized wire rope, ASTM A 741, Type II, 3/4 in. (19 mm), 6 x 19, with right regular lay</td>
</tr>
<tr>
<td>Cable clips and cable thimble</td>
<td>Commercial quality, galvanized, drop-forged steel</td>
</tr>
</tbody>
</table>
### Section 859 — Guardrail

<table>
<thead>
<tr>
<th>Material</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bolts and nuts</td>
<td>ASTM F 568</td>
</tr>
<tr>
<td>Swaged fittings</td>
<td>Steel, ASTM A 576, Grade 1035; annealed, galvanized, suitable for cold swaging Ensure the swaged fittings and stud assembly develop at least 100% of the breaking strength of the cable.</td>
</tr>
<tr>
<td>Galvanized stud</td>
<td>Steel, ASTM A 449</td>
</tr>
<tr>
<td>Concrete deadman</td>
<td>Precast Class A concrete, according to the plans</td>
</tr>
</tbody>
</table>

2. **Certification**
   Submit a certification for these materials according to Subsection 106.05, *Materials Certification*.

B. **Fabrication**
   Fabricate and assemble according to the plans.
   1. **Anchor/Metal Plates**
      Build up anchor plates and other metal plates, as shown on the plans, or form them on a press, with or without welded seams.
   2. **Anchor Rod**
      Drop-forge or form the eye of the anchor rod with a full penetration weld that develops 100 percent of the rod strength.
   3. **Metal Components:**
      a. Galvanize all metal components of the assembly, except the anchor cable, according to ASTM A 123/A 123M.
      b. Galvanize bolts, washers, etc., as stated in ASTM A 153/A 153M.

C. **Acceptance**
   The Department will accept material based on the certification.

D. **Materials Warranty**
   General Provisions 101 through 150.

### 859.2.03 Steel Guardrail Posts and Offset Blocks

A. **Requirements**
   1. **Type**
      Use steel posts of the dimensions and shapes shown on the Plans for Guardrails. Unless the plans show otherwise, use posts that meet the requirements of ASTM A 709 (A 709M), Grade 36 (250) or ASTM A 769 (A 769M) Class I, Grade 40 (380), and found in QPL 8.
   2. **Certification**
      Submit a certification according to Subsection 106.05, *Materials Certification*.

B. **Fabrication**
   Galvanize steel posts and offset blocks according to ASTM A 123/ A 123M.

C. **Acceptance**
   The Department will accept the material based on the certification.

D. **Materials Warranty**
   General Provisions 101 through 150.
Section 859 — Guardrail

859.2.04 Wood Guardrail Posts and Offset Blocks

A. Requirements
   1. Grade
      Use posts and offset blocks that meet the requirements for No. 1 timbers, paragraph 402, of the 1994 SPIB rules.
      Do not use offset blocks with splits longer than 3 in. (75 mm).

B. Fabrication
   1. Tolerances
      Ensure that the posts do not vary from the specified length by more than ± 1 in. (± 25 mm). If the plans specify a slope for the top, ensure that the slope does not vary more than ±1/4 in. (± 6 mm).
   2. Seasoning and Preservative Treatment
      Bore and frame posts, then treat the posts and offset blocks according to the requirements of Section 863.

C. Acceptance
   The Department will accept the material based on tests conducted by the Department or on the manufacturer’s QPL status.

D. Materials Warranty
   General Provisions 101 through 150.

859.2.05 Plastic Offset Blocks

A. Requirements
   1. Type
      Use only plastic offset blocks that are listed on QPL 8.
      Use plastic offset blocks that consist of 70 percent low density polyethylene and approximately 30 percent high density polyethylene with a trace of other plastic.
      Other compositions may be used if approved by the Office of Materials and Research.
   2. Certification
      Submit a certification according to Subsection 106.05, Materials Certification.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the material based on the manufacturer’s certification.

D. Materials Warranty
   General Provisions 101 through 150.
Section 860 — Lumber and Timber

860.1 General Description
This section includes the requirements for lumber and timber.

860.1.01 Related References
A. Standard Specifications
   Section 502—Timber structures
   Section 863—Preservative Treatment of Timber Products

B. Referenced Documents
   American Softwood Lumber Standard PS 20-70, US Department of Commerce or the National Hardwood Association
   ASTM D 245

860.2 Materials
For the definition and limitations of defects, use the current manufacturing association grade rules applicable for the species specified.

860.2.01 Lumber and Timber
A. Requirements
   1. Saw or finish all lumber and timber as specified from the plants listed in QPL 50.
   2. Grades
      Use grade rules from an agency that follows the basic provisions of American Softwood Lumber Standard PS 20-70, US Department of Commerce or the National Hardwood Association.
      a. Furnish all structural timber in the grades, sizes, and finish shown in the plans and these specifications, or as directed by the Engineer.
      b. Unless otherwise specified, use No. 2 or higher grade Southern Pine to construct buildings, shelving, and forms.
      c. Mark the grade on the lumber or timber according to the current manufacturing grade rules for the species.
   3. Uses
      Refer to Table 1 below for the working stress requirements for various structural uses of lumber and timber.
      a. The numerical stress values in the table are based upon stress-graded material meeting the requirements of grading rules for the indicated stress, developed from the ASTM D 245, Methods for Establishing Structural Grades of Lumber.
      b. You may use commercial stress grades of lumber and timber with grade descriptions if the materials will meet the stress requirements under rules developed from ASTM D 245.

B. Fabrication
   1. Seasoning and Preservation: Season and treat according to the requirements of Section 863, except use an assay zone for marine lumber timber of .01 to 1 in. (0.25 to 25 mm)

C. Acceptance
   The Department will accept the material based on inspection certification or on the results of tests conducted by the Department.

D. Materials Warranty
   General Provisions 101 through 150.
Section 861 — Piling and Round Timber

861.1 General Description
This section includes the requirements for timber piles and timber poles.

861.1.01 Related References
A. Standard Specifications
Section 863—Preservative Treatment of Timber Products

B. Referenced Documents
ANSI 05.1
National Electrical Safety Code (National Institute of Standards and Technology)
QPL 50

861.2 Materials
A. Definition and Limitation of Defects
Decay: Disintegration of the wood substance due to wood-destroying fungi. The words “dote” and “rot” mean the same as decay. Red heart is a form of decay.

Compression Wood: An abnormal, dense, hard growth frequently occurring on the underside of limbs and leaning trunks of coniferous trees. It is characterized by very wide and eccentric annual growth rings and includes what appears to be an exceptional proportion of summerwood growth.

The contrast in color between springwood and summerwood, however, is usually less in compression wood than in normal wood.

Turpentine Butt: A scar caused from bleeding the trees to obtain turpentine.

Scar: A damaged surface caused from injury to the tree during growth.

Sweep: Deviation of a piece or stick from a straight line measured from the center of one end to the center of the other end. A straight line from the center of the butt to the center of the tip shall lie entirely within the body of the pile.

Short Crook: A crook in which the direction of the piece or stick changes in a very short distance measured lengthwise.

Burst Check: A crack approximately at right angles to the annual rings, usually radial cracks in sticks from the center or from near the center to the outside, or a combination of this crack and a ring shake caused through either seasoning, exposure to high temperature, or the process of preservative treatment.

Unsound Knot: A knot solid across the face, but containing incipient decay.

Cluster Knot: Two or more knots grouped together, the fibers of the wood being deflected around the entire unit.

A group of single knots with fibers deflected around each knot separately is not a cluster, even though the knots may be close together.

Punk Knot: A fungus decay that extends from the interior of the piece of pile to the outside, which when prodded is usually found to contain a snuff-like substance.

Ring Knots: Three or more knots appearing in the same line of circumference, or any foot of length.
Section 861 — Piling and Round Timber

861.2.01 Timber Piles

A. Requirements

1. Use round timber piles of any species of wood that will withstand driving and support the load specified. Use plants listed on QPL 50.

2. Soundness
   - Use piles of sound wood, free from decay, red heart, or insect attack.
     a. Cedar and Cypress: The butt ends may have a pipe or stump rot hole not more than 1-1/2 in. (40 mm) in diameter. Cypress piles may have peck aggregating not more than 1-1/2 in. (40 mm) in diameter.
     b. Southern Pine: Piles may have unsound knots less than half the permitted size of a sound knot, providing that the unsoundness does not extend more than 1-1/2 in. (40 mm) deep and that the adjacent areas of the trunk are not affected.

3. Density
   a. All piles shall be dense with at least 6 annual rings per 1 in. (25 mm) and 1-1/2 in. (40 mm) or more of summerwood (the darker, harder portion of the annual ring), as measured over the outer 3 in. (75 mm) of butt diameter on a radial line from the pith.
      The contrast in color between summerwood and springwood shall be sharp and the summerwood shall be darker in color.
   b. Piles excluded by the above rule may be accepted provided they have at least four annual rings per 1 in. (25 mm) and 1/3 or more summerwood, as measured over the outer 3 in. (75 mm) of butt diameter on a radial line from the pith.

4. Knots
   a. Sound knots:
      
      | For piles 50 ft. (15 m) long or less, and in. 3/4 of the length of piles over 50 ft. (15 m), measured from the butt | Sound knots less than 4 in. (100 mm) or 1/3 the diameter of the pile, whichever is smaller. |
      | For the top 1/4 length of piles over 50 ft. (15 m) long | Sound knots less than 5 in. (125 mm) or 1/2 the diameter of the pile, whichever is smaller |
      
      The size of a knot shall be its diameter measured at right angles to the length of the pile.

   b. Unsound knots are not permitted except in Southern Pine piles as specified in Subsection 861.2.01.A.2.b.
   c. The sum of sizes of all knots in any 12 in. (300 mm) of the pile shall not exceed twice the size of the largest permitted single knot.

5. Holes
   Allow holes that average less than 1/2 inch (15 mm) in diameter if the sum of the average diameter of all holes in any 1 ft.² (0.1m²) of pile surface is less than 1-1/2 in. (40 mm).

6. Splits and Shakes
   Splits shall not be longer than the butt diameter of the pile.
   The length of any shake or combination of shakes in the outer half of the radius of butt of the pile, when measured along the curve of the annual ring, shall not exceed 1/3 the circumference of the butt of the pile.

7. Sapwood
   Piles to be treated with preservative shall have at least 1 in. (25 mm) of sapwood at the butt end.

8. Heartwood
   a. In untreated piles for use in exposed work, the diameter of the heartwood at the butt shall be at least 8/10 of the diameter of the pile at the butt.
   b. If high heartwood content is required for untreated foundation piles, the plans will specify the ratio of heartwood to total diameter.
9. Peeling
   a. Peel piles by removing all of the outer bark and at least 80 percent of the inner bark, well distributed over
      the surface of the pile.
   b. If piles will be treated with preservative, do not leave inner bark wider than 1/2 in. (15 mm).
   c. Do not remove more than three annual rings of the solid wood.

10. Cutting and Trimming
    a. Saw butts and tips square with the axis of the pile.
    b. Trim or smoothly cut all knots and limbs flush with the surface of the pile or the surface of the swell
       surrounding the knot.

11. Straightness
    In general, a straight line from the center of the butt to the center of the tip shall lie entirely within the body of
    the pile.
    If specified, the Department can accept long piles for foundations (but not for trestles) if the straight line lies
    partly outside the body of the pile. The maximum distance between the line and the pile shall not exceed 0.5
    percent of the length of the pile or 3 in. (75 mm), whichever is smaller.

12. Taper
    Cut piles above the butt swell so it has a continuous taper from the point of butt measurement to the tip.

13. Twist of Grain
    Do not allow spiral grain to exceed 180 degrees of twist when measured over any 20 ft. (6 m) section of the pile.

14. Limits of Defects
    a. Piles shall not have short crooks that deviate more than 2-1/2 in. (65 mm) from straightness in any 5 ft.
       (1.5 m) length.
    b. Burst checks in piles shall be less than 1 in. (25 mm) wide, measured at the outside, and shall not extend
       over 12 in. (300 mm) long.

15. Circumferences, Diameters, and Lengths
    a. The circumferences of piles measured under the bark shall have the minimum and maximum values in
       Table 1 (metric Table 1) for the class specified. No more than 10 percent of the piles in any shipment may
       have circumferences 2 in. (50 mm) less than the tabulated minimum values.

    NOTE: Requirements for tip circumference of piles that are longer than the required length may
    be applied at the tip end of the required length.

    b. The ratio of the maximum to the minimum diameter at the butt of any pile shall not exceed 1.2.
    c. Individual piles may vary from the length specified by ± 12 in. (300 mm) in piles shorter than 40 ft. (12 m),
       and ± 2 ft. (600 mm) in. piles 40 ft. (12 m) or longer.
    d. The average length of all piles of a specified length in each lot shall not be less than the length specified.

</tbody>
</table>

**NOTE:** If the pile length is 25 feet (7.6 m) or less, a minimum circumference of 34 in. (850 mm) and minimum diameter of 11 in. (275 mm) at a point 3 ft. (900 mm) from the butt are required.
16. Branding and Inspection
   a. Ensure the pile length and the diameter of the butt and tip are branded in the butts of the piles.
   b. Legibly brand the Preliminary inspection date in the tips.

B. Fabrication
   Seasoning and Preservative Treatment: Where required, season and treat according to Section 863.

C. Acceptance
   The Department will reject the pile based on any of the following defects:
   - Decay
   - Deep scars
   - Unsound knots
   - Punk knots
   - Ring knots
   - Cluster knots
   - Compression wood (if readily identifiable based on ordinary visual inspection)

   The Department may accept piles with sound turpentine scars undamaged by insects, provided they meet all other requirements.

D. Materials Warranty
   General Provisions 101 through 150.

861.2.02 Timber Poles

A. Requirements
   1. Select timber poles from plants listed on QPL 50.
   2. Ensure that the poles that meet the requirements of the latest revision of ANSI 05.1, in the National Electrical Safety Code published by the National Institute of Standards and Technology, with the following exceptions:
      a. Section 2 Definitions—Modify the “Short Crook" definition as follows:
         “Any localized deviation from straightness within any section 5 ft. (1.5 m) or less in length shall not be more than 1 in. (25 mm) when measured with a straightedge parallel to the long axis of the pole.”
      b. Section 4 Material Requirements, 4.4.9 Shape (1), (a)—shall read as follows:
         “For poles 50 ft. (15 m) and shorter, of all species except northern white cedar, a straight line joining the edge of the pole at the butt and the edge of the pole at the top, in 90 percent or more of those poles supplied, shall not be distant from the surface of the pole at any point by more than 1 in. (25 mm) for each 10 ft. (3 m) of length between these points. In the remainder of those poles supplied (10 percent), the poles may have a deviation of 1 in. (25 mm) for each 6 ft. (1.8 m) of length when measured as above.”
      c. Section 4 Material Requirements, 4.4.9 Shape (2)—shall read as follows:
         “Sweep in two planes (double sweep) - NOT PERMITTED."
   3. Use the class and length specified on the plans.
   4. You may peel poles by machine, except that poles more than 55 ft. (17 m) long may be debarked and trimmed by hand in lieu of machine peeling. Trim so that you preserve the buttressing effects of all overgrown knots.
   5. Unless otherwise specified or indicated on the plans, frame poles with flat roofs and slab grains.
   6. Frame, drill, and machine poles as necessary before preservative treatment.

B. Fabrication
   Seasoning and Preservative Treatment: Where required, season and treat according to Section 863.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 862—Wood Posts And Bracing

862.1 General Description
This section includes the requirements for wood fence posts and bracing, and wood sign posts.

862.1.01 Related References
A. Standard Specifications
   - Section 859—Guard Rail Components
   - Section 863—Preservative Treatment of Timber Products

B. Referenced Documents
   - ASTM A 525M
   - QPL 50

862.2 Materials

862.2.01 Wood Fence Posts and Bracing
A. Requirements
   1. Type
      Use Southern Pine for wood posts and bracing. Use the dimensions specified on the plans.
   2. Physical Characteristics
      Use posts and bracing that have the following characteristics:
      - Be round or sawed, but all posts on a single Project shall be the same.
      - Be cut from sound and solid trees and contain no unsound knots. Accept sound knots if the diameter of the knot does not exceed 1/3 of the diameter of the piece at the point where it occurs.
      - Be free from decayed wood, rot, and red heart, and a ring shake and season checks that penetrate at any point more than 1/4 the diameter of the piece, or are greater than 1/4 in. (6 mm) wide.
      - Show at least four annual rings per 1 in. (25 mm), and at least 1/3 summerwood unless using Southern Pine veneer cores.
      - Have no short or reverse bends.
   3. Draw a line from the center of the top to the center of the butt. The line shall not fall outside the body of the post, nor be more than 2 in. (50 mm) from the geometric center of the post at any point.
   4. The maximum allowable change in diameter of the post shall not exceed 1-1/2 in. (38 mm) in. 10 ft. (3 m).
   5. Accessories
      Use metal caps to cover the tops of the posts. Use caps that are at least 0.008 in (0.20 mm) thick.
      Use material that is aluminum or galvanized steel with 1.25 oz/ft.² (380 g/m²) coating according to ASTM A 525M. Use caps only when required by the plans.

B. Fabrication
   1. Peel all posts and bracing for their full length. Remove all bark and inner skin.
   2. Trim knots close to the body of the post before treatment.
   3. Saw all butts and tips square. For posts that will be driven, you may make the butt end pointed before treatment.
   4. Seasoning and Preservative Treatment
      Treat all posts according to the requirements of Section 863.
C. Acceptance

Check QPL 50 for pre-approved manufacturers that supply materials compliant with this Specification.

D. Materials Warranty

General Provisions 101 through 150.

862.2.02 Wood Sign Posts

A. Requirements

1. Unless otherwise specified, surface wood sign posts on all four sides to the dimensions specified.
   a. Ensure wood sign posts meet the same quality requirements as wood guard rail posts in Subsection 859.2.04, Wood Guard Rail Posts and Offset Blocks.
   b. Ensure posts do not vary from the specified length by more than ± 1 in. (25 mm).
   c. Trim both ends of the posts.

2. Accessories
   Use metal caps to cover the tops of the posts. Use caps that are at least 0.008 in. (0.20 mm) thick.
   Use material that is aluminum or galvanized steel with 1.25 oz/ft.$^2$ (380 g/m$^2$) coating according to ASTM A 525M. Use caps only when required by the Plans.

B. Fabrication

1. Seasoning and Preservative Treatment
   Bore and frame posts before treating them. Treat the posts according to the requirements of Section 863.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.
Section 863—Preservative Treatment of Timber Products

863.1 General Description
This section includes the requirements for applying preservatives, conditioning, treating, inspecting, marking, testing, and documenting the necessary information for treated timber used in Department Work.

863.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   American Wood Preservers Association (AWPA), C14, Wood for Highway Construction—Preservative Treatment by Pressure Method
   AWPA C2
   AWPA M2
   AWPA M3
   AWPA P9
   AASHTO M 133
   QPL 50

863.2 Materials
863.2.01 Conditioning and Preservative Treatment
A. Requirements
   1. Condition and preservative treat all timber products to meet the requirements of American Wood Preservers Association (AWPA) Standard C14, Wood for Highway Construction—Preservative Treatment by Pressure Method, except as described in this Section.
   2. Treatment Plants
      Ensure treatment plants comply with quality control procedures in AWPA M3.
      a. To expedite the work, a commercial inspection agency approved by the Department will inspect and test all treated timber products, including any preservative treatment at the treatment plant before it is delivered to the project. The treatment plant shall bear all the cost associated with the inspection and test.
      b. Before requesting an inspection, the authorities of the treatment plant shall acquaint themselves with the timber specification requirements and shall segregate the material to be inspected for Department work from other stock.
   3. Preservatives
      Use preservatives that meet the requirements in the AWPA Standard, unless otherwise specified in the plans or the specifications.
      a. You may select one of three preservatives (creosote, pentachlorophenol, Chromated Copper Arsenate (CCA)) from the Materials and Usage Table in AWPA C14.
      b. Ensure pentachlorophenol solutions have at least 5 percent pentachlorophenol, by weight, dissolved in the petroleum solvents specified or pentachlorophenol in AWPA P9, Type “A.”
Section 863 — Preservative Treatment of Timber Products

B. Fabrication

1. As practicable, cut, frame, and bore timber before treatment.
2. Condition the timber first. For Southern Pine species, use the following treatment:

<table>
<thead>
<tr>
<th>Treatment</th>
<th>Conditions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Penta-petroleum</td>
<td>Dry in kiln to 30% average moisture content or less or condition in steam</td>
</tr>
<tr>
<td>Chromated Copper Arsenate</td>
<td>Dry in kiln to 25% average moisture content or less</td>
</tr>
</tbody>
</table>
(CCA)                      |                                                 |

**NOTE:** Do not heat the wood in the preservative, and do not use Boulton drying.

3. Preservative Penetration
   Ensure the preservative penetrates at least 3 in. (75 mm) or 90 percent of the sapwood for all lumber, timber, wood fence posts, and ties in contact with the ground.
   a. Ensure lumber, timber, and ties that do not contact the ground meet AWPA C2 requirements.
   b. Ensure preservative penetrates all other materials, piles, and poles according to applicable AWPA requirements.

4. Preservative Retention
   Treat guard rail posts and offset blocks with pentachlorophenol or CCA with a minimum 0.6 lb./ft.³ (9.6 kg/m³) retained in the outer 0.6 in. (15 mm), as required in AWPA C14 and C2.

5. Retreatment:
   You may retreat a charge of material, or a portion of it, if the initial treatment does not meet requirements for retention, penetration, or appearance. The Department will allow only one retreatment.

**NOTE:** The Department will reject any damage due to retreatment.

6. Conditioning after Treatment
   a. Condition material that is dust-free.
   b. For lumber or timber that is treated with water-borne preservative and is to be painted, dry by air, kiln, or some method of artificial conditioning, to a moisture content of not more than 19 percent of the weight of the oven-dry wood.
   c. Protect the treated lumber from the elements with a prime coat of paint or other approved means.
   d. Ensure the moisture content does not rise above 19 percent before applying the first coat of paint.
   e. Dry material treated with water-borne preservative that will not be painted to surface dryness in air or otherwise before installing it.
C. Acceptance

1. Inspection
   The Department will sample and test preservatives according to the requirements of AASHTO M 133.

   **NOTE:** Check QPL 50 for pre-approved manufacturers that supply material compliant with this specification.

   a. The Department will determine the level of preservative retention by testing the 0.6 to 1.5 in. (15 to 38 mm) assay zone.
   b. Unless otherwise provided, an approved commercial inspection agency will inspect treated timber products according to AWPA M2.
   c. The Inspector will test before, during, and after treating.

2. Marking
   The Inspector will mark each acceptable piece with a hammer stamp before and after treatment.
   a. Stamp only 25 percent of the offset blocks after treatment.
   b. Ensure that both inspection stamps identify the Inspector. Ensure that the before-treatment stamp is clearly distinguished from the after-treatment stamp.

3. Reporting
   The Inspector from an approved commercial inspection agency shall:
   a. Prepare reports of the treating process and results of the inspection that confirm treatment was completed according to these specifications.
   b. Furnish these reports to the Office of Materials and Research.
   c. Report according to AWPA M2.
   d. Get a shipping report from the treatment plant showing the project number, purchaser, sizes and amounts of materials, and preservative type for each shipment for Department Work.
   e. Furnish the shipment report and the treatment report to the Office of Materials and Research.

D. Materials Warranty

1. Retest treated material that has been in stock for two years before using.
2. The Department will reject any materials that fail to meet specifications unless they are retreated to meet all applicable requirements.
Section 865 — Manufacture of Prestressed Concrete Bridge Members

865.1 General Description
This section includes the following requirements for precast-prestressed concrete bridge members and piling:

- Manufacturing
- Inspecting
- Testing
- Marking
- Painting
- Rubbing as specified
- Plant handling
- Storing
- Shipping

The term "precast-prestressed concrete" is referred to as "prestressed concrete" in the rest of this Section.

</tbody>
</table>

**NOTE:** Do not use accelerators (24-hour accelerated strength concrete) that contain chlorides in any prestressed concrete.
865.2.01 Prestressed Concrete Bridge Members

A. Requirements

1. Portland Cement
   Use Type I, Type II, or Type III cement that meets requirements of AASHTO M 85 for low alkali cement.
   a. Use Type II cement in concrete to cast pile for specific locations noted on the plans.

2. Coarse Aggregate
   a. Use the size specified and approved for prestressed concrete products.
   b. Do not use unconsolidated limerock coarse aggregate in prestressed concrete piling or in any structure that has direct contact with water.

3. Microsilica (Silica Fume)
   The Department may approve silica fume as an additive to concrete. If approved, add the silica fume at a rate not to exceed 10 percent of the cement content.

4. Epoxy-coated Reinforcement Steel and Wire:
   If the top steel mat of the bridge deck is epoxy-coated, the shear steel in the prestressed concrete beams will be epoxy-coated in accordance with Section 514.

5. Welded Wire Fabric
   Use welded wire fabric that meets the following requirements:
   a. Use smooth wire fabric that meets the material requirements of AASHTO M 55 (ASTM A 185) and this Section.
   b. Use deformed wire fabric that meets the requirements of AASHTO M 221 (ASTM A 497) and this Section.

6. Pretensioning Steel Wire Strand
   Use strands that meet all the requirements of ASTM A 416, Grade 270.

7. Slump Limitation
   Ensure the slump meets Subsection 500.1.03.A Table 1 – Concrete Mix Table, except when Type F high range water reducers (HRWR) are added. With HRWR, you may increase the slump value from 4 in. to 6 in. (100 mm to 150 mm) with a maximum slump value not to exceed 7 in. (175 mm), provided the concrete mix does not segregate.

8. Facilities and Equipment Plans
   Facilities are approved according to Laboratory SOP-3, Standard Operating Procedures for Precast/Prestressed Concrete. See QPL 9 for a list of approved facilities.
   Submit a complete set of plans and an itemized equipment list of the prestressing facilities to the Engineer.
   a. For established plants already approved by the Department, the Department will send a written notice about approval. The plant need not comply with the requirements concerning plans and equipment listing.
   b. The Department may withdraw the waiver at its discretion if the plant changes the facilities, equipment, production methods, types of products, or for any other reason.
Section 865 — Manufacture of Prestressed Concrete Bridge Members

B. Fabrication

1. General Plant Requirements
   Furnish erection drawings to the Engineer that show the placement of superstructure units, especially when
   the units are not interchangeable with respect to transverse placement within a span or with respect to the
   reversal of ends within a span.

2. Manufacturing Facilities and Equipment
   Ensure that the prestressed concrete bridge members are made at a plant that has as a minimum the facilities
   and equipment specified as follows:
   a. Do not start manufacturing until the Engineer approves the facilities and equipment.

   NOTE: Regardless of approval, the Contractor is responsible for the facilities’ performance and
   obtaining additional equipment as needed.

   b. Beds: Construct beds for casting prestressed concrete of concrete; these shall be level or on a grade
      acceptable to the Engineer.

   c. Anchorages: Design and construct anchorages so they will not yield under 150 percent of the maximum
      design load.

   d. Forms: Construct steel side and bottom forms unless the Department allows other materials.
      1) Design the forms so the bridge members will be well within the tolerances specified in Subsection
         865.2.01.B.11.
      2) Anchor the forms to prevent movement.

   e. Stressing Equipment
      1) Jacks: Use jacks in good repair that do not leak. Calibrate them with the actual gauge or gauges that
         you will be using. You may use pressure gauges, load cells, or dynamometers. Ensure all jack systems
         have devices that prevent the gauge pointer from fluctuating.
      2) Calibration: Calibrate all devices to a reading accuracy of 2 percent within the proposed stressing
         range.

         Use an approved testing laboratory to calibrate the devices. Have the laboratory furnish at least five
         copies of the calibration chart for each device to the Engineer.

         Recalibrate all stressing systems at least every 6 months and as required by the Engineer. Use
         gauges that you can read from 6 ft. (1.8 m) and have a capacity of twice the maximum load.

   f. Elongation Measurement: Use a system approved by the Engineer and isolated from any movement in the
      bed or anchorages.

   g. Curing Systems Equipment: Use one of the curing methods listed below. Do not use curing compounds
      on prestressed concrete units unless the Engineer gives written permission.
      1) Water Curing: Use equipment that consists of a clean, non-deleterious water source, a method of
         application, and enough burlap or other means of moisture retention that will keep all surfaces of the
         concrete wet during the curing cycle, except those in contact with the forms.
      2) Steam Curing: Use the following minimum basic equipment:

         • An enclosure tight enough to maintain a uniform atmospheric temperature around the concrete
           units.
         • A steam system that distributes live steam uniformly through nozzles, capable of maintaining a
           temperature of at least 120 °F (50 °C) in all weather. Do not eject steam directly against
           concrete or forms.
         • A controlling device installed in the steam line that helps maintain a constant temperature.
         • A recording thermometer for each 200 ft. (60 m) of bed length.
Section 865 — Manufacture of Prestressed Concrete Bridge Members

3) Heated Forms: Uniformly heat the forms with a recirculating system that distributes the heat evenly. Use a system that includes:
   - A means of retaining moisture on concrete surfaces, except those in contact with the forms.
   - A recording thermometer for each 200 ft. (60 m) of bed length.
   - A weathertight covering for each bed to ensure uniform heating throughout the bed.

h. Vibrators: Use internal vibrators with at least 4,500 impulses per minute. Ensure the vibrator heads are small enough to reach through the prestressing and reinforcing steel to all portions of the form.
   1) Use enough vibrators to properly compact the concrete. Have an additional stand-by vibrator in good operating condition for each concrete placing operation.
   2) Get the Engineer’s approval of the vibration procedure and of the number and types of vibrators before pouring.
   3) You may use external vibration in conjunction with internal vibration when the Engineer so approves.

i. Grout Pump: Use grout pumps that can pump the fluid grout and maintain a uniform pressure of 75 lbs./in.² (520 kPa) for at least 15 seconds.

j. Storage Areas: Use plant storage areas that have surfaces capable of supporting the prestressed concrete bridge members without settlement. Ensure the storage area has blocks to support the units properly at the required points.

3. Substitution of Reinforcement

You may substitute welded wire fabric for the bar reinforcement shown on the plans. The Department will not pay extra for the substitution.

The substitution is subject to the following:
   a. Design Notes: Submit detailed shop drawings and design notes, including any changes, to the Engineer for approval before using welded wire fabric.
   b. Indicate on the design notes that the welded wire fabric will provide the same or greater strength as that provided by the bar reinforcing shown on the plans.
   c. Design fabric use according to the latest AASHTO Specification for Highway Bridges. Prepare the drawings on 22 x 36-in. (550 x 990 mm) sheets.
   d. Have an Engineer registered in the State of Georgia stamp both drawings and notes.
   e. Design the yield strength for the wire fabric not to exceed 60,000 psi (415 MPa) but not be less than 40,000 psi (275 MPa). Do not splice by welding or mechanical coupling.
   f. If using welded wire fabric for stirrups of bar reinforcement, embed the wires perpendicular to the axis of the beam at least 6 in. (150 mm) into the slab. Leave at most a clearance of 4 in. (100 mm) from the top of slab to the welded wire fabric.
   g. Embed at least two cross wires (wires parallel to the longitudinal axis of the beam) in the slab, with the closer cross wire clearing the top of the beam by at least 2 in. (50 mm).
   h. You may use welded wire fabric in the anchorage zone at the ends of the beam to replace the stirrups that enclose the prestressing steel in the bottom flange, and the vertical stirrups that do not protrude beyond the top of the beam.
   i. Ensure that the wires perpendicular to the longitudinal axis of the beam have the same steel area as that of the bar reinforcing.
   j. Use either smooth or deformed wires for welded wire fabric. Use the AASHTO Specification for Highway Bridges for the proper methods to embed and splice the fabric.
4. **Substitution of Strands**
   You may use strands of different arrangement, size, or arrangement and size. The Department will not pay extra for the substitution.
   The substitution is subject to the following structural and physical requirements:
   a. Ensure that the net prestressed force of the strands after losses equals that shown on the plans.
   b. Ensure that the ultimate strength of the member meets the applicable requirements of AASHTO Specification for Highway Bridges.
   c. Ensure that the eccentricity pattern of the substituted strands is about the same as the pattern shown on the plans.
   d. Before substituting strands, submit to the Engineer all changes and detailed shop drawings, with design notes. Ensure that the design notes indicate compliance with the requirements. Prepare drawings on 22 x 36-in. (550 x 900 mm) sheets.

   **NOTE:** If you propose to use strands that differ in size from those covered in ASTM A 416, submit complete data on the strands to the Engineer for approval.

   Do not use individual strand couplings.

   e. Have an Engineer registered in the State of Georgia stamp both drawings and notes.

5. **Concrete Manufacture and Mixing**
   a. Manufacture and place concrete according to the requirements of Section 500.
   b. Mix the concrete according to Subsection 500.3.04.E and Subsection 500.3.02.D.2 except when adding HRWR.
      1) When adding HRWR, dose the HRWR at the casting yard under the direct supervision of the producer's Quality Control. Do not exceed the HRWR manufacturer’s recommended dosage.
      2) After dosing, mix the concrete at mixing speed for at least 70 revolutions.

   **NOTE:** Do not exceed 360 total revolutions at mixing and agitating speeds.

   3) After adding the plasticizer, no additional mixing water will be permitted.

6. **Concrete Pouring**
   Fabricate the ends of all beams and girders to be vertical in the final erected position.
   a. Rough-float the tops of beams at approximately the initial set.
   b. All nominal lengths shown on the plans are horizontal dimensions.
   c. Ensure that the Fabricator adjusts the lengths, as necessary, to account for the final erected position of the member.
   d. Slope bearing assemblies to accommodate the erected position of the member.

7. **Methods of Prestressing**
   You may either pretension, post-tension, or combine these methods to prestress concrete bridge members.
   a. Pretensioning: You may pretension with either the single-strand or the multi-strand jacking method.

   **NOTE:** Do not use strands from more than one source in any one tensioning operation.
Ensure the method used meets these requirements:

1) Strand Splices: Get approval from the Engineer for splicing methods and devices.

<table>
<thead>
<tr>
<th>Jacking Method</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-strand</td>
<td>Use only one splice per strand.</td>
</tr>
<tr>
<td>Multi-strand</td>
<td>Splice all strands or no more than 10% of the strands.</td>
</tr>
</tbody>
</table>

Ensure that the spliced strands have similar physical properties, are from the same source, and have the same “twist” or “lay.” Locate splices outside the prestressed units.

2) Wire Failures: The Engineer may accept wire failures if the area of broken wires does not exceed 2 percent of the total area of the strands.

3) Stressing Preparations: Prepare the members as follows:
   a) Carefully place and thread all strands in the bed.
   b) Avoid contaminating the strand with oil, grease, or other bond breaking material. If any strand is contaminated, clean the strand with a suitable solvent or replace the strand.
   c) After final stressing, position all strands within the location tolerances specified in Subsection 865.2.01.B.11.
   d) Use strand vises designed for the size of pretensioning strand to anchor the strand.
   e) After anchoring, ensure that the vises sustain the pretensioning force without slipping until the release of stress. Ensure that the vise grips seat no more than 1/4 in. (6 mm) each.
   f) To prevent strands from bonding together, encase the strand in a conduit that can resist the pressure exerted by the concrete.
   g) Use conduit with an ID allowing free movement of the encased strand, but no greater than the diameter of the strand plus 1/8 in. (3 mm).
   h) Secure the conduit to prevent both longitudinal movement along the strand and bonding at the location shown on the plans, ± 1 in. (25 mm).
   i) Tape the conduit to keep concrete out. Use tape and conduit manufactured from a non-corrosive material compatible with both the concrete and steel. Do not debond the strand for the full length of members.

4) Pretensioning Operation: Use elongation to control this operation. Ensure that the hydraulic pressure gauge readings at the time of the measured net elongation are within 5 percent of the calculated gauge reading for that particular elongation.

Ensure that the net elongation and final gauge measurements agree within ± 5 percent of their computed theoretical values.

The measurements of force and elongation shall algebraically agree with each other within a 5% tolerance.

If any measurement varies by more than 5 percent, the Department will stop all work. Correct the defect before proceeding.

Pretension the members as follows:
   a) Initial Tension: After threading the strand in the bed, apply an initial tensioning force to each strand.

Do not use elongation to measure the amount of initial tension, but use a dynamometer, hydraulic jack gauge, or dead weight.
Section 865 — Manufacture of Prestressed Concrete Bridge Members

b) Final Tension: Calculate the final stress from the final elongation measured between established reference points. Use points that are independent of any movement in the bed or anchorages that might occur during the pretensioning operation.

Calculate the design elongation as follows:

\[ D = \frac{PL}{AE} \]

where

\[ D = \text{Design elongation in inches (millimeters).} \]
\[ P = \text{Tensioning force, in pounds (kilonewtons); subtract the initial tensioning force from } P. \]
\[ L = \text{Distance from dead end anchorage to reference point, measured in inches (millimeters).} \]
\[ A = \text{Cross-sectional area of strand, in square inches (millimeters).} \]
\[ E = \text{Modulus of elasticity of strand, in pounds per square inch (MPa).} \]

c) Add correction factors to the design elongation for strand anchorage slip and temperature. Correct any movement in the anchorage abutments or in the overall anchorage system. Use the final elongation figure as the net elongation in jacking the strand.

d) Single-Strand Jacking: Do not let the jack ram rotate more than one revolution while stressing any strand.

e) Draped Strand Jacking: Partially jack draped strands from the end of the bed to add tension. Raise or lower the strands to their final position to get the final tension.

Ensure that the strands have no more than four points where the strand changes slope, two of which shall be at each anchorage.

Use approved, low friction devices at pick-up and hold-down points. Make the devices maintain the desired vertical and horizontal positioning of the strand.

After partial jacking, deflect the strands to their final position in a sequence approved by the Engineer.

f) Final Readings: After final stressing, position all strands within the location tolerances specified in Subsection 865.2.01.B.11.

g) Calculate the final elongation according to Subsection 865.2.01.B.7.a.4).b).

Uniformly distribute stress in the strands throughout the bed length.

5) Detensioning Operation: Before detensioning, submit the pattern and schedule for releasing the strands to the Engineer for advance approval.

Detension the members as follows:

a) Strip or loosen forms that tend to restrict the horizontal or vertical movement of the member prior to releasing the stress.

b) If curing with steam, carefully release the strand because of dimensional changes due to temperature and shrinkage changes. Where possible, release the pretensioned strand while the units are moist and warm.

c) In deflected strand construction, immediately release the hold down devices within the member or members after curing with steam.

6) Stress Release Strength: You may transfer stress to the concrete, unless otherwise specified on the plans or in the Special Provisions, based on the following requirements (minimum strength determined by cylinders cast of the same concrete):
**Section 865 — Manufacture of Prestressed Concrete Bridge Members**

<table>
<thead>
<tr>
<th>Section</th>
<th>Minimum Strength</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>Concrete I-beams, box beams, flat slab deck sections, or tee slab deck sections</td>
<td>4500 psi (30 MPa)</td>
<td>18 hrs</td>
</tr>
<tr>
<td>Piling</td>
<td>4000 psi (28 MPa)</td>
<td></td>
</tr>
<tr>
<td>Other members</td>
<td>As specified on the plans</td>
<td></td>
</tr>
</tbody>
</table>

7) Strand Release: Use the following table for each type of strand:

<table>
<thead>
<tr>
<th>Type of Strand</th>
<th>Release</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single strand</td>
<td>Heat each strand and allow it to pull itself apart in the sequence of the approved pattern and schedule of release. Do not cut the strands.</td>
</tr>
<tr>
<td>Multiple strand</td>
<td>Release either a symmetrical group of strands or all of the strands simultaneously. Remove the load on the strands from the anchorage and place it on the jacking system. Gradually release the jack or jacks until the strands are relaxed.</td>
</tr>
<tr>
<td>Draped strand</td>
<td>Release according to a method where the weight of the beam is compared with twice the total amount of the vertical components of the hold-down forces.*</td>
</tr>
</tbody>
</table>

*Use one of the following two methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Release as follows:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method I (beam weight less than twice the total amount and vertical restraints cannot counteract the vertical components of the hold-down forces)</td>
<td>Heat each draped strand at the end of each member to failure in the sequence of the approved pattern and schedule of release. Release hold-downs and remove hold-down bolts. Release straight strands as noted in Subsection 865.2.01.B.7.a.(7)</td>
</tr>
<tr>
<td>Method II (beam weight more than twice the total amount)</td>
<td>Release hold-down devices within the beam. Release the strands from the top to the bottom by either heating or jacking in the sequence of the approved pattern and schedule of release.</td>
</tr>
</tbody>
</table>

b. Post-tensioning: Use either the system required by the plans or an approved alternate system. Alternate systems may include the post-tensioning of both straight and draped tendons. Ensure that the system meets the appropriate requirements that follow:

1) Tendons: Do not splice post-tensioning tendons.

2) Ducts: Accurately position the ducts in which post-tensioning tendons are placed and securely fasten them to prevent movement during concrete placement. Use flexible metal conduit, metal tubing, or other acceptable material for the ducts.

3) Stressing Requirements: Prepare the members as follows:

   a) Carefully thread tendons into the ducts.

   b) Avoid contaminating the strand with oil, grease, or other bond breaking material. If any strand is contaminated, clean the strand with a suitable solvent or replace the strand.

   c) Follow the stressing procedures and sequences approved by the Engineer.

   d) After stressing, anchor the tendons against the ends of the members and fill the ducts with grout.
Concrete Strength: Stress the post-tensioning tendons after the concrete in the member has reached the minimum strength and age requirements, as follows:

<table>
<thead>
<tr>
<th>Minimum Strength</th>
<th>Age</th>
</tr>
</thead>
<tbody>
<tr>
<td>4500 psi (30 MPa)</td>
<td>3 days</td>
</tr>
<tr>
<td>4000 psi (28 MPa)</td>
<td>5 days</td>
</tr>
</tbody>
</table>

c. Post-tensioning Operation: In general, tension straight tendons from one end. Simultaneously tension draped tendons from each end.

Pretension the members as follows:
1) Initial Tension: After threading the tendon in the duct, apply an initial tensioning force of up to 5 percent of the final tensioning force with a jack.
   Determine the initial tension by reading the gauge. Do not use elongation to measure the amount of initial tension.
2) Final Tension: Compute the final stress on tendons from the amount of the final elongation measurement, checked by the jack pressure gauge reading.
3) Gauge Reading: Ensure that the pressure gauge reading at the time of the measured elongation is within 5 percent of the calculated gauge reading for that particular elongation.
   If the gauge pressure reading varies by more than 5 percent from the calculated reading, stop the stressing operation and correct the defect before proceeding.
4) Jacking: While jacking draped tendons, ensure that jack pressures and elongations are kept as near equal as is possible at each of the two jacks so the elongation measurements and jack pressures remain proportional.
5) Anchor Devices: Design anchor devices that secure the tendon for the size of post-tensioning tendon used.
   After anchoring, ensure that the devices can maintain a prestressed load of 150 percent of the maximum design load and do not slip more than 1/8 in (3 mm) after anchoring.
   Place anchor devices exactly at right angles to the axes of the post-tensioned tendons. Carefully note anchorage losses and take the proper corrective measures to ensure that the tendon has the final design stress.
8. Grouting
   a. Time Limitations: Complete all grouting within 48 hours after post-tensioning.
   b. Grout: Make grout to a consistency of thick paint.
      1) Mix, by volume, 1 part Portland cement, 0.75 part (max.) sand passing a No. 30 (600 µm) sieve, and 0.75 part (max.) water.
      2) Within the limit specified, vary the proportions of sand and water as required by the Engineer.
      3) If you need to fill enclosures as hereinafter specified, you may eliminate sand and use a neat cement grout in the mix.
      4) After adding all ingredients, mix the batch for three minutes.
      5) Make batches of grout small enough so that the batch may all be used up in less than 45 minutes.
      6) Immediately before grouting, blow out tendon ducts with compressed air. Ensure that the compressed air does not contain oil.
      7) Vent each duct at each end. Ensure the vent has the means for positive closure when subjected to a minimum pressure of 75 psi (515 kPa).
      8) Pump the grout into the duct towards an exit vent.
      9) After the grout has expelled all entrapped air and is flowing in a solid stream, close the exit vent and build the pumping pressure to a minimum of 75 psi (515 kPa). Hold it at that level for a minimum of 15 seconds.
     10) Close the grout entrance vent.
     11) Do not move or disturb the member at all for at least 48 hours after grouting.

9. Concrete Finish
   a. Beams
      1) Finish the outside face of certain exterior beams specified in the Table of Bridge Areas Requiring a Type III Finish in Subsection 500.3.05.AB with the Type III Special Surface Coating Finish.
      2) Finish all other beams with a steel form finish.
      3) Score the surfaces of the top flanges of all beams with a stiff wire brush or equivalent. Score the beams transverse to the longitudinal axis of the beams.
      4) Transversely scrub the entire beam top with a coarse brush to remove all laitance and to produce a roughened surface for bonding to the slab. Remove all concrete fins or projections to produce a vertical face at the edge of the beam.
      5) If using prestressed concrete deck panels, finish both sides of the beam’s top flange with a trowel for 2 in. (50 mm) from each panel edge to ensure a smooth and level bearing area.
   b. Superstructure Deck Units: Finish the riding surface of superstructure deck units—flat slabs, channels, double tees, etc.—as specified in Subsection 500.3.05.T.9 and the plans.
      Finish the traffic face and top face of curbs on exterior units and the outside face of certain exterior beams as specified in the Table of Bridge Areas Requiring a Type III Finish in Subsection 500.3.05.AB.
   c. Substructure Units: Finish the top surfaces of caps and piling with the Type IV—Floated Surface Finish specified in Subsection 500.3.05.AB.5.
   d. Patching: The Engineer will inspect all honeycombed areas. The Engineer may reject bridge members with extensive honeycombs within bearing areas.
      1) Patch as directed by the Engineer, as soon as possible after form stripping.
      2) The Engineer may require that you use an epoxy bonding compound.
      3) Remove hold-down devices from the bottoms of the beams.
      4) Coat the resulting holes with an epoxy bonding compound and plug them with grout.
10. Concrete Curing
Cure concrete with one of the methods listed below. Provide means for keeping the temperature of bridge members above the freezing point for 6 days after concrete placement, except for steam curing. The Department may reject bridge members based on improper curing.

a. Water Curing: Cover all concrete surfaces that are not in contact with the forms with wet burlap or other suitable material. Keep the member wet for 7 days or until the concrete has reached the stress release strength specified in Subsection 865.2.01.B.7.a.(6).

b. Steam Curing: Do not begin steam curing for at least four hours after final placement of concrete.
   1) The Engineer may delay the start longer if the concrete has not taken its initial set. You may use sufficient heat during the delay to maintain the temperature of the concrete between 50 ° and 70 °F (10 ° and 21 °C).
   2) Ensure the steam curing enclosures retain moisture and heat.
   3) After steaming begins, you may raise the enclosure temperature at a maximum rate of 80 °F (27 °C) per hour until the surface temperature of the concrete reaches an optimum temperature, not to exceed 190 °F (88 °C).
   4) Ensure that the differential surface temperature of the concrete within a member does not exceed 40 °F (4 °C) during the curing period.
   5) Continue steaming until reaching the stress release strength.
   6) Lower the enclosure temperature at a maximum rate of 40 °F (4 °C) per hour.
   7) Maintain a film of water on all exposed surfaces of the concrete during the steam curing cycle.
   8) Do not exceed the maximum temperatures.
   9) The Department may reject bridge members based on excessive temperature.

c. Heated Forms: When using approved heated forms, keep the exposed surfaces of the concrete wet at all times.
   1) Enclose the beds with a suitable weather-tight covering supported to uniformly heat throughout the bed.
   2) Apply the requirements stated in Subsection 865.2.01.B.10.b concerning the delay period, temperature control, curing duration, and basis of rejection.

11. Tolerances
a. Manufacture prestressed concrete bridge members within the dimensional tolerances listed in SOP-3, Standard Operating Procedures for Precast/Prestressed Concrete. These tolerances generally will be the maximum deviation allowed, although normal manufacturing tolerances will be well within those listed.

b. The Department may reject bridge members based on excessive deviations.

12. Galvanized Coatings
a. Before shipping beams, galvanize the exposed surfaces and edges of embedded structural steel bearing components and all exposed surfaces of attached structural steel bearing components according to ASTM A 123/ A 123M or A 153/ A 153M.

b. Touch up all areas to be welded after the welded area has cooled, and the weld is completed and cleaned.

c. Galvanize miscellaneous structural steel, hardware, bolts, and washers prior to storage at the casting yard or jobsite.
13. Marking

**NOTE:** This requirement does not apply to single point pick-up locations placed on piling.

a. With the exception of the Department’s inspection stamp, the Contractor is responsible for the placement and accuracy of all markings on bridge members according to these specifications.

b. The Inspector will not act for the manufacturer with respect to marking, but will cooperate with the plant personnel to ensure that the work is properly done with respect to time of marking, accuracy of description, and accuracy of location of marks and lettering.

c. Locate the markings so they are hidden after completing Project construction.

d. Do not ship any unit from the plant until it carries the official GDT stamp and number assigned by the Department to the Inspector at the plant, nor until the Inspector checks and approves the markings required by these specifications.

e. Required Markings: Clearly mark bridge members to indicate the Project identification, date of manufacture, beam identification number (properly located to coordinate with the erection drawing), pile length, and location of pile single-point pick up.

f. Time of Marking
   1) Before Stress Transfer: Immediately after forms are removed and before transferring stress, individually identify and date members. This helps keep accurate records on each member’s bed location and date of concrete placement.
   2) Before Shipping: Give the Inspector advance notice of shipping. After securing members for shipment, apply marking consisting of the Project identification to each member.

g. The Inspector will place the GDT stamp and number on each member. The Inspector will not use the GDT stamp until after the members have been satisfactorily finished and stored.

14. Handling and Storing

a. Prestressing Steel: Protect all prestressing steel from contact with dissimilar metals to prevent galvanic action and excessive rusting.
   1) The Department will not consider light rust that does not visibly etch the steel as detrimental.
   2) Keep prestressing steel free of harmful materials, such as grease, oil, wax, clay, dirt, paint, and loose rust.
   3) Use special care to keep prestressing steel free of form oil and other bond-reducing material that may be used on the forms.
   4) Handle prestressing steel at all times in such manner as to prevent kinks and nicks. The Department will not allow prestressing tendons that have kinks, nicks, bends, or other defects.
   5) Do not use torches or welding equipment adjacent to tensioned strand unless the strand is insulated against heating or burning.

b. Reinforcement Steel: Handle, place, and support all reinforcement steel according to the requirements of Section 511.

c. Prestressed Concrete Bridge Members: Handle, store, and ship prestressed concrete bridge members in a way to eliminate the danger of cracks, fractures, and excessive bending stresses. Handle members by the two embedded pick-up points, unless the Engineer approves other methods.
   1) Except for piling, handle members so their vertical axes remain plumb at all times.
   2) Support members in storage on firm blocking located immediately below the two embedded pick up points. In multiple layer storage, support members in the stack with blocks of uniform thicknesses and in a vertical line.
   3) Set all blocking at right angles to the longitudinal axis of the member, and the longitudinal axis of the blocking shall be horizontal. Do not ship members until the concrete reaches its ultimate design strength.
d. Piling: Handle, store, and ship piling after stress release.
   1) The Department may reject any piling cracked in handling, storing, or loading if the crack warrants.
   2) The Department will reject any cracked piling destined for locations involving sea water or alkali soils.
   3) Mark rejected pile as rejected.
   4) Store piling in groups with the same length.
   5) Transport piling in a manner approved by the Engineer. Upon request, the Engineer will furnish drawings giving the limits of truck bolster spacing for various sizes and lengths of piling.

e. Beams: Handle or store fully pretensioned beams after stress release.
   1) Use pick-up and support points within 3 ft. (900 mm) of the beam ends.
   2) Support beams on firm blocking located within 3 ft. (900 mm) of the permanent bearing area of the beam.
   3) You may handle or store fully post-tensioned beams 48 hours after the grout has been placed in the tendon ducts.
   4) For beams manufactured by the combined method of pretensioning and post-tensioning, you may handle and store them after the pretensioning phase is completed. Do not handle again until 48 hours after grout placement.
   5) Do not ship beams and other superstructure units until after their strength reaches the required minimum 28-day design strength.
   6) Store beams in single layers, not in stacks. Support beams so they meet the following requirements concerning warp and sweep:

<table>
<thead>
<tr>
<th>Twist of vertical axes of the ends of beams due to misalignment of blocking</th>
<th>The maximum deviation between the vertical axes of the ends of beams shall be 1/4 in./ft. (20 mm/m) of beam height.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tilt of vertical axis of an end of beam from the vertical due to deviation of blocking from the horizontal</td>
<td>The maximum deviation of the vertical axis of an end of a beam shall be 1/4 in./ft. (20 mm/m) of beam height.</td>
</tr>
<tr>
<td>Lateral sweep due to manner of storage</td>
<td>There shall be no discernible sweep induced by the manner in which a beam is stored.</td>
</tr>
</tbody>
</table>

C. Acceptance

1. Plant Inspection
   a. Give Notice to the Engineer: Give the Engineer ample notice before starting work so that the Engineer can inspect all plant facilities involved in the production. Do not manufacture anything until the Engineer approves all facilities.
   b. Facilities for Inspection: Allow free access to the Inspector to all parts of the plant involved in the production process.
   c. Inspector Authority: The Inspector has the authority to reject materials or quality of work that do not meet the specifications. In cases of dispute, the Contractor may appeal to the Engineer, whose decision will be final.
Section 865 — Manufacture of Prestressed Concrete Bridge Members

2. Rejections
   If any material or finished members are defective, they will be rejected, even though the Inspector may have accepted them.
   a. Promptly replace rejected material or quality of work or make it good at your own expense.

3. Provisions for Testing
   Furnish and maintain sufficient testing equipment so that the Inspector can conduct the following tests at the casting yard:

<table>
<thead>
<tr>
<th>Material</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fine Aggregate</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Coarse Aggregate</td>
<td>AASHTO T 27</td>
</tr>
<tr>
<td>Hardened Concrete</td>
<td>GDT 35</td>
</tr>
</tbody>
</table>

   a. Hardened Concrete: Make cylindrical molds available for use on each casting bed.
   b. Provide and maintain a machine and other accessories, such as capping molds, heating pots, and capping compound, sufficient to test compression specimens according to AASHTO T 22.
   c. Furnish all testing materials, without cost to the Department, well in advance of the anticipated time of use. The Department will not compensate the Contractor if the work is delayed waiting for approval of the materials furnished for testing.

4. Facilities for the Inspector: Furnish for the sole use of the Inspector a suitable field laboratory according to Subsection 106.04, Subsection 106.11, and Subsection 152.

D. Materials Warranty
   General Provisions 101 through 150.
Section 866—Precast Concrete Catch Basin, Drop Inlet, and Manhole Units

866.1 General Description
This section includes the requirements for manufacturing the following to the dimensions shown on the plans:

- Precast reinforced concrete catch basins
- Drop inlets
- Manhole units

866.1.01 Related References
A. Standard Specifications
   - Section 500–Concrete Structures
   - Section 853–Reinforcement and Tensioning Steel

</tbody>
</table>

*Ensure that the concrete compressive strength is at least 4,000 psi (28 MPa). Do not use the gradation requirements.
Section 866 — Precast Concrete Catch Basin, Drop Inlet, and Manhole Units

For a list of sources, see QPL 4.

866.2.01 Precast Concrete Catch Basin, Drop Inlet, and Manhole Units

A. Requirements

1. Reinforcement
   Follow the plans, except as follows:
   a. Do not let steel reinforcement vary by more than 1/4 in. (5 mm) from the position shown in the design, except at pipe connections.
   b. Ensure the cover on the steel reinforcement is not less than that shown on the plans.
   c. Macro-synthetic fibers are permitted as reinforcement in lieu of steel reinforcement in precast manhole riser sections only. Approved fibers are listed on the Department’s Qualified Products List 86 (QPL 86), entitled Macro-Synthetic Fibers for Concrete Reinforcement.

2. Ensure all precast concrete units are true to shape with smooth, dense, and uniform surfaces.

B. Fabrication

1. Casting
   a. Place the concrete in each unit without interruption.
   b. Consolidate the concrete with an approved vibrator and hand-tamping as necessary. Force the concrete into the corners of the forms to prevent stone pockets or cleavage planes.

2. Holes for Pipes
   Make each hole about 4 in. (100 mm) larger than the outside diameter of the appropriate pipe.

3. Curing:
   Cure the units with one of the following methods until the minimum compressive strength has been achieved, or for 24 hours, whichever comes first.
   a. Method 1
      1) Place the units in a curing chamber, free from outside drafts, and cure them in a moist atmosphere not exceeding 160 °F (70 °C).
      2) Use steam injection for the time and temperature needed to obtain proper curing.
      3) Construct the curing chamber and place the units so that steam may fully circulate around the entire unit.
   b. Method 2
      1) Keep the units wet by covering the concrete not in contact with the forms with wet burlap or other suitable material.
      2) Protect the units from freezing between when you place the concrete until curing is complete.

4. Removing the Forms
   Leave the forms in place until you can remove them without damaging the unit.

5. Quality of Work
   a. Correct minor surface cavities or irregularities that do not impair the service value of the unit by pointing with an approved mortar. Apply the mortar immediately after removing the forms.
   b. Minor defects will not be cause for rejection.

C. Acceptance

1. Testing Facilities
   Ensure that the manufacturer furnishes facilities and assistance as required for the Inspector to sample and test quickly and efficiently.
Section 866 — Precast Concrete Catch Basin, Drop Inlet, and Manhole Units

NOTE: Check QPL 4 for pre-approved manufacturers that supply material compliant with this specification.

2. The Department will accept the units based on the results of compressive tests on concrete cylinders and on inspection during manufacture. The tests will determine the unit’s conformance with the design and quality of work prescribed in these specifications and on the plans.

3. The Department will accept any unit that meets the test requirements, regardless of age.

4. Rejection
   The Inspector will reject units if they fail to meet any requirements in this specification, and for any of the following defects:
   - Imperfect mixing and molding
   - Honeycombed or open texture
   - Exposure of the reinforcement that indicates the reinforcement is misplaced

5. Marking
   Ensure that each approved unit is marked with the name or trademark of the manufacturer and the date it was cast. The mark will be stenciled or otherwise placed on the inside of the unit so it is clearly legible at time of delivery.
   a. When approved by the Inspector, each unit will be stamped with the official mark of the Department or Certified Pipe Technician number (CPT).
   b. Accepted units or finished units will be rejected at any time if found to be defective.

6. Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Compressive strength</td>
<td>AASHTO T 22 and AASHTO T 24</td>
</tr>
</tbody>
</table>

7. Compressive Strength Test
   The Inspector shall do the following:
   a. Make compression tests on cylinders to satisfy the minimum strength requirements.
   b. Make at least three cylinders from each day’s pour and cure them in the same manner as the precast units.

D. Materials Warranty

1. Shipping
   Do not ship or transport any unit to the installation site unless it bears the required markings, stated in Subsection 866.2.01.C.5.
867.1 General Description
Specifications for this work will be included elsewhere in the Contract.
Section 868—Adhesive for Raised Pavement Markers

868.1 General Description
This section includes the requirements for hot-melt adhesive used to place raised pavement markers.

Section 868 – Adhesive for Raised Pavement Markers

b. Certification: Submit a certification from the manufacturer that includes the physical properties of the adhesives and that the material conforms with this specification, as stated in Subsection 106.05, Materials Certification.

c. Participation in the National Transportation Product Evaluation Program (NTPEP) evaluation for standard (non-plowable), snow plowable, temporary and chip seal raised pavement markers and adhesives.
   • Pavement Markers Adhesives shall meet the requirements and testing criteria for the NTPEP evaluation of adhesives.
   • Submit to the Office of Materials & Testing (OMAT) a letter of certification from the adhesive manufacturer indicting testing was conducted by NTPEP.

2. Packaging and Labeling
   a. Pack the adhesive in a self-releasing cardboard container or meltable bag.
   b. Put the manufacturer, quantity, and batch number on the label.
   c. Print “Thermoplastic Adhesive for Pavement Markers” on the label.

868.2.03 Pavement Marker Adhesive

A. Fabrication
   General Provisions 101 through 150.

B. Acceptance for Adhesives
   1. Acceptance is based on the certification furnished by the manufacturer that includes the physical properties of the adhesives.

   2. The physical properties of the adhesive shall meet the requirements listed in applicable table shown in the specification.

   3. The Department will reject any adhesive if it meets all requirements of this specification but fails in actual use.

C. Materials Warranty
   General Provisions 101 through 150.
Section 870—Paint

870.1 General Description
This section includes the requirements for all paints, including pigments, vehicles, and the compositions of prepared paints for all purposes specified.

870.2 Materials
A. Requirements
   1. Ingredients
      The Engineer shall approve all paint ingredients. Mix the paints in the proportions specified in this section for each kind of paint. The formulas given represent the proportions by weight of the materials to be used.
   2. Condition of Mixed Paints
      Ensure that mixed paints do not liver or curdle, and that the pigments remain in suspension to a reasonable degree satisfactory to the Engineer.
3. Filling and Packaging

The manufacturer shall strain paints before filling the containers. The manufacturer also shall ship paints in strong, substantial containers (according to QPL 46 and QPL 73) plainly marked with the paint name and number, color, volume, manufacturer name and address, date of manufacture, and the manufacturer’s lot number on every package. The inspection stamp on the paint container will be evidence of approval.

Traffic line paint manufactured for the Department shall be delivered in 55 gallon (208 L) drums or 250 gallon (946 L) totes. The manufacturer shall stencil on the head of each drum the kind of paint, requisition number, purchase order number, and gross and net weights. Ensure that the drums are the removable head types. Ensure the totes are labeled appropriately.

4. Finished Paints

Unless otherwise specified, deliver paints to the Project or the Department completely mixed and ready for use without adding oils or thinner. Use well ground paints that do not settle or badly cake in the container, and can readily be broken up to a smooth, uniform paint with good brushing consistency.

When brushed or rolled on a smooth, vertical surface, the paint shall dry hard and elastic without running, streaking, sagging, or spotting. Use paint for spray application that sprays satisfactorily and does not run, sag, or streak.

The first coat of paint applied in the shop or in the field to uncoated structural steel or wood is called the primer coat. The paint covering the primer coat is called the second coat, and the paint covering the second coat is called the third coat.

B. Fabrication

The formulas given in this specification represent proportions by weight.

C. Acceptance

1. Testing
   Test methods for paint analyses shall be according to the Federal Test Methods, Standard No. 141 or the ASTM standard methods of tests for paint.

2. Color
   Match color visually by comparing with standard color chips obtained from the Office of Materials and Research.

3. Inspection
   Inspection and analysis will be made at the point of manufacture according to SOP 14. The manufacturer shall assist as necessary, permit the Inspector to test the ingredients before the paint is made, and witness the paint grinding.
   The Department reserves the right to sample and test all paint at any time before it is used.

4. Tolerances
   The Department will accept a tolerance of 1 percent of the required value for the paint formulation and property requirements.

**EXCEPTION: This tolerance does not apply where maximum and minimum values are noted.**

D. Materials Warranty

The following people shall furnish the Department a certificate of analysis and manufacturer’s guarantee:

- The manufacturer of each brand of paint submitted for acceptance under these specifications
- All Contractors proposing to use any paint specified in this Section

Ensure that the certificate of analysis shows the paint trade name to be furnished, including a facsimile of the label if the paint is ready-mixed, and an analysis showing the percentage of each of the chemical elements and compounds in the pigment and vehicle. The guarantee shall assert that all paint furnished conforms to the analysis shown on the certificate filed and to the statement of percentages of ingredients shown on the labels, which are required to be on each container. The guarantee shall be sworn to by a person having authority to bind the manufacturer into an agreement.
870.2.01 Paints for Structural Steel

A. Requirements

1. Use structural steel paint that meets the applicable requirements of Subsection 870.2 and the following:
   - No. 1A, Red Primer (see Table 1). Apply this paint with brush, roller, or airless spray.
   - No. 1W, Waterborne Red Primer (see Table 2).
   - No. 1 Z, Inorganic Zinc Rich Primer (See Table 3)
   - No. 2A, Buff (see Table 4). Apply this paint with brush, roller, or airless spray.
   - No. 2B, Aluminum (See Table 5 and Subsection 870.2.01.B, “Fabrication”).
   - No. 2W, Waterborne Intermediate Coat (see Table 6).
   - No. 3A, Brown (see Table 7). Apply this paint with brush, roller, or airless spray.
   - No. 3B, Green (see Table 8). Apply this paint with brush, roller, or airless spray.
   - No. 3W, Waterborne Green (see Table 9).

B. Fabrication

1. No. 2B, Aluminum

   Prepare the aluminum paint by thoroughly mixing aluminum paste with mixing vehicle.
   a. Ensure the paints are well ground, do not settle or cake badly in the container, and are readily broken up to a smooth, uniform paint of good brushing consistency.
   b. Use 2 lbs. (0.24 kg) of paste to 1.0 gal (1.0 L) of vehicle. Mix this at the factory.
   c. Ensure a thorough mix with a minimum of stirring. Ensure that the paint shows satisfactory leafing qualities and solidly covers in one coat without running, streaking, or sagging.
   d. If applying two coats of aluminum paint, tint the first coat with iron blue paste to help distinguish the two coats.

C. Acceptance

See Subsection 870.2.C.

D. Materials Warranty

See Subsection 870.2.D.
A. Requirements

Use traffic line paints that meet the applicable requirements of Subsection 870.2 and the following:

1. No. 4C, Black Traffic Line Paint
   a. Paint Composition: (See Table 10).
   b. Finished Paint:
      1) Flexibility: Ensure paint flexibility by following this procedure:
         a) Use a doctor blade or other suitable means to apply the paint to a 30-guage (0.39 mm) clean tin plate panel. Apply to a wet film thickness of approximately 2 mils (0.05 mm).
         b) Dry the panel in a horizontal position for 18 hours, and then bake it for 5 hours at 220 °F to 225 °F (105 °C to 110 °C).
         c) Cool the panel to approximately 77 °F (25 °C) and bend double over a ½ inch rod (13 mm rod). Ensure that the film does not show cracking or flaking upon bending or straightening.
      2) Color: Ensure that the paint dries to a pure, flat black and furnishes the maximum amount of opacity and visibility under both daylight and artificial light.
         Ensure that the paint does not discolor when exposed to weather or traffic and does not appreciably discolor with stains during service life on either concrete or bituminous surfaces.
      3) Weight per gallon (liter): Use paint weighing at least 14.0 lb/gal (67 kg/L) at 77 °F (25 °C).
      4) Consistency: The paint viscosity when measured at 77 °F shall be 85 to 100 Krebs Units.
      5) Moisture content: The paint shall contain no more than 0.5% water.
      6) Drying: The paint shall dry to no pickup within 45 minutes when tested according to ASTM D 711.
      7) Spraying: The paint shall be factory-mixed ready for application through spray machines without using thinners.
      8) Storage: The paint shall not cake, liver, thicken, curdle, gel, or show other objectionable properties after storage for 6 months.
      9) Coarse particles and skins: The paint shall not contain more than 1.0 percent of coarse particles and skins.
     10) Fineness of Grind: The paint shall have a grind of 3 to 5 Hegman scale.
     11) Packaging: The finished paint shall be passed through a No. 40 mesh screen while filling the containers.

2. Prewet Organo Montmorillonite with 20-30% (95%) methyl alcohol by weight.

3. Use modifying oil acids, isolated by Federal Test Method No. 141, Method 7031 that have an Iodine Number as specified in Table 870.8, Alkyd Resin Solution Characteristics.
2. No. 5A, Waterborne White Traffic Line Paint
   a. Paint Composition: (See Table 11).
   b. Finished Paint
      1) Flexibility: Apply the paint to a 30 gauge (0.39 mm), clean tin plate panel, to a wet film thickness of approximately 2 mils (0.05 mm). Use a doctor blade or other suitable means.
         a) Dry the panel horizontally for 18 hours.
         b) Bake the panel for 5 hours at 220 ° to 230 °F (105 ° to 110 °C).
         c) Cool the panel to about 77 °F (25 °C) and bend it double over a 1/2 in (13 mm) rod. Ensure that the film does not crack or flake when bent or straightened.
      2) Bleeding: Ensure that the paint does not bleed over a bituminous surface type used in Georgia.
      3) Color: Ensure that the paint dries to a pure, intense white and furnishes the maximum amount of opacity and visibility under both daylight and artificial light.
         Ensure that the paint does not discolor when exposed to weather or traffic and does not appreciably discolor with stains during service life on either concrete or bituminous surfaces.
      4) Consistency: Use paint with a viscosity of 80 - 100 Krebs units at 77 °F (25 °C).
      5) Drying: Ensure that the paint dries to no-pick-up within six minutes when tested according to ASTM D 711.
         Ensure that the paint dries through within 20 minutes when applied at 15 mils (0.38 mm) wet thickness at 77 °F (25 °C).
      6) Spraying: Mix the paint at the factory so it can be applied by spray machines without adding thinners.
      7) Storage: Ensure that the paint does not cake, liver, thicken, curdle, gel, or show any other objectionable properties after storage for six months.
      8) Coarse Particles and Skins: Ensure that the paint contains less than 1 percent of coarse particles and skins.
      9) Fineness of Grind: Ensure that the paint has a grind of 2 to 5 Hegman scale.
     10) Weight per gallon (liter): Use paint weighing at least 14.00 lb./gal. at 77 °F (1.68 kg/L at 25 °C).
     11) Packaging: Pass the finished paint through a No. 40 (425 µm) screen while filling the containers.
     12) Freeze-Thaw and Heat Stability: Ensure that the paint shows no coagulation, discoloration, or change in consistency greater than 10 Krebs units, when tested according to TT-P-1952E.
     13) pH: Ensure that the pH is greater than 9.5.

3. No. 5B, Waterborne Yellow Traffic Line Paint
   a. Paint Composition: (See Table 12).
   b. Finished Paint:
      1) Flexibility: Apply the paint with a doctor blade to a 30 gauge (0.39 mm), clean tin plate panel, to a wet film thickness of approximately 2 mils (0.05 mm).
         a) Dry the panel horizontally for 18 hours.
         b) Bake the panel for 5 hours at 220 ° to 230 °F (105 ° to 110 °C).
         c) Cool the panel to about 77 °F (25 °C) and bend it double over a 1/2 in (13 mm) rod. Ensure that the film does not crack or flake when bent or straightened.
      2) Bleeding: Ensure that the paint does not bleed on any bituminous surface type used in Georgia.
      3) Color: Ensure that the paint dries to a bright yellow that matches color chip #33538 of Federal Color Standard #595B, within the limits of the Highway Yellow Color Tolerance Chart.
         Ensure that the paint does not discolor when exposed to weather or traffic and does not appreciably discolor from stains during service life on either concrete or bituminous surfaces.
      4) Consistency: Ensure a viscosity of 80 - 100 Krebs units at 77 °F (25 °C).
      5) Drying: Ensure that the paint dries to no-pick-up within 6 minutes when tested according to ASTM D 711.
         Ensure that the paint dries through within 20 minutes when applied at 15 mils (0.38 mm) wet thickness at 77 °F (25 °C).
      6) Spraying: Mix the paint at the factory so it can be applied by spray machines without adding thinners.
7) Storage: Ensure that the paint does not cake, liver, thicken, curdle, gel, or show any other objectionable properties after storage for 6 months.

8) Coarse Particles and Skins: Ensure that the paint contains less than 1 percent of coarse particles and skins.

9) Fineness of Grind: Ensure that the paint has a grind of 3 to 5 Hegman scale.

10) Weight per gallon (liter): Use paint weighing at least 13 lb./gal (1.56 kg/L) at 77 °F (25 °C).

11) Packaging: Pass the finished paint through a No. 40 (425 µm) screen while filling the containers.

12) Freeze-Thaw and Heat Stability: Ensure that the paint shows no coagulation, discoloration, or change in consistency greater than 10 Krebs units, when tested according to TT-P-1952E.

13) pH: Ensure that the pH is greater than 9.5.

B. Fabrication

See Subsection 870.2.B.

C. Acceptance

See Subsection 870.2.C.

D. Materials Warranty

See Subsection 870.2.D.

870.2.03 Sign Enamel

A. Requirements

1. Ensure that sign enamels, either baking or air-drying, except black, meet the requirements of Federal Specifications TT-E-489 and Subsection 870.2.

2. Use the identified class shown in Table 15 for the respective types. Also, ensure that each color matches Federal Standard 595A as designated.
### TABLE 15—SIGN ENAMEL FEDERAL SPECIFICATION REQUIREMENTS

3. For a black sign enamel, use a semi-gloss enamel that matches Federal Standard Number 595 A, Color 27038 and meets the requirements of Military Specifications MIL-E-698 B and Subsection 870.2.

**B. Fabrication**  
Prepare the surface and use a primer recommended by the manufacturer of the sign enamel.

**C. Acceptance**  
See Subsection 870.2.C.

**D. Materials Warranty**  
See Subsection 870.2.D.

#### 870.2.04 Paint for Timber

**A. Requirements**  
Ensure that paints for timber meet the requirements of Subsection 870.2 and Federal Specification TT-P-104b, unless otherwise specified.

1. If lead-free, fume-resistant paint is specified, ensure that it meets the requirements of Federal Specification TT-P-103b.

2. If chalking is a specified requirement, ensure that the paint meets Federal Specification TT-T-103b modified to require that the percentage of anatase be equal to that specified in TT-P-103b for both rutile and anatase.

**B. Fabrication**  
See Subsection 870.2.B.

**C. Acceptance**  
See Subsection 870.2.C.

**D. Materials Warranty**  
See Subsection 870.2.D.
870.2.05 Miscellaneous Paints

A. Requirements

1. Paint for Steel Piling and Sway Bracing

   Use paint for steel piling and sway bracing that meets the requirements of Subsection 870.2 and the following:
   a. No. 1P, General: Ensure that materials used as a primer and/or finish coat are formulated from either a coal tar pitch or a native pyrobitumen resin. You may use other types of material if they meet the requirements in Table 16, below.

   TABLE 16—PRIMER/FINISH COAT REQUIREMENTS

<table>
<thead>
<tr>
<th>Properties</th>
<th>Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color</td>
<td>Black</td>
</tr>
<tr>
<td>Odor</td>
<td>Ensure coal tar materials have no pyridine, pyridine base, or tar acid odor.</td>
</tr>
<tr>
<td>Consistency</td>
<td>Easily applied by brush or spray to a coverage of 60 ft²/gal (1.5 m²/L), without sagging, yielding film thicknesses of about 26 mils (0.66 mm) wet and 13 mils (0.33 mm) dry.</td>
</tr>
<tr>
<td>Drying time</td>
<td>Apply at a rate of 60 ft²/gal (1.5 m²/L). Ensure that the material dries to a firm film within 24 hours at 70 ° - 80 °F (21 °- 27 °C) and can receive a second coat.</td>
</tr>
<tr>
<td>Chemical resistance</td>
<td>Ensure that the material remains intact and in good condition when immersed for 30 days in each of the following inorganic acids, alkales, and salts:</td>
</tr>
<tr>
<td></td>
<td>● 5% sulfuric acid</td>
</tr>
<tr>
<td></td>
<td>● 5% hydrochloric acid</td>
</tr>
<tr>
<td></td>
<td>● 2% phosphoric acid</td>
</tr>
<tr>
<td></td>
<td>● 5% sodium hydroxide</td>
</tr>
<tr>
<td></td>
<td>● 25% sodium chloride</td>
</tr>
<tr>
<td></td>
<td>● 25% calcium chloride</td>
</tr>
</tbody>
</table>

1) Durability: Before initially accepting a product to be supplied under this specification, the complete system—from primer, when required, to finish coat(s)—shall be subjected to accelerated weathering and atmospheric exposure tests according to ASTM D 822 and ASTM G 23, Type D.

2) Ensure that the system remains intact without cracking, and prevents significant steel corrosion for at least 1,500 hours exposure in the accelerated weathering test, and 5 years atmospheric exposure in a coastal environment.

3) The State Materials Engineer may approve systems that perform satisfactorily for up to 3,000 hours of accelerated weathering pending completion of the 5-year atmospheric exposure tests.

4) After the Department initially accepts the material, you do not need to test each lot of material. However, the Department will conduct other durability tests at its discretion.

b. No. 2P, Special Provisions Coating: Use special protective coatings instead of any other coating required by the specifications for steel-H piling, steel sway bracing, metal shells for cast-in-place concrete piling, or prestressed concrete piling in all intermediate bents of the cap and pile trestle-type.
   1) Get approval from the Laboratory for the protective coating material.
   2) Use a two-component, chemically cured, coal-tar epoxy that meets the requirements of either Type I, Class 2, Military Specification MIL-P-23236 (Ships) or U.S. Corps of Engineers Specification C-200.
Section 870 — Paint

3) Ensure that the coating exhibits optimum chemical and physical resistance to alkalies and mineral acids under continuous immersion service.

4) Ensure that the cured coating withstands considerable physical abuse such as direct impact, abrasion, and flexing.

5) Furnish a written certification to the Engineer that the material meets the requirements of these specifications.

2. Galvanizing Repair Compound

Use a compound that meets the general requirements of Subsection 870.2 and Table 17.

### TABLE 17—GALVANIZING REPAIR COMPOUND REQUIREMENTS

<table>
<thead>
<tr>
<th>Paint Composition, percent by weight</th>

</tr>
</tbody>
</table>

a. Non-volatile Vehicle: Use chlorinated rubber and a suitable plasticizer for the non-volatile portion of the vehicle. Ensure that the chlorine content, based on the non-volatile vehicle, is at least 60 percent by weight.

b. Volatile Vehicle: Use a volatile vehicle that is completely compatible with the other ingredients of the finished product. Ensure that the vehicle meets all the physical and chemical requirements of the end product.

c. Finished Compound: Ensure that the finished compound meets the requirements of Table 18.
TABLE 18—FINISHED COMPOUND REQUIREMENTS

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Condition in the container</strong></td>
<td>No pigment component of the ready-mixed compound settles. When the package remains unopened for one year, you can readily disperse the pigment by hand mixing. The vehicle does not liver, curdle, or show excessive bodying.</td>
</tr>
<tr>
<td><strong>Application</strong></td>
<td>The material to repair galvanizing and to galvanize welds in the field shall be such that when applied, there is no unusual difficulty in horizontal, vertical, or overhead positions.</td>
</tr>
<tr>
<td><strong>Adhesion</strong></td>
<td>Expose test panels coated according to field application specifications to weather for at least 3 months in a position 45 degrees vertical, facing south. After this time, ensure that the test panels show no visible signs of peeling or flaking.</td>
</tr>
<tr>
<td><strong>Gassing</strong></td>
<td>No build up of gas or excessive pressure in the container when stored at room temperature for 3 months.</td>
</tr>
<tr>
<td><strong>Dry film thickness</strong></td>
<td>The compound leaves a dry film between 2 - 2-1/2 mils (0.051 - 0.064 mm) thick, when applied according to field application specifications.</td>
</tr>
<tr>
<td><strong>Drying time</strong></td>
<td>The compound is set to touch in 30 minutes and is dry to recoat in 4 hours. The material is thoroughly hard within 48 hours after application.</td>
</tr>
<tr>
<td><strong>Hardness</strong></td>
<td>Dry and cure the test panels coated under these specifications for at least 48 hours. Brush a section by hand with a wire brush. Continue brushing until you see bright metal. Measure the dry film thickness. Accept the material if the brushing does not reduce the film below the specified thickness.</td>
</tr>
<tr>
<td><strong>Consistency</strong></td>
<td>Viscosity at 77 °F (25 °C) is 123 ± 7 Krebs units, as measured by the Stormer Viscometer.</td>
</tr>
<tr>
<td><strong>Weight per lb (liter)</strong></td>
<td>22 ± 10% lbs (2.64 ± 10% kg) at 77 °F (25 °C).</td>
</tr>
<tr>
<td><strong>Packaging</strong></td>
<td>Commercial paint packaging is acceptable for containers smaller than 1 gal (3.8 L). For 1 gal (3.8 L) packages, use No. 26 gauge steel pails. Do not pack more than 1 gal (3.8 L) of compound in a single container.</td>
</tr>
<tr>
<td><strong>Storage</strong></td>
<td>Store the compound where the temperature stays above 45 °F (7 °C).</td>
</tr>
</tbody>
</table>

3. **Aluminum Caulking Compound**

   Use a compound that meets the requirements of Subsection 870.2, third bullet, and Table 19.

</tbody>
</table>

B. Fabrication
See Subsection 870.2.B.

C. Acceptance
See Subsection 870.2.C.

D. Materials Warranty
See Subsection 870.2.D.
870.2.06 Miscellaneous Paint Materials

A. Requirements

Use other paint materials that meet the following requirements:

1. Raw Linseed Oil: Use oil that meets the requirements of ASTM D 234.
2. Boiled Linseed Oil: Use oil that meets the requirements of ASTM D260.
3. Turpentine: Use turpentine that meets the requirements of ASTM D 13.
4. Mineral Spirits: Use petroleum spirits (mineral spirits) that meets the requirements of ASTM D 235.
6. Tinting Pigment Paste: Use lampblack, venetian blue, or iron blue as tinting pigments.
   - The Engineer may approve other tinting pigments, subject to limitations.
   - Add all tinting pigments in paste form.
7. Putty: Use putty that meets the requirements of Federal Specifications TT-P-791a, Type II.

B. Fabrication

See Subsection 870.2.B.

C. Acceptance

See Subsection 870.2.C.

D. Materials Warranty

See Subsection 870.2.D.
880.1 General Description
This section includes the requirements for water used in Portland cement mixtures.

880.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents

880.2 Materials
880.2.01 Water for Portland Cement Mixtures
A. Requirements
   1. Use water that is reasonably clear without oil, salt, acid, alkali, organic, and other injurious substances.
   2. The Department may allow drinking water that is used for ordinary household use without testing it.
   3. Do not use water from shallow, muddy, or marshy surfaces. Test and approve all other sources before using them.
   4. When the source of water is relatively shallow, ensure that the source depth and intake exclude silt, mud, grass, and all other foreign material.
   5. Do not use water with detergents that will entrain air in Portland cement concrete.
   6. Do not use water with impurities above the following limits:

<table>
<thead>
<tr>
<th>Impurity</th>
<th>Concentration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acidity or alkalinity calculated in terms of calcium carbonate</td>
<td>0.05%</td>
</tr>
<tr>
<td>Total organic solids</td>
<td>0.05%</td>
</tr>
<tr>
<td>Total inorganic solids</td>
<td>0.05%</td>
</tr>
<tr>
<td>Sulfate (SO₄)</td>
<td>0.05%</td>
</tr>
<tr>
<td>Chloride</td>
<td>0.01%</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.
C. Acceptance

The Department will reject any water that, when compared with accepted water, shows any indication of unsoundness, marked change in time of set, or reduction of more than 10 percent in mortar strength.

Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quality of water, solids ppm</td>
<td>AASHTO T 26</td>
</tr>
<tr>
<td>Setting time of concrete mixtures</td>

<td>AASHTO T 260</td>
</tr>
</tbody>
</table>

D. Materials Warranty

General Provisions 101 through 150.

880.2.02 Recycled Wash Water

A. Requirements

Recycled Wash Water shall conform to AASHTO M 157 and meet the following requirements:

<table>
<thead>
<tr>
<th>Chemical Designation</th>
<th>Limits</th>
<th>Test Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>SO₄, ppm</td>
<td>3000</td>
<td>ASTM D 516</td>

<td>50,000</td>
<td>AASHTO T 26</td>
</tr>
<tr>
<td>Cl, ppm</td>
<td>600</td>
<td>AASHTO T 26</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Conduct test methods according to the following:

| Quality of Water, Solids, ppm          | AASHTO: T26 |
| Setting Time of Concrete Mixtures     | ASTM: C 403 |
| Mortar Making Properties              | AASHTO: T 71|
| Air Content of Concrete               | GDT: 26     |
| SO₄, ppm, Alkalis, ppm                | ASTM D 516  |
| Cl, ppm                               | AASHTO T 26 |

1691
881.1 General Description
This section includes the requirements for the following fabrics:

- Plain cotton duck
- Rubber-impregnated cotton duck
- Burlap and cotton bags
- Plastic filter fabric
- Pavement reinforcement fabric
- Silt fence filter fabric

881.2 Materials

881.2.01 Plain Cotton Duck

A. Requirements

1. Use plain cotton duck meeting the requirements of Federal Specification CCC-C-419 Type III.
2. Ensure the duck weighs at least 8 oz./yd² (270 g/m²).

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.

881.2.02 Rubber-Impregnated Cotton Duck

A. Requirements

1. Use preformed rubber-impregnated fabric pads made of multiple layers of 8 oz (270 g) cotton duck, impregnated and bound with high quality natural rubber, or made of equivalent materials compressed into resilient pads of uniform thickness.
2. Use enough plies to reach the specified thickness after compression and vulcanizing.
3. Ensure the finished pad withstands compression loads of not less than 10,000 psi (70 MPa) when applied perpendicular to the plane of the laminations. Ensure the pad does not extrude or harmfully reduce in thickness.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.

881.2.03 Burlap Bags

A. Requirements

Use burlap bags made of at least 95 percent jute and manila fibers.

Use burlap weighing 8 to 18 oz/10 ft² (250 to 550 g/m²).

Use bags with a capacity of 1 to 2 ft³ (0.03 to 0.06 m³).

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.
### Section 881 — Fabrics

#### 881.2.04 Cotton Bags

**A. Requirements**

1. Use cotton bags with Osnaburg 40 x 26 thread count and a nominal fabric weight of 6.8 oz/yd² (230 g/m²).
2. Use bags having 1/2 in. (13 mm) sewn seams with at least 1 stitch per 1/5 in. (5 mm).
3. Use 4 or 5 ply, 12 cotton yarn or equivalent for the stitches.
4. Ensure seam efficiency is at least 80 percent. Ensure the inside measurements tolerance is ± 1/2 in. (13 mm).

**B. Fabrication**

General Provisions 101 through 150.

**C. Acceptance**

General Provisions 101 through 150.

**D. Materials Warranty**

General Provisions 101 through 150.

#### 881.2.05 Plastic Filter Fabric

**A. Requirements**

1. Use pervious sheets of plastic yarn made from a long-chain synthetic polymer. Use polymer composes of at least 85 percent by weight of propylene, ethylene, amide, ester, or vinylidene chloride.
   
   *Use a sheet of plastic yarn containing stabilizers and/or inhibitors added to the base plastic to make the filaments resistant to deterioration due to ultra-violet and/or heat exposure.*

2. Ensure the fabric is finished so that the filaments will retain their relative position with respect to each other.

3. Use fabric without defects, rips, holes, or flaws.

4. Use fabric meeting the following physical requirements for woven and non-woven fabric:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Woven Fabrics</th>
<th>Non-woven Fabrics</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength (any direction)</td>
<td>200 lbs. (890 N) minimum</td>
<td>30 lbs. (135 N) minimum</td>
</tr>
<tr>
<td>Bursting strength</td>
<td>500 psi (3.5 MPa) minimum</td>
<td></td>
</tr>
<tr>
<td>Elongation before breaking</td>
<td>10% to 35%</td>
<td>40% minimum</td>
</tr>
<tr>
<td>Percent open area</td>
<td>4.0% to 6.5%</td>
<td></td>
</tr>
<tr>
<td>Puncture resistance</td>
<td>65 lbs. (290 N) minimum</td>
<td>50 gal/min/ ft.² (34 liters/second/m²) (minimum) to 350 gal/min/ft.² (240 liters/second/m²) (maximum)</td>
</tr>
<tr>
<td>Grab tensile strength</td>
<td>40% minimum</td>
<td></td>
</tr>
<tr>
<td>Grab elongation</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Flow rate [H from 3 to 1 in. (75 to 25 mm)]</td>
<td>50 gal/min/ ft.² (34 liters/second/m²) (minimum) to 350 gal/min/ft.² (240 liters/second/m²) (maximum)</td>
<td></td>
</tr>
</tbody>
</table>

1. Use fabric evaluated by the National Transportation Product Evaluation Program (NTPEP).
Section 881 — Fabrics

2. Seams
   a. Get approval on the seams from the Engineer before use on a Project.
   b. Use fabric sewn with thread of the same chemical requirements as the fabric, or use fabric bound with cement or heat. Either have the fabric bound or sewn at the point of manufacture or at a location approved by the Engineer.
   c. Seam Uses: You may use one seam in edge drain and underdrain applications. You may bond or sew fabric together to form sections at least 6 ft. (1.8 m) wide for use under rip rap or behind retaining walls.

3. Fabric Use
   a. Use woven fabrics beneath rip rap when dropping stone from 3 ft. (1 m) or less.
   b. You may use woven fabrics that meet the flow rate for edge drains.
   c. Use non-woven fabrics to line edge drains, underdrains, or behind retaining walls, where specified.
   d. Do not use non-woven fabrics for filter beneath rip rap.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test according to the following:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Puncture resistance</td>
<td>ASTM D 4833</td>
</tr>
<tr>
<td>Tensile strength, elongation, grab strength</td>
<td>ASTM D 4632</td>

<td>ASTM D 3786</td>
</tr>
<tr>
<td>Percent open area</td>
<td>GDT 88</td>
</tr>
<tr>
<td>Flow rate</td>
<td>GDT 87</td>
</tr>
</tbody>
</table>

1. See QPL 28 for acceptable woven and non-woven fabrics meeting the requirements of this specification. See QPL 47 for acceptable Geocomposite wall drains.
2. The Department will reject any fabrics that meet this specification but fail to perform in actual use.

D. Materials Care and Warranty
   Wrap fabric in burlap or similar heavy duty protection during shipment and storage to protect it from mud, dirt, dust, and debris.

881.2.06 Pavement Reinforcement Fabric

A. Requirements
   Type I and Type II Pavement Reinforcement Fabric
   1. Use pavement reinforcement fabric that has the following properties:
      - Is non-woven, heat-resistant material composed of polypropylene or polyester fibers
      - Can be saturated with asphalt cement
      - Can be placed smooth with mechanical devices and be without wrinkles
      - Can withstand the heat of asphaltic concrete mixes during paving operations
      - Can withstand normal field handling and construction operations without damage
      - Meets the following physical requirements. The bid item or plans will indicate which type of fabric is required for a project.
Section 881 — Fabrics

<table>
<thead>
<tr>
<th></th>
<th>Type I</th>
<th>Type II</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength, minimum</td>
<td>90 lbs. (400 N)</td>
<td>125 lbs. (555 N)</td>
</tr>
<tr>
<td>Elongation at break</td>
<td>40% min., 100% max.</td>
<td>40% min., 100% max.</td>
</tr>
<tr>
<td>Asphalt retention, minimum</td>
<td>0.18 gal/yd² (0.8 L/m²)</td>
<td>0.28 gal/yd² (1.3 L/m²)</td>
</tr>
</tbody>
</table>

2. Submit a certificate from the manufacturer showing the physical properties of the material used and how it meets this specification. Submit the certificate according to Subsection 106.05, Materials Certification.

3. Demonstrate to the Department that fabric meeting the physical properties requirements of this specification has been used successfully in installations with similar environmental and project conditions.
   - For a list of sources, see QPL 40.

High Strength Pavement Reinforcement Fabric

1. Use pavement reinforcement fabric with the following properties:
   - Is a flexible, water-resistant, high-density asphaltic membrane laminated between two layers of high strength, heat resistant polypropylene or polyester fabric.
   - Can be placed smooth with mechanical devices and be without wrinkles.
   - Can withstand the heat of asphaltic concrete mixes during paving operations.
   - Can withstand normal field handling and construction operations without damage.
   - Has a self-adhesive backing adhered to a film release liner.
   - Meets the following physical requirements. The bid item or plans will indicate which type of fabric is required for a Project.

<table>
<thead>
<tr>
<th>Property</th>
<th>Type I</th>
<th>Type II</th>
</tr>
</thead>
<tbody>
<tr>
<td>Width, minimum</td>
<td>18 in. (450 mm)</td>
<td></td>
</tr>
<tr>

D. Materials Warranty
   General Provisions 101 through 150.

881.2.07 Silt Fence Filter Fabric
A. Requirements
   1. Use approved silt fence from QPL 36.
      a. Type “A” and “B” Fences: Use either woven or nonwoven filter fabric for Type “A” and “B” fences. If using woven fabric, the fabric may have slit tape yarns in one direction (warp or fill) only.
      b. Type “C” Fences: Use non-calendered woven fabric constructed with monofilament yarns only.

NOTE: Approved fabrics must consistently exceed the minimum requirements of this specification as verified by the Office of Materials and Research. If a fabric is removed from the Qualified Products List, do not use it in the work until the Department has reestablished the product’s acceptability.
2. Ensure silt fence filter fabrics have the following characteristics:
   - Has strong rot-proof synthetic fibers formed into either a woven or non-woven fabric
   - Has no treatment or coating that might significantly alter its physical properties after installation
   - Contains stabilizers and/or inhibitors to make the filaments resistant to deterioration resulting from exposure to sunlight or heat
   - Makes a pervious sheet of synthetic fibers oriented into a stable network so that the fibers retain their relative position with respect to each other under normal handling, installation, and service conditions
   - Has finished fabric edges to prevent the outer yarn from pulling away from the fabric
   - Has no defects or flaws that would significantly affect its physical and/or filtering properties
   - Meets the following physical or dimensional requirements:

<table>
<thead>
<tr>
<th>Type Fence</th>
<th>A</th>
<th>B</th>
<th>C</th>
</tr>
</thead>
<tbody>
<tr>
<td>Elongation (% Max.)</td>
<td>40</td>
<td>40</td>
<td>40</td>
</tr>
<tr>
<td>Apparent opening size (max. sieve size)</td>
<td>No. 30 (600 um)</td>
<td>No. 30 (600 um)</td>
<td>No. 30 (600 um)</td>
</tr>
<tr>
<td>Flow rate, gal/ min./ft.² (L/min./m²)</td>
<td>25 (1015)</td>
<td>25 (1015)</td>

<td>36 in. (914 mm)</td>
<td>22 in. (559 mm)</td>
<td>36 in. (914 mm)</td>
</tr>
</tbody>
</table>

1. Minimum roll average of five specimens.
2. Percent of required initial minimum tensile strength.

3. Use silt fence filter fabrics evaluated by the National Transportation Product Evaluation Program (NTPEP).

B. Fabrication

The fabric may be manufactured with pockets for posts, hems with cord, or with posts pre-attached using staples or button head nails.

Ensure the fabric has the manufacturer’s name and product trade name labeled on the fabric at a minimum of 25 ft. (7.6 m) intervals. Ensure the fabric has a color yarn mark in the fabric 14 inches (355 mm) ± 0.5 inch (12 mm) from both top and bottom ends for Type A and C and 8 inches (203 mm) ± 0.5 inch (12 mm) from both top and bottom ends for Type B fabric.
C. Acceptance

Test according to the following:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tensile strength</td>
<td>ASTM D 4632</td>
</tr>
<tr>
<td>Elongation</td>

<td>ASTM D 3786, Diaphragm Bursting Strength Tester</td>
</tr>
</tbody>
</table>

D. Materials Care and Warranty

Wrap fabric in a heavy-duty protective covering during shipment and storage to protect it from mud, dirt, dust and debris.

Do not expose fabric to temperatures greater than 140 °F (60 °C).

881.2.08 Filter Fabric for Embankment Stabilization

See Special Provision.
Section 882 — Lime

882.1 General Description
This Section includes the requirements for agricultural lime; lime for subbase and subgrade stabilization; and lime for asphaltic concrete.

882.1.01 Related References
A. Specifications
   General Provisions 101 through 150.
   Section 163 – Miscellaneous Erosion Control Items
   Section 700 – Grassing
   GSP 18
B. Referenced Documents
   AASHTO M 303
   ASTM C 25
   ASTM C 110
   ASTM C 977
   Liming Materials Act of 1996

882.2 Materials

882.2.01 Agricultural Lime
A. Requirements
   Apply agricultural lime made of ground or pelletized dolomitic limestone at the rate recommended by a public or private Soil Laboratory that participates in a national proficiency testing program. Proof of testing is the responsibility of the Contractor. Provide a soil test report to the Engineer prior to application. Take soil test samples in accordance with GSP 18 Sampling Testing and Inspection Specifications. Agricultural lime will meet the following requirements:

<table>
<thead>
<tr>
<th>Requirements</th>
<th>Percent by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calcium Carbonates Equivalent, min.</td>
<td>85</td>
</tr>
<tr>
<td>Elemental magnesium derived from magnesium carbonate, min.</td>
<td>6</td>
</tr>
<tr>
<td>Passing No. 10 (2.00 mm) sieve, min</td>
<td>90</td>
</tr>
<tr>
<td>Passing No. 100 (150 µm) sieve, min</td>
<td>25</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept agricultural lime that meets the above requirements.
D. **Materials Warranty**  
General Provisions 101 through 150.

### 882.2.02 Lime for Subbase and Sub-Grade Stabilization

**A. Requirements**  
Use either a commercial dry hydrated lime or a commercial granular quicklime for soil stabilization.

1. **Hydrated Lime:** Use hydrated lime that meets the requirements of ASTM C 977, except use lime that has at least 85 percent by weight passing the No. 200 (75 µm) sieve.

2. **Quicklime:** Use quicklime that meets the requirements of ASTM C 977, except use lime that has 100 percent by weight passing the 3/8-inch (9.5 mm) sieve. If slurry is to be made from slaking quicklime, use quicklime containing at least 94 percent total calcium oxide and magnesium oxide (CaO + MgO), and at least 90 percent total available calcium oxide (CaO).
   
   a. Furnish certified test reports with each shipment of lime attesting that the lime meets the requirements of the specification. However, the Engineer may inspect, test, and reject the material at any time.
   
   b. Lime from more than one source or more than one type on the same Project may be used, but do not mix lime of different types or from different sources.
   
   c. Protect the lime from exposure until used. Ensure that the lime is dry enough to flow freely when handled.

**B. Fabrication**  
General Provisions 101 through 150.

**C. Acceptance**  
Test the hydrated and quicklime used for soil stabilization according to ASTM C 977.

**D. Materials Warranty**  
General Provisions 101 through 150.

### 882.2.03 Lime for Asphaltic Concrete

**A. Requirements**  
Use hydrated lime that meets the chemical and physical properties of AASHTO M 303, Type I.

**B. Fabrication**  
General Provisions 101 through 150.

**C. Acceptance**  
1. Run the chemical analysis of hydrated lime used in asphaltic concrete according to ASTM C 25.

2. Test the physical properties of the hydrated lime according to the residue test in ASTM C 110.

   **NOTE:** QPL 41 for lime is used in asphaltic concrete only.

3. See QPL 41 for acceptable hydrated lime that meets the requirements of this specification.

**D. Materials Warranty**  
General Provisions 101 through 150.
Section 883—Mineral Filler

883.1 General Description
This section covers mineral filler used as an ingredient in bituminous paving mixtures. Use mineral filler listed in the approved Asphalt Mix Design and Job Mix Formula and in Qualified Products List (QPL) 81. Use an approved mineral filler that meets the requirements below and consist of finely divided rock dust, slag dust, hydrated lime, hydraulic cement, or fly ash. Other fine, inert, non-toxic materials produced as by-products of industrial processes and meeting the requirements below may be approved as mineral filler based on satisfactory performance in the asphalt mix design procedure. Ensure mineral filler is sufficiently dry, flows freely, and is free from lumps.

   AASHTO T 315
   GDT-22
   GDT 123

883.2 Materials
883.2.01 Mineral Filler
A. Requirements
   Use mineral filler meeting the following gradation limits:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing</th>
</tr>
</thead>
<tbody>
<tr>
<td>No. 30 (600 µm)</td>
<td>100</td>
</tr>
<tr>
<td>No. 50 (300 µm)</td>
<td>95-100</td>
</tr>
<tr>
<td>No. 200 (75 µm)</td>
<td>55-100</td>
</tr>
</tbody>
</table>

   Ensure that the mineral filler is free from impurities.
Section 883 — Mineral Filler

Subject mineral filler for use in Stone Matrix Asphalt (SMA) to mortar property testing according to AASHTO T-240, AASHTO R-28, AASHTO T-313, and AASHTO T-315. Mineral filler may be rejected and removed from QPL-81 for unsatisfactory performance as an ingredient in an asphalt mixture, as determined in these procedures or in the SMA Mix design procedure, GDT-123. Ensure the total fine mortar meets the following requirements:

<table>
<thead>
<tr>
<th>Test</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unaged DSR, G'/sinδ(kPa)</td>
<td>5 minimum</td>
</tr>
<tr>
<td>RTFO Aged DSR, G'/sinδ(kPa)</td>
<td>11 minimum</td>
</tr>
<tr>
<td>PAV Aged BBR, Stiffness (MPa)</td>
<td>1500 maximum</td>
</tr>
</tbody>
</table>

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Test gradation according to GDT-22.

D. Materials Warranty
   General Provisions 101 through 150.
Section 884 — Chlorides

884.1 General Description
This section includes the requirements for calcium chloride.

884.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   AASHTO M 144

884.2 Materials

884.2.01 Calcium Chloride
A. Requirements
   Use calcium chloride that meets the requirements of AASHTO M 144, Type I or Type II.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
885.1 General Description
This section includes the requirements for elastomeric bearing pads.

885.1.01 Related References
A. Standard Specifications
   Section 106—Control of Materials

B. Referenced Documents
   AASHTO Standard Specifications for Highway Bridges: Divisions I and II

   NTPEP Committee Work Plan for Evaluation of Plain and Laminated Elastomeric Bridge Bearing Manufacturer
   (EBB-17-01)

885.2 Materials
885.2.01 Elastomeric Pads
A. Requirements
   1. Type
      Use elastomeric bearing pads of the types, dimensions, and shapes specified in the plans.
      a. Design the pads according to Division I of the AASHTO Standard Specifications for Highway Bridges or
         Section 14 of the AASHTO LRFD Bridge Design Specifications, as specified in the plans.
      b. Use 100 percent virgin chloroprene (neoprene) that meets the requirements of AASHTO M 251 as the
         elastomer portion of the compound, unless otherwise specified.
   2. Certification:
      Submit, with each shipment from the neoprene manufacturer, a certification to the Engineer about the
      physical properties of the material and compliance with these specifications.
      a. Submit a certificate from the pad manufacturer stating that the lot representing the shipment has been
         tested according to AASHTO M 251.
      b. Include test results data in the certificates.
   3. Participation in the National Transportation Product Evaluation Program (NTPEP)
      a. Elastomeric bearing pads shall meet the requirements, auditing and testing criteria for the NTPEP
         Committee Work Plan for Evaluation of Plain and Laminated Elastomeric Bridge Bearing Manufacturer.
      b. Submit to the Office of Materials & Testing (OMAT), the audit results from the NTPEP evaluation.

B. Fabrication
   Use the materials, fabricate, and install the pads according to Division II of the AASHTO Standard Specifications
   for Highway Bridges or Section 18 of the AASTHO LRFD Bridge Construction Specifications, as specified in the
   plans.
C. Acceptance

The Department will accept the pads based on the material certification and inspection of each pad. The Department will inspect the pads when received for compliance to quality of work, type, dimension, and shape requirements.

The Department reserves the right to sample and test completed pads according to the provisions of Section 106.

D. Materials Warranty

General Provisions 101 through 150.
Section 886 — Epoxy Resin Adhesives

886.1 General Description
This section includes the requirements for the most common epoxy adhesives used in highway construction or maintenance.

886.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   AASHTO T 237
   ASTM 2240
   Federal Hazardous Products Labeling Act
   GDT 58
   QPL 15
   NTPEP Committee Work Plan for Evaluation of Pavement Markers and Adhesives (RPM-15)

886.2 Materials
886.2.01 Epoxy Resin Adhesives
A. Requirements
   1. Use the types of epoxy adhesives below:
      a. Type I-R: Rapid-setting marker adhesive for bonding raised pavement markers to pavement.
      b. Type I-S: Standard setting marker adhesive for bonding raised pavement markers to pavement.
      c. Type II: Epoxy adhesive for bonding plastic concrete to hardened concrete.
      d. Type III: Epoxy adhesive for bonding hardened concrete to hardened concrete, or for bonding miscellaneous materials such as metals.
      e. Type IV: Epoxy adhesive for creating an epoxy mortar for use with clean concrete or mortar sand.
      f. Type V: Epoxy adhesive for repairing cracks in concrete by intrusion grouting.
      g. Type VI: Epoxy adhesive for a complete application or as a component in the application of a skid resistant or protective coating on hardened Portland cement concrete or asphaltic concrete.
      h. Type VII: Discontinued.
      i. Type VIII: Epoxy adhesive used for anchors and dowel bar implants. Do not use in sustained tension load applications. Either mix this epoxy by machine to the proper ratio or package it in a two-component cartridge with a mixing nozzle that thoroughly mixesthe two components as they are dispensed. Use a nozzle at least 8 in. (200 mm) long.
   2. Furnish the epoxy adhesive as two separate components.
3. Viscosity
   Ensure that the viscosities of the separate components are similar and conducive to easy blending of the epoxy adhesive system.
   a. Submit the viscosity for the epoxy adhesive system to the Engineer.
   b. Ensure that the viscosity of the mixed system is compatible with the intended use of the system.

4. Labeling
   Clearly label each container of the separate components of an epoxy adhesive system with the following information:
   - Specification number and type
   - Component designation (A or B)
   - Manufacturer’s batch number—a batch is a single charge of all components in a mixing chamber
   - Expiration date (shelf life for separate components in original containers)
   - Mixing ratio and directions (by volume or weight as designated by the manufacturer)
   - Potential hazards and precautions according to the Federal Hazardous Products Labeling Act

5. Stencil the component designation on the top of each container.

6. Physical Requirements
   Ensure that the mixed epoxy adhesive system meets the applicable requirements of Table 1.

7. Participation in the National Transportation Product Evaluation Program (NTPEP) evaluation for standard (non-plowable), snow plowable, temporary and chip seal raised pavement makers and adhesives.
   a. Pavement Markers Adhesives shall meet the requirements and testing criteria for the NTPEP evaluation of adhesives.
   b. Submit to the Office of Materials & Testing (OMAT), a letter of certification from the adhesive manufacturer indicting testing was conducted by NTPEP.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Each epoxy adhesive system shall meet the requirements of this Section.
   If the Department qualifies or disqualifies a system for one of the types specified, it will not affect the qualification or disqualification of any other type.
   The Department will reject any epoxy adhesive system that meets all the requirements of this Section, but fails in actual use. For a list of sources, see QPL 15.

D. Materials Warranty
   General Provisions 101 through 150.

Section 887—Bearing Plates with Polytetrafluoroethylene Surfaces

887.1 General Description
This section includes the requirements for polytetrafluoroethylene (PTFE) bearing surfaces.

887.1.01 Related References
A. Standard Specifications
   Section 106—Control of Materials
B. Referenced Documents
   AASHTO LRFD Bridge Construction Specifications
   ASTM D 4894
   ASTM D 4895

887.2 Materials
887.2.01 PTFE Bearing Surfaces
A. Requirements
   1. Ensure the expansion bearings with polytetrafluoroethylene (PTFE) sliding surfaces meet the dimensions shown on the Plans and meet the requirements of the fastening method to the structure.
   2. Use bearings that meet the requirements for PTFE Bearing Surfaces in the AASHTO LRFD Bridge Construction Specifications.
   3. Ensure the PTFE resin is virgin material, not reprocessed, and meets the requirements of ASTM D 4894 and ASTM D 4895.
   4. Submit certified test reports, materials certificates, and a certificate of compliance with this Specification.
B. Fabrication
   1. Package each completed bearing to protect it from damage during shipment and storage.
   2. Clearly identify and mark the components of each bearing and securely fasten them for shipment. Ship to the Project locations for each structure, as stated on plans.
C. Acceptance
   The Department reserves the right to sample and test completed bearings or components according to Section 106.
D. Materials Warranty
   General Provisions 101 through 150.
Section 888 — Waterproofing Membrane Materials

888.1 General Description
This section includes the requirements for waterproofing materials that serve as a barrier between the concrete bridge deck and the overlay of asphaltic concrete. The membranes included herein are for bridge decks, pavement joints and cracks, and retaining wall joints.

888.1.01 Related References
A. Standard Specifications
   Section 106—Materials Certification

   GDT 69
   QPL 22

888.2 Materials
888.2.01 Waterproofing Membrane Material for Bridge Decks
A. Requirements
   1. Use a water-resistant primer adhesive that is supplied by the manufacturer of the membrane or other approved equal compatible with the membrane.
   2. Use an approved sealant compatible with the membrane and primer as mastic.
   3. Provide certified results from the manufacturer of the membrane system of the tests in Subsection 888.2.01.C.
   4. Re-submit the certified test results each time the product’s formulation is changed.
   5. For a list of sources, see QPL 22.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   Test the membrane system with GDT 69 and meet these requirements:

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bond</td>
<td>No break in bond, curled edges, bubbles, or pinholes</td>
</tr>
<tr>
<td>Water permeability</td>
<td>Above 500,000 ohms/ft.$^2$ (5.4 megaohms/m$^2$), measured indirectly in ohms per square foot (meter)</td>
</tr>
<tr>
<td>Heat resistance</td>
<td>Withstand 300 °F (150 °C) and retain an electrical resistance above 500,000 ohms/ft.$^2$ (5.4 megaohms/m$^2$)</td>
</tr>
</tbody>
</table>
### Section 888 — Waterproofing Membrane Materials

<table>
<thead>
<tr>
<th>Characteristic</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Resistance to aggregate penetration</td>
<td>Retain an electrical resistance above 500,000 ohms/ft.² (5.4 megaohms/m²) after granite chip creep damage test for 20 hours at 140 °F (60 °C)</td>
</tr>
<tr>
<td>Resistance to freeze-thaw cycles</td>
<td>After 10 cycles of freezing and thawing, the test membrane shall have the tensile strength of similar samples of the same membrane unfrozen</td>
</tr>
</tbody>
</table>
| Chemical resistance | Remain intact and in good condition when immersed for 30 days in each of the following inorganic acids, alkalies, and salts:  
- 5% sulfuric acid  
- 5% hydrochloric acid  
- 5% sodium hydroxide  
- 25% sodium chloride  
- 25% calcium chloride |
| Resistance to shear | Have a shear resistance of 100 lbs. (45 kg) or pass the Department’s evaluation of where and how the shear failure took place. |
| Waterproofing effectiveness | The membrane system does not displace; retain an electrical resistance above 500,000 ohms/ft.² (5.4 megaohms/m²) |

See QPL 22 for membranes that meet the requirements of this specification.

#### 888.2.02 Waterproofing Membrane for Pavement Joints and Cracks

**A. Requirements**

   a. Ensure that the membrane contains at least 14 percent synthetic rubber by weight.
   b. Ensure that the combined amount of asphalt and plasticizer oils is at least 60 percent of the total weight of the membrane. The total weight of the membrane for this purpose does not include the weight of any reinforcement or fabric.

2. Get primer from the membrane manufacturer or some approved equal compatible with the membrane.

3. Use membrane with the following physical properties:

<table>
<thead>
<tr>
<th>Physical Property</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thickness of rubber-asphalt membrane</td>
<td>0.065 in. (1.65 mm) minimum</td>
</tr>
<tr>
<td>Water permeability</td>
<td>500,000 ohms/ft.² (5.4 megaohms/m²)</td>
</tr>
<tr>
<td>Breaking factor</td>
<td>50 lbs./in. (8.75 kN/m) minimum</td>
</tr>
<tr>
<td>Heat resistance</td>
<td>300 °F (150 °C) minimum without membrane damage and retain minimum 500,000 ohms/ft.² (5.4 megaohms/m²) resistivity</td>
</tr>
<tr>
<td>Puncture resistance (mesh)</td>
<td>200 lbs. (900 N) minimum</td>
</tr>
<tr>
<td>Elongation of mesh</td>
<td>15 to 60% minimum</td>
</tr>
<tr>
<td>Pliability 1/4 in. (6 mm) Mandrel 180° bend at −15 °F, ± 2 °F (−26 °C, ± 1 °C)</td>
<td>No cracks in the membrane</td>
</tr>
</tbody>
</table>

**B. Fabrication**

General Provisions 101 through 150.
Section 888 — Waterproofing Membrane Materials

C. Acceptance

1. Test as follows:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Water permeability</td>
<td>GDT 69</td>
</tr>
<tr>
<td>Breaking factor</td>
<td>ASTM D 882 (Method A)</td>
</tr>
<tr>
<td>Heat resistance</td>
<td>GDT 69</td>
</tr>
<tr>
<td>Puncture resistance</td>
<td>ASTM E 154</td>
</tr>
<tr>
<td>Elongation of mesh</td>
<td>ASTM D 146</td>
</tr>
<tr>
<td>Pliability ¼ in. (6 mm) mandrel, 180° bend at –15 °, ± 2 °F (-26 °, ± 1 °C)</td>
<td>ASTM D 146</td>
</tr>
</tbody>
</table>

2. See QPL 22 for membranes that meet the requirements of this specification.

3. The Department will remove from the list any membrane that meets this specification but fails in actual use.

D. Materials Warranty

General Provisions 101 through 150.

888.2.03 Waterproofing Membrane for Retaining Wall Joints

A. Requirements

1. Use these waterproofing barriers for concrete and other masonry surfaces at locations shown on the plans.

2. Use waterproofing membrane that incorporates a cross-laminated, high density polyethylene film, adhered to a flexible, self-adhesive, rubberized asphalt.

3. Get primer from the membrane manufacturer or an approved equal compatible with the membrane.

4. Use membranes that meet the following requirements when tested with the required test method:

<table>
<thead>
<tr>
<th>Requirement</th>
<th>Requirement Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Thickness</td>
<td>0.060 in. (1.5 mm) minimum</td>
</tr>
<tr>
<td>Thickness of polyethylene film</td>
<td>0.004 in. (100 µm) minimum</td>
</tr>
<tr>
<td>Tensile strength</td>
<td>250 psi (1.7 MPa) minimum</td>
</tr>
<tr>
<td>Ultimate elongation</td>
<td>200% minimum</td>
</tr>
<tr>
<td>Permeance-perms grains/ft.²/hr/in. Hg (ng/s·m²·Pa)</td>
<td>0.1 (5.7) maximum</td>
</tr>
<tr>
<td>Cycling over crack at –15 °F (–26 °C)</td>
<td>No effect 100 cycles</td>
</tr>
<tr>
<td>Puncture resistance</td>
<td>40 lbs. (180 N) minimum</td>
</tr>
<tr>
<td>Pliability (180° bend over 1 in. (25 mm) mandrel at –25 °F (–32 °C))</td>
<td>No cracks</td>
</tr>
</tbody>
</table>

5. Submit a certification from the manufacturer that the physical properties of the membrane meet the specification according to Subsection 106.05, Materials Certification.

B. Fabrication

General Provisions 101 through 150.
Section 888 — Waterproofing Membrane Materials

C. Acceptance

Test as follows:

<table>
<thead>

<tr>
<td>Cycling over crack</td>
<td>Apply and roll membrane across two primed concrete blocks with no separation between the blocks. Open and close the crack from 0 to 1/4 in. (6 mm).</td>
</tr>
</tbody>
</table>

See QPL 22 for membranes that meet the requirements of this specification.

D. Materials Warranty

General Provisions 101 through 150.
Section 890—Seed and Sod

890.1 General Description
This section includes the requirements for seed and sod.

890.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   General Provisions 101 through 150.

890.2 Materials

890.2.01 Seed
A. Requirements
   1. Use seed that meets the requirements of the Georgia Seed Laws and Rules and Regulations.
   2. The germination, purity, and maximum weeds specified in the Georgia Seed Laws for all seeds used by DOT are:

   | Germination and hard seed minimum | 70%   |
   | Purity minimum                   | 90%   |
   | Weed seeds maximum               | 2%    |
   | Noxious seeds maximum            | 300 seeds per lb. (660 seeds per kg), subject to the limitations in Table 1 |

   3. Seed Mixture
      When seed mixtures are specified, each variety of seed shall be furnished separately and mixed after approval by the Engineer.

</tr>
</tbody>
</table>

Sum Total Noxious Weeds: 300 per pound (660 per kg)

B. Fabrication
General Provisions 101 through 150.
Section 890 — Seed and Sod

C. Acceptance

1. Get approval from the Engineer before sowing seed.
2. Ensure each bag of seed is tagged with an analysis tag showing the results of a test made within 9 months of planting.
   a. Collect and check the tags to ensure that they show a lot number, a test date within 9 months, and that the seed quality meets the requirements in Table 1.
   b. The Georgia Department of Agriculture and the laboratory will randomly sample seed.
3. Even though the Engineer approves the seed, you are still responsible to furnish and sow seed that meets these specifications at the time of sowing.
4. If the Engineer requires, provide seed samples to the Engineer early enough before seeding to allow further testing before seeding.
5. You may increase the rate of seeding to obtain the minimum pure live seed content specified if a low percentage of germination causes the quality of the seed to fall below the minimum.

   NOTE: You may increase the seeding rates if the noxious weed seed per square yard (meter) does not exceed the allowable quantity at the regular rate of seeding.

6. The Department will reject wet, moldy, or otherwise damaged seed.

D. Materials Warranty

General Provisions 101 through 150.

890.2.02 Sod

A. Requirements

1. Use living, growing sod of the designated species for block or big roll sod. This includes sod that is dormant during the cold or dry season and capable of renewing growth after the dormant period.
2. Obtain all sod from approved nurseries that have a Georgia Live Plant License.
3. Ensure that at least 75 percent of the plants in the sod are of the designated variety of grass.

B. Fabrication

1. Mow grass and weeds to a maximum height of 3 in. (75 mm). Rake and remove the grass before cutting the sod.
2. Cut the sod into the following sizes:
   - Block sod—12 in. (300 mm) by 22 in. (550 mm)
   - Big roll sod—21 in. (525 mm) by 52 ft. (15.8 m)
   Ensure that the sod has at least 1/2 in. (15 mm) of soil adhering firmly to the roots.
3. Always exercise care to retain the soil on the roots of the sod during cutting, transporting, and planting. Do not dump the sod from vehicles.

C. Acceptance

The Department will accept the material based on the following:

1. Notify the Engineer to inspect the sod sources before it is harvested.
2. The Engineer will inspect the sod while it is being planted.
3. The Department will reject sod with weeds or other growth or foreign material that may be detrimental to the planting. Sod that is excessively dried out, exposed to heat, or not viable will also be rejected.

Do not assume that an approval of a source means that the material is accepted.
D. Materials Warranty

1. Transplant the sod within 72 hours from the time it is harvested.

2. Sod that is not transplanted within 24 hours shall be kept moist and protected from exposure to heat, direct sunlight, and freezing until it is transplanted. Do not exceed the 72-hour time limit for transplanting all of the harvested sod.

3. Cut and install sod only when the soil moisture conditions are favorable.
Section 891—Fertilizers

891.1 General Description
This section includes the requirements for fertilizers. Comply and meet the fertilizer requirements of the Georgia Fertilizer Act of 1997 and the Georgia Soil Amendment Act of 1976 which regulates labeling, sampling and tonnage reporting. Purchase all fertilizers through a Georgia registered licensed distributor. All fertilizer is subject to a sampling inspection by the Georgia Department of Agriculture.

891.2 Materials

891.2.01 Fertilizer
A. Requirements
   1. Use commercial fertilizer as a single nutrient or mixed grade.
   2. Apply fertilizer based on recommendations from a public or private Soil Laboratory that participates in a national proficiency testing program. Proof of testing is the responsibility of the Contractor. Provide a soil test report to the Engineer prior to application. Take soil test samples in accordance with GSP 18 Sampling, Testing and Inspection Specifications.
   3. From this recommendation use single nutrient or mixed grade fertilizers containing the nutrients - nitrogen(N), phosphate (P2O5), and potash(K2O) in amounts recommended by the soil test. Composted animal manure may be substituted for commercial fertilizer that meets the soil test recommendations. See web-based Fertilizer Calculators to assist in determining the correct analysis and amounts to be applied according to the soil test.
   4. Clearly label the analysis on the fertilizer container.
   5. Apply fertilizer as a dry or liquid material, using equipment specifically designed for mixing and agitating the fertilizer. Dry or liquid fertilizer may be applied by use of a hydroseeder.
   6. Any fertilizer that becomes caked or otherwise damaged, making it unsuitable for use, shall be replaced at the Contractor’s expense.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   The Department will accept fertilizer that meets the above requirements.
D. Materials Warranty
   General Provisions 101 through 150.
893.1 General Description

This section includes the requirements for miscellaneous planting materials, such as the following:

- Plant topsoil
- Mulch
- Vines, shrubs, trees, and miscellaneous plants
- Inoculants
- Porous material
- Prepared plant topsoil
- Tree paint
- Stakes
- Organic soil additives
- Erosion Control Compost
- Engineered Topsoil

893.1.01 Related References

   GDT 41

893.1.02 Submittals

For erosion control compost submit a notarized certification that includes the following:

- The feedstock by percentage in the final compost product.
- A statement that the compost meets federal and state health and safety regulations.
- A statement that the composting process has met time and temperature requirements.
- A copy of the lab analysis, less than four months old, performed by a Seal of Testing Assurance certified lab verifying that the compost meets the physical requirements specified.

When requested by the Engineer, one Solvita Compost Maturity Test kit (six tests) for every 1000 yd.³ (765 m³) of compost supplied shall be provided. The Solvita Compost Maturity Test kit is available from:

   Woods End Research Laboratory Inc.
   Box 297
   Mt. Vernon, Maine 04352
   1-800-0451-0337
   email: info@woodsend.org
   or approved equal.
Section 893 — Miscellaneous Planting Materials

893.2 Materials

893.2.01 Plant Topsoil

A. Requirements

1. Use plant topsoil with the following characteristics:
   - Obtained from well-drained, arable land, but not from fields where tobacco grew in the last three years, or where Johnson grass or kudzu is present.
   - Friable, loamy soil with between 2 and 30 percent organic matter. Determine the percentage by measuring the loss on ignition of oven-dried samples ignited at 1,200 °F (650 °C).
   - Reasonably free from subsoil, heavy or stiff clay, coarse sand, and other deleterious substances.
   - Has no toxic amounts of acid or alkaline elements.
   - Can sustain healthy plant life.
   - Meets the grade requirements of Subsection 814.2.01.A.8.

2. The Department reserves the right to inspect all plant topsoil during the planting period. The Department will reject any material that does not meet the specifications.

3. Do not use frozen, muddy, or nonfriable topsoil.

4. Before delivering any topsoil to the job site, clear stones larger than 2 in. (50 mm) size and roots, sticks, brush, coarse litter, and other substances that would interfere with mixing, planting, and maintenance.

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   General Provisions 101 through 150.

D. Materials Warranty

   General Provisions 101 through 150.

E. Delivery and Packaging

1. Delivery
   a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
   b. Send an invoice with each shipment that shows the sizes and varieties of material included.

2. Packaging

   Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.02 Mulch

A. Requirements

1. Use mulch materials from two groups:
   a. Grassing and Erosion Control: Threshed rye, oat or wheat straw; or Bermuda grass hay
   b. Vine, Shrub, Tree, and Miscellaneous Plant Plantings: Pine straw, pine bark, or hardwood mulch (see 893.2.07.A.2 for pine bark and hardwood mulch).

2. Use mulch materials from either group that meet the following requirements:
   - Are accepted by the Engineer.
   - Can be distributed uniformly when properly loosened
   - Produce the desired results
Section 893 — Miscellaneous Planting Materials

- Meet the moisture requirements specified herein
- Contain no excessive amounts of noxious weed seeds

3. Noxious Weed Seeds
   Do not use hay or straw mulch material that has matured seeds from noxious weeds or other species that would harm surrounding farmland.

4. Moisture Content
   Ensure that the mulch material is reasonably dry.

5. Erosion Control Compost
   Use compost that meets the requirements in Table 1. Erosion Control Compost can be 100% compost or a blend of no more than 50% wood chips by volume.
   a. Wood Chips shall be fresh or partially composted wood chips less than or equal to 3 in. (75 mm) in length with 100% passing a 2 in. (50 mm) sieve and less than 10% passing a 1 in. (25 mm) sieve. Wood chips shall not contain any visible refuse or other physical contaminants, material toxic to plant growth, or over 5% sand, silt, clay or rock material.
   b. Produce General Use Compost by aerobic (biological) decomposition of organic matter. Compost feedstock may include, but is not limited to, leaves and yard trimmings, Class A biosolids, food scraps, food processing residuals, manure or other agricultural residuals, forest residues, bark, and paper. Compost shall not contain any visible refuse or other physical contaminants, material toxic to plant growth, or over 5% sand, silt, clay or rock material. Mixed municipal solid waste compost and Class B biosolids, as defined in the United States Environmental Protection Agency Code of Federal Regulations (USEPA, CFR), Title 40, Part 503 are unacceptable. Ensure Compost meets all applicable USEPA, CFR, Title 40, Part 503 Standards for Class A biosolids and the following requirements:

<table>
<thead>
<tr>
<th>TABLE 1 – PHYSICAL REQUIREMENTS FOR COMPOST</th>

</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

*A soluble salt content up to 10.0 dS/m for compost used in Compost Manufactured Topsoil will be acceptable.

NOTE: All physical requirements are in accordance with the United States Department of Agriculture and the United States Composting Council, “Test Methods for the Examination of Composting and Compost” (TMECC). Organic Matter Content and Particle Size requirements are in accordance with AASHTO R51-13.
Section 893 — Miscellaneous Planting Materials

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   1. If the material feels damp, the Department will use GDT 41 to test for moisture content.
   2. To pass, materials shall have a moisture content of 12 percent or less.

D. Materials Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
   1. Delivery
      a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
      b. Send an invoice with each shipment that shows the sizes and varieties of material included.
   2. Packaging
      Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.03 Vines, Shrubs, Trees, and Miscellaneous Plants

A. Requirements
   1. Use stock that meets the requirements of all State and Federal Laws for inspection of plant diseases and infestation.
   2. Use nursery grown and collected plant materials that meet all regulations of the States of their origin and destination, and that meet Federal regulations governing interstate movement of nursery stock.
   3. Use stock that is true to name and variety and is of first class quality with well developed tops and vigorous, healthy root systems.

   NOTE: Use plant names according to the edition of “Standardized Plant Names” in effect at the time of Invitation For Bids.

   4. Use only nursery-grown stock that conforms to ANSI Z60.1 American Standard for Nursery Stock.
      a. The Department will not accept plants and/or trees that are severely cut back or pruned to conform to contract size requirements.
      b. The Department will reject trees and shrubs that are undersized, have poorly developed tops or root systems, or are infected with disease or infested with insects.
   5. Certification
      Furnish all certificates of disease and infestation inspection, a list of plant materials purchased, and a complete list of nurseries from which each plant was grown.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will inspect plants at the nursery whenever necessary.
   1. Inspect and grade living plants for type, size, and quality according to ANSI Z60.1 American Standard for Nursery Stock.
   2. Even if the Department accepts materials after a test at the source, the Department may inspect the stock during planting and reject any that does not meet specification.
3. The Department will reject any of the following:
   • Stock damaged during digging, loading, transporting, planting, and transplanting
   • Broken or loose balls or balls of less diameter than that specified
   • Large canopy shade trees without a single dominant central leader
4. Replace rejected stock at your own expense.
5. Dispose of rejected stock to the satisfaction of the Engineer.

D. Materials Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
1. Delivery
   a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
   b. Send an invoice with each shipment that shows the sizes and varieties of material included.
2. Packaging
   Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.04 Inoculants
A. Requirements
1. Use a pure culture of nitrogen-fixing bacteria for an inoculant to treat seeds. Select an inoculant for maximum
   vitality and ability to transform nitrogen from the air into soluble nitrates and deposit them into the soil.
2. Use only purebred cultures less than one year old.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Engineer will review acceptable cultures.

D. Material Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
1. Delivery
   a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
   b. Send an invoice with each shipment that shows the sizes and varieties of material included.
2. Packaging
   Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.05 Prepared Plant Topsoil
A. Requirements
1. Use prepared plant topsoil made from plant topsoil, organic soil additive, commercial fertilizer, and lime, as
   described in Subsection 893.2.07.B.
2. Base any volume for peat moss used as an organic soil additive on the compressed bale.
3. For loose peat, double the volume.
Section 893 — Miscellaneous Planting Materials

B. Fabrication
   1. Make prepared plant topsoil from the following:
      • Four parts plant topsoil, Subsection 893.2.01
      • At least one part organic soil additive, by volume, Subsection 893.2.07.
      • A commercial fertilizer, grade 6-12-12, at the rate of 3 lbs./yd³ (1.8 kg/m³)
      • Lime at the rate of 5 lbs./yd³ (3 kg/m³)
   2. Base the above volumes on naturally compacted, undisturbed topsoil.

C. Acceptance
   The Department will accept the materials based upon their compliance with this specification.

D. Material Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
   1. Delivery
      a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
      b. Send an invoice with each shipment that shows the sizes and varieties of material included.
   2. Packaging
      Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.06 Stakes

A. Requirements
   1. Use wood stakes as indicated in the specifications or shown on the plans. Use the stakes for vine, shrub, tree, and miscellaneous plantings.
   2. Saw wood stakes from either oak or gum. Use only stakes that are number two common or better, either rough or dressed.

B. Fabrication
   1. Cut the stakes from sound, solid, undecayed wood, without unsound knots.
   2. Shape stakes to within 1/4 in. (6 mm) for all dimensions.
   3. Taper all stakes at one end.

C. Acceptance
   The Department will reject any stake that does not meet the following test:
   1. Draw a line from the center of the top to the center of the butt of each stake.
   2. Ensure that the line stays within the body of the stake and is not more than 1 in. (25 mm) from the geometric center of the stake.

D. Materials Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
   1. Delivery
      a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
      b. Send an invoice with each shipment that shows the sizes and varieties of material included.
Section 893 — Miscellaneous Planting Materials

2. Packaging
Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.07 Organic Soil Additives

A. Requirements
Use four types of organic additives: peat moss, pine bark, compost, and hardwood mulch.

1. Peat Moss
Use peat moss that meets the following requirements:
- Be granulated sphagnum virtually free from woody substances, consisting of at least 75 percent partially decomposed stems and leaves of sphagnum
- Be essentially brown in color
- Be free of sticks, stones, and mineral matter
- Be in an air-dry condition
- Shows an acid reaction of 3.5 pH to 5.5 pH
- Meets State and Federal regulations

2. Pine Bark
Use pine bark that meets the following requirements:
- Be obtained from disease-free wood, 100 percent of which is 9 in² (5625 mm²) or less in area, and 50 percent is more than 1 in.² (625 mm²) in area.
- Contain no noxious weed seeds, soil, sawdust or any substance toxic to plant growth
- Be at least two years old

3. Compost
Use compost that meets the following requirements:
- Be organic materials that have undergone biological decomposition
- Be disinfected using composting or similar technologies
- Be stabilized so it is beneficial to plant growth
- Be mature, dark brown or black in color and have minimal odors
- Contain no human pathogens
- Fall within a pH range of 5 to 8

Provide to the Department a list of all the ingredients in the original compost mix in the order of their relative proportions on a weight basis.

4. Hardwood Mulch
Use hardwood mulch that meets the following requirements:
- Derived from disease-free deciduous trees
- Particle size of less than 1 in. (25 mm) diameter and less than 3 in. (75 mm) in length. Hardwood mulch shall complete two composting cycles of 140 °F (60 °C) so that all viable weed seeds are destroyed and no further decomposition due to nitrification will occur
- Free from toxic levels of acidity and alkalinity
- Derived from sources other than cypress trees

Provide test results stating that the ingredients meet Federal, State, and local requirements for priority pollutant limits and do not contain levels of any chemicals that are harmful to plants or humans.
B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   The Department will accept the materials based upon their compliance with this specification.

D. Material Warranty
   General Provisions 101 through 150.

E. Delivery and Packaging
   1. Delivery
      a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
      b. Send an invoice with each shipment that shows the sizes and varieties of material included.
   2. Packaging
      Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.

893.2.08 Engineered Topsoil

A. Requirements
   1. Use an engineered mixture meeting the requirements herein. Do not use a mixture containing deleterious substances. Obtain the materials from sources approved by the Engineer. Ensure the aggregate retained on No. 10 (2 mm) sieve is of hard, durable particles.
   2. Remove particles with diameters greater than 2 in. (50 mm) before placing the topsoil. Remove particles with screens or by hand if few oversized pieces exist. Otherwise, crush the oversized pieces to less than 2 in. (50 mm) and use them in the proportions shown by the sieve table below.
   3. Use 5-10% by dry weight aerobically composted organic matter as topsoil components. The composting pile shall reach temperatures of 55-65°C (131-149°F) for a minimum period of 24 hours to kill pathogens. Obtain composted organic matter certified as having gone through the prescribed composting process and whose raw materials are from the following approved sources: grass clippings; leaf litter; cafeteria waste (with the exception of meat products); livestock manure from cows, sheep, goats, pigs, horses, chickens, etc.; and brewery waste. All components shall be free of pesticides and herbicides.
   4. Use 90-95% by dry weight inorganic topsoil components with the following properties:

<table>
<thead>
<tr>
<th>Sieve Size</th>
<th>Percent Passing by Weight</th>
</tr>
</thead>
<tbody>
<tr>
<td>Passing 2 in. (50 mm)</td>
<td>100</td>

</tr>
<tr>
<td>Maximum dry density, lb./ft.³ (kg/m³)*</td>
<td>105 (1680)</td>
</tr>
</tbody>
</table>
*by standard proctor

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   The engineered topsoil to be used shall be sampled and tested as directed by the Engineer according to the following properties:

<table>
<thead>
<tr>
<th>Test</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Soil gradation</td>
<td>GDT 4</td>

<tr>
<td>Plastic Limit and Plasticity Index</td>
<td>AASHTO T 90</td>
</tr>
</tbody>
</table>

   The engineered topsoil shall be resampled and retested as directed by the Engineer when 150 tons of use on a project is reached; and it shall be resampled and retested for every 150 tons of use thereafter.

D. Materials Warranty

   General Provisions 101 through 150.

E. Delivery and Packaging

1. Delivery
   a. Give the Engineer at least 24 hours notice before delivering any stock to the job site.
   b. Send an invoice with each shipment that shows the sizes and varieties of material included.

2. Packaging
   Pack stock for shipment to properly protect against drying, freezing, breaking, or other injury.
894.1 General Description
This section includes the requirements for the following types of fence and fencing accessories:

- Chain link fence
- Woven wire fence
- Barbed wire
- Ground rods
- Field fencing
- Silt fabric fencing

894.2 Materials
894.2.01 Chain Link Fence
A. Requirements
Use zinc or aluminum coated steel fabrics, fittings, accessories, and posts for chain link fence conforming to the following requirements:

1. Fence Fabric
   Use woven wire with reasonably uniform 2 in. (50 mm) square mesh. Ensure the mesh has parallel sides and horizontal and vertical diagonals of uniform dimensions. Use the wire size specified on the plans or in the Proposal.
   a. Zinc Coated: Use steel fabric conforming to AASHTO M 181. Ensure the wire and hot-dip coating conform to AASHTO M 181, Type I, Class C.
   b. Aluminum Coated: Use steel fabric conforming to AASHTO M 181. Ensure the wire and coating conform to AASHTO M181, Type II.
Section 894 — Fencing

2. Fittings and Accessories
   a. Tension Wire: Use wire conforming to AASHTO M 181. Use wire coated according to AASHTO M 181, Section 25.2 for aluminum coated fabric. Use wire coated according to AASHTO M 181, Section 3.5.2 for zinc-coated fabric.
   b. Fittings: Use fittings conforming to AASHTO M 181.
      1) Ensure fittings or accessories not included in AASHTO M 181 conform to industry standards for heavy, industrial-type fences.
      2) Hot-dip the materials in zinc with AASHTO M 111 Grade 50 Coating. For aluminum coated fabric, you may use materials made from Aluminum Alloy 360, die-cast, or Sand Alloy 356, ZG61A, or Tenzalloy.
      3) Use bolts and nuts conforming to industry standards and are zinc coated with the hot-dip process according to AASHTO M 232/ M 232M.

3. Posts, Rails, and Braces
   Use posts, rails, and braces conforming to AASHTO M 181 and ASTM F 1043. Ensure diameter, wall thickness, and weight conform to ASTM F 1043, Figure 2, Summary of Requirements for Industrial Fence, and the physical tolerance and material requirements conform to AASHTO M 181. Do not use Light Industrial/Commercial Fence as detailed in ASTM F 1043, Figure 3. Check the Plans for specifications on posts used for special applications. Use special posts conforming to AASHTO M 181 or posts approved by the Office of Materials and Testing.

4. Gates
   Use support posts and gate frames as designated on the Construction Detail or Project Plans. Use gate materials meeting the requirements of Subsection 894.2.01.A.3.
      a. Use the same coating requirements as for the fence posts. Coat gate frames after completing all welding.
      b. Use fittings and hinges conforming to Subsection 894.2.01.A.2.b.

B. Fabrication
   Ensure the chain link fence fabric is produced by recognized, good commercial practices.
      1. Apply the zinc or aluminum coating to the fabric in a continuous process. Do not apply in roll form.
      2. Carefully inspect the coated fabric visually, both before and after weaving, to determine the coating quality.

C. Acceptance
   The Department will reject chain link fabric with excessive roughness, blisters, sal ammoniac spots, bruises, flaking, bare spots, or other obvious defects to any considerable extent.

D. Materials Warranty
   General Provisions 101 through 150.

894.2.02 Woven Wire Fence

A. Requirements
   1. Fabric
      Use fabric meeting the requirements of ASTM A 116, Design Number 1047-6-11, with Class 3 coating.
      a. Ensure the galvanizing is uniform.
      b. Ensure less than 5 percent of the joints are deficient in zinc coating, as determined by ASTM A 239.
      c. You may use aluminum coated steel meeting the requirements of ASTM A 584, Design Number 1047-6-11, for the woven wire fence fabric.
2. Posts
   Use steel or wood posts of the sizes shown on the Plans.
   a. Use wood posts meeting the requirements of Subsection 862.2.01.
   b. Use steel posts and bracing meeting the requirements of ASTM A 702. Galvanize posts and braces with the hot-dip method according to ASTM A 123/A 123M.

3. Certification
   Furnish a certification to the Engineer from the manufacturer showing the physical properties of the materials.

4. Accessories
   Galvanize the following accessories according to ASTM A 153/ A 153M. Use 0.80 oz./ft² (245 g/m²) as the galvanizing minimum. Galvanize other accessories as necessary or specified on the Plans.
   a. Wire Fasteners: Use fasteners meeting the requirements of ASTM A 702.
   b. Tension Wire: Use No. 11 gauge wire.
   c. Staples: Use No. 9 gauge (3.77 mm) staples, 1-1/2 in. (38 mm) long.
   d. Nails: Use 1 in. (25 mm) roofing nails to fasten metal caps to wooden posts.

5. Gates
   Use support posts and gate frames of the size designated on the Construction Detail or Project Plans.
   a. Use an all welded frame unit. Ensure the gate is galvanized after welding with 2 oz./ft² (610 g/m²) of spelter coating.
   b. Use hinges, latches, and other accessories of good commercial quality, coated as in Subsection 894.2.02.A.4.

B. Fabrication
   1. Ensure the woven wire fence fabric is produced by methods recognized as good commercial practices.
   2. Carefully inspect the galvanized fabric to determine the zinc coating quality.

C. Acceptance
   The Department will reject woven wire fabric with excessive roughness, blisters, sal ammoniac spots, bruises, flaking, bare spots, or other obvious defects to any considerable extent.

D. Materials Warranty
   General Provisions 101 through 150.

894.2.03 Barbed Wire

A. Requirements
   1. Galvanized Steel Barbed Wire
      Use wire meeting the requirements of ASTM A 121 and has a Class 3 zinc coating.
   2. Aluminum Coated Steel Barbed Wire
      Use wire meeting the requirements of ASTM A 585.
   3. Posts
      Use posts as specified in Subsection 894.2.02.A.2 for barbed wire fence.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.
D. Materials Warranty
   General Provisions 101 through 150.

894.2.04 Ground Rods

A. Requirements
   1. Use ground rods 9/16 to 5/8 in. (14 to 16 mm) in diameter and at least 8 ft. (2.4 m) long, unless otherwise shown on the Plans.
   2. Ensure ground rods are galvanized steel with a minimum coating of 2 oz./ft.² (610 g/m²) according to the requirements of ASTM A 153/ A 153M.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.

894.2.05 Field Fencing (Woven Wire and Barbed Wire)

A. Requirements
   1. Definition
      Field fencing designates replacement fencing outside the Right of Way or temporary fencing inside the Right of Way, provided you do not reuse the materials for permanent fencing inside the Right of Way.
   2. Fence fabric
      Use woven wire fabric meeting the requirements of ASTM A 116 Design No. 939-6-12-1/2, and has a Class I coating, unless otherwise designated.
   3. Barbed wire
      Use wire meeting the requirements of ASTM A 121 and has a Class I coating. Use the same number of barbed wire strands as the existing or replaced fence, or as specified in the plans.
   4. Posts
      Use either galvanized steel, painted steel, or treated timber of the dimensions and spacing shown on the construction detail or plans.
   5. Gates
      Use posts, frame material, hinges, and fittings of acceptable commercial quality. Get approval from the Engineer before use.
   6. Use the Special Plan Details and/or Special Provisions for any special design of the field fence.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   1. Get approval from the Engineer for all materials. Ensure materials are of an acceptable commercial quality and are equivalent in quality to the fence being replaced or to the existing fence, as applicable.
   2. Do not send materials to the laboratory unless requested by the Engineer or required by the plans.

D. Materials Warranty
   General Provisions 101 through 150.
Section 894 — Fencing

894.2.06 Silt Fabric Fencing

A. Requirements

1. Fabric
   a. See Subsection 881.2.07, Silt Fence Filter Fabric, for the types of fabric available.
   b. Use a woven wire support fence or a polypropylene support mesh with Type “C” fence.
      1) Woven Wire Support Fence
         a) Ensure the woven wire support fence is at least 26 inches (660 mm) high with at least 6 horizontal wires.
         b) Ensure the vertical wires have a maximum spacing of 12 in. (300 mm).
         c) Ensure the top and bottom wires are at least 10 gauge (3.43 mm) and all other wires are at least 12-1/2 gauge (3.00 mm). Use Washburn and Moen Standard requirements for determining wire gauge.
         d) You may use other designs subject to approval by the Office of Materials and Testing.
      2) Polypropylene Support Mesh
         a) Ensure the polypropylene support mesh is sewn to the fabric 2 in. (50 mm) ± 1 in. (25 mm) from top and bottom of fabric and 11 in. (279 mm) ± 1 in. (25 mm) from top and bottom of fabric. Use a T-90 or T-45 black polyester thread to sew mesh to fabric with a lock stitch at 5 to 7 stitches per inch (5 to 7 stitches per 25 mm).
         b) Ensure the height of the polypropylene support mesh is at least 36 in. (914 mm) with a plus tolerance of 1 in. (25 mm).
         c) Ensure the polypropylene support mesh minimum tensile strength in the machine direction is 60 lbs./3 inches and 72 lbs./3 inches (32.6 kg/76.2 mm) the transverse direction.
         d) Ensure minimum average weight of the polypropylene support mesh is 10.3 lbs./1000 ft.² (4.7 kg/92.9 m²).
         e) Ensure the average strand count of the polypropylene support mesh in the machine direction is a minimum 7.5 per 10 inches (7.5 per 254 mm) and a minimum 13 per 10 inches (13 per 254 mm) in the transverse direction.
         f) Ensure the polypropylene support mesh contains stabilizers and/or inhibitors that make the mesh resistant to deterioration from exposure to sunlight or heat.

2. Posts
   Use post sizes and types as determined by the type of fence being installed. Generally, hardwood posts will be limited to ash, hickory, or oak. Other hardwoods may be acceptable if approved by the Office of Materials and Testing.
   a. Type “A” Fence: Use either wood or steel posts at least 4 ft. (1.2 m) long.
      1) If using soft wood, use posts at least 3 in. (75 mm) in diameter or nominal 2 x 4 in. (50.8 x 101.6 mm) and straight enough to provide a fence without noticeable misalignment.
      2) If using hardwood, use posts 1-1/2 x 1-1/2 in. (38.1 x 38.1 mm) with a minus tolerance of 3/8 in. (9.5 mm) providing the cross sectional area is at least 2.15 in² (1385 mm²).
      3) If using steel, use “U,” “T,” or “C” shaped posts with a minimum weight of 1.15 lbs/ft. (1.7 kg/m) and have projections for fastening the fence to the posts.
   b. Type “B” Fence: Use either wood or steel posts at least 3 ft. (900 mm) long.
      1) If using soft wood, use posts at least 2 in. (50 mm) in diameter or nominal 2 x 2 in. (50.8 x 50.8 mm).
      2) If using hardwood, use posts 1 x 1 in. (25.4 x 25.4 mm) with a minus tolerance of 1/ 4 in. (6.3 mm) providing the cross-sectional area is at least 0.95 in² (610 mm²).
      3) If using steel posts, use “U,” “T,” or “C” shaped posts with a minimum weight of 0.75 lb/ft. (1.1 kg/m).
c. Type “C” Fence:

1) Woven Wire Supported: Use only steel posts with a minimum length of 4 ft. (1.2 m). Use “U,” “T,” or “C” shaped posts with a minimum weight of 1.15 lbs./ft. (1.7 kg/m). Use posts with projections for fastening the woven wire and filter fabric.

2) Polypropylene Mesh Supported: Use either wood or steel posts at least 4 ft. (1.2 m) long.
   a) If using soft wood, use posts at least 3 in. (75 mm) in diameter or nominal 2 x 4 in. (50.8 x 101.6 mm) and straight enough to provide a fence without noticeable misalignment.
   b) If using hardwood, use posts 2 x 2 in. (50.8 x 50.8 mm) with a minus tolerance of 1/4 in. (6.3 mm) providing the cross sectional area is at least 3.28 in² (2120 mm²).
   c) If using steel posts, use “U”, “T”, or “C” shaped posts with a minimum weight of 1.15 lbs./ft. (1.7 kg/m). Use posts with projections for fastening the woven wire and filter fabric.

[NOTE: You must use woven wire or polypropylene mesh to provide extra support for Type “C” fence installations.]

3. Fasteners for Wooden Posts
   a. Wire Staples: Use at least 17 gauge (1.37 mm) staples, with legs at least 1/2 in (13 mm) long, and a crown at least 3/4 in. (19 mm) wide.
   b. Nails: Use at least 14 gauge (2.03 mm) nails, 1 in. (25.4 mm) long, with button heads of at least 3/4 in. (19 mm).

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 895—Polyacrylamide (PAM)

895.1 General Description
This section covers the use of anionic Polyacrylamide (PAM) as a flocculant on construction projects.

895.1.01 Related References
A. Standard Specifications
   Section 700—Grassing
B. Referenced Documents
   QPL 84

895.2 Materials
A. Requirements
   Use only Polyacrylamide (PAM) products listed on the Qualified Products List (QPL 84).
   Ensure Polyacrylamide (PAM) emulsions and powders are of the **anionic type only** and meet the following requirements:
   1. Meets the EPA and FDA acrylamide monomer limits of equal to or less than 0.05% acrylamide monomer.
   2. Has a density of 10% to 55% by weight and a molecular weight of 6 to 24 Mg/mole.
   3. Mixture is non-combustible.
   4. Contains only manufacturer recommended additives.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   1. Polyacrylamide (PAM) products must meet the requirements of Section 895 and be listed on QPL 84.
   2. Provide manufacturer’s data on charge density and molecular weight.
D. Materials Warranty
   General Provisions 101 through 150.
Section 900 — Miscellaneous

900.1 General Description
Specifications for this work will be included elsewhere in the contract.
Section 910—Sign Fabrication

910.1 General Description
This section includes the requirements for fabricating and applying messages on sign blanks, laminated panels, and extruded panels.

910.1.01 Related References
A. Standard Specifications
   Section 107—Legal Regulations and Responsibility to the Public
   Section 911—Sign Posts
   Section 912—Sign Blanks and Panels

</table>

1. Handle the clean metal blanks and panels with either a mechanical device or with clean cotton gloves before applying any paint.
2. After the final metal treatment, protect the blanks and panels at all times from contact or exposure to greases, oils, dusts or other contaminants.
3. Get approval for all materials used to fabricate the finished signs according to these Specifications.
Section 910 — Sign Fabrication

910.2.01 Painted Signs

A. Requirements

1. Use paint in fabricating these signs that meets the requirements in this Specification and is of the type specified.
2. Do not paint sign blanks or panels on which reflective sheeting shall be applied.

B. Fabrication

1. Coat the sign blanks or panels on one face and all the edges with one coat of primer. Allow the primer to dry thoroughly.
2. Apply a coat of the specified enamel to the primed face and edges.
   a. Ensure the film is 2.5 mils, ± 0.5 mils (60 µm, ± 10 µm) thick when dry. Determine the thickness with a suitable gauge accurate to 0.1 mil (3 µm).
   b. Apply the paint with either sprayers or rollers.
3. Ensure that the finished paint surface is smooth, uniform, and exhibits neat work quality.
4. Ensure that the paint does not run, curdle, or separate after application.

C. Acceptance

The Department will reject any sign panels or blanks with paint that is not of the proper thickness, or with paint that has run, curdled, or separated after application.

D. Materials Warranty

General Provisions 101 through 150.

910.2.02 Reflective Sheeting Signs

A. Requirements

Use materials that meets the requirements of these Specifications and is of the type specified.

B. Fabrication

1. Apply the reflective sheeting to the face of the sign blank or panel with either an approved vacuum applicator, using a combination of vacuum and heat, or an approved roller process, using heat when necessary.
2. Apply the specified sheeting type and level of reflectivity according to the sheeting manufacturer’s recommendations.
3. Splice the sheeting on a sign according to the sheeting manufacturer’s recommendations.
4. Age the sheeting for 48 hours.

C. Acceptance

After applying the sheeting properly, test the adhesion to ensure it produces a durable bond equal to or greater than the strength of the reflective sheeting.

1. Ensure that the adhesion is strong enough to resist stripping from the blank when tested with a stiff putty knife.
2. Ensure that no air pockets or bubbles exist between the sheeting and the sign blank.

D. Materials Warranty

General Provisions 101 through 150.
910.2.03 Message

A. Requirements

Ensure that all finished signs have the following characteristics:

- The signs are clear-cut
- The lines of all letters and details true, regular, and free from all waviness, unevenness, and furry edges or lines
- The signs do not have scaling, cracking, pitting, blistering, dents, or blemishes of any kind
- The size, style, and spacing of the letters, numerals, symbols, and borders used to convey the message are according to the details shown in the MUTCD and on the plans.

See Subsection 107.03, *Patented Devices*, if patented materials are used.

B. Fabrication

Ensure that the legends and borders have one coat of silk screen paint as per Subsection 914.2.01.

1. Apply legends and borders by using one of the following processes:
   - Silk screening
   - Reverse screening
   - Directly applying nonreflective, durable, glossy plastic film that meets the requirements of Section 917.

2. Air-dry or oven-bake the sign at a temperature that will not affect the sign.

3. Demountable legends and borders may be used where approved by the Engineer.

   **NOTE:** Attach all demountable legends (letters, numerals, symbols, and borders) to the sign face with pull-through rivets recommended by the manufacturer.

C. Acceptance

The Department will accept finished signs based on quality of workmanship and accuracy of dimensions and message.

D. Materials Warranty

General Provisions 101 through 150.
911.1 General Description
This section includes the requirements for the following:
- Galvanized steel sign posts
- Galvanized steel structural shape posts
- Aluminum structural shape posts
- Delineator posts
- Wood sign posts
- Ground-mounted breakaway sign supports

911.2.01 Galvanized Steel Sign Posts (Drive Type)

A. Requirements

Use drive-type steel posts made of flanged “U” channel or square tubular sections. For a list of sources, see QPL 35.

1. U-Channel

Use U-channel posts made of rerolled rail steel or new billet steel that meets the mechanical requirements of ASTM A 499, Grade 60, and the chemical requirements of ASTM A 1 for rails with nominal weights of 91 lbs./yd (45 kg/m) or greater.

a. Dimensions, Weights, Tolerances: Use the dimensions, weights, and tolerances in Table 1 for U-channel posts, unless otherwise indicated on the plans.

1) Use post lengths as specified on the plans.

2) Use post assemblies within a sign structure from the same manufacturer.

b. Bolt Holes: Ensure the bolt holes are properly punched or drilled with the following characteristics:

1) Holes are 3/8 in. (10 mm) diameter and spaced 1 in., ±1/32 in. (25 mm, ± 1 mm), center to center.

2) Ensure that the holes start 1 in. (25 mm) from the top and extend the full length of the post for Types II, III, and IV, and at least 18 in. (450 mm) for Type I.

3) The Department will not accept field-punched holes.

c. Coatings: Ensure that the posts are coated according to ASTM A 123/A 123M after the holes are punched or drilled.

2. Square Tubular

Use square tubular posts that meet the requirements of ASTM A 653/A 653M, Structural Steel, Grade 50, Class 1 (Grade 340, Class 1).

a. Dimensions, Weights, Tolerances: Use the dimensions, weights, and tolerances shown in Table 2 for square tubular posts unless otherwise indicated on the plans:
TABLE 2—DIMENSIONS, WEIGHTS, AND TOLERANCES FOR SQUARE TUBULAR POSTS

</tr>
</tbody>
</table>

1) Use post lengths as specified on the plans.
2) Use post assemblies within a sign structure from the same manufacturer.

b. Bolt Holes: Ensure all bolt holes are properly punched or drilled with the following characteristics:
   1) Holes are 7/16 in., ± 1/64 in. (11 mm, ± 0.5 mm) diameter and spaced 1 in., ± 3/64 in. (25 mm, ± 1 mm) center to center.
   2) Ensure that the holes start 1 in. (25 mm) from the top and extend the full length of the post on all four sides for Types 6, 7, and 8, and at least 18 in. (450 mm) on all four sides for Type 5.
   3) The Department will not accept field-punched holes.

c. Coatings: Coat square tubular posts with zinc at a minimum thickness of 0.90 oz/ft² (275 g/m²).

3. Bolts, Nuts, and Washers

Use bolts, nuts, metallic washers, and spacers made of aluminum, stainless steel, or galvanized steel. Use stainless steel that meets the requirements of ASTM A 193/A 193M, Type B8.

a. Bolts: Use bolts 5/16 in. (8 mm) diameter with hexagonal heads. Ensure they are long enough to extend at least 0.25 in. (6 mm) beyond the nut when installed.
   1) Use a bolt thread fit of ANSI B 1.13M, Class 6H.
   2) If using aluminum bolts, ensure that the aluminum meets the requirements of ASTM B 211 (B 211M), Alloy 2024-T4.

   1) Use a bolt thread fit of ASNI B 1.13, Class 6G.
   2) If using aluminum bolts, ensure that the aluminum meets the requirements of ASTM B 211(B 211M), Alloy 2017-T4.

c. Washers: Place metallic washers under all bolt heads. Place nylon washers between the metallic washer and the sign face.
   1) If using aluminum washers, ensure that the aluminum meets the requirements of ASTM B 209 (B209M), Alloy 2024-T4.
   2) Use aluminum washers with 25/64 in. (10 mm) inside diameter, 0.75 in. (19 mm) outside diameter, and 0.091 in. (2.3 mm) thick.
   3) Use standard galvanized and stainless steel washers that meet the size requirements of ANSI B 18.22.1.
   4) Use nylon washers with 13/32 in. (10 mm) inside diameter, 13/16 in. (21 mm) outside diameter, and 1/16 in. (1.6 mm) thick. Use nylon washers in combination with metallic washers to prevent torsional damage caused by the twisting action of the bolt heads.

d. Coatings: Use galvanized steel bolts and nuts that meet ASTM A 307 requirements.
B. Fabrication

1. Roll or form post sections of the dimensions specified.
2. Round all sharp corners and make rough or burred parts smooth.
3. Punch or drill holes as specified in Subsection 911.2.01.A.1.b.
4. Galvanize as necessary, according to ASTM A 153/A 153M.

C. Acceptance

Get approval for each sign support matrix from the FHWA.

The FHWA evaluates the matrix according to the AASHTO Standard Specifications for Structural Supports for Highway Signs, Luminaries, and Traffic Signals, current edition.

D. Materials Warranty

General Provisions 101 through 150.

911.2.02 Galvanized Steel Structural Shape Posts

A. Requirements

1. Ensure that the galvanized steel shapes for sign posts match the shape and dimensions shown on the plans.
   a. Use steel that meets the requirements of ASTM A 709 (A 709M) Grade 36 (245).
   b. Galvanize the shapes according to ASTM A 123/A 123M. Handle the structural shape through only one hole during galvanizing.
2. Submit a certification according to Subsection 106.05, Materials Certification.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.

911.2.03 Aluminum Structural Shape Posts

A. Requirements

1. Ensure that the aluminum shapes for sign posts match the shape and dimensions shown on the plans.

   **NOTE:** Use aluminum that meets the requirements of ASTM B 308/B 308M, Alloy 6061-T6.

2. Submit a certification according to Subsection 106.05, Materials Certification.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.
911.2.04 Delineator Posts

A. Requirements

1. Check the plans for the types of delineator posts to use. For a list of sources, see QPL 69.

2. If using flexible delineator posts, use only those indicated on the Georgia Department of Transportation Qualified Products List.

3. Mounting

   Fasten all delineators to be mounted on galvanized or aluminum posts with commercial aluminum lock bolts.

   **NOTE:** Fasten delineators to be mounted on wood posts with galvanized wood screws.

4. Galvanized Steel Posts

   Use posts that meet the requirements of Subsection 911.2.02.A.

5. Aluminum Flange Type Posts

   Use aluminum that meets the requirements of ASTM B 221 (B 221M), Alloy 6063-T6.

   a. Provide a post section in the form of a flanged “U” with dimensions shown on the plans. Point the bottom of the post.

   b. Punch or drill holes as specified in Subsection 911.2.01.A.1.b.

6. Wood Delineator Posts

   Use 4 in. (100 mm) square posts of the length specified on the plans.

   a. Use wood posts that meet the requirements of Subsection 862.2.02.

   b. Treat wood posts with preservative according to Section 863.

7. Flexible Delineator Posts

   Use posts made of a durable plastic or poly resin material. Check the plans to see the type of flexible delineator post used for each location.

   a. Physical Characteristics: Use posts that can either be driven into the ground with equipment that does not damage the posts or reflective sheeting, or be surface-mounted onto pavement.

      1) Drill or form pilot holes where necessary to embed the posts as shown on the plans.

      2) Classify flexible delineator posts as follows:

| Type I       | Curved or flat
|              | Soil mount
|              | Surface mount
| Type II      | Tubular
| A            | Soil mount
| B            | Surface mount

   3) Use durable, flexible, non-discoloring posts that can recover from repeated vehicle impacts.

   4) Ensure that materials used to manufacture flexible delineator posts are stabilized with UV (ultraviolet) inhibitors to prevent degradation.

   5) Ensure that the posts are inert to normal atmospheric elements and chemicals possibly used in grass or weed control.

   6) Use material for the post that can accept reflective sheeting.
b. Color: Use gray, white, or yellow posts, as required.

c. Reflective Sheeting: Use white or yellow reflective sheeting on the posts as required.
   Use sheeting that meets the requirements of Subsection 913.2.01, Type III.
   Obtain approved reflective sheetings from QPL 29.

d. Certification: Submit a certification from the manufacturer that the flexible delineator posts are formulated
   of the same material as when tested by National Transportation Product Evaluation Program (NTPEP) and
   will meet the requirements of this specification.

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   1. Performance Criteria

      Get approval for flexible delineator posts through the evaluation performed by NTPEP.
      The Department will use the data generated by the NTPEP testing to select usable materials that performed
      satisfactorily when tested with the following material and field tests.

   2. Shapes and Dimensions (Materials Test)

      a. Ensure that flexible delineator posts are curved, flat, or tubular with the upper 14 in. (350 mm) presenting
         at least a 3 in. (75 mm) wide profile facing approaching traffic.
      b. Place the top of the wide profile sheeting 0.5 in. (13 mm) from the top of the delineator post.
      c. Cap the top of tubular posts to prevent water inclusion.
      d. Design flexible delineator posts that are soil mounted to connect with a drive-type anchor base made of
         corrosion-resistant material. When a post is no longer serviceable, remove it and replace it in the same
         anchor base.
      e. Ensure that the minimum length for the anchor base is 18 in. (450 mm) and the minimum height above
         ground for the soil mount flexible delineator posts is 48 in. (1200 mm).
      f. Design surface-mount flexible delineator posts to connect with the base assembly and be easily replaced
         when the existing post is no longer serviceable. Use post heights of 24 in. (600 mm), 36 in. (900 mm), or
         48 in. (1200 mm), as required.

   3. Weathering (Materials Test)

      a. Ensure that flexible delineator posts withstand 1,000 hours of UV exposure in the QUV weatherometer
         without significant color change or physical deterioration. If the Department sees splitting, cracking,
         delaminating, or other failures, it will reject the delineator post.
      b. The Department will conduct the test according to ASTM G 53.

   4. Field Tests

      Perform impact tests on the flexible delineator posts as described below:

      a. Install 8 delineator posts in 2 rows of 4 each so that 1 row will be bumper hits and 1 row will be wheel hits
         in 1 pass of the vehicle.
      b. Set the delineator post with a height of 48 in., ± 1 in. (1200 mm, ± 25 mm) from ground level with the
         reflective sheeting facing the test vehicle.
      c. Use a standard American sedan or pickup for the test vehicle. Ensure that the vehicle has no unusually
         sharp hood ornaments or other appurtenances.
      d. Impact 8 delineator posts 10 times with the test vehicle at 55 mph (90 kph)
      e. Hit the posts five times at an ambient temperature of 32 °F, ± 5 °F (0 °C, ± 2 °C) and five times at an
         ambient temperature of 85 °F, ± 5 °F (30 °C, ± 2 °C).
Section 911 — Sign Posts

f. After concluding the impact test, ensure that at least 5 of the 8 posts remain intact, are securely anchored, and return to their original vertical orientation within an angle of ±10 degrees.

g. Of the 5 posts that remain intact, ensure that they also retain at least 50 percent of their reflective sheeting and show minimal signs of distress (cracking, loss of rigidity).

5. The Department will place flexible delineator posts that pass the laboratory material test and field test requirements on the approved list.

D. Materials Warranty
General Provisions 101 through 150.

911.2.05 Wood Sign Posts

A. Requirements
1. Use wood sign posts to support special signs, when noted on the plans. Use posts that comply with Georgia Standard No. 9055.
2. Treat the posts with preservative according to Section 863 and Standard No. 9055 notes.
3. Use wood that matches that specified in Subsection 859.2.04, except that it shall meet the grading requirements for No. 1 SR or No. 2 SR as specified in the current Southern Pine Inspection Bureau Rules.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
General Provisions 101 through 150.

D. Materials Warranty
General Provisions 101 through 150.

911.2.06 Ground Mounted Breakaway Sign Supports

A. Requirements
1. Use ground-mounted breakaway sign supports of any assembly approved by the Department as a breakaway foundation. For a list of sources, see QPL 63.
2. Design the support to modified AASHTO wind loads of 70 mph (112 kph).
3. Certification
   a. Furnish evidence that the support has been tested and has met the criteria established in NCHRP 350.
   b. Supply a certification showing the physical properties of the material and how it meets the specifications, as stated in Subsection 106.05, Materials Certification.
   c. Show evidence that the assembly has been used successfully in installations with similar environmental and Project conditions to the satisfaction of the Department.
4. Sign Support Design
   a. Type A: A single-post mount that can support a 7 ft.² (0.65 m²) sign mounted to the centroid 9 ft. (2.7 m) above ground.
   b. Type B: A two-post mount that can support a 18 ft.² (1.67 m²) sign mounted to the centroid 9 ft. (2.7 m) above ground.
Section 911 — Sign Posts

c. Type C: A three-post mount that can support a 37 ft.² (3.4 m²) sign mounted to the centroid 9 ft. (2.7 m) above ground.

5. Base Assembly
   a. Ensure that the furnished base assembly protrudes no more than 4 in. (100 mm) above ground.
   b. Ensure that the foundation assembly is compatible with the applicable sign post in Subsection 911.2.01.
   c. Ensure that the assembly is galvanized with the hot-dip method as per ASTM A 123/A 123M or an approved equal.
   d. To use an alternate protective coating, obtain approval from the Office of Materials before using it on Department Projects.

6. Assembly Hardware
   a. Use base attachment hardware that matches the plans and is as recommended by the manufacturer.
   b. Ensure that the hardware is protectively coated as in ASTM A 153/A 153M, ASTM B 695 Class 55, or ASTM B 766 Type II, class 12-, whichever is applicable.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   Use foundation assemblies that are FHWA-approved for the specific design category for which the unit was evaluated.

   Foundation assemblies are evaluated according to AASHTO Standard Specifications for Highway Signs, Luminaires, and Traffic Signals, current edition.

D. Materials Warranty
   General Provisions 101 through 150.
912.1 General Description
This section includes the requirements for aluminum sign blanks and panels, and extruded aluminum sign panels.

912.2 Materials
912.2.01 Aluminum Sign Blanks
A. Requirements
   1. Use aluminum sign blanks of the type, size, and shape specified:
      a. Type I: Signs with an area of 9 ft.² (0.84 m²) or less, at least 0.08 in., ± 0.005 in. (2 mm, ± 0.125 mm) thick.
      b. Type II: Signs with an area more than 9 ft.² (0.84 m²), at least 0.10 in., ± 0.006 in. (2.5 mm, ± 0.150 mm) thick.
   2. Use metal for the sign blanks that meets the requirements of ASTM B 209 (B 209M), Alloy 6061-T-6 or 5052-H38.
   3. See Table 1 for locations of bolt holes in the sign blanks. Punch or drill bolt holes 10 mm diameter. The table shows where the holes are located for each type and size of blank.
   4. Submit to the Engineer at least 1 ft.² (0.1 m²) of the sign material for each lot or shipment of each type.

B. Fabrication

1. Complete all fabrication, including shearing, cutting, and drilling or punching holes, before treating the metal and applying the face material.

2. Cut the metal blanks to size and shape. Ensure that the blanks are free of buckles, warp, dents, cockles, burrs, and defects resulting from fabrication.

3. Finish each face of the blank to be a plain surface and flat.

4. Metal Treatment

Use conversion coating or anodizing to finish the metal before painting or applying the reflective sheeting.

a. Ensure the finished sign blank or panel has a uniform, light-colored appearance, without splotches or stains.

b. If the finishing procedure produces an iridescent color, ensure that the shade is uniform.

c. Thoroughly clean the metal before finishing.

1) Begin cleaning with an etch-type alkaline cleaner or with a vapor degreaser, using a trichloroethylene or perchloroethylene solvent.

2) Use the cleaner according to the manufacturer’s specifications.

3) After using an alkaline etching cleaner, treat the metal with an acid solution or desmutting compound. Use the desmutting agent according to the manufacturer’s specifications.

d. Finish: Finish the metal with a conversion coating according to ASTM B 449, ASTM B921 or by anodizing with a chromic acid anodizing solution. Use the conversion coating compound according to the manufacturer’s specifications.
Section 912 — Sign Blanks and Panels

e. Handling: Carefully handle the metal with a device or with clean cotton gloves between all cleaning and finishing operations and before applying the finish material.

Be sure that the metal never comes in contact with greases, oils, dust, or other contaminants before you apply the finish material.

C. Acceptance

The Department will accept the sign blanks based on results of chemical and physical tests on the materials, approval of methods and procedures for metal treatment, and acceptable quality of work of the finished blank.

D. Materials Warranty

General Provisions 101 through 150.

912.2.02 Extruded Aluminum Sign Panels

A. Requirements

1. Use extruded aluminum sign panels close to the shape and size shown on the plans.

2. Ensure that the aluminum meets the requirements of ASTM B 221 (B 221M), Alloy 6063-T6 or 6061-T6.

3. Accessories

   Ensure that the accessories for fabricating the signs meet the following:

   a. Bolts: Use bolts for connecting the panels that are 3/8 in. (M10x1.5), tolerance grade 16 UNC 2A thread (6G threads), and 3/4 in. (19 mm) long. Use bolts that meet the requirements of ASTM F 468 (F 468M), Alloy 2024-T4.

   b. Hex Nuts: Use hex nuts with tolerance grade 4 threads that meet the requirements of ASTM F 467 (F 467M), Alloy 6061-T6.

   c. Washers: Use washers that meet the requirements of ASTM B 209 (B 209M), Alloy 2024-T4.

   d. Posts Clips: Use clips as shown on the plans and that meet the requirements of ASTM B 108, Alloy 356-T6.

   e. Post Clip Bolts: Use bolts that are 3/8 in. (M10x1.5), tolerance grade 16 UNC 2A thread (6G threads), and 1-3/4 in. (44 mm) long, and meet the requirements of ASTM F 468 (F 468M), Alloy 2024-T4.

   f. Post Clip Nuts: Use hex locknuts that meet the requirements of ASTM B 211 (B 211M), Alloy 2017-T4.

   g. Post Clip Washers: Use washers that meet the requirements of ASTM B 209 (B 209M), Alloy 2024-T4.

4. Tolerances

   Ensure that the sections are within the established commercial tolerances of the aluminum industry.

   a. Ensure that all panels 6 in. (150 mm) wide have a nominal weight of 1.115 lb./ft. (1.7 kg/m). Use these sections only at the top of signs that do not conform to 1 ft. (300 mm) modules.

   b. Ensure that all panels 1 ft. (300 mm) wide have a nominal weight of 2.707 lb./ft. (4.0 kg/m). Use these sections as the normal sign panel.

   c. Before supplying an alternate extruded panel section of equal or greater section moduli with dimensions suitable to use hardware, as shown on the plans, obtain written approval from the Engineer.

5. Submit to the Engineer at least 1 ft². (0.1 m²) of the sign material for each lot or shipment of each type.

B. Fabrication

1. Make the extruded panel signs as shown on the plans.

2. Finish the extruded panels as specified in Subsection 912.2.01.B.4.

C. Acceptance

The Department will accept these sign panels based on results of chemical and physical tests of materials, approval of methods and procedures for metal treatment, and the quality of workmanship on the finished panel.
D. Materials Warranty

General Provisions 101 through 150.
Section 913—Reflectorizing Materials

913.1 General Description
This section includes the requirements for reflective sheeting.

913.1.01 Definitions
• Reflective Sheeting Types:
  Type I: Medium-intensity retroreflective sheeting (engineering grade) that is typically an enclosed lens glass-bead retroreflective material.
  Type II: Medium-high-intensity retroreflective sheeting (super engineering grade), that is typically enclosed lens glass-bead retroreflective material.
  Type III: High-intensity retroreflective sheeting that is typically an encapsulated glass-bead retroreflective material or an unmetallized microprismatic retroreflective element material.
  Type IV: High-intensity retroreflective sheeting that is typically an unmetallized microprismatic retroreflective element material.
  Type V: Super-high-intensity retroreflective sheeting that is typically a metallized microprismatic retroreflective element material. This material is typically used for delineators.
  Type VI: Elastomeric high-intensity retroreflective sheeting without adhesive that is typically a vinyl microprismatic retroreflective material. This material is typically used for orange temporary roll up signs.
  Type VII: Super-high-intensity retroreflective sheeting that is typically an unmetallized microprismatic retroreflective element material.
  Type VIII: Super-high-intensity retroreflective sheeting that is typically an unmetallized microprismatic retroreflective element material.
  Type IX: Very-high-intensity retroreflective sheeting that is typically an unmetallized microprismatic retroreflective element material.
  Type X: Super-high intensity retroreflective sheeting that is typically an unmetallized microprismatic retroreflective element material.
  Type XI: Very-high-intensity retroreflective sheeting that is typically an unmetallized cube corner microprismatic retroreflective element material.

B. Referenced Documents
  ASTM D 4956
  QPL 29
913.2 Materials

913.2.01 Type I, II, III, IV, V, VI, VII, VIII, IX, X, and XI Reflective Sheeting

A. Requirements
1. Use reflective sheeting that meets the requirements of ASTM D 4956.
2. Use reflective sheeting as listed in QPL 29.
3. Use reflective sheeting that has been evaluated by the National Transportation Product Evaluation Panel (NTPEP) test facility or other approved test facility.
4. Submit the following to the Department:
   a. A certificate with each lot or shipment stating the following:
      • The material supplied will meet all the test requirements listed herein.
      • You have performed the specified tests to ensure compliance.
      • You will submit test results upon request.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
1. The Engineer will reject reflective sheeting in the following situations:
   a. The material fails to meet any one of the designated requirements.
   b. The material meets the requirements but later fails during sign fabrication or in actual field use. Cracks, wrinkles, delamination, color change, or abnormal loss of reflectivity constitute failure.
   c. Natural causes deteriorate the material to the extent that:
      1) The sign is ineffective for its intended purpose as defined in Subsection 913.2.01.C.1.b above.
      2) The average nighttime reflective brightness does not meet the outdoor weathering requirements of ASTM D 4956.

D. Materials Warranty
   Transfer to the Department a performance warranty for Type I, II, III, IV, V, VI, VII, VIII, IX, X, or XI reflective sheeting issued by the manufacturer.

   Ensure that the warranties cover the full replacement cost, including material and labor.

   Include in these warranties a provision that the warranty is subject to a transfer to the Department.

   Submit a warranty from the manufacturer that states that the reflective sheeting—processed, applied to sign blank materials, and cleaned—meets the outdoor weathering photometric requirements of ASTM D 4956.
914.1 General Description
This section includes the requirements for opaque silk screen lettering paint and transparent process colors intended for fabricating high quality, durable reflective signs and emblems by screen processing, spraying, roll coating, or hand brushing.

914.1.01 Related References
A. Standard Specifications
General Provisions 101 through 150.
B. Referenced Documents
ASTM G 23, Type D
ASTM D 822

914.2 Materials
914.2.01 Silk Screen Lettering Paint
A. Requirements
1. Process Colors
   Use process colors and toner that are weather resistant and designed for use on reflective sheeting.
   a. You may tone or blend process colors to make the desired color, but supply each color ready-mixed to a smooth, uniform texture.
   b. If painting on reflective sheeting, use only paint recommended by the sheeting manufacturer.
2. Submittals
   a. Submit a 1/2-pint (0.25L) sample of each color paint from each lot to be used.
   b. Submit to the Engineer a certificate from the fabricator stating that the paint used on the Project signs is recommended by the sheeting manufacturer and is of the same lot as the test sample.
3. Color and Transparency
   Ensure that the transparent colors have the following characteristics when processed, according to the manufacturer’s instructions, through a 10XX screen onto silver-white reflective sheeting background:
   a. Produce a true color under both diffuse and reflected light.
   b. Match the color samples submitted by the Engineer.
   c. Allow good reflective brilliance of the processed sheeting.
4. Process Color and Toner
   Use process colors that flow out and dry to a tough, smooth, glossy surface free of defects, pattern, non-wet spots, and have a sharp edge (screen processed).
   Ensure that the process colors have the following characteristics when applied according to the manufacturer’s instructions:
   • Have an appropriate viscosity for the purpose intended.
   • Dry to a solid film in 24 hours at 77 °F (22 °C) and 50 percent relative humidity.
   • Withstand curing at temperatures up to 150 °F (66 °C) for 4 hours without adverse effect or embrittlement.
   • Be removable with a recommended solvent before it thoroughly dries, without damaging the reflective sheeting.
Section 914 — Sign Paint

5. Durability
   a. Use weather-resistant colors when processed through a 10XX screen and finished according to the recommended procedures.
   b. After cleaning, ensure that the material meets the following requirements:
      • No appreciable color change
      • No loss by either diffuse or reflected light
      • No significant change in transparency when exposed to accelerated weathering for 100,000 Langley's, facing south, unprotected at 45 degrees in south Florida; or 1,000 hours Atlas Twin Arc Weathering (ASTM G 23, Type D) as per ASTM D 822.
   c. After accelerated exposure, ensure that no process color can be removed when tested by scratching through the surface, applying cellophane tape over the scratched area, and removing the tape with one quick motion.

B. Fabrication
   1. When using color silk screen paint other than black, thoroughly stir the paste before use and frequently during use. Stir especially when using reverse silk screening.
   2. Ensure that the finished silk screen has no streaks. If the paint has streaks, the Engineer or Inspector will reject it.
   3. Apply the paste on the silk screen with a rubber squeegee that is as wide as the sign.

C. Acceptance
   The Engineer will approve the lettering paint based on the results from the color, transparency, viscosity, dry time, and removability tests from submitted paint samples.

D. Materials Warranty
   Storage and Packaging: Ensure that the material in storage for up to one year does not skin, settle, change color, thicken, or liver so that normal mixing procedures do not return the material to the proper consistency and texture.
Section 915—Mast Arm Assemblies

915.1 General Description
This section includes the requirements for steel posts, arms, and guy wires and cable for mast arm assemblies.

915.1.01 Related References
A. Standard Specifications
   Section 106—Control of Materials
B. Referenced Documents
   ASTM A 53/A 53M
   ASTM A 475
   Federal Specification FF-T-2765, Type III
   QPL 72

915.2 Materials

915.2.01 Steel Posts and Arms for Mast Arm Assembly
A. Requirements
   1. Use steel posts and arms of the dimensions shown on the plans and that meet the requirements of ASTM A 53 for Type E or S, Grade B with a galvanized finish.
   2. Use pipe of weight class XS, schedule No. 80. Do not use the hydrostatic test requirements.
   3. Submit a certification to the Engineer from the manufacturer that the materials meet the requirements of this section.
B. Fabrication
   General Provisions 101 through 150.
C. Acceptance
   The Engineer will accept the material based on the certification, according to Subsection 106.05, Materials Certification, and on results of galvanized coating tests made by the Department.
D. Materials Warranty
   General Provisions 101 through 150.

915.2.02 Guy Wires and Cable
A. Requirements
   1. Use guy wires for mast arm assemblies and cable for overhead sign assemblies of the dimensions shown on the plans and that meet the requirements of ASTM A 475, Siemens-Martin Grade, with Class A coating.
   2. Provide extra heavy wire rope thimbles that meet Federal Specification FF-T-2765, Type III for each end of the cable.
   3. Submit a certificate from the manufacturer according to Subsection 106.05, Materials Certification.
      For a list of sources, see QPL 72.
B. Fabrication
   General Provisions 101 through 150.
Section 915 — Mast Arm Assemblies

C. Acceptance
   The Engineer will accept the material based on the certificate.

D. Materials Warranty
   General Provisions 101 through 150.
916.1 General Description
This section includes the requirements for center mount reflector delineators.

916.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   General Provisions 101 through 150.

916.2 Materials
Definitions for Optical Requirements: Use the following definitions in this specification:

A. Entrance Angle
   The angle at reflector between direction of light incident on it and direction of reflector axis.

B. Observation Angle
   The angle at reflector between observer's line of sight and direction of light incident on reflector.

C. Specific Intensity
   Candlepower/footcandle (mcd) returned at the chosen observation angle by a reflector for each footcandle (lux) of illumination at the reflector.

916.2.01 Center Mount Reflector Delineators
A. Requirements
   1. Use a reflector delineator made of a hermetically sealed, acrylic plastic, prismatic reflex reflector with a single grommeted hole.
   2. Submit 50 delineators of each color to be used on the Project to the Department for testing.
   3. Acrylic Plastic Reflector
      Use an acrylic plastic reflector. Submit to the Department the manufacturer of the raw material and the identification number of the particular molding compound to be furnished.
      a. Ensure that the reflector has the following characteristics:
         • A clear, transparent plastic face with at least 6.5 in.² (4200 mm²) of reflective area (the lens)
         • A heat-scalable plastic back fused to the lens under heat and pressure around the entire perimeter of the lens and the central mounting hole
         • A unit permanently sealed against dust, water, and water vapor
      b. Use a crystal (colorless), amber, or red reflector, as specified on the plans.
      c. Ensure that the lens has the following characteristics:
         • A smooth surface without projection or indentations other than a central mounting hole and identification number
         • A rear surface bearing a prismatic configuration that will affect total internal reflection of light
         • The manufacturer’s trademark molded legibly into the lens face
Section 916 — Delineators

4. Specific Intensity

Ensure that the specific intensity of each reflex reflector used in delineators or markers equals or exceeds the following minimum values, regardless of reflector orientation.

<table>
<thead>
<tr>
<th>Observation Angle</th>
<th>Entrance Angle</th>
<th>Specific Intensity, candlepower per footcandle (mcd per lux)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Degrees</td>
<td>Degrees</td>
<td>Crystal</td>
</tr>
<tr>
<td>0.1</td>
<td>0</td>
<td>119</td>
</tr>
<tr>
<td>0.1</td>
<td>20</td>
<td>47</td>
</tr>
</tbody>
</table>

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

1. The Engineer will accept the material based on test results (optical, seal, and heat resistance) of samples taken by the Department.

   The Department will return undamaged delineators to the Contractor.

2. Optical Test
   a. Place the reflex reflector to be tested about 100 ft. (30 m) from a single light source that has an effective diameter of 2 in. (50 mm). Operate the light source at normal efficiency.

   NOTE: If using a test distance other than 100 ft (30 m), modify all other dimensions for this test in the same proportion as the test distance.

   b. Measure the return light from the reflector with a photoelectric photometer that has a minimum sensitivity scale of $1 \times 10^{-7}$ footcandles/mm ($1 \times 10^{-6}$ lux/mm).

   NOTE: Use a photometer with a receiver aperture 0.5 in (13 mm) diameter, shielded to eliminate stray light.

   c. Place the light source center 2.1 in. (53 mm) from the aperture center for a 0.1 degree observation angle.

   d. During testing, spin the reflectors to average the orientation effect.

   e. The Department will reject a tested reflector if it fails the specific intensity minimum. If more than 2 reflectors fail out of 50 tested, the Department will reject the lot.

3. Seal Test

   Use this test to determine if a reflector is adequately sealed against dust and water.

   a. Submerge 50 samples in a water bath at room temperature.

   b. Subject the submerged samples to a vacuum of 5 in. (125 mm) gauge for 5 minutes.

   c. Restore atmospheric pressure and leave the samples submerged for 5 minutes.

   d. Examine the samples for water intake.

   e. The Department will reject the lot if more than 2 percent of the reflectors fail.

4. Heat Resistance Test

   a. Place three reflectors in a horizontal position on a grid or perforated shelf inside a circulating oven that allows air to circulate freely.

   b. Set the oven temperature at 175 °F, ± 5 °F (80 °C, ± 3 °C) and let the specimens sit at this temperature for 4 hours.

   c. After the 4 hours, remove the samples from the oven and let them cool in air to room temperature.
d. Rejection: The Department will reject the lot if any sample shows significant change in shape and general appearance when compared with unexposed control standards.

D. Materials Warranty

General Provisions 101 through 150.
Section 917—Reflectors and Nonreflective Characters

917.1 General Description
This section includes the requirements of demountable characters with Type VI reflective sheeting, and direct-applied, nonreflective characters.

917.1.01 Related References
A. Standard Specifications
   Section 106—Certification of Materials
   Section 913—Reflectorizing Materials
B. Referenced Documents
   ASTM B 209 (B 209M)
   ASTM D 822

917.2 Materials
917.2.01 Demountable Characters with Type IX Reflective Sheeting
A. Requirements
   1. Use Type IX reflective sheeting letters, numerals, symbols, and borders that meet the requirements of Subsection 913.2.02, Type IX.
   2. Use a silver color, unless otherwise specified on the plans.
   3. Apply the characters to aluminum flat frames as recommended by the sheeting manufacturer.
   4. Use flat frames (letter, numerals, symbols and borders) made from aluminum sheet 0.032 in. (0.813 mm) thick matching ASTM B 209 (209M), Alloy 3003-H14.
   5. Submit to the Department:
      • One letter of a predominant size and type to be used on the Project.
      • A certificate to the Engineer stating that the material used on the Project is the same as the sample submitted.
B. Fabrication
   1. Before applying any sheeting, properly degrease, etch, and treat each frame with a light, tight amorphous chromate-type coating.
   2. Mechanically apply the reflective sheeting to the prepared flat aluminum frames. Use the proper equipment as prescribed by the sheeting manufacturer.
   3. When recommended by the sheeting manufacturer, coat the completed demountable letters, numerals, symbols and borders with a clear finish approved by the sheeting manufacturer.
      Apply the clear coat to the sheeting surface to ensure the sheeting has a fully glossy coat and a complete edge seal.
   4. Ensure that the finished letters, numerals, symbols, and borders show careful workmanship, are clean cut, sharp, and have a plane surface.
   5. Use the character size and shape to determine the hole spacing to mount the frame with aluminum rivets or other approved non-corrosive fasteners. Do not space holes more than 8 in. (200 mm) on center.
C. Acceptance
The Department will accept the material based on test results of samples taken by the Department or of samples submitted by the manufacturer or fabricator, when directed. The sample shall consist of one letter of predominant size and type to be used on the Project. Samples submitted by the manufacturer or fabricator to the Engineer, shall include a certificate stating that the material used on the Project is the same as the sample submitted.

D. Materials Warranty
General Provisions 101 through 150.

917.2.02 Direct Applied Nonreflective Characters

A. Requirements
1. Use direct-applied, nonreflective characters as opaque legend, stripping, and symbols on traffic control signs made from reflective sheeting that meets Subsection 913.2.
2. Use nonreflective, weatherproof plastic film that is precoated with pressure-sensitive or heat-sensitive adhesive backing.
3. Use sheeting that is flexible enough to be easily cut, shaped, and applied over reflective sheeting.
4. Submit the manufacturer’s certification to the Engineer showing the properties of the materials used and how they match the specifications, as required by Subsection 106.05, Materials Certification.
5. Ensure that the nonreflective sheeting is weather resistant after processing and application, according to the manufacturer’s recommended procedures.
   a. Expose the nonreflective sheeting for 1,200 hours in an Atlas Twin Arc Weatherometer, as per ASTM D 822.
   b. Clean the sheeting.
   c. The Department will reject nonreflective sheeting that appreciably discolors, cracks, crazes, blisters, changes dimensionally, or adversely effects the reflective sheeting on which it is mounted.
6. Use adhesive that has the following characteristics:
   • Is precoated and pressure-sensitive (Class 1) or tack-free and heat-activated (Class 2). Be able to apply either without adding more adhesive to either the nonreflective sheeting or to the reflective sheeting.
   • Has a protective liner that can be peeled off without being soaked in water or other solvents.
   • Ensure that the liner is easily removed after accelerated storage for 4 hours at 150 °F (65 °C) under 2.5 psi (17 kPa) of pressure.
   • Forms a durable, vandal-resistant bond to smooth and weather resistant surfaces.
   • Adheres securely at temperatures ranging from –30 ° to 200 °F (–35 ° to 95 °C), just 48 hours after application.
   • Prevents the sheeting from shocking off the panel when struck at –10 °F (–25 °C).

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
The Department will accept the material based on the manufacturer’s certificate.

D. Materials Warranty
General Provisions 101 through 150.
Section 918—Wild Animal Warning Reflector System

918.1 General Description
Specifications for this work will be included elsewhere in the contract.
Section 919—Raised Pavement Markers

919.1 General Description
This section includes the requirements for raised pavement marker materials for use in reflective, ceramic, and channel markers.

919.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.

B. Referenced Documents
   ASTM C 424
   ASTM C 373
   ASTM D 2240
   ASTM D 4280
   Federal Method TT-T-141, Method 4252

919.2 Materials
A. Requirements
   Do not use any marker materials until the laboratory approves it.
   1. Use raised pavement marker sources as listed in QPL 76.
   2. Use raised pavement markers of the type shown in the plans or specified in the proposal. This specification references markers as follows:

<table>
<thead>
<tr>

</tbody>
</table>

3. **Certification**
   Submit a certification to the Engineer from the manufacturer showing the physical properties of the markers and their conformance to this specification.

4. **Packaging**
   Pack shipments in containers that are acceptable to common carriers.
   - Pack the containers to ensure delivery in perfect condition.
   - Clearly mark each package of pavement markers with the size, color, type, and lot number.
   - You are liable to replace any damaged shipments.

#### 919.2.01 Raised Retro-Reflective Pavement Markers (Type 1, 2, 3, 11, 12, and 13)

**A. Requirements**

1. Use raised retro-reflective pavement markers that meet the requirements of ASTM D 4280, designation H.
2. Use raised retro-reflective pavement markers as listed in QPL 76.
3. Use raised retro reflective pavement markers that have been evaluated by the National Transportation Product Evaluation Panel (NTPEP) test facility or other approved test facility.

**B. Fabrication**

General Provisions 101 through 150

**C. Acceptance**

The Department will give conditional and final approval to retro reflective pavement markers evaluated by the National Transportation Product Evaluation Program (NTPEP), the Georgia Department of Transportation, or other Department-approved test facilities and place them on QPL 76.

All white and yellow retro reflective pavement markers must meet the requirements of this specification and the following NTPEP field performance requirement.

- **Conditional QPL Placement:** The Department may add markers on a conditional basis to QPL 76. These markers must maintain an average coefficient of luminous intensity for 12 months during the NTPEP evaluation of not less than 25% of the values shown in Table 1 of ASTM D 4280.
- **Final QPL Approval or Rejection:** The Department will approve or reject markers based on the marker maintaining an average coefficient of luminous intensity of 0.2 cd/fc for 24 months during the NTPEP evaluation.
Section 919 — Raised Pavement Markers

919.2.02 Flexible Reflective Markers (Type 14 and 15)

A. Requirements

Use markers manufactured by extruding plastic into an “L” shape, with nominal dimensions of 4 in. (100 mm) long x 2 in. (50 mm) high (vertical face) x 1 in. (25 mm) wide (base leg). Ensure that the markers have the following:

- A pressure-sensitive adhesive with a paper release liner to the bottom of the base leg.
- Strips of metallized acrylic reflective sheeting on either one or both sides of the vertical face.
- A clear plastic cover to protect the reflective strip. Ensure that the cover withstands a chip-seal operation and is easily removed after the operation.

1. Hardness
   a. Select five random markers
   b. Use ASTM D 2240 to determine the Shore A hardness
   c. The Department will reject markers whose body and clear protective cover hardness is less than 80.

B. Fabrication

General Provisions 101 through 150.

919.2.03 Ceramic Pavement Markers (Type 4, 5, 6, 7, and 8)

A. Requirements

1. Use ceramic pavement markers made from a heat-fired, white, vitreous, ceramic base and a heat fired, opaque, glazed surface to produce the properties required in these specifications.
   a. Do not place glaze on the marker bottom where it connects to the road surface.
   b. Thoroughly and evenly mature the markers. Ensure that they have no defects that affect appearance and serviceability.
   c. Use reflective ceramic markers that meet the specific intensity of each reflective surface according to Table 1 of ASTM D 4280.
   d. Ensure that the mean thickness of the glazed surface is at least 0.005 in. (0.13 mm) when measured at least 0.25 in. (6 mm) from the edge of the marker.
   e. Ensure that the water absorption of the ceramic markers does not exceed 2 percent of the original dry weight when tested according to ASTM C 373.
   f. Ensure that the glazed surface does not craze, spoil, or peel when passed through one cycle of the Autoclave test at 250 psi (1724 kPa) (ASTM C 424).

2. Use the designated colors for the white and yellow markers.
   a. Ensure that the colors are uniform.
   b. Ensure that black matches Federal Color No. 595-27038.
   c. Determine the color by visually comparing each marker with calibrated standards having CIE Chromaticity Coordinate limits. Determine the limits with Federal methods of test TT-T-141, Method 4252, using a rectangle with the following corner points:

<table>
<thead>
<tr>
<th></th>
<th>1</th>
<th>2</th>
<th>3</th>
<th>4</th>
<th>(90MGO)</th>
</tr>
</thead>
<tbody>
<tr>
<td>White</td>
<td>.290</td>
<td>.316</td>
<td>.310</td>
<td>.296</td>
<td>.330</td>
</tr>
</tbody>
</table>
Section 919 — Raised Pavement Markers

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   1. Use a random sample of five markers for lens impact strength, temperature cycling and compressive strength tests specified in ASTM D 4280.
   2. Use the following table to determine if the markers pass the tests.

<table>
<thead>
<tr>
<th>Markers that Pass</th>
<th>Department Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 of 5</td>
<td>Accept the lot.</td>
</tr>
<tr>
<td>3 or less of 5</td>
<td>Reject the lot; no resample allowed.</td>
</tr>
<tr>
<td>4 of 5</td>
<td>The Contractor may request a retest. The Department will retest an additional 25 random markers in the test or tests where the original sample failed.</td>
</tr>
<tr>
<td>20 of 25 retested</td>
<td>Accept the lot.</td>
</tr>
<tr>
<td>19 or less of 25 retested</td>
<td>Reject the lot; no resample allowed.</td>
</tr>
</tbody>
</table>

3. Compressive Strength Test
   a. The markers pass if the average compressive load of all five markers is at least 1,500 psi (6.7 kN). No individual marker shall be less than 1,200 psi (5.3 kN).

D. Materials Warranty
   General Provisions 101 through 150.

919.2.04 Channel Pavement Markers (Type 9 and 10)

A. Requirements
   1. Use channel pavement markers made of either a heat-fired, white, vitreous, ceramic base with a heat-fired, opaque, glazed surface, or a 9 gauge (3.9 mm) steel body with a heat-fired porcelain finish.
      a. Ensure both ceramic and steel channel markers have no defects that affect appearance and serviceability.
      b. Ensure that the mean thickness of the glazed surface of ceramic channel markers is at least 0.005 in. (0.13 mm) when measured at least 0.25 in. (6 mm) from the edge of the marker.
      c. Ensure that mean thickness of the porcelain finish on the steel channel markers is at least 0.030 in. (0.76 mm).
      d. Ensure that the water absorption of the ceramic markers does not exceed 2.0 percent of the original dry weight when tested according to ASTM C 373.
      e. Ensure that the surface of the markers do not craze, spoil, or peel when passed through one cycle of the Autoclave test at 250 psi (1724 kPa) (ASTM C 424).
   2. Use the designated colors for the white and yellow markers.
      a. Ensure that the colors are uniform.
      b. Determine the color by visually comparing them with calibrated standards having CIE Chromaticity Coordinate limits. Determine the limits with Federal methods of test TT-T-141, Method 4252, using a rectangle with the following corner points:

General Provisions 101 through 150.

**C. Acceptance**

1. Ensure that Type 10 markers meet the specific intensity of each reflective surface according to Table 1 in ASTM D 4280.

2. Use a random sample of five markers for lens impact strength, temperature cycling and compressive strength tests specified in ASTM D 4280.

3. Select two of the five markers and subject them to all the required tests.

4. Use the following table to determine if the markers pass the tests.

920.1 General Description
This section includes the requirements for the structural components of poles, towers, bases, anchor bolts, luminaires, and other attachments used for roadway, high mast, or other lighting.

In particular, the section covers the following:

- Steel lighting standards and towers
- Aluminum lighting standards
- Prestressed concrete standards
- Support and lowering assemblies
- Grounding

AASHTO Specifications for Structural Supports for Highway Signs, Luminaires, and Traffic Signals, with Interims (SLTS)

ANSI C136.30, American National Standard for Roadway and Area Lighting Equipment—Pole Vibration
Section 920 — Lighting Standards and Towers

920.1.01 Submittals
Submit to the Engineer shop drawings and design calculations for each type of lighting standard, or tower to be used, for review and approval. Submission should be made electronically in a portable document format (pdf) and include an index. Format all drawings to fit 11 in. x 17 in. (279 mm x 432 mm) paper. Present calculations to fit 8.5 in. x 11 in. (216 mm x 297 mm) paper. The submission shall be prepared and stamped by the Design Engineer who shall be registered as a Professional Engineer in the State of Georgia.

The Engineer will distribute submitted documents to the Bridge Engineer (SLTS@dot.ga.gov) for review.

920.2 Materials
Design lighting assemblies consisting of standard, tower, bracket arms, lowering assembly, and luminaire support and assemblies according to AASHTO SLTS

920.2.01 Steel Lighting Standards and Towers
A. Requirements
1. Design
   Poles shall be designed to the following wind speeds using a 1700 Mean Recurrence Interval (MRI) with Fatigue Category 1 for the listed counties:
   - 150 mph: Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
   - 140 mph: Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnall, Wayne
   - 130 mph: Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady, Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
   - 120 mph: For all counties not listed above

2. Include the following in the makeup of lighting standards and towers:
   - A pole and bracket arms as required on the Contract.
   - A steel base welded to the other end complete with bolts for use as an anchor base pole, or attached to an approved breakaway device, such as slip base, aluminum transformer base, breakaway couplings, etc., when so specified.

3. Steel Structures
   Use structural carbon or structural low alloy steel that meets the requirements of AASHTO SLTS. However, do not use ASTM A 588/A 588M steel.

4. Steel Pipe
   When steel pipe is used, use steel pipe complying with ASTM A 53/A 53M Grade B or approved equal. No hydrostatic test is required.

B. Fabrication
1. Roadway Standards
   Unless otherwise specified, do the following:
   a. Make the shaft or appropriate shape continuously tapered with a base welded to the lower end.
   b. The welds of the base flange to the shaft shall be configured such that the weld joints are loaded in shear, never in tension.
   c. Construct the standard of steel at least 11 gauge (3.1 mm) thick to the dimensions required for the specified mounting height. Form the standard from one piece with one electrically full penetration welded longitudinal joint and no intermediate horizontal joints.
   d. After forming and welding, cold-roll the shaft longitudinally under sufficient pressure to flatten the weld and increase the physical characteristics of the metal in the shaft.
   e. Ensure that the shaft has a reinforced handhole with a cover, except where a transformer base is specified.
1) Provide a 0.5 in. (13 mm) approved grounding connector in the shaft or base.
2) Equip the top of the shaft with a removable pole cap held securely in place.
3) Galvanize the shaft, base plate, bracket arm(s), handhole cover, and all elements of the pole with the hot-dipped method in ASTM A 123/A 123M.
   f. Equip the top of the shaft with a removable pole cap held securely in place with set screws. Cap shall match material and meet the same requirements as the pole.

2. Lighting Towers
   a. Make the shaft to meet the requirements of the roadway standard (Subsection 920.2.1.B.1).
   b. Construct the standard to continuously taper 0.14 to 0.40 in./ft. (12 to 33 mm/m).
   c. Ensure that the standard has the necessary dimensions and metal quality to meet the requirements for the specified mounting height.
   d. The shaft may be formed in sections with each section having no more than two longitudinal welded seams. Sections shall be a minimum of 30 feet in length.
   e. Use intermediate horizontal welds only at section joints.
   f. Make telescoped joints overlap at least 1-1/2 pole diameters, measured at the minimum diameter of the inner telescoping section.
   g. Have field welding performed only by an approved certified welder who represents the manufacturer. Ensure the welding follows the requirements of Section 501.
   h. Repair any damage to galvanized coating according to Section 645.
   i. Match-mark all sections of the shaft so that the tapered sections are assembled properly.

3. Post Top or Other Standards for Special Installation
   a. Make the post top and other standards meet the requirements for roadway standards (Subsection 920.2.01.B.1).
   b. Make the top diameter of the shaft 2 in. (50 mm) or include a 2 in. (50 mm) tenon, unless otherwise specified, to insert the shaft or tenon into the luminaire.

4. Anchor Base
   Do the following, unless otherwise specified:
   a. Secure a steel base to the lower end of the shaft with two continuous electric welds. Ensure that the base develops the full strength of the adjacent shaft section to resist bending.
   b. Provide removable cast or pressed steel covers with each base. Appropriately attach each cover to the base.

5. Steel Bracket Arms
   Do the following, unless otherwise specified:
   a. Use the design dimensions from the Contract.
   b. Bracket arms shall be of the same material and meet the same requirements as the pole shaft.
   c. Ensure that the installed bracket connects securely with the shaft and has a smooth wiring raceway.
   d. Use stainless steel bolts and nuts that meet the requirements of ASTM A 193/A 193M, Type B8C or AISI 304 to attach the bracket arm assembly.

6. Transformer Bases
   Do the following, unless otherwise specified:
   a. Use the dimensions on the Contract to build the bases.
      1) Make top and bottom plates that meet the requirements of ASTM A 709/A 709M, Grade 36 (250), and are fabricated to receive the shaft, anchor bolts, and the foundation bolts.
      2) Make the side panels meet the requirements of AISI 1020.
      3) Create a base thick enough for the height of the standard.
   b. Fit the base with a handhole and cover that can be securely fastened.
7. Anchor Bolts
   a. Provide bolts as follows:

<table>
<thead>
<tr>
<th>Lighting Standard</th>
<th>4 anchor bolts (minimum)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lighting Tower</td>
<td>8 anchor bolts (minimum)</td>
</tr>
</tbody>
</table>

   b. Use the size indicated on the Contract or as required by the manufacturer’s shop drawings.
   c. Use anchor bolts, nuts, and washers that meet the requirements of AASHTO M 314, Grade 55(370).
      Supplementary requirement S 1 of AASHTO M 314 also applies.

   **NOTE: Do not use Grade 105 (724).**

d. Install anchor bolts with a leveling nut and a flat washer between the leveling nut and the base plate.
   1) Use a template to install the bolts.
   2) Place a flat washer on top of the base plate.
   3) Use a lock washer on top of the flat washer and secure the nut.
   4) Fully grout the space between the shoe base and the top of the footing with non-shrink grout.

e. Galvanize threaded ends of anchor bolts, hexagonal nuts, flat washers, and lock washers according to

8. Finish
   Unless otherwise specified, galvanize all steel lighting standards and towers, including pole, base, transformer
   base, and bracket arm assembly according to ASTM A 123/A 123M.

C. Acceptance
   1. The Engineer reserves the right to inspect and run tests as necessary to ensure compliance with these
      specifications and to reject items that fail testing.
   2. The Engineer will accept the steel lighting standards and towers based on:
      • The results of physical and chemical tests made by the Department.
      • The manufacturer’s certification showing physical and chemical properties of the metal prior to forming.

D. Materials Warranty
   General Provisions 101 through 150.

920.2.02 Aluminum Lighting Standards

A. Requirements
   1. Design
      Poles shall be designed to the following wind speeds using a 1700 Mean Recurrence Interval (MRI) with
      Fatigue Category 1 for the listed counties:
      150 mph: Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
      140 mph: Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnall, Wayne
      130 mph: Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady,
               Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
      120 mph: For all counties not listed above

   2. Include the following in making aluminum lighting standards:
      a. A pole and bracket arm(s) as required on the Contract.
      b. An aluminum base welded or bonded to the lower end, complete with bolts for use as an anchor base
         pole or attached to an approved breakaway device such as an aluminum transformer base, breakaway
         couplings, etc., when so specified.
Section 920 — Lighting Standards and Towers

B. Fabrication

Use aluminum materials that meet the requirements of AASHTO SLTS

3. Roadway Standards
   a. Make the shaft with a continuous taper formed from an extruded blank (preferably 6063-T6). Weld a base plate to the lower end.
   b. Give the shaft a reinforced handhole with a cover, except when a transformer base is specified.
   c. Provide a 0.5 in. (13 mm) approved grounding connection in the shaft or base.
   d. Equip the top of the shaft with a removable pole cap held securely in place with set screws. Cap shall match material and meet the same requirements as the pole.

4. For Post Top or Other Standards for Special Installation, Do the following, unless otherwise specified:
   a. Build the standard to meet the requirements for roadway standards (Subsection 920.2.01.B.1).
   b. Make the top diameter of the shaft 3 in. (75 mm) or include a 3 in. (75 mm) tenon to insert the shaft or tenon into the luminaire.

5. Anchor Base
   Do the following, unless otherwise specified:
   a. Secure the one-piece aluminum base to the lower end of the shaft by using two continuous welds.
   b. Ensure that the base develops the full strength of the adjacent shaft section to resist bending.
   c. When the Contract call for a frangible or breakaway base, attach the base to an approved breakaway device with an approved number and type of bolts, or use a base that is an approved breakaway type.
   d. Provide removable cast or pressed aluminum covers with each base. Appropriately attach each cover to the base.

6. Aluminum Bracket Arms
   a. Use the Contract design and dimensions.
   b. Ensure that the installed bracket arm connects securely with the shaft and has a smooth wiring raceway.
   c. Use stainless steel bolts and nuts that meet the requirements of ASTM A 193/A 193M, Type B8C or AISI 304, to attach the bracket arm assembly.

7. Transformer Bases
   a. Form the base of cast aluminum that meets the requirements of ASTM B 108, Alloy A03560, T6 to dimensions on the Contract.
   b. Make the top so it can receive the anchor base bolts and the bottom so it can receive the anchor bolts.

8. Anchor Bolts
   Use bolts as described in Subsection 920.2.01.B.7.

9. Finish all aluminum lighting standards, including pole, base, transformer base, and bracket arm assembly in a natural aluminum color, unless otherwise specified.

C. Acceptance

1. The Engineer reserves the right to inspect and run tests as necessary to ensure compliance with these specifications and to reject items that fail tests.

2. The Engineer will accept the aluminum lighting standards based on:
   a. The results of physical and chemical tests made by the Department
   b. The manufacturer’s certification showing physical and chemical properties of the metal prior to forming the standard

D. Materials Warranty

General Provisions 101 through 150.
Section 920 — Lighting Standards and Towers

920.2.03 Prestressed Concrete Lighting Standard

Concrete poles are only to be used where approved and as specified within the Contract.

A. Requirements

1. Design

Poles shall be designed to the following wind speeds using a 1700 Mean Recurrence Interval (MRI) with Fatigue Category 1 for the listed counties:

- 150 mph: Bryan, Camden, Chatham, Effingham, Glynn, Liberty, McIntosh
- 140 mph: Brantley, Bulloch, Charlton, Evans, Long, Screven, Tattnall, Wayne
- 130 mph: Appling, Bacon, Brooks, Burke, Candler, Clay, Clinch, Decatur, Early, Echols, Emanuel, Grady, Jeff Davis, Jenkins, Lowndes, Miller, Pierce, Seminole, Thomas, Toombs, Ware
- 120 mph: For all counties not listed above

2. Make the pre-stressed concrete lighting standard of the design and dimensions in the Contract. Make the standard with machines in steel forms by the centrifugal spinning process to ensure maximum density.

3. Use a manufacturing method that produces a smooth cable raceway throughout the length of the standard. Make the raceway between 1.5 to 2 in. (38 to 50 mm) in diameter when measured at the top of the standard.

B. Fabrication

1. Use materials and manufacturing methods according to Section 865 with the following exceptions:
   a. Concrete: Use Class AAA concrete with a maximum aggregate size of 3/8 in. (10 mm) and a maximum slump of 0.5 in. (15 mm) after the spinning process.
   b. De-tension: You may de-tension the standards after 24 hours under a low-temperature steam process. However, if the standard does not reach a compression strength of 3,500 psi (25 MPa) in this 24-hour period, the Inspector will reject the standard.
   c. Finish: Ensure that the standard has a smooth, uniform finish from a water carborundum mechanical process that removes the laitance and surface content revealing the aggregate.

2. Bases
   a. Furnish the standards with an anchor base or a precast butt base.

   NOTE: If using the precast butt base, cast it as an integral part of the standard during the spinning process. Make a conduit entrance as shown on the Contract.

   b. Make the bolt-down anchor base have a cast steel anchor base that meets the requirements of ASTM A 27/A 27M, Grade 70-36 (485-250).
   c. Secure the base to the primary pole reinforcement so it is strong enough to transmit the required loads to the anchor bolts.
   d. Fit the base with a handhole and cover that can be securely fastened.

C. Acceptance

1. The Engineer reserves the right to make, inspect and run tests as necessary to ensure compliance with these specifications and to reject those items failing such tests.

2. The Engineer will accept these standards based on tests made by representatives of the Department during the manufacturing process.

3. Give sufficient notice to the Engineer prior to manufacture to arrange for the required inspection.

D. Materials Warranty

General Provisions 101 through 150.
920.2.04 High Mast Luminaire Support and Lowering Assembly

A. Requirements

1. This assembly shall be a mechanical device capable of supporting the luminaire assembly at the required operating position and raising the assembly to the operating height and lowering the assembly to ground level for servicing.
2. Furnish shop and working drawings or illustration sheets according to Section 105.
3. Transfer to the Engineer all guarantees on materials and equipment that the manufacturer normally furnishes, together with all operating instructions and service manuals.
   Include in the guarantees the provision that they are subject to such transfer.

B. Fabrication

1. Use AASHTO SLTS to build the assembly.
2. Support Head Frame
   Use a head frame with at least two supports for the suspension cables and a pulley for the power cable.
   a. Place the suspension supports 120 degrees apart. Place the power cable pulley midway between two suspension supports.
   b. Attach two pulleys to the inside of each support, one at each end. Construct the pulleys so that the suspension cables ride freely in the groove of the pulleys.
      Provide cable guides and retainers to keep the suspension cables and power cable inside the pulleys.
   c. Supply a hood for the support head frame to protect against weather for all working components at the pole top. Ensure that the hood adequately ventilates the pole.
3. Luminaire Mounting Ring
   a. Equip the inner portion of the ring with approved roller-contact, spring loaded centering arms. The arms should center the luminaire ring while ascending or descending the pole, protect the pole and luminaires, and prevent jamming during the raising and lowering operations.
      Make the rollers for the centering arms of a water-resistant, non-marking composition material.
   b. Design the mounting ring to symmetrically mount the number of luminaires indicated on the Contract.
      1) Provide a weatherproof junction box and terminal board terminating the power cable and connecting the luminaire wiring.
      2) Provide a weatherproof power receptacle to test the luminaires when the ring is in the lowered position.
4. Non-Latching Device Design
   a. If the design does not have a latching device at the top of the pole, position the luminaire mounting ring tightly against the support head frame.

   NOTE: Use a positive, visible indication that the required force has been applied.

   b. Make sure the luminaire mounting ring and support head frame can hold the luminaire mounting ring in place and prevent rotation and unwanted movement while in the raised position.
   c. A spring-loaded arrangement is preferred to provide proper cable tension and hold the luminaire ring securely in place.
5. Latching Device Design
   a. Use a latching device at the top of the pole to latch all three suspension points and support the total weight of the ring including luminaires.
   b. Place all moving parts of the latching device in the luminaire mounting ring.

   NOTE: Use a positive, visible indication of the latching position.
Section 920 — Lighting Standards and Towers

6. Miscellaneous Hardware
   Use non-corrosive miscellaneous fittings, fasteners, and hardware for the support head frame and luminaire mounting ring. Use an approved means for locking nuts.

7. Hoisting Systems
   a. Ensure that each pole has three suspension cables and one hoisting cable.
   b. Use cables that have 7 strands of 19 wires each, made of stainless-steel aircraft cable according to MIL-W-83420, Type 1, Composition B.
   c. Use at least 0.2 in. (5 mm) diameter suspension cables and at least a 0.25 in. (6 mm) diameter hoisting cable.
   d. Anchor the ends of the pole’s suspension cables to the top of the suspension cable bracket or transition plate assembly. Pass the other ends through the pulleys on the support head frame and attach to the luminaire mounting ring.
   e. Secure the hoisting cable at the bottom center of the suspension cable bracket assembly. Attach the other end to the drum of the motor-driven winch.
      Prevent future twisting and eliminate any tension developed during initial installation of the hoisting cable system.
   f. Use a worm-gear reducing winch with a reduction ratio that is self-locking in both raising and lowering operations.
      Completely enclose the worm-gear in a lubricating reservoir.
   g. Make the winch operable with either an electric drill motor or a NEMA frame motor as described in Lowering Device Power Supply Unit.
   h. Provide a hand crank for raising and lowering.
   i. Include a cable guard/retainer for the winch drum. This will force the cable away from the ends of the drum for spooling and prevent the cable from coming off the drum.
   j. Design the entire hoisting system so that power cable, suspension cables, and hoisting cable may be replaced from the ground.

8. Lowering Device Power Supply Unit
   a. Use a lowering device power supply unit that is either an electric drill motor or a NEMA frame motor.
      1) Equip both motors with a factory-set torque limiter. Power each from a weatherproof outlet or receptacle located in the service area of the pole.
      2) You may use a step-down transformer to supply the required motor voltage.
   b. Make the transformer an integral part of the power supply unit, when required.
   c. Attach and lock in place the drill or motor at the pole handhole. Provide a remote-control system that works from at least 20 ft. (6 m) away.

9. High Mast Power Cable
   a. Use extra heavy-duty power cable in a jacket that resists oil and sunlight. Include in the cable the number and size of copper insulated conductors required on the Contract.
   b. Securely connect the power cable to the luminaire mounting ring and the suspension cable bracket assembly so it will not damage the cable and supports only its own weight.

10. Pole Disconnect
    a. Furnish each pole with a molded case circuit breaker in a NEMA enclosure of the size and type specified on the Contract.
    b. Make the breaker accessible through the pole handhole. Get the breaker from the manufacturer of the raising and lowering device.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   Submit guarantees on materials and equipment.
Section 920 — Lighting Standards and Towers

920.2.05 Grounding

A. Requirements
   General Provisions 101 through 150.

B. Fabrication and Construction
   1. In accordance with AASHTO recommendations, pole must be grounded independently from power system ground using a ground rod.
   2. Ground rod and equipment must meet provisions set forth within Section 682.6.01 P.
   3. Include a grounding conductor with the high mast power cable and connect it to the luminaire mounting ring.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 921—Luminaires

921.1 General Description
This section includes the requirements for the following types of luminaires:

- Roadway
- Rest area
- High mounting height
- Offset
- Underpass
- Navigation lighting

921.1.01 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   ANSI/IES Types (specified on plans)

921.2 Materials
Use luminaires that are complete, including ballast, lamps, fuses, and associated hardware and wiring.

921.2.01 Luminaires
A. Requirements
   1. Standard Equipment for Roadway, Rest Area, High Mounting Height, and Offset Luminaires
      Use luminaires for these locations that have the following equipment:
      a. Lamps: Check the Plans for the lamp wattage, type, and size.
      b. Ballasts: Use ballasts that meet these requirements, unless otherwise specified:
         - Are part of the luminaire housing or in a separate weatherproof housing attached to the luminaire housing.
         - Are used for multiple circuits, unless otherwise specified.
         - Operate at voltages shown on the plans.
         - Provide rated lamp watts to the lamp through a range in primary voltage of +10 percent.
         - Have a power factor of at least 0.90.
         - Provide enough open circuit voltage to start lamps at a temperature as low as –20 °F (-29 °C).
         - Are enclosed in an epoxy encapsulated covering (mounted on the external pole base or cabinet).
      c. Controls: The local power company will provide and install control equipment, including photoelectric control, receptacle, contactor, and other equipment, unless otherwise indicated on the plans.
      d. Level Indicator: When shown on the plans as a required item, ensure that each luminaire has a built-in device indicating the direction and amount of tilt over a range of 0 to 5 degrees in any direction. Ensure that the indicator has the following characteristics:
Section 921 — Luminaires

• Has three calibrations, accurate to within 1/2 degree:

<p>| | | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td></td>
<td>Level</td>
</tr>
<tr>
<td>B</td>
<td></td>
<td>3 degree tilt</td>
</tr>
<tr>
<td>C</td>
<td></td>
<td>5 degree tilt</td>
</tr>
</tbody>
</table>

• Is clearly visible without aid in daylight to a distance of 50 ft. (15 m).
• Does not alter or reduce the amount of light from the luminaire.
• Has a transparent container made of clear, ultraviolet-inhibited acrylic. The lower surface is curvilinear in any vertical cross-section to support a spherical indicator and dampening fluid.
• Uses a clear dampening fluid made of 70 percent glycerol and 30 percent iron-free water.
• Uses a highly visible orange or red color ball in the spherical indicator that is chemically inert to the dampening fluid.

2. Roadway Luminaires

Ensure that roadway luminaires have or meet the following requirements:

a. Are placed horizontal or vertical as indicated on the plans.
b. Have an aluminum housing with the following:
   • A 2 in. (50 mm) slipfitter
   • A removable aluminum reflector
   • A detachable prismatic glass refractor and aluminum refractor holder
   • A prewired terminal board and integral ballast
   • An adjustable, porcelain enclosed mogul socket with spring loaded center contact and lamp grips
   • An approved type gasket with a positive latch at the street side of the luminaire
c. Distribute light according to ANSI/IES type as specified on the plans.

3. Rest Area Luminaires

Ensure that rest area luminaires have or meet the following requirements:

• Are placed vertically
• Have a hinged aluminum canopy
• Have a pressed glass prismatic refractor, unless otherwise specified
• Have a die cast aluminum base/housing with access door and slipfitter for a 3 in. (75 mm) OD pile top or tenon
• Have a prewired terminal board and integral ballast
• Have a porcelain enclosed mogul socket with spring loaded center contact and lamp grips
• Distribute light according to ANSI/IES type as specified on the plans

4. High Mounting Height Luminaires

Ensure that high mounting height luminaires have or meet the following requirements:

a. Have a rain-tight, precision-cast, aluminum housing that includes an adjustable slipfitter for a 2 in. (50 mm) mast arm that allows adjustments of at least 3 degrees above and below the mast arm axis.
b. Contain a prewired terminal board.
c. Have an integral ballast with quick disconnect plug.
d. Have an adjustable porcelain-enclosed mogul socket with spring-loaded center contact and lamp grips.
Section 921 — Luminaires

1) Ensure that the lamp socket adjusts to obtain maximum intensity at vertical angles from 55 to 65 degrees.
2) Provide a separate lamp support to prevent vibration damage.

e. Be able to accept No. 6 to No. 14 AWG wire with clamp-type terminals.

f. Have ballast enclosed in a rain-tight cast aluminum housing, fully serviceable without removing the luminaire from its bracket.

g. Have refractors and/or lens that are heat- and shock-resistant tempered glass.

h. Distribute light according to ANSI/IES type as specified on the plans.

5. Offset Luminaires

Ensure that offset luminaires have or meet the following requirements:

a. Have rain-tight, precision-cast aluminum housing with a baked-on enamel finish and the following:
   • Twin trigger latches
   • A hinged door for easy access to internal components
   • Non-corrosive hardware

b. Include a porcelain-enclosed mogul socket with spring-loaded center contact and lamp grips.
   1) Ensure that the grips are permanently attached to the reflector to properly position the lamp.
   2) Equip the socket wiring with a quick-disconnect to easily remove the reflector/socket assembly.

c. Include a highly polished, anodic-surfaced, aluminum reflector and a prismatic borosilicate glass refractor.

d. Have seals or gaskets at all critical points to form a weather-tight breathing seal.

e. Include a prewired terminal board.

f. Have integral wired ballast (that meets the ballast requirements of this specification and the plans).

g. Have a slipfitter for a 2-3/8 to 3 in. (60 to 75 mm) OD pole tenon and external means to level and aim, both horizontally and vertically, for rapid and versatile field installation.

h. Be adjusted and sized, after the pole is erected and plumbed, to provide the lighting pattern according to the plans and the manufacturer’s recommendations and instructions.

i. Efficiently distribute light uniformly along the roadway when offset as shown on the plans and with spacings up to 7 mounting heights.

6. Underpass Luminaires (Type A)

a. Housing: Ensure that the Type A housing meets these requirements, unless otherwise indicated on the plans:
   • Be surface-mounted at about 15 ft. (4.5 m) above the edge of the finished pavement on an outside bridge pier, shown on the plans
   • Be die-cast aluminum with an integral ballast
   • Have a specular aluminum reflector
   • Have a detachable thermal shock-resistant glass refractor
   • Have an adjustable porcelain-enclosed mogul socket with spring-loaded center contact and lamp grips to properly position the lamp
   • Have a hinged door assembly protected by safety chains and an approved gasket to keep out moisture and dirt
   • Be able to attach directly to the bridge pier or underpass wall
b. Light Distribution: For Type A, use an enclosed High Intensity Discharge (H.I.D.) luminaire, unless otherwise indicated on the plans. Ensure that the luminaire distributes light in a wide-beam, diffused pattern.

c. Lamp: Use a lamp of the wattage, type, and size shown on the plans.

d. Ballast: Use ballast that meets the provisions of Subsection 921.2.01.A.1.b.

e. Controls: Use controls that meet the provisions of Subsection 921.2.01.A.1.c.

f. Include all thimbles, fittings, elbows, etc., in the price bid for conduit. The Department will include a pay item for necessary conduit in the contract.

7. Underpass Luminaires (Type B)

a. Housing: Ensure that Type B housing meets the following requirements:
   - Be made from aluminum with a specular-finish, one-piece aluminum reflector and a clear, ribbed, one-piece detachable, side-hinged cover of acrylic plastic. Ensure that the cover is completely gasketed to keep out contamination.
   - Have a heavy-duty, galvanized mounting support that allows the unit to rotate 180 degrees around its lateral axis when mounted.
   - Include spring-loaded, heavy-duty, recessed, double-contact lamp holders to accept a single F-72/PG 17 fluorescent lamp.
   - Be able to attach to the bridge pier or underpass wall.

b. Light Distribution: For Type B, use an enclosed fluorescent luminaire with a wide-beam, diffused light distribution pattern.

c. Lamp: Use a 165 watt F-72 PG 17/CW fluorescent lamp with a recessed double contact base and a rated life of at least 12,000 hours, unless otherwise indicated on the plans.

d. Ballasts for Multiple Circuits: Use ballasts that meet the following requirements:
   - Have a power factor of at least 0.90 to operate at voltages shown in the plans
   - Provide enough open-circuit voltage to start lamps at temperatures as low as –20 °F (-29 °C)
   - Are inside the luminaire housing
   - Can service one or two luminaires as indicated on the plans

e. Controls: Use controls that meet the provisions of Subsection 921.2.01.A.1.c.

f. Circuit Breakers: Install galvanized, weatherproof circuit breakers and cabinets as indicated on the plans. Use cabinets 12 x 10 in. (300 x 250 mm) deep.

g. Install cabinets, conduit, and complete wiring as shown on plans and as directed by the Engineer.

8. Navigation Lighting Luminaires

a. Housing: Use cast aluminum housing of the type specified on the plans. Use housing that has a gasketed service door for relamping.

b. Lamps: Use clear, 100-watt, rough service lamps with 125-130 volt rating.

c. Receptacles: Use receptacles rated at least 660 watts, 250 volts for medium screw base lamps. Use a design that will not freeze the lamps with aluminum screw base shells.

d. Lens: Use 8 in. (200 mm) marine type, fresnel lens(es).
   1) Use a lens color with horizontal arcs of visibility as shown on the plans.
   2) For fixed span installations, you may use a combination of the following luminaires and colors:
Table: Location, Color, Degrees of Horizontal Arcs of Visibility

<table>
<thead>
<tr>
<th>Location</th>
<th>Color</th>
<th>Degrees of Horizontal Arcs of Visibility</th>

<td>180</td>
</tr>
</tbody>
</table>

3) Mount channel marker luminaires with a swivel so that you can move the arm and luminaire in a 180-degree arc to replace the lamp and maintain the unit.

4) Unless otherwise noted, use pivot or swivel-type channel marker luminaires with either bronze or galvanized steel retriever chain and swivel.

B. Fabrication

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 922—Electrical Wire and Cable

922.1 General Description
This section includes the requirements for electrical conductors, wire, and cable.

922.1.1 Definitions
General Provisions 101 through 150.

922.1.2 Related References
A. Standard Specifications
   General Provisions 101 through 150.
B. Referenced Documents
   NFPA-70, National Electrical Code

   UL 83, Thermoplastic-Insulated Wires and Cables
   UL 854, Standard for Service-Entrance Cables

922.2 Materials
922.2.1 Electrical Wire and Cable
A. Requirements
   1. Conductors
      Unless otherwise specified, use conductors that meet the following requirements:
      a. Are made of copper
      b. Are Nationally Recognized Testing Laboratories listed to the appropriate UL Standards
      c. Are the size and type shown on the Contract
      d. Meet the requirements of the National Electrical Code
      e. Have the appropriate conductor size, insulation type and rating, rated insulation voltage, and UL listing mark identification on the outer jacket.

      NOTE: Do not use conductors not meeting this requirement or with illegible identification.

   2. Wire and Cable
      Use wire and cable that meet the following requirements:
      a. Are new without kinks or other defects when installed
      b. Are listed for use in Wet Locations
      c. Are single conductor or multi-conductor with one of the following wire types:
         RHW, RHW-2, THW, THW-2, THHW, THWN, THWN-2, USE-2, XHHW, XHHW-2, or ZW
      d. Use insulation rated for 600 volts, 75°C minimum, wet location, and as indicated on the Contract.
3. Underground Cable
   Use underground wire that meets the following requirements:
   a. Be rot and vermin proof
   b. Be UV, oil and chemical resistant
   c. Be the proper size
   d. Be a type recommended by the cable manufacturer for direct burial in earth

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 923—Electrical Conduit

923.1 General Description
This section includes the requirements for metallic, nonmetallic, and flexible electrical conduit.

923.2 Materials

923.2.01 Rigid Metallic Conduit

A. Requirements

1. General Requirements for all Rigid Metallic Conduit
   a. Use metallic conduit that meets the requirements of and is used according to the latest edition of the National Electrical Code Article 344.
   b. The type and material of conduit specified within the Contract.
   c. Ensure each section of conduit bears the listing mark by the Underwriter’s Laboratories, Inc. (UL) or a Nationally Recognized Testing Laboratory (NRTL).
   d. All RMC conduit must be listed to UL 6 or 6A.
   e. Ensure that rigid steel conduit, elbows, and couplings meet ANSI C-80.1.
   f. Use fittings of the same material as the conduit to avoid galvanic corrosion.
   g. Use fittings that are NRTL listed to the appropriate UL standards

2. Galvanized Rigid Steel Conduit
   a. Galvanized steel shall be used for all Rigid Metallic Conduit installations, unless otherwise specified.
   b. Use conduit protected by a uniform metallic zinc coating on both the exterior and interior surfaces.
   c. Conduit and couplings must have a minimum zinc coating of 1.24 oz./ft.² (378 g/m²), total of both surfaces.
   d. Determine the weight of the zinc coating using either ASTM A 90, or, if the Engineer elects, a magnetic or electromagnetic thickness gage to measure the coating thickness.

3. Rigid Aluminum Conduit (Aluminum RMC)
   a. Ensure that rigid aluminum conduit, elbows, and couplings meet Federal Specification WW-C-540c.
   b. Aluminum RMC shall be provided with approved supplementary corrosion protection where encased in concrete or in direct contact with the earth.
   c. Install only as specified in the Contract.

4. Stainless Steel Conduit
   a. Stainless steel conduit, elbows, couplings, and fittings may be permitted to be installed in concrete, in direct contact with the earth, or in areas subject to severe corrosive influences where protected by corrosion protection approved for the condition.
   b. Install only as specified in the Contract.

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   General Provisions 101 through 150.

D. Materials Warranty

   General Provisions 101 through 150.
923.2.02 Rigid Nonmetallic Conduit

A. Requirements

All Non-Metallic Conduit shall be Polyvinyl Chloride (Type PVC) Conduit. Ensure unplasticized PVC conduit meets the requirements of UL 651.

1. Type II Conduit (Schedule 40 PVC)
   a. Use Type II conduit for all direct buried conduit as well as all conduit encased or embedded in concrete.
   b. May be used as specified in Contract for exposed or concealed applications above ground
   c. All Type II shall be Schedule 40 (heavy wall), unplasticized PVC conduit that meets the requirements of Federal Specification W-C-1094a, unless otherwise specified.
   d. Must be rated for use with 90°C conductors.
   e. Must meet Federal Specification WC1094a and NEC Article 352.

2. Type III Conduit (HDPE)
   Use Type III conduit when specified within the Contract, which is HDPE. ASTM D3035-15, Standard Specification for Polyethylene (PE) Plastic Pipe (DR-PR) Based on Controlled Outside Diameter, ASTM International, West Conshohocken, PA, 2015, www.astm.org

3. Fiberglass Reinforced Epoxy (FRE) Conduit: Type RTRC
   a. Use FRE conduit and fittings that meet the requirements of NEMA Standard TC 14, NEC Article 355 applies.
   b. The Department shall approve all materials and design of bridge-attached conduit systems prior to any field installation. All bridge hanger assembly components that are in contact with the FRE conduit’s outer surface shall be manufactured of the same fiberglass reinforced epoxy material or shall employ low-friction roller bushings.

923.2.03 Directionally Bored Conduit

A. Requirements

Conduits used for boring shall be either steel or HDPE, standard dimension ratio 11 (SDR-11) or better and shall meet the requirements of ASTM D3035-15.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.

923.2.04 Flexible Conduit: Type LFMC (Liquid tight Flexible Nonmetallic Conduit)

A. Requirements

1. Use flexible liquid tight UV-resistant conduit that is compliant with UL 1660 (Type B).
2. Use conduit that meets the requirements of Article 350 of the National Electrical Code, including maximum lengths allowed.
3. This type should be used for electrical service to luminaires under bridge decks or in tunnels, or where vibration may be an issue.
Section 923 — Electrical Conduit

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
924.1 General Description

This section includes the requirements for the following miscellaneous electrical materials:

- Ground rods—924.2.01
- Pull and Junction Boxes—924.2.02
- Breakaway Bases—924.2.03
- Fuses and fuse holders—924.2.04
- Surge Protective Devices and Lightning Arrestors—924.2.05
- Circuit breakers—924.2.06
- Photoelectric controls—924.2.07
- Magnetic contactors—924.2.08
- Service Entrance Caps (Weatherheads)—924.2.09
- Transformers—924.2.10
- Enclosures—924.2.11
- Service Disconnect Switch—924.2.12

924.2 Materials
Ensure that all electrical materials are approved by the Underwriter’s Laboratory or other acceptable testing agency.

924.2.01 Ground Rods
A. Requirements

1. Use ground rods that are 3/4 in. ± 1/16 in. (19 mm, ± 2 mm) diameter and 10 ft. (3.05 m) long, unless otherwise shown in the Contract.

2. Ensure that the rods are copper bonded (copper clad) steel with a minimum coating of 10 mils according to UL 467. Complies with IEC EN 62561-2

3. Nationally Recognized Testing Laboratory (NRTL) listed to UL 467 and must contain NRTL markings on exposed end.

B. Fabrication
General Provisions 101 through 150.

C. Acceptance
General Provisions 101 through 150.

D. Materials Warranty
General Provisions 101 through 150.
924.2.02 Pull and Junction Boxes

A. Requirements

1. General Requirements for all Pull and Junction Boxes
   a. Pull and junction boxes shall be sized appropriately to accommodate the cables necessary, only to 40% capacity of the box's internal capacity in accordance to NEC 314.28(A).
   b. Concrete and Polymer pull boxes are utilized in at grade installations and used as locations to pull, or roll cable. Splicing of service or branch circuit cable within pull boxes is not allowed.
   c. Junction boxes are above grade boxes and utilized where conduit makes a transition from installation type, conduit type or other transition. Proper splicing within above grade junction boxes is permitted.

2. Concrete Pull Boxes
   a. Construct concrete boxes from Class A concrete and according to Section 500.
   b. Provide cast iron, steel, or reinforced concrete covers with each pull or junction box according to the Contract.
   c. Ground the cast iron or steel covers to electrical junction or pull boxes according to the NEC.
   d. Concrete pull boxes installed within 12 feet of active lanes shall be traffic rated and compliant with AASHTO H-15 loading requirements, including the lid. For installations where heavy truck traffic is expected, AASHTO H-20 load rating shall be used.

3. Precast Pull Boxes
   b. Precast boxes installed within 12 feet of active lanes shall be traffic rated and compliant with AASHTO H-15 loading requirements. For installations where heavy truck traffic is expected, AASHTO H-20 load rating shall be used.

4. Fiberglass/Polymer Pull Boxes
   a. Boxes shall meet or exceed Tier 22 requirements of ANSI/SCTE 77 2017, AMERICAN NATIONAL STANDARD--Specifications for Underground Enclosure Integrity
   b. Boxes installed within 12 feet of active lanes shall be traffic rated and compliant with AASHTO H-15 loading requirements. For installations where heavy truck traffic is expected, AASHTO H-20 load rating shall be used.

5. Metal Junction Boxes
   a. Metal junction boxes shall be galvanized rigid steel, unless specifically approved by the Engineer, and shall comply with NEC Article 314.28, Pull and Junction Boxes and Conduit Bodies.
   b. Shall be listed to UL 50, Enclosures for Electrical Equipment, non-Environmental Consideration

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
Section 924 — Miscellaneous Electrical Materials

924.2.03 Breakaway Bases

A. Requirements
   1. Breakaway bases are only intended to be used on street light poles installed within clear zone and not intended to be utilized on traffic signal, camera, ATMS or other poles that have electrical equipment.
   2. In compliance with AASTHO, quick disconnect/breakaway fusing is required within all breakaway bases. See Section 924.2.4.
   3. Shall only be utilized as indicated in the Contract or as approved by the Engineer.
   4. Shall have been evaluated using the AASHTO Loading Guide and MASH testing criteria requirements for the application in which it is used, and the manufacturer must furnish a letter of eligibility for the device from the FHWA.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150

924.2.04 Fuses and Fuse Holders

A. Fuse Holders
   1. Each fuse holder shall consist of a two-section unit designed to hold small-dimension cylindrical fuses of the type UL Class CC or as required. Each section shall be permanently marked with line and load side designations and the unit shall have a water and vapor-tight seal rated IP67 when the sections are joined. Two-pole fuse holders with setscrew terminals shall be used unless otherwise specified.
   2. The terminals and the contacts in the fuse holder shall be made of tinned copper or other material suitable for contacts as approved by the Engineer. The contacts shall be spring loaded or tulip style to exert contact pressure on mating parts. Fuse holders shall be rated for 30 A at 600 V at 167 °F (75 °C) operation.
   3. Fuse holders shall have a molded neoprene rubber, or impact resistant polymer housing. Wires shall attach to the fuse holder by a crimping operation, except that connection of No. 2 wires to breakaway fuse holder receptacles may be via a set screw connection. Each fuse holder shall be of a size proper for the wires to be attached. The assembly shall be provided with insulating boots as needed.
   4. Phase to phase circuit applications shall be designed so that both phase conductors are disconnected at the same time. Phase to neutral circuit applications shall be designed so that both phase and neutral conductors are disconnected at the same time. Blanks shall be used instead of fuses for the neutral conductor and they shall be clearly marked with white bands to designate a neutral plug.
   5. The fuse holder shall be capable of disconnecting upon sufficient tension in the connected wires, as in a pole knockdown. The fuse shall remain enclosed in the de-energized portion of the fuse holder upon disconnection. The fuse shall not be utilized as the disconnection means. Break-away style must readily disconnect from power in case of a pole knockdown and shall be compliant with AASHTO breakaway quick disconnect requirements. The breakaway feature shall consist of a receptacle permanently attached to the power line and a fuse holder with matching terminals. If a knockdown occurs, the parts shall separate, leaving the energized conductor recessed and unexposed.
Section 924 — Miscellaneous Electrical Materials

B. Fuses
   1. Fuses for installation within fuse holders for protection of luminaires shall be small-dimension, 1 1/2 in. long x 13/32 in. dia. (38 mm x 10 mm), cylindrical fuses of the time-delay type. The fuses shall be rated for 600 V AC, Type FNQ time-delay fuses and meet the requirements of UL Standard 248-4. The fuses shall have a UL listed interrupting rating of not less than 10,000 rms symmetrical amperes at rated voltage. They shall be sized at 300 percent of the starting or operating current whichever is greater, but in no case greater than 50 percent of the branch circuit conductor ampacity.

   2. Fuses shall be NRTL listed to UL 248-4 and be marked accordingly.

A. Acceptance
   General Provisions 101 through 150.

B. Materials Warranty
   General Provisions 101 through 150.

924.2.05 Surge Protective Devices and Lightning Arrestors

Lightning Arrestors shall be located in the Controller Cabinet when the application calls for equipment to be powered from the secondary side of a step-down transformer. Each Luminaire shall have an internal primary lightning arrestor or surge protective device. See below for details.

A. Primary Surge Protective Device (SPD) (Luminaire)
   1. The surge protector shall be labeled Type 2 in accordance with UL 1449.
   2. The surge protector shall include a thermally protected transient voltage suppression circuit.
   3. The surge protector shall be totally weatherproof.
   4. The surge protector shall be rated for operation at the system voltage.
   5. The surge protector shall provide protection for Line-Ground or Line-Neutral/Ground and Line-Line in accordance with ANSI/IEEE C62.41.2 guidelines.
   6. The surge protector shall have a high temperature, flameproof enclosure with a minimum of 85°C maximum case temperature rating.
   7. The surge protector shall be rated to withstand a surge current of 20,000 amperes using industry standard 8/20 μSec waveform and repetitive surges of 200 amperes for a minimum of 10,000 occurrences.
   8. The surge protective device shall have a clamping voltage that is less than that of the surge protection provided in the LED driver used in the luminaire, and a maximum continuous over voltage (MCOV) rating of at least 550V.
   9. The surge protector response time shall be less than 50 nanoseconds.
   10. The surge protector current drain (leakage) shall not exceed 100 microamperes.
   11. The surge protector shall not allow holdover current or conduction to ground after the surge ends.
   12. The surge protector shall be provided with an integral LED indicating light which shall be illuminated to indicate proper function and protection for each line.
   13. The device shall disconnect power to the luminaire upon failure of the device. Device failure is defined as the inability of the device to provide its rated surge protection to the luminaire.
Section 924 — Miscellaneous Electrical Materials

B. Secondary Surge Protector (Control Cabinet)
   1. Secondary Surge Arrestors shall be a type 1 SPD, two pole units of the valve-type, consisting of a spark
gap structure and silicon carbide valve blocks.
   2. The arrestors shall be 650 Volt, maximum rated, designed for the protection of 480-volt, single phase,
   ungrounded secondary services. The arrestors shall meet all applicable ANSI, NEMA, IEEE, and OSHA
   standards, Such as IEEE C62.1-1989 Standard for Gapped Silicon-Carbide Surge Arresters for
   AC Power Circuits.

C. Fabrication
   General Provisions 101 through 150.

D. Acceptance
   General Provisions 101 through 150.

E. Materials Warranty
   General Provisions 101 through 150.

924.2.06 Circuit Breakers

A. Requirements
   1. Circuit breakers employed either as individual devices or as components of a panelboard shall be of the
   manually-operated molded-case type with frame size, number of poles, current trip ratings and enclosures
   as shown in the Contract.
   2. Circuit breakers shall have a UL listed interrupting rating of not less than 65,000 rms symmetrical amperes at
   rated circuit voltage.
   3. Circuit Breakers shall have inverse-time thermal, and instantaneous magnetic overload trip elements. Multi-
pole breakers shall have trip elements on each pole connected to a common trip bar. The circuit breakers
   shall be trip-free from the handle on overloads and short circuits. Automatic tripping shall be clearly
   indicated by the handle position. The breakers shall be treated to resist fungus Circuit breakers shall
   conform to adjacent breakers, be NRTL listed per UL 1066, conform to NEMA Standard AB 1, and meet
   Federal Specifications W-C-375b.
   4. Breakers shall have proper sized lugs for the cable used. Do not cut cable strands to attach to
   circuit breakers.
   5. Be enclosed in a lockable, weatherproof enclosure.
   6. The number of branch circuit breakers shall be as indicated on the Control Cabinet detail drawing or as
   indicated in the lighting system wiring diagram whichever is greater plus two spare circuit breakers.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Material Warranty
   General Provisions 101 through 150.
Section 924 — Miscellaneous Electrical Materials

924.2.07 Photoelectric Controls

A. Requirements

1. Have a suitable differential between turn-on and turn-off levels to prevent cycling at critical levels and a time delay response to preclude nuisance tripping due to stray light.

2. Photo Electric Control Switches shall have a hermetically sealed silicon sensor cell with an NIR filter and rated for 1,000 watts minimum load.

3. A fail-safe operating feature such as normally closed contacts shall be included so that the lighting circuits will remain energized in the event the photo control components become inoperative.

4. Operating Light Levels, Turn-on: 1.5 FC, 1.5:1 Off/On Ratio These illumination settings shall be set by the Manufacturer and maximum tolerances of ± 20% for the specified values shall be acceptable.

5. Photo Electric Control Switches shall comply with ANSI C136.10 Standard twist lock type design with high-impact resistant plastic weatherproof housing. A locking type receptacle mounted in an impact resistant housing with ¾ in. pipe thread suitable for conduit mounting shall be provided for installation as indicated on the Standard Drawings or the Contract. Receptacles shall be impact resistant and withstand the impact of the luminaire being dropped from a 3-foot height and the receptacle striking a concrete surface. It shall operate on a supply voltage of 105-130 volts, 60 Hz AC, with an inrush rating of 120 amperes at 120 volts and be NRTL listed to UL 773.

6. Contain built-in surge and lightning protection and an MOV rated at 320 joules minimum.

7. Have a rated life at full load of at least 5,000 on-off operations

8. Have relay contacts that are single-pole, single-throw (SPST), normally closed (NC)

9. Have dielectric strength of at least 5,000 volts between any current carrying part and metal mounting surface

10. Have a moisture proof housing about 2-1/4 in. (60 mm) high with a base diameter of less than 3-1/4 in. (85 mm)

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.
Section 924 — Miscellaneous Electrical Materials

924.2.08 Magnetic Contactors

A. Requirements

1. Lighting contactors, unless otherwise noted, shall be two-pole, line voltage and current rated contactors in a lockable NEMA type 4x enclosure (per NEMA 250) as shown in the Contract or in the Standard Drawings. The contactors shall meet the requirements of Underwriters’ Laboratories Standard UL 508.

2. Lighting contactors shall be of a single-coil, electrically operated, mechanically held type. Positive locking shall be obtained without the use of hooks, latches or semi-permanent magnets.

3. Main contacts shall be double-break silver alloy or silver alloy-type, protected by arcing contacts. Contacts shall be self-aligning and renewable from the front of the panel. Terminals shall be pressure wire connectors.

4. Each contactor shall be furnished complete with a 2-wire control relay for reversing the switch and breaking the control circuit. The control solenoid and circuit shall be fused and wired for operation from a separate 120V, AC supply source unless otherwise specified. One set of spare contacts and 2 sets of spare fuses shall be provided with each contactor.

5. Have proper lugs that are sized for the cable used. Do not cut cable strands to attach to contactor terminals.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150.

924.2.09 Service Entrance Caps (Weatherheads)

A. Requirements

1. Devices shall be listed to UL 514B, Conduit, Tubing, and Cable Fittings

2. The device shall be mechanically and environmentally compatible with the conduit that it is attached to.

3. Shall be as specified in the Contract or as approved by the engineer.

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

General Provisions 101 through 150.

D. Materials Warranty

General Provisions 101 through 150
Section 924 — Miscellaneous Electrical Materials

924.2.10 Transformers

A. Requirements
   1. Transformers located within control cabinets shall be single phase dry type.
   2. They shall be rated for 1.5 times the maximum load of the application.
   3. All control transformers shall be listed to UL 5085-1 and certified to NEMA ST-20.

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   General Provisions 101 through 150.

D. Materials Warranty

   General Provisions 101 through 150.

924.2.11 Enclosures

A. Requirements
   1. Enclosures shall be listed by an NRTL to UL 50
   2. Shall comply with NEC Article 110.28
   3. Shall be rated NEMA 4X
   4. Shall be fabricated from Stainless Steel Type 316
   5. Shall be free standing and capable of being pad mounted.
   6. Shall have continuous door hinges with lockable door handles
   7. Unless otherwise specified material to be type 316 SS with a brushed finish, depending on application, with all hardware of the same or higher grade.
   8. Shall be sized to accommodate all of the equipment to mounted within it plus a minimum of 25 percent to accommodate future requirements.
   9. General construction shall be of sheet steel with all welds to be continuously finished smooth, free of all burrs, scale and imperfections.
   10. Shall be stiffened to prevent any deformation or bowing during installation and after components are mounted.
   11. All doors are to be formed flush fitting with all welds ground smooth, latching as specified with permanent gasket installed.
   12. Supply print pocket for documentation.
   13. Shall be provided with an Internal mounting panel.

B. Fabrication

   General Provisions 101 through 150.

C. Acceptance

   General Provisions 101 through 150.

D. Materials Warranty

   General Provisions 101 through 15.

924.2.12 Service Disconnect Switch

A. Requirements
   1. Use disconnect switches that are NRTL listed to UL 98 or 489 as appropriate with the voltage and ampere rating specified in the Contract.
   2. Use switches that are 2-pole, 3-wire, solid neutral with heavy duty rating, unless otherwise specified. Switch may be installed separately or with a magnetic contactor.
Section 924 — Miscellaneous Electrical Materials

3. Enclose the switch in a lockable, stainless steel, weatherproof enclosure that is rated 4X per NEMA 250. The switch shall have an external lockable handle and shall provide for locking in either the “On” or “Off” positions. Padlocks shall be included and shall be certified to ASTM F883-13 Grade 6 and comply with relevant safety and security standards.

4. Use the proper sized lug for the cable used. Do not cut cable strands to attach to disconnect switches.

B. Fabrication
   General Provisions 101 through 150.

C. Acceptance
   General Provisions 101 through 150.

D. Materials Warranty
   General Provisions 101 through 150.
925.1 General Description
Furnish and provide warranty for traffic control signal equipment and materials as specified herein and shown in the contract.

The Standard Detail Drawings include information related to the equipment specified in Section 925, as noted in Table 1.

925.1.01 Definitions, Acronyms, and Abbreviations

A. Definitions

1. **Advanced Transportation Controller (ATC):** The ATC Standards are intended to provide an open architecture hardware and software platform that can support a wide variety of Intelligent Transportation Systems (ITS) applications including traffic management, safety, security and other applications.

2. **Advanced Transportation Controller Cabinet (ATCC):** Cabinet that utilizes high-speed serial communications for an increased number of detection inputs and signal outputs, increased monitoring and diagnostic capabilities, enhanced worker safety, simplified wiring, and reduced cabinet size.

3. **CalTrans Cabinet Type L:** Type of traffic control device equipment cabinet with an energy-efficient power supply, reduced circuit breaker sizes, solid state relays, service panel with raw and clean power circuits, main breaker and Uninterruptible Power Supply (UPS) standard interface.

B. Acronyms and Abbreviations

Refer to Sections 101.01 and 647.1.01 for a list of acronyms, abbreviations, and terminology used in this section.

925.1.02 Submittals
Refer to Section 647.1.03 for submittal requirements. Requirements for traffic signal equipment, materials, and components are specified herein.

925.2 Materials

925.2.01 General Requirements
A. General
1. Provide equipment that is new and not refurbished.
2. All equipment and equipment applications shall meet MUTCD requirements.
3. Provide device that complies with the limits of a Class A digital device, pursuant to FCC Part 15.

B. Materials Warranty
1. Refer to Section 647.3.02 for warranty transfer information to the Department.
2. The equipment provided under this section is warranted by the manufacturer to be free from defects in materials and workmanship for a minimum period of two years from date of receipt or one year from date of Maintenance Acceptance Letter, whichever is greater.
3. Exceptions for materials that have longer warranty durations is presented in Table 3.

4. The manufacturer shall repair or replace faulty equipment during the warranty period at no charge to the Department for parts, labor, and shipping to and from the factory.

C. Environmental
1. All equipment assemblies outside of the controller or flasher cabinet shall be placed in a NEMA Type 3R or 4x enclosure, unless specified otherwise in this section.
2. All equipment shall meet or exceed the temperature and humidity limits per current NEMA TS2 requirements, unless specified otherwise in this section.

</tr>
<tr>
<td>Manufacturer’s name, part number, date code, and electrical characteristics of the LED signal module shall be visible on the unit for warranty purposes.</td>
</tr>
<tr>
<td><strong>UPS</strong></td>
</tr>
<tr>
<td>Manufacturers shall provide a two-year factory-repair warranty for parts and labor on the UPS from date of acceptance by the Department</td>
</tr>
</tbody>
</table>
925.2.02 Controller Assembly Requirements

A. General

1. Documentation
   a. Provide manuals that document the controller programming, operation, and maintenance.
   b. Include schematic drawings and pin assignment charts in the manuals to support maintenance activity.
   c. Include all components, including communications modules, in documentation.
   d. Required documentation includes the documentation listed in Section 1.2.4 in the CalTrans TEES 2009.

2. Configuration
   a. Provide controller assembly that conforms with the input and output configurations shown in this section.
   b. Program the default input and output configurations shown in this section.

3. Testing
   a. Perform testing and provide complete testing results of the controller unit before it is shipped. If the controller unit is shipped with application firmware installed, it must be tested with the application (e.g., traffic signal control).
   b. If a random sample of greater than 10% of the units tested fails, then the whole shipment shall be rejected, and the vendor will be responsible for the cost to test and repair the units.

B. Type 2070 Controller

1. 2070 controller assembly shall meet the State of California Business, Transportation, and Housing Agency; Department of Transportation TEES, 2009.

2. Provide Type 2070LX controller assembly with the following I/O configuration.
   a. CPU module version 2070-1C Single-Board.
   b. Power supply module versions 2070-4A or 2070-4N.
   c. Field I/O module version 2070-2E or 2070-E+.
   d. Front panel assembly version 2070-3B.

C. ATC Controller

1. ATC controller assembly shall meet ATC 5201 v06A.34.

2. As part of the submittal package, provide detailed information regarding the CPU module, power supply module, field I/O module and front panel assembly.

925.2.03 Type 2070 Controller Subassembly Requirements

A. CPU Module

1. Provide single-board CPU module version 2070-1C in conformance with CalTrans TEES 2009 with Errata 1, 2, 3, and 4.

2. Provide CPU module that contains the required files to be compatible with the Department’s current applications software.

3. Provide CPU module with a minimum of two (2) RJ-45 Ethernet ports.
Section 925 — Traffic Control Signal Equipment

B. Power Supply Module
   1. Provide power supply module version 2070-4A or 2070-4N in conformance with CalTrans TEES 2009 including Errata 1, 2, 3 and 4.
   2. The power supply module may be supplied as a separate item.
   3. The power supply module shall be an independent, self-contained module.
   4. Provide power supply module that is vented and cooled by convection only.
   5. Provide power supply module that slides into power supply compartment from the back of the chassis and is attached to the backplane mounting surface with four #3 TSD thumbscrews.
   6. Provide power supply module shall supplies a minimum of 10A of +5 VDC.
   7. Provide power supply module that is compatible with Model 2070LX controller assembly and the Department’s current traffic signal or ramp meter operating system.
   8. Mark the model of the power supply module clearly on the unit.

C. Field I/O Module
   1. Provide field I/O module version 2070-2E or 2070-E+ in conformance with CalTrans TEES 2009 with Errata 1 and 2, 3 and 4.
   2. The field I/O module may be supplied as a separate item.
   3. Provide field I/O module that consists of the field controller unit; parallel input/output ports; other module circuit functions (includes muzzle jumper); serial communication circuitry; module connectors C1S, C11S, and C12S mounted on the module front plate; VDC power supply (+12 VDC to +5 VDC); and required software.
   4. Provide field I/O module configuration jumpers that are compatible with the Department’s current traffic signal software.
   5. Verify that the field I/O module functions with a Model 2070LX controller assembly and compatible with the Department’s current traffic signal software.

D. Front Panel Display Module
   1. Provide front panel assembly version 2070-3B CalTrans TEES 2009 including Errata 1, 2, 3 and 4.
   2. The front panel display module may be supplied as a separate item.
   3. Provide a front panel display module that includes a front panel assembly controller, two keyboards, AUX switch alarm bell, and 8 line by 40-character display.
   4. Provide a panel with latch assembly and two TSD #1 thumbscrews hinge attachments, assembly PCB, external serial port connectors, CPU active LED indicator, contrast adjustment, and front panel harness.
   5. Verify front panel display module configuration jumpers are compatible with the Department’s current traffic signal software.
   6. Verify the front panel display module functions with a Model 2070LX controller assembly and is compatible with the Department’s current traffic signal software.
   7. Verify the hardware hinge attaching devices mate with existing 2070 assemblies.
   8. Verify the front panel harness is connected to the front panel via a removable connector.
   9. Verify the front panel connector supports the auxiliary switch.
925.2.04 Signal Monitor for L Series Traffic Signal Cabinets

A. General

1. Provide signal monitor that complies with specifications outlined in the referenced CalTrans TEES 2009 with Errata 1, 2, 3, and 4. This specification governs where differences occur.

2. Provide a signal monitor that can monitor 18 channels, as required by the Contract at each location. Each monitored output shall consist of the green, yellow, and red inputs for each channel.

3. Conflict Monitoring
   a. The signal monitor shall detect the presence of conflicting green or yellow signal voltages on the AC field terminals between two or more non-compatible channels.
   b. A conflict fault (CONFLICT) shall be a latching fault.

4. Conflict Recognition Time
   a. The signal monitor shall trigger a CONFLICT when voltages on conflicting channels are present for more than 500 ms.
   b. The signal monitor shall not trigger a CONFLICT when voltages on conflicting channels are present for less than 200 ms. Conflicting signals sensed for more than 200 ms and less than 500 ms may or may not trigger the unit.

5. 24 VDC Monitoring VDC
   a. The signal monitor shall detect when the cabinet +24 VDC supply falls below 18 VDC.
   b. A 24 VDC failure (VDC FAIL) shall be a latching fault.

6. 24 VDC Recognition Time
   a. The signal monitor shall trigger VDC FAIL when the voltage on the +24V input is below 18 VDC for more than 500 ms.
   b. The signal monitor shall not trigger VDC FAIL when the voltage on the +24V input is below 18 VDC for less than 200 ms. A voltage level of +22 VDC will be required to prevent the unit from triggering.

7. Controller Watchdog Monitoring (WDT)
   a. The signal monitor shall trigger when the controller unit’s watchdog input does not toggle within the programmed time period (WDT ERROR).
   b. A WDT ERROR shall be a latching fault.
   c. The signal monitor remains latched in the fault state until reset by the reset button, an external reset input command, or AC line voltage restoring from an AC line brownout event.
   d. A reset resulting from an AC line brownout event shall not clear the WDT ERROR.

8. Controller Watchdog Latch Option
   a. The signal monitor shall have a programming option that sets the watchdog monitoring function to a latching mode and only resets by the manual the reset button or external reset input.
   b. An AC line brownout condition shall not reset the fault.

9. Controller Watchdog Recognition Time
   a. The signal monitor shall have a programming option that sets the maximum watchdog recognition time to 1,000 to 1,500 ms, ±100 ms.

10. Controller Watchdog Enable Switch
    a. Provide an internal switch to disable the watchdog monitoring function.
    b. Mount the switch on the PCB and clearly label WD ENABLE - ON...OFF.
    c. Placing the switch in the OFF position shall inhibit watchdog monitoring.
11. WDT ERROR LED Control
   a. The WDT ERROR LED shall illuminate when the unit has been triggered by a watchdog fault.
   b. If the watchdog monitoring function is inhibited due to the watchdog enable switch, the WDT ERROR LED shall flash at a 0.5 Hz rate.

12. AC Line Monitoring
   a. AC Line Brownout Recognition
      i. Verify that the signal monitor can detect that the AC line has fallen below 98 ±2 VAC for greater than 400 ±50 ms. This shall force the output relay to the de-energized fault state, enable the stop-time output, and cause the AC POWER LED to flash at a 2 Hz rate.
      ii. Verify that the unit maintains this state until the AC line voltage rises above 103 ±2 VAC for greater than 400 ±50 ms.
      iii. Provide a jumper option that will change the AC brownout dropout level to 92 ±2 VAC and the restore level to 98 ±2 VAC.
   b. AC Line Power-up and Brownout Delay Time
      i. When the AC Line is greater than 103 ±2V after power-up or brownout restore, verify that the Signal Monitor holds the output relay in the de-energized fault state and enable the stop-time output for a period of not less than 6.0 ±0.5 sec and not greater than 10.0 ±0.5 sec.

13. Red Fail Monitoring
   a. The Signal Monitor shall detect the absence of an active voltage on the green, yellow and red field signal inputs of a channel.
   b. Red fail fault (RED FAIL) shall be a latching fault.

14. Red Fail Recognition Time
   a. Verify the Signal Monitor triggers when an active voltage on one of the three inputs of a channel is absent for more than 1,500 ms.
   b. Verify that the Signal Monitor does not trigger when an active voltage on one of the three inputs of a channel is absent for less than 1,200 ms. Channels without proper voltages sensed for more than 1,200 ms and less than 1,500 ms may or may not trigger the unit.
   c. Provide an option switch (RF 2010) that will change the fault recognition time to between 700 ms and 1,000 ms.

15. Dual Indication Monitoring
   a. Verify that the Signal Monitor can detect the presence of active voltage on the green and yellow field signal inputs of a channel.
   b. Green/Yellow/Red (GYR) Dual Indication fault (DUAL IND) shall be a latching fault.
   c. When selected by the GYR ENABLE switch, verify that the GY Dual Indication monitoring function is disabled when pin #EE is active.

16. Dual Indication Recognition Time
   a. Verify that the Signal Monitor triggers when multiple inputs are active on a channel for more than 500 ms.
   b. Verify that the Signal Monitor does not trigger when multiple inputs are active on a channel for less than 250 ms. Channels with multiple voltages active for more than 250 ms and less than 500 ms may or may not trigger the unit.
17. Clearance (Short or Absent Yellow) Monitoring
   a. Verify that the Signal Monitor can detect that a channel has not provided a yellow clearance interval during a green to yellow to red sequence.
   b. A sequence failure (SEQUENCE) shall be a latching fault.
   c. Verify that the sequence monitoring function is enabled for all selected channels except when the Red Enable input is not active or pin #EE is active.

18. Clearance Recognition Time
   a. Verify that the yellow clearance interval is a minimum of 2.7 sec.

19. Flickering Indication Detection
   a. Verify that the Signal Monitor provides a method of detecting Conflict, Red Fail, and Dual Indication faults that result from intermittent or flickering signal inputs that may not meet the minimum duration requirement.
   b. The flickering indications shall result in a latching fault with an indication illuminated along with the resulting Conflict, Red Fail, or Dual Indication indicator.

20. Configuration Change Monitoring
   a. On power-up, reset, and periodically during operation, verify that the Signal Monitor compares the current configuration settings with the previously stored value and if the settings have changed, the Signal Monitor automatically logs the new setting.
   b. Verify that the settings include the permissive diode matrix, switches, jumpers, and the Watchdog Enable switch.
   c. Provide a programming option such that change in the configuration parameters will cause the Signal Monitor to enter the fault mode, causing the output relay contacts to close and enabling the stop-time output to the controller.
   d. To indicate the fault mode, verify that the PCA indicator will flash at a 4 Hz rate.
   e. Depressing the Reset button for a minimum of 5.0 sec is required to clear the fault and log the new configuration parameters.
   f. If the programming option is not selected, verify that the unit does not set the fault mode but will still log the configuration change.

21. Exit Flash
   a. When the Signal Monitor exits the flash state (output relay de-energized) as a result of a Reset command or AC Line brownout restore, verify that the stop-time output goes to the inactive state 250 ±50 ms before the output relay transfers to the energized state.
   b. The transition shall provide an early indication to the controller unit that the cabinet will transfer from flash to signal operation.

22. Display Functions
   a. Verify that it is possible to view the active channels for each individual color (GYR) during operation and when latched in a fault state.
   b. When the Signal Monitor is latched in a fault state, verify that it is also possible to view the active channels for each individual color and fault status for each channel for the current fault and the two previous faults.
      i. When triggered by a fault, the channel status display shall alternate between the channels that were involved in the fault (fault status) for 2 sec and the field signals active at the time of the fault for 6 sec.
      ii. The channels involved in the fault shall flash their respective green, yellow, and red indicators simultaneously at a 4 Hz rate for the 2 sec interval.
      iii. The two previous faults may also be displayed individually.
iv. The status is not reset by an AC Line power interruption.

v. To enter the display mode, remove the program card. The sequence is shown in Table 4.

### 23. Event Logging Functions

a. Verify that the Signal Monitor can store a minimum of 100 events in non-volatile memory.

b. Mark each event with the time and date of the event. The events consist of fault events, AC Line events, reset events, and configuration change events.

c. Provide a graphical means of displaying the signal states of all field inputs for 30 sec prior to a fault trigger event.

d. Provide the capability to assign a four-digit identification number to the unit.

e. Upload the event logs to a PC using the RJ-45 of the Signal Monitor and provided.

f. Verify each event log report contains the following information:

   i. Monitor ID#: a four-digit (0000-9999) ID number assigned to the monitor.

   ii. Time and Date: time and date of occurrence.

   iii. Event Number: the record number in the log. Event #1 is the most recent event.

### 24. Monitor Status Report (CS):

Verify the Current Status report contains the following information:

a. Fault Type: the fault type description.

b. Field Status: the current green, yellow, or red (GYR) field status and field RMS voltages (Vrms) if the monitor is not in the fault state, or the latched field status and field RMS voltages and fault channel status at the time of the fault.

c. Cabinet Temperature: the current temperature if the monitor is not in the fault state, or the latched temperature at the time of the fault.

d. AC Line Voltage: the current AC Line voltage if the monitor is not in the fault state, or the AC Line voltage at the time of the fault.

e. Control Input Status: the current state and RMS voltages of the Red Enable input, EE input, and Special Function #1 and #2 inputs if the monitor is not in the fault state, or the status latched at the time of the fault.

### 25. Previous Fault Log (PF):

Verify the Previous Fault log contains the following information:

a. Fault Type: the fault type description.

b. Field Status: the latched field status with RMS voltages and fault channel status at the time of the fault.

c. Cabinet Temperature: the latched temperature at the time of the fault.

d. AC Line Voltage: the AC Line voltage at the time of the fault.

e. Control Input Status: the latched state of the Red Enable input, EE input, and Special Function #1 and #2 inputs at the time of the fault.
Section 925 — Traffic Control Signal Equipment

26. AC Line Event Log (AC): The AC Line log shall contain the following information:
   a. Event Type: the type of AC Line event that occurred.
      i. Power-up—AC on, monitor performed a cold start
      ii. Interrupt—AC Line < Brownout level
      iii. Restore—AC restored from brownout or interruption (AC Off), no cold start
   b. AC Line Voltage: the AC Line voltage at the time of the event.

27. Monitor Reset Log (MR): Verify the Monitor Reset log contains the following information:
   a. Event Type: The monitor was reset from a fault by the front panel Reset button or External Reset input.
   b. Time and Date: the time and date of the event.

28. PC Communications
   a. Have the manufacturer provide software to access the Signal Monitor status and event logs.
   b. Verify the software operates with the current version of Microsoft Windows.

29. Red Monitoring
   a. Red Field Inputs
      i. Verify that the Signal Monitor is capable of monitoring 18 Red field signals.
      ii. Verify that a Red input is sensed active when the input voltage exceeds 70 Vrms.
      iii. Verify that a Red input is sensed not active when the input voltage is less than 50 Vrms. A Red input may or may not be sensed active when the input voltage is between 50 Vrms and 70 Vrms.
   b. Red Enable Input
      i. Verify that the Red Enable input provides an AC input to the unit that enables Red Monitoring, Dual Indication Monitoring, and Sequence monitoring when the input is sensed active.
      ii. Verify that the Red Enable input is sensed active when the input voltage exceeds 70 Vrms.
      iii. Verify that the Red Enable input is sensed not active when the input voltage is less than 50 Vrms. The Red Enable input may or may not be sensed active when the input voltage is between 50 Vrms and 70 Vrms.
   c. Special Function Preemption Inputs
      i. Verify that the Special Function Preemption #1 and #2 inputs provide an AC input to the unit that disables only Red Fail Monitoring (Lack of Output) when either input is sensed active.
      ii. Verify that a Special Function input is sensed active when the input voltage exceeds 70 Vrms.
      iii. Verify that a Special Function input is sensed not active when the input voltage is less than 50 Vrms. A Special Function input may or may not be sensed active when the input voltage is between 50 Vrms and 70 Vrms.
      iv. Use a PCB-mounted switch to provide the option to invert the active status of the Special Function #1 input.
      v. Verify that the Special Function #1 input is sensed active when the input voltage is less than 50 Vrms. The Special Function #1 input may or may not be sensed active when the input voltage is between 50 Vrms and 70 Vrms.
   d. Red Interface Connector
      i. Provide connector with the required inputs for the unit to monitor the red field signal outputs.
      ii. Verify the connector is a 20-pin connector that mates with the P20 Cable from the output file.
      iii. Provide a high-quality connector that is polarized to verify proper mating with the cable.
iv. Verify ejector latches are included to facilitate removal and prevent the cable from inadvertently disconnecting.

v. Verify the unit functions as a standard 210 Signal Monitor when the cable is disconnected.

vi. Use the pin assignments shown in Table 5.

*A jumper option shall be provided to enable the connection of Pin #4 to be made with Chassis Ground.

30. Front Panel

a. Verify the model information is permanently displayed on the front surface.

b. Verify the front panel is constructed of aluminum with a minimum thickness of 0.090 in. (2.3 mm) and finished with an anodized coating.

c. Verify that all display indicators are mounted on the front panel of the Signal Monitor and are water clear, T-1 package, Super Bright type LEDs.

d. Verify that all fault LEDs are red except the AC POWER indicator, which is green.

e. Provide a separate red, yellow, and green indicator for each channel.

f. Label the indicators and provide the information as follows:

i. **AC Power**: Verify the AC Power indicator flashes at a rate of 2 Hz when the unit has detected a low voltage condition as described in Section 925.2.04.A.13. Verify the AC POWER indicator flashes at a rate of 4 Hz during the minimum flash interval. Verify that the indicator illuminates when the AC Line voltage level is restored above the brownout level. Verify the indicator extinguishes when the AC Line voltage is less than 80 VAC.

ii. **VDC Failed**: Verify the VDC FAILED indicator illuminates when a 24 VDC fault condition is detected. The indicator remains extinguished if the monitor has not been triggered by a 24 VDC fault.

iii. **WDT Error**: Verify the WDT ERROR indicator illuminates when a controller Watchdog fault is detected. Verify the WDT Error indicator flashes ON once every 2 sec if the WD Enable switch on the monitor is placed in the OFF position to disable Watchdog monitoring, or the AC Line voltage is below the Watchdog disable level.

iv. **Conflict**: Verify that the CONFLICT indicator illuminates when a conflicting signal fault is detected.
v. **Diagnostic:** Verify the DIAGNOSTIC indicator illuminates when one of the following faults is detected: Internal Watchdog fault, Memory Test fault, or Internal power supply fault. The indicator is intended to inform the service technician of a monitor hardware or firmware failure.

vi. **Red Fail:** Verify the RED FAIL indicator illuminates when an absence of signal is detected on a channel. Verify the RED FAIL indicator flashes ON once every 2 sec if the RED ENABLE input is not active, or a Special Function input is active, or the EE input is active.

vii. **Dual IND:** Verify the Dual IND. indicator illuminates when a GY-Dual or GYR-Dual Indication fault is detected on a channel.

viii. **Clearance:** Verify the Sequence indicator illuminates when the minimum yellow clearance time has not been met on a channel.

ix. **PCA:** Verify the PCA indicator illuminates if the program card is absent or not properly seated. If the unit is in the Diagnostic Display mode, verify the PCA indicator flashes ON (once, twice, or three times) to indicate the fault event number being displayed.

x. **RP Detect:** Verify the RP DETECT indicator illuminates when the unit has detected a Conflict, Red Fail, or Dual Indication fault as a result of recurring pulse field inputs.

xi. **Channel Status:** Verify that during normal operation the 48 channel status indicators display all active signals (red, green, and yellow). In the fault mode, verify that the Channel Status indicators display all signals active at the time of the fault for 6 sec and then indicate the channels involved in the fault for 2 sec.

31. **Front Panel Control-Reset Button**
   a. Provide a momentary single pole, single through switch labeled RESET on the unit front panel to reset the monitor circuitry to a non-failed state.
   b. Position the switch on the front panel such that the switch can be operated while gripping the front panel handle.
   c. Verify that a reset command issued from either the front panel button or External Reset input is a one-time reset input to prevent the unit from constant reset due to a switch failure or constant external input and causes all LED indicators to illuminate for 300 ms.
   d. Verify the Reset button provides control of the Diagnostic Display mode.

32. **Electronics**
   a. **RMS Voltage Sampling**
      i. Use high speed sampling techniques to determine the true RMS value of the AC field inputs.
      ii. Sample each AC input at least 32 times per cycle.
      iii. Verify that the RMS voltage measurement is insensitive to phase, frequency, and waveform distortion.
   b. **Internal MPU Watchdog**
      i. Use a microprocessor for all timing and control functions.
      ii. Verify continuing operation of the microprocessor by an independent monitor circuit that forces the output relay to the de-energized fault state, enables the stop-time output, and illuminates the DIAGNOSTIC indicator if a pulse is not received from the microprocessor within 300 ms.
      iii. If the microprocessor resumes operation, verify the Signal Monitor continues to operate.
      iv. Verify that the monitoring circuit is also configurable to latch in the fault state.
      v. Verify the unit requires a power-up cycle to reset the circuit once it is triggered.
c. Sockets
   i. Provide only PROM memory device for the microprocessor firmware is socket mounted.
   ii. Verify that the PROM memory socket is a precision screw machine type socket with a gold contact
       finish that provides a reliable gas tight seal. Low insertion force sockets or sockets with wiper type
       contacts are not acceptable.

d. Internal Power Supply
   i. Use a built-in, high-efficiency switching power supply to generate required internal voltages.
   ii. Verify that all supply voltages are regulated.
   iii. Failure of the internal power supply to provide proper operating voltages shall force the output relay to
        the de-energized fault state, enable the stop-time output, and illuminate the DIAGNOSTIC indicator.
   iv. Provide a user replaceable slow blow fuse for the AC Line input.
   v. Provide unit that is operational over the AC Line voltage range of 75 VAC to 135 VAC.

33. RJ-45 Interface
   a. The RJ-45 port interface shall be electrically isolated from all monitor electronics except chassis ground.

34. Configuration Parameters
   a. Select user-programmed configuration settings using PCB-mounted switches or jumpers. Designs
      requiring a PC to program or verify the configuration parameters are not acceptable.
   b. Verify that user-programmed configuration settings that are transferred to memory are stored in a PROM
      or EEPROM. Designs using a battery to maintain configuration data are not acceptable.

35. Field Terminal Inputs
   a. Verify that all 120 VAC field terminal inputs provide an input impedance of 50K to 150K ohms.
   b. Verify 120 VAC field terminal inputs are terminated with a discrete resistor having a power dissipation
      rating of 0.5 W or greater and a voltage rating exceeding 350 V.

36. Printed Circuit Boards
   a. Verify that all printed circuit boards meet the requirements of the California TSCES, January 1989.
   b. Meet the following requirements.
      i. All plated-through holes and exposed circuit traces are plated with solder.
      ii. Both sides of the printed circuit board are covered with a solder mask material.
      iii. The circuit reference designation for all components and the polarity of capacitors and diodes are
           clearly marked adjacent to the component.
      iv. Verify Pin #1 for all integrated circuit packages is designated on both sides of all printed circuit
          boards.
      v. All electrical mating surfaces are gold plated.
      vi. All printed circuit board assemblies are coated on both sides with a clear moisture-proof and fungus-
          proof sealant.
      vii. All components and wire harnesses are mounted to the PCB using plated holes. Piggy back
           connections or jumper wires are not acceptable.
B. Type 2018 Signal Monitor

1. Provide Model 2018 Monitor Unit in accordance with CalTrans TEES 2009 with Errata 1, 2, 3 and 4.

2. Meet the following requirements for monitor functions.
   a. Conflict Monitoring
      i. Verify that programming of the permissive matrix is contained in the memory key.
      ii. AC Line Power-up and Brownout Delay Time
          a) Verify that the flash interval is terminated after at least 6.0 ±0.5 sec if the Signal Monitor has detected at least five transitions of the Watchdog input.
          b) If the Signal Monitor does not detect five transitions of the Watchdog input before 10.0 ±0.5 sec, verify that the Signal Monitor goes to the fault state.
          c) During the interval, verify that the AC POWER LED flashes at a 4 Hz rate.
          d) Verify that the memory key Minimum Flash Time parameter has a range of zero and from 6 to 16 sec.
   b. Red Fail Monitoring
      i. Verify that the Red Fail monitoring function is enabled in the memory key on a per channel basis except when the Red Enable input is not active, or pin #EE is active, or Special Function #1 input is active, or Special Function #2 input is active.
   c. Red Fail Recognition Time
      i. Verify that a memory key Red Fail Timing option is provided that will change the fault recognition time between 700 ms and 1,000 ms.
   d. Red Interface Cable Fault
      i. Provide a memory key programming option such that operating without the Red Interface cable installed causes the Signal Monitor to enter the fault mode, causing the output relay contacts to close and enabling the stop-time output to the controller.
      ii. To indicate the fault mode, verify that the Red Fail indicator is illuminated with all fault channel indicators off.
      iii. Verify that Red Fail preemption control to the monitor uses the Special Function #1 or #2 input.
   e. Dual Indication Monitoring
      i. Verify the function is enabled in the memory key on a per channel basis for green and yellow combinations, green and red combinations, and yellow and red combinations.
      ii. Verify that the GYR Dual Indication monitoring function is enabled for all selected channels except when the Red Enable input is not active or pin #EE is active.
   f. GY Dual Indication Monitoring
      i. Enable the function with a dip switch on the PCB labeled GY ENABLE.
      ii. When the switch is in the ON position, monitor all channels for simultaneous active green and yellow inputs on a channel.
   g. Clearance (Short or Absent Yellow) Monitoring
      i. Verify that the function is enabled in the memory key on a per channel basis.
   h. Flickering Indication Detection
      i. Provide a programming option on the memory key to disable the RP Detect function.
i. Memory Key Error
   i. Verify that when the memory key is removed or when a nonvalid Memory key is inserted, the Signal Monitor forces the output relay to the de-energized fault state, enables the stop-time output, and illuminates the KEY indicator.
   ii. Verify that a reset command from the front panel Reset switch or External Reset input is required once a valid memory key is in place.
   iii. Verify that failure to read the memory key correctly results in a memory key Error illuminating the KEY indicator.

j. Display Functions
   i. Previous Fault GYR Display
      a) To exit the display mode, replace the memory key.
   ii. AC Line Event Log (AC): The AC Line log shall contain the following information:
      a) Event Type: the type of AC Line event that occurred.
         1) Power-up—AC on, monitor performed a cold start
         2) Interrupt—AC Line < Brownout level
         3) Restore—AC restored from brown-out or interruption (AC Off), no cold start
      b) AC Line Voltage: the AC Line voltage at the time of the event.
   iii. Configuration Change Log (CF): Verify the Configuration Change log contains the following information:
      a) Memory key contents and additional programming parameters resulting from hardware configuration settings.
      b) Changed items since the last log entry.
      c) Time and date of the event.
   iv. Signal Sequence Log:
      a) Provide a log that graphically displays all field signal states for up to 30 sec prior to the current fault trigger event.
      b) Verify that the resolution of the display is at least 50 ms.

k. Communications Functions
   i. Verify that the Signal Monitor is compatible with the protocol of the Department’s current operating system for 2070 controllers and Central System Control.
   ii. Verify the 2018 Conflict Monitor can communicate via a RJ-45 connector (Ethernet).

l. Hardware
   i. Monitor Configuration Programming
      a) Verify monitor parameter programming is provided in a removable and interchangeable memory key (nonvolatile memory device) mounted on the front panel.
   b) Monitor Unit Serial Memory Key
      1) Verify that the monitor has a Datakey model KC4210 Keycepticle socket or equal mounted on the front panel containing a Datakey model LCK4000-RED serial memory key or equal.
      2) (Note: Datakey and Keycepticle are registered trademarks of Datakey Electronics, Inc.)
      3) Verify that the serial memory key is rated for –40 to +176°F (–40 to +80°C) operation.
c) Monitor Unit Serial Memory Key Interface
   1) Verify that the Signal Monitor does not provide the capability to program the serial memory key. It shall be used only as a read only device.
   2) Verify that the 16-bit Frame Check Sequence (FCS) procedure defined in clause 4.6.2 of ISO/IEC 3309 is used to verify the integrity of the read data.
   3) Verify that failure to read the serial memory key correctly results in a latched Diagnostic fault.
   4) Verify that interface circuitry to the memory utilizes the LOFO switch on the serial memory key socket to verify the device is removed and inserted with no power applied to the interface pins (i.e., dead socket).

d) Memory Key Programming Tool
   1) Verify the programming tool provides all the electronics necessary to read data from and write data to the memory key device.
   2) Verify the programmer is configured to read and write to the Datakey model LCK4000, which provides 512 bytes of storage.
   3) Verify power for the programming tool is obtained from the PC communications port so that no external power supply source is required.

e) Memory Key Programming Software
   1) Verify that the manufacturer provides software to operate the memory key programming tool.
   2) Verify that the memory key programming parameters are stored in a Windows file format according to currently used Signal Monitor identification number and name.

f) Parameter Forms
   1) Provide a parameter form for each programmable Signal Monitor function.
   2) Verify that Signal Monitor configuration data is entered on a parameter form and then saved to the main data buffer image.
   3) When all parameter forms are completed verify that a write function transfers the contents of the data buffer to the nonvolatile memory of the memory key device.
   4) Verify that reading the contents of a memory key device sets the parameters of each form for review or modification.

g) Memory Key Parameter Verify
   1) Verify that a memory key Parameter Verify function compares the contents of a memory key device with parameters in the data buffer. The data buffer parameters may be set by changing parameters on the forms, reading the contents of a memory key device, or loading a set of parameters from a file.

h) Initial Parameter Setup Wizard
   1) Verify that an Initial Parameter Setup wizard is provided that defines and sets a basic set of parameters for a new memory key setup.
   2) Verify that the wizard asks a series of questions describing basic intersection setup and develop a template for the following parameters: Red Fail Monitoring, Dual Indication Monitoring, Clearance Monitoring, and Yellow Disable.

i) Parameter Check Wizard
   1) Verify that a Parameter Check wizard is provided that will apply a set of basic configuration rules to the data buffer and provide a warning that configuration conflicts or inconsistencies may exist.
Section 925 — Traffic Control Signal Equipment

j) Parameter Reports
   1) Verify that the contents of the data buffer are displayed in a hex format for numerical analysis. A text report shall also be printed that specifies all parameter settings.

k) Special Function Preemption Inputs
   1) Verify that a programming option is provided in the memory key to invert the active status of the Special function #1 input. When the option is enabled, verify that the Special Function #1 input is sensed not active when the input voltage exceeds 70 Vrms.

ii. Output Relay
   a) Verify the Signal Monitor Output Relay provides both normally open and normally closed contacts.
   b) Verify a programming option is provided to select the polarity of the EE input to accommodate the flash drive voltage state drive on pin EE.

C. Model 208 Monitor Unit for Ramp Meter Cabinets

1. Provide Model 208 Monitor Unit in accordance with CalTrans TEES 2009 with Errata 2, 3 and 4.

2. Meet the following requirements for monitor functions.
   a. Verify the Model 208 Monitor Unit reliably senses and causes a relay output contact (FAILED STATE) when monitoring the following:
      i. Watchdog Timer (WDT) Timeout Condition
      ii. Cabinet +24 VDC Power Supply below specified threshold
   b. WDT Circuitry
      i. Provide WDT circuitry to monitor a controller unit output line state routed to the monitor unit at its assigned pin.
      ii. Provide WDT circuitry that senses line state change and the time since the last change.
      iii. No state change for 1.5 ± 0.1 sec shall cause a FAILED state.
      iv. Provide timer that resets at each state change in a NON-FAILED state.
      v. Only the Unit Reset or WDT inactive due to the voltage sense shall reset the WDT from a FAILED state.
      vi. A FAILED state caused by the WDT shall illuminate a front panel indicator light labeled WDT ERROR. The indicator shall remain ON until Unit Reset Issuance.
      vii. Provide WDT circuitry that senses the incoming VAC line.
      viii. Provide WDT circuitry that inhibits the WDT function when the voltage falls below 98 ±2 VAC for 50 ±17 ms.
     ix. Provide WDT circuitry that becomes active when the incoming VAC line rises above 103 ±2 VAC for 50 ±2 ms.
   c. Power Supply Monitor
      i. Provide monitor unit that senses the cabinet +24 VDC power supply output voltage.
      ii. Voltages sensed at +18 VDC or below for 500 ms or longer shall cause a FAILED state.
      iii. Voltages sensed at +22 VDC or above shall NOT cause a FAILED state.
      iv. Voltages sensed below +22 VDC for 200 ms or less shall NOT cause a FAILED state.
      v. All timing and voltage conditions other than those specified above may or may not cause a FAILED state.
vi. A FAILED state caused by sensing the power supply shall illuminate a front panel indicator light labeled \textit{VDC FAILED}.

vii. The indicator shall remain ON until unit reset.

viii. Only unit reset shall reset the power supply sense circuitry from a FAILED state.

d. FAILED State Output Circuits

i. Provide electro-mechanical relay to switch an output circuit during a FAILED state.

ii. The relay coil shall be energized in a NON-FAILED state.

iii. The relay contacts shall be rated for a minimum of 3A at 120 VAC and 100,000 operations.

iv. Contact opening/closing time shall be 30 ms or less.

e. Monitor Unit Reset

v. Provide a momentary SPST CONTROL switch labeled \textit{RESET} on the unit front panel to reset the monitor unit circuitry to a NON-FAILED state.

vi. Position the switch on the front panel so that the switch can be operated while gripping the front panel handle.

vii. The unit shall have provision to drive an external NE2H light through a 56K ohm, 0.5 W Series resistor (resident on unit).

viii. The WDT Reset Input on the PDA Type 3 cabinet power supply shall not be sensed by the unit.

ix. The output relay CONTACT FOR FAILED STATE shall be OPEN.

3. Provide Model 208 Monitor Unit with pin assignments as shown in Table 6.

\textbf{925.2.05 Cabinet Monitor Unit for the ATC Cabinet}

The Model 2212 CMU shall meet the specifications set forth in Section 6.3 of the ATC 5301 v02.02, March 18, 2019.
925.2.06 Traffic Control Device Cabinet Assembly Requirements

A. General

The supplied Traffic Control Device Cabinet Assembly shall follow CalTrans cabinet type L as defined in the CalTrans TEES or the ATCC as defined in the ATC 5301 V2: Advanced Transportation Controller Cabinet (ATCC), published March 12, 2019.

In addition to the CalTrans L specifications, the provided cabinet assembly shall conform to the additional requirements listed below. The following supersedes the CalTrans TEES where differences occur.

1. Provide one or more of the cabinet types listed in Table 7 as specified in the Contract.

<table>

*One of these options shall be provided with the 336S cabinet per proposed mounting style identified in the Contract.

**A ground mounted 336S cabinet shall be configured with an auxiliary output file rack.

Other cabinet components such as controllers, monitors, load switches, etc., may be ordered as separate items.

3. Locks
   a. Equip the main cabinet door with locks that accept No. 2 Corbin keys.
   b. Provide two sets of keys with each cabinet. One set of keys is defined as one No. 2 key and one police panel (skeleton) key.
4. Interior Cabinet Lighting
   a. Include LED ribbon light strips along the full perimeter of each inside door flange. A gap in the LED ribbon is permitted to avoid conflict points such as the door locking mechanism.
   b. Install a door-actuated switch to turn on the cabinet light, at the upper corner of the hinge side of the door.
   c. Cabinet lighting shall be active when either door is opened.
   d. Provide hard wire connection to the cabinet AC power, controlled by a circuit breaker.

5. Cabinet Fans
   a. The cabinet ventilation shall include exhaust fans, filtration, fan assemblies, and environmental controls.
   b. Each electric fan shall be equipped with a ball or roller bearing and have a minimum capacity of 100 cubic feet per minute (cfm).
   c. The fan shall be mounted on the cabinet ceiling and exhaust directly to the vent.
   d. The fan shall be thermostatically controlled and shall be adjustable between 80°F - 150°F (27°C – 66°C).
   e. Provide hard wire connection to the cabinet AC power, controlled by a circuit breaker.

6. Laptop Shelf
   a. Install hinged aluminum shelf and integrated storage compartment mounted on the inside of the front door.
   b. Laptop shelf shall have a smooth, non-slip surface for use as a writing platform and enough size and stability to support a typical laptop computer when extended.
   c. Provide laptop shelf that has rounded or insulated edges that prevent harm the user.
   d. Provide laptop shelf that folds upward for storage and locks into place.
   e. Provide laptop shelf that does not require the use of any tool for locking the shelf for storage or extending it for use.

7. The field wiring terminals may be mounted on the rear of the input file.

8. The cabinet has one shelf for the controller.

9. Equip the cabinet assemblies with a power distribution assembly to generate AC and DC power for the electronic components, except the DC power for the controller units.

10. Auxiliary Output File Rack
    a. Provide six (6) solid state flash transfer relays to enable all 18 channels to flash during backup operation.
    b. Provide a total of 18 flash jumper sockets to enable a flash color for all 18 output channels.

11. Manual Jack
    a. The manual jack shall be installed at the top of the EIA rail nearest the police panel.
    b. The jack shall intermate with a three circuit 0.25 in. (6.35 mm) diameter phone plug.
    c. The tip and ring (middle) circuits of the jack shall be connected to the logic ground and the interval advance inputs of controller unit.
    d. When the manual hand cord is plugged into the jack and the pushbutton is pressed, logic ground shall be connected to the interval advance input of the controller unit.
    e. Provide a manual ON-OFF switch on the police panel that grounds the Manual Control Enable (C1 Pin 53) input to the controller whenever the switch is in the ON position.
    f. The tip and ring (middle) circuits of the jack shall be connected to the logic ground and the interval advance inputs of the controller unit.
    g. When the manual hand cord is plugged into the jack and the pushbutton is pressed, logic ground shall be connected to the interval advance input of the controller unit.
h. A manual ON-OFF switch shall be provided on the police panel that grounds the Manual Control Enable (C1 Pin 53) input to the controller whenever the switch is in the ON position and advance input (C1 Pin 80).

a. Provide a manual pushbutton cord with a minimum length of 6 ft. (1.8 m).
b. Pushbutton shall have a 0.25 in. (6.35 mm) diameter, three circuit plug connected to one end and a manual pushbutton enclosed in a handheld enclosure at the other end.
c. A complete cycle (push-release) of the manual pushbutton shall terminate the controller unit interval, which is active except the vehicular yellow and all red clearance intervals.
d. Cycling the pushbutton during the vehicular yellow or all red clearance intervals shall not terminate the timing of those intervals.
e. Button shall be fit within the police panel for storage.

13. Power Strip
a. Provide metal bracket mounted vertically on the rear rail.
b. Verify that the power strip can host adaptor block power supplies in a manner that the block power supplies of cabinet accessories do not restrict use of other outlets.
c. Attach power strip to a permanent location that is easily accessible to devices in the rear of the cabinet.
d. Provide hard wire connection to the cabinet AC power, controlled by a 15A breaker.

14. Surge Protection
a. Equip each cabinet with devices to protect the control equipment from surges and over voltages.
b. Design the surge protector panels to enable adequate space for a wire connection and surge protector replacement without the removal of terminal blocks or panels.
c. Provide surge protectors for the input sections as detailed below and as shown in the Input Terminal and Surge Arrestor Detail.
d. Supply surge protectors that meet the following specifications.
   i. AC Service Input
      a) Include a surge protection unit for each cabinet on the AC service input that meets or exceeds the following requirements:
         1) Provide a hybrid type power line surge protection device on the cabinet service panel.
         2) Install the protector between the applied line voltage and earth ground.
      b) Use a surge protector capable of reducing the effect of lightning transient voltages applied to the AC line that conforms to Table 9.

### Table 9 – Surge Protection Device Requirements for Power Service Input

<table>

</tr>
<tr>
<td>Spike suppression for ±700V spike:</td>
<td>±40V deviation from sine wave at all phases</td>
</tr>
</tbody>
</table>
Section 925 — Traffic Control Signal Equipment

c) Provide a protector that is modular and uses a 12 pin Beau connector with the following terminals:
   1) Main Line (AC line first stage terminal)
   2) Main Neutral (AC neutral input terminal)
   3) Equipment Line In (AC line second stage input terminal, 10A)
   4) Equipment Line Out (AC line second stage output terminal, 10A)
   5) Equipment neutral out (neutral terminal to protected equipment)
   6) GND (Earth connection)

d) Supply a protector that is epoxy encapsulated in a flame-retardant material.

e) Configure the equipment line out to provide power to the Type 2070 controller and to the 24V power supply.

ii. Inductance Loop Detector Inputs

a) Protect each inductance loop detector channel input by an external surge protection device that meets or exceeds the following requirements:
   1) A three-terminal device, two of which are connected across the signal inputs of the detector with the third connected to the chassis ground to protect against common mode damage.
   2) Instantly clamps differential mode surges (induced voltage across the loop detector input terminals) via a semiconductor array. The array appears as a low capacitance to the detector.
   3) Clamps common mode surges (induced voltage between the loop leads and ground) via solid state clamping devices.
   4) Withstand 25-100A surge current occurrences of a 10 x 700 ms waveform.
   5) Clamp characteristics shall meet the minimum requirements in Table 10.

<table>
<thead>
<tr>
<th>Table 10 – Surge Protection Clamp Requirements for Loop Detector Inputs</th>

</tbody>
</table>

#### iii. Signal Load Switches (Switchpacks)

a) Provide the output of all switchpacks in all output files and output/PDAs with metal oxide varistors (MOV) tied from the AC positive field terminal to the chassis ground to protect switchpacks from surges on the AC output lines.

b) Provide MOVs that meet or exceed the following requirements:
   1) Steady state sinusoidal voltage (RMS) rating at 50 to 60 Hz of at least 150V at 77°F (25°C).
   2) Steady state applied DC voltage rating of at least 200V at 77°F (25°C).
   3) Transient energy rating of at least 80 J for a single impulse of 10/1,000 ms current waveform at 77°F (25°C).
   4) Peak current rating of 6,500A for a single impulse of 8/20 ms waveform with the rated continuous voltage applied
   5) Varistor voltage of at least 212V at 1.0 mA of DC current applied for the duration of 20 ms to 5 sec.
   6) Clamping voltage of at least 395V with an applied 8/20 ms impulse of 100A.
   7) Typical capacitance at a frequency of 0.1 to 1.0 MHz of 1,600 pF.
   8) Two-terminal device, one of which is connected to the AC output of the signal load switch on the output file terminals (backside of the field terminals) with the other connected to AC neutral.

#### 15. Low Voltage DC Inputs

a. Provide an external surge protection device for each low voltage DC input channel that meets the same requirements as the communication inputs except for the voltage clamp, which shall be 30V line-to-line.

#### 16. Unused Phase Monitoring

a. Provide odd-phase reds with ballast resistor (2K, 10W) dummy loads.
   b. Do not wire the cabinet to monitor pedestrian yellow indications.
   c. When auxiliary output file is used, provide resistors for all channels.
   d. Neatly lace, label, and bundle the wiring from the signal monitor for pedestrian yellow monitoring on the back panel.

#### 17. Red Monitoring cable shall connect directly between the output file and monitor, without using a red enable board.

#### 18. Provide Model 242L DC Isolators

a. Provide Model 242L DC Isolators in accordance with CalTrans TEES 2009 with Errata 1 and 2.
   b. Provide Model 242L DC Isolators with polarity jumper.

#### 19. Provide Model 200 Switchpacks that are in accordance with CalTrans TEES 2009 with Errata 1.

#### 20. Provide Model 204 Flasher Units that are in accordance with CalTrans TEES 2009 with Errata 1 and 2.

#### 21. Provide Flash Transfer Relays that are in accordance with CalTrans TEES 2009 with Errata 2.
B. Fabrication

1. The signal cabinet shall be manufactured of aluminum with a minimum thickness of 0.125 in. (3 mm).
2. The cabinet exterior shall have a smooth, uniform bare aluminum finish with all joints between adjoining cabinet components (sides and bottom) continuously welded on the outside to prevent the intrusion of moisture and dust.
3. The welds shall be free of cracks, blow holes, and other irregularities.
4. The shelves inside the cabinet shall be vented in order to enable air circulation throughout the cabinet.
5. Required shelves include those used for the controller input file, output file, and PDA.
6. The cabinet body shall be double flanged on all four sides to prevent the entry of dirt and liquids when the door is open.
7. Install a gasket formed around the door opening to ensure a weather-tight seal when the door is secured.
8. Install an aluminum back panel in the cabinet, mounted on standoffs, to facilitate mounting of internal components.
9. For pole mounted installations:
   a. Install exterior aluminum mounting brackets that extend a minimum of 1.75 in. (44 mm) and a maximum of 2.5 in. (63 mm) from the top and bottom of the cabinet.
   b. Provide the brackets with holes for mounting to a flat surface with screws and vertical slots for banding to poles.

C. Exceptions to CalTrans TEES 2009 and Errata 1, 2, 3 and 4.

1. Do not install the interlock circuit.
3. Meet surge suppression specifications are presented in Table 15.
4. For ramp meter applications, meet the output and auxiliary file assignments for the 334 cabinet in Tables 16 and 17.

All other switchpacks unused
D. Cabinet Model 337
   1. Supply the cabinet assembly with capacity for 11 two-channel slots in the input file.
   2. The cabinet has two full-size doors to enable complete access from the front or back of the cabinet.
   3. Design the rack assembly to mount in CalTrans standard rails to enable a Model 204 flasher.
   4. Provide a receptacle to accept the plug-in power distribution assembly card guides and edge connectors for
      the input file card guides to support the conflict monitor, and load switches and flash transfer relays.

E. Cabinet Model 334 with Auxiliary Output File for Ramp Metering Operations
   1. The controller cabinet shall comply with the CalTrans TCSES (1989), Model 334 Cabinet specifications
      (Chapter 6) and the specification Clarifications dated December 20, 1993.
   2. Do not use the February 1993 Amendments for specifications for the Model 334C Cabinet.

F. ATC Cabinet Model 332 and 342
   1. The controller cabinet shall comply, without modification, based upon the referenced ATC:5301 v.02 specification.
   2. Supply controller cabinet assembly in specified Model 332 or 342 cabinet shell as defined in the Contract.

925.2.07 Uninterruptible Power Supply Requirements

A. General
   1. Provide UPS for outdoor applications in accordance with the CalTrans TEES 2009 Chapter 4, July 7, 2009.
   2. Provide UPS that is compatible with CalTrans L Series and ATC Cabinets, Model 2070LX Controllers, and all
      other cabinet components for full-time operation.
   3. Provide UPS inverter that is line interactive.
   4. UPS Mounting Configurations
      a. See Contract for project-specific information about the UPS and select one of the following
         configuration options.
      b. Configuration options include:
         i. Configuration 1: The UPS (Inverter/Charger, Bypass Switch, and Transfer Relay only) installed inside
            the cabinet, with the batteries installed in the externally mounted cabinet.
         ii. Configuration 2: The entire UPS, including batteries, installed inside the externally mounted cabinet.
         iii. Configuration 3: The entire UPS, including batteries, installed inside the traffic control device cabinet.

B. Functional Requirements
   1. Provide battery capacity (A-hr) to provide a minimum 4 hours of run-time at an assumed 500 W load full
      operation of an intersection.
   2. Provide minimum 1000 W at 25°C (77°F), with 80% minimum inverter efficiency.
   3. Provide an inverter/charger, power transfer relay, batteries, a separate, manually operated non-electric bypass
      switch, hardware, and interconnected wiring.
   4. The transfer time from disruption of normal utility line voltage to stabilized inverter line voltage from batteries,
      shall be a maximum of 5 ms. The same maximum transfer time shall also apply when switching from inverter
      line voltage to utility line voltage.
   5. Recharge time for the battery, from protective low-cutoff to 80% or more of full battery charge capacity, shall
      not exceed 20 hours.
   6. Provide LCD display for monitoring unit.
7. Provide four dry contact closures.
8. Provide automatic low-battery and high temperature shutdown features.
9. Provide capability to return to normal operations without a manual reset.
10. Provide UPS with a maximum audible noise of <50 dBA at 3 ft. (0.9 m).

C. Environmental
1. The UPS shall use a temperature-compensated battery charging system.
2. The charging system shall compensate over a range of 2.5 to 4.0 mV/°C (5 to 8 mV/°F) per cell.
3. Batteries shall not be recharged when battery temperature exceeds 50°C (122°F) ±3°C (6°F).
4. Temperature sensor
   a. Provide temperature sensor that is located external to the inverter/charger unit.
   b. Provide temperature sensor with 10 ft. (3 m) of wire.
   c. Provide temperature sensor that connected to the battery a with ring terminal to prevent loss of connectivity.

D. Electrical
1. For achieving a bypass of the UPS:
   a. The power transfer relay shall be rated at minimum 120 VAC/30A, or
   b. The bypass switch shall be rated at a minimum 120VAC/10A for triggering the transfer relay.
2. When utilizing battery power, the UPS output voltage shall be between 110 VAC and 125 VAC, pure sine wave output, ≤3% THD, 60 Hz ±3 Hz.
3. UPS shall bypass the utility line power whenever the utility line voltage is outside of the following voltage range: 100 VAC to 130 VAC (± 2 VAC).
4. In cases of low (below 98 VAC) or absent utility line power, when the utility line power has been restored at above 105 VAC ±2 VAC for more than 30 sec, the UPS shall transfer from battery backed inverter mode back to utility line mode.
5. In cases of high utility line power (above 132 VAC), when the utility line power has been restored at below 125 VAC ±2 VAC for more than 30 sec, the UPS shall transfer from battery backed inverter mode back to utility line mode.
6. Provide capability to prevent a malfunction feedback to the cabinet or from feeding back to the utility service.
7. In the event of inverter/charger failure, battery failure or complete battery discharge, the power transfer relay shall revert to the NC (and de-energized) state, where utility line power is connected to the cabinet.

E. User Interface
1. Provide the user with three sets of normally open (NO) and normally closed (NC) single-pole double-throw (SPDT) dry relay contact closures, available on a panel-mounted terminal block, rated at a minimum of 120V/1A, and labeled or marked On Batt.
2. The first set of NO and NC contact closures shall be energized whenever the unit switches to battery power. Contact shall be labeled or marked On Batt.
3. The second set of NO and NC contact closures shall be energized whenever the battery approaches approximately 40% of remaining useful capacity. Contact shall be labeled or marked Low Batt.
4. The third set of NO and NC contact closures shall be energized two hours after the unit switches to battery power. Contact shall be labeled or marked Timer.
5. Relay contact activation shall be annunciated on the front panel via a visual indication. This can be either discrete LED, or part of LCD screen, etc.
Section 925 — Traffic Control Signal Equipment

F. Network Addressable Capability Requirements
   1. Provide Domain Name System (DNS) capability.
   2. Support both fixed IP addresses and dynamically assigned IP addresses provided by a DHCP server.
   4. The IP-addressable and communication addresses shall be user-programmable.
   5. The system processor shall enable a remote user with a standard web browser to gain remote access, collect data, and control and configure the UPS.

G. Remote Monitoring Requirements
   1. Provide UPS that supports local and remote monitoring and control via Ethernet port interface.
   2. Provide remote environmental sensing hardware and software integrated with SNMP minimally capable of temperature and including generating alarms for low battery, over/under voltage, over/under frequency, and high temperature.
   3. Provide an addressable SNMP command set including, at a minimum:
      i. UPS state.
      ii. Battery condition (voltage, sampling temperature of one battery).
      iii. Current AC input conditions (voltage, frequency).
      iv. Current AC output conditions (voltage, AC amps, frequency).
      v. Diagnostic/self-test control and status.

H. Battery System
   1. Provide maintenance-free sealed batteries that can be serviced and replaced separately from the UPS.
   2. Provide batteries that are rated for extreme temperatures that have been field proven and tested.
   3. Provide UPS batteries that maintain 70% of original capacity for a minimum of five years.
   4. Provide battery charger with a minimum of three-stage, temperature compensated charging and keeps the batteries above a minimum depth of discharge point of 50% or as recommended by the manufacturer.
   5. Provide user-replaceable and hot-swappable battery packs.
   6. Provide batteries with non-conductive terminal covers.

I. Cabinet Requirements
   1. Provide battery bank(s) that mount on an EIA 19 in. (483 mm) rack using a maximum space of five rack units.
   2. Provide inverter/charger unit that can be shelf-mounted or rack-mounted on a standard EIA 19 in rack.
      a. If the inverter/charger is mounted inside the Model 332 Cabinet (Configuration 1), provide a shelf that supports the weight of the unit.
      b. Power transfer relay and manual bypass switch shall be mounted on EIA rail.
      c. Interconnect wiring shall be provided between power transfer relay, bypass switch, and cabinet terminal service block.
3. Interconnect cable requirements
   a. UL Style 1015 CSA TEW
   b. Minimum 10 ft. (3 m) length
   c. Minimum No. 6 AWG, and 133 strands of No. 30 AWG tinned copper
   d. Minimum rating: 600V, 221°F (105°C), PVC insulation

4. Relay contact cable provided for each set of NO/NC relay contact closure terminals requirements
   a. UL Style 1015 CSA TEW
   b. Minimum of 10 ft. (3 m)
   c. Minimum No. 18 AWG wire, and 16 strands of No. 30 AWG tinned copper
   d. Minimum rating: 600V, 221°F (105°C), PVC insulation

5. Wiring
   a. Trim wiring as necessary for installation.
   b. Wire UPS power transfer relay and manual bypass switch as shown in Figure 1 to provide interconnectivity with cabinets for interchangeability between UPS manufacturers.

* As a minimum, these wires shall be provided in 3-meter lengths as part of the interconnect wiring kit.

**FIGURE 1 – UPS UTILITY POWER CONNECTION DIAGRAM**
Section 925 — Traffic Control Signal Equipment

6. External Cabinet
   a. General
      i. Provide external cabinet that is NEMA 3R rated cabinet conforming to the CalTrans TEES 2009.
      ii. The external cabinet shall be used for housing batteries or UPS, which includes inverter/charger unit, power transfer relay, manually operated bypass switch, other control panels, and wiring harnesses.
      iii. The same inverter/charger, power transfer relay, and manually operated bypass switch that fits inside a 2070 L series cabinet or ATC cabinet shall also fit inside the externally mounted cabinet.
      iv. The external cabinet finish shall be bare aluminum.
   b. Shelf
      i. Provide four shelves.
      ii. Provide a minimum of 12 in. (305 mm) clearance between shelves.
      iii. Provide shelf size of a minimum of 10.38 in. (264 mm) X 25 in. (635 mm).
      iv. Provide shelves that can support a minimum of 125 lb. (57 kg) each.
      v. Provide shelves with edges turned down on all four sides for support and to provide a flat top surface.
      vi. Provide shelves with predrilled holes for EIA rail mounting.
      vii. Provide a vertical passageway for wiring in the rear of the cabinet on both the left and right of the shelves.
      viii. Provide capability of removing the bottom shelf.
   c. Rack mounting
      i. Two EIA angle rails and all necessary mounting hardware (four sets of 10-32 bolts and nuts with captive washers) shall be provided with the external cabinet (not installed).
      ii. Rails shall be symmetric to enable installation on either right or left sides of the cabinet.
      iii. Mounting holes and bracket shall enable EIA rail installation at any location in the external cabinet.
      iv. The EIA mounting angle nominal thickness shall be either 0.1345 in. (3.4 mm) plated steel or 0.105 in. (2.6 mm) stainless steel.
      v. EIA rail mounting bracket shall be of continuous, one-piece design bolted into the cabinet to provide support for rail-mounted equipment.
      vi. Pressed in, flush-head threaded screw posts shall be inserted into the front face of the cabinet enclosure top sill.
      vii. The threaded posts shall be used to mount both the fan panel and the EIA rail-mounting bracket.
      viii. The screw posts shall be #10-32 thread size stud 0.625 in. (16 mm) length.
   d. Ventilation
      i. The external UPS cabinet shall be ventilated using louvered vents, filter, and a minimum of one thermostatically controlled fan per CalTrans TEES 2009.
      ii. The thermostat shall be accessible without removing the UPS controller.
      iii. Provide a two-position terminal block on the fan panel, along with 10 ft. (3 m) of connected hookup wire.
   e. Cabinet Door
      i. The door shall be attached to the cabinet per the CalTrans TEES 2009.
      ii. The door shall use a padlock clasp or latch and lock mechanisms as described in the CalTrans TEES 2009, in order to lock the door.
Section 925 — Traffic Control Signal Equipment

7. Maintenance, Displays, Controls, and Diagnostics
   a. Provide display or meter to indicate current battery charge status and conditions.
   b. Provide remote monitoring of current battery charge status and conditions.
   c. Provide voltmeter standard probe input-jacks (+) and (−) to read the exact battery voltage drop at the
      inverter input.
   d. Provide a 0 to 100% battery capacity LED indicator.
   e. Provide lightning surge protection compliant with IEEE/ANSI C.62.41.
   f. Provide an integral system to prevent battery from destructive discharge and overcharge.
   g. Provide batteries shall be easily replaced with all needed hardware and shall not require special tools
      for installation.
   h. Provide a front-panel event counter display to indicate the number of times the UPS was activated and a
      front-panel hour meter to display the total number of hours the unit has operated on battery power.
   i. Provide meters with the capability of a reset option.
   j. Manufacturer shall include a set of equipment lists, operation and maintenance manuals, and board-level
      schematic and wiring diagrams of the UPS, and the battery data sheets.
   k. Manual switch shall conform to the CalTrans TEES 2009.

J. Acceptance

1. The manufacturer, or an independent testing lab hired by the manufacturer, shall perform design qualification
   testing on the new UPS system and when a major design change has been implemented on an existing design.
2. Each UPS shall be given a minimum of five (5), 4-hour full battery cycle tests during the Operational Test
   period defined in Section 647.
3. Each system shall be visually inspected for exterior physical damage or assembly anomalies. Defects will be
   cause for rejection.

925.2.08 Solar Power System Requirements

A. General

1. Solar power systems may be used for flashing beacon type applications including:
   a. RRFB
   b. School Speed Zone Flasher
   c. Beacon on MUTCD warning or regulatory sign.
2. Provide solar power system that can be mounted in a permanent configuration or in a temporary portable type
   configuration.
3. Provide DC-to-DC and DC-to-AC conversion equipment, as specified herein.

B. Equipment

1. The solar power system shall be comprised of:
   a. Solar Panel
   b. Battery
   c. Charge Controller
   d. Power Inverter
2. Refer to Section 939 for the solar power system specifications.
925.2.09 Prefabricated Controller Cabinet Base Requirements

A. General
1. Provide controller cabinet bases that are precast polymer concrete and grey in color.
2. Provide controller cabinet bases with dimensions as shown in the Standard Details.
3. The prefabricated controller cabinet base shall meet ASTM D 543 Section 7, Procedure 1.
4. Provide a copy of test reports from a certified laboratory along with the materials certification package.

B. Equipment
1. Provide prefabricated controller cabinet base with correct bolt pattern for the cabinet to be installed.
2. Provide prefabricated controller cabinet bases with UNC inserts as shown in the Contract.
3. UNC inserts shall be stainless steel and designed for a minimum of 15 ft.-lb. (20 N-m) of torque.
4. The prefabricated controller cabinet bases shall withstand wind loading of 125 mph. (200 kph.) with the cabinets mounted as shown in the Contract.
5. The prefabricated controller cabinet bases shall withstand a minimum static vertical load of 5,000 lb. (2,262 kg) over a 10 in. (254 mm) by 10 in. (254 mm) by 1 in. (25 mm) thick distribution plate and withstand a tested load of 7,500 lb. (3,394 kg).
6. The prefabricated controller cabinet bases shall withstand a minimum lateral load of 1,800 lb. (814 kg) over an 18 in. (457 mm) by 24 in. (610 mm) by 1 in. (25 mm) steel plate applied to the longest side and withstand a tested load of 2,700 lb. (1,222 kg).
7. The prefabricated controller cabinet base shall withstand a 50 ft.-lb. (67.8 Nm) impact administered with a 12-lb. (5.4 kg) weight having a C tup without puncture or splitting, in accordance with ASTM D 2444.

925.2.10 Rectangular Rapid Flashing Beacon Assembly Requirements

A. General
1. Provide Rectangular Rapid Flashing Beacon Assemblies in the quantities and locations indicated in the contract.
2. Provide all equipment, materials, and work in accordance with manufacturers’ recommendations, including mounting, wiring and cabling, power supply, surge suppression, and communications equipment and materials.
3. All provisions of the MUTCD applicable to warning beacons shall be met, except as otherwise provided in this section.
4. RRFB assembly shall consist of the following components: beacons, mounting pole and foundation, wireless subsystem, and solar power subsystem.

B. Equipment
1. Provide a RRFB assembly that meets the criteria FHWA Interim Approval for Optional Use of Pedestrian-Actuated Rectangular Rapid-Flashing Beacons at Uncontrolled Marked Crosswalks (IA-21), March 20, 2018.
2. The Rectangular Rapid Flashing Beacon Assembly consists of the following components and materials:
   a. Rectangular Rapid Flashing Beacon
   b. Solar cell with battery or utility power service
   c. Signs
   d. Wireless subsystem
   e. Pushbutton activation system
   f. Mounting hardware
Section 925 — Traffic Control Signal Equipment

3. Rectangular Rapid Flashing Beacon Assembly shall meet the performance requirements listed below:
   a. Beacon Dimensions and Placement in Sign Assembly
      i. Indications
         a) Face LED indications towards oncoming traffic.
         b) Locate indications between the bottom of the crosswalk warning (S1-1) sign and the top of the supplemental downward diagonal arrow (W16-7p) sign.
   b. Beacon Operation
      i. Uses pedestrian pushbuttons per Section 937.2 to actuate the Rectangular Rapid Flashing Beacons.
      ii. Powered by:
         a) Solar cells and batteries with automatic battery charging and power control.
         b) Utility power may be used in areas where significant tree or building canopies prevent adequate solar charging.
      iii. Uses wireless communication to avoid trenching.
      iv. Provide a minimum visual distance of 1,000 ft. (305 m) during daytime and nighttime.
   c. Wireless Subsystem
      i. Frequency in the 900 MHz FHSS or 2.4 GHz range.
      ii. Range: minimum 500 ft. (152 m).
   d. Solar Panel Subsystem and Batteries
      i. Provide solar panel output with a minimum 20 W panel or as required by the manufacturer.
      ii. Provide batteries that are sealed and maintenance free with a minimum lifespan of 3 years.
      iii. Provide batteries that are 12V, 20-40 A-Hr sealed gel, or approved equivalent.
      iv. Provide cabinet (if required) that is pole mounted, NEMA 4x rated fiberglass cabinet with locking clasps or powder coated aluminum with tamper-proof hinged door or approved equivalent.
      v. Provide solar panel mount for pole mount that includes a 60-degree angle bracket or per manufacturer recommended specifications.

4. Mounting Pole and Foundation
   a. Provide a breakaway mounting pole and foundation designed to support the Rectangular Rapid Flashing Beacon and the associated solar panel, batteries, and equipment required to supply a complete Rectangular Rapid Flashing Beacon.
   b. Determine pole foundation dimensions based on the local conditions at the locations indicated in the contract.
   c. Verify the pole foundation provides a safe and secure mounting of the solar-powered Rectangular Rapid Flashing Beacon Assembly.

925.2.11 Flashing Beacon Assembly Requirements

A. General

This specification is for a flashing beacon cabinet that consists of an aluminum cabinet containing a flasher assembly, field connection terminal block, surge arrester, and circuit breaker wired in a manner to operate flashing beacons.
B. Equipment

1. Flasher Unit
   a. Supply a standard plug-in two circuit NEMA solid state flasher.
   b. Provide solid state flasher rated for a minimum of 10 A per circuit.
   c. The flasher shall utilize a zero-voltage turn-on, turn-off current, and capable of dimming outputs.

2. Surge Arrestor
   a. Supply a flasher cabinet that incorporates an AC surge arrestor to protect the internal components from lighting and over voltages on the AC service input.
   b. The requirements for the surge arrestor are listed in Table 18.

<table>
<thead>
<tr>
<th>Table 18 – Surge Arrestor Requirements for Flashing Beacon Cabinet</th>

</tr>
<tr>
<td>Clamp Voltage</td>
</tr>
<tr>
<td>Continuous AC Voltage</td>
</tr>
<tr>
<td>Response Time</td>
</tr>
<tr>
<td>Operating Temperature</td>
</tr>
</tbody>
</table>

3. Circuit Breaker
   a. Provide circuit breakers in the cabinet.
   b. The circuit breaker shall have the following characteristics.
      i. Thermal Magnetic 1 pole 120/240 VAC at 50/60 Hz 15A
      ii. Interrupting rating of 10 kA at 48 VDC
      iii. Wire Size No. 14 to No. 2 AWG
      iv. 35 mm. DIN Rail mounting

4. Terminal Block
   a. Include a four-position terminal block in the cabinet for making field connections.
   b. Label all field terminal connections.

5. Construction
   a. Assemble the flasher assembly, terminal block, surge arrestor, and circuit breaker in the cabinet.
   b. Wire all components together as a working unit, thus requiring only field connections to and from the AC power and flashing beacons.

925.2.12 Flashing Signal Cabinet for School Speed Zones

A. General

1. This specification is for a flashing signal cabinet consisting of an aluminum cabinet containing:
   a. Flasher assembly.
   b. Activation device (Time clock, GPS clock or wireless device).
c. Field connection terminal block.
d. Surge arrester.
e. Circuit breaker.

B. Equipment

1. Supply activation devices that are single circuit, calendar programmable, solid state, fully self-contained units that meet the following specifications:
   a. Alphanumeric liquid crystal display.
   b. Automatic daylight savings time and leap year compensation.
   c. Changes in the daylight savings time program made through device keypad or remote connectivity.
   d. Minimum 24-hour capacitive backup. Battery backup is not acceptable.
   e. Operate on 95 to 135 VAC, 60 Hz line current or solar assembly as defined in this Section.
   f. SPDT relay output rated at 15A.
   g. Maximum size of 4.75 in. (121 mm) wide, 10.375 in. (264 mm) high, and 2 in. (51 mm) deep.
   h. Ability to do program transfer from unit to unit.
   i. Ability to schedule a minimum of six unique daily and 25 unique annual exception events.

2. Include a programming manual with each unit.
3. Include program transfer cable with unit.

925.2.13 Wire and Cable

A. General

All cable and wire from the traffic signal cabinet to all vehicular and pedestrian signal faces, pedestrian pushbuttons, and inductance loops shall meet IMSA specifications.

B. Equipment

1. All wire used for signal conductors shall be stranded copper.
2. Table 19 provides requirements for wire specification for traffic signal and ramp meter input and output applications.

<table>
<thead>

3. All traffic control device grounding conductors and grounding electrodes shall conform to Section 682.
925.2.14 Signal Module Requirements

A. General

This specification covers Type 1 LED red, green, and yellow modules for vehicle signal faces for both circular and arrow indications.

B. Equipment

1. General

a. Supply LED Signal Modules that fit in standard incandescent vehicle traffic signal housings and meet the performance specification of ITE Vehicle Traffic Control Signal Heads.

b. Verify that Type 1 LED signal modules include a LED circuit board with LEDs and required circuit components, 36 in. (900 mm) No. 16 AWG wire leads with strain relief and spade terminals, a rigid housing, and a one-piece neoprene gasket.

c. Supply Type 1 LED signal modules that are weathertight when mounted in the traffic signal housing.

d. Submit life data on the LEDs from the LED signal module manufacturer to calculate the expected useful life.

e. Supply modules with permanent markings of date of manufacture and date of installation.

f. Verify that the Type 1 LED signal modules utilize the same mounting hardware that is used to secure the incandescent lens and gasket assembly.

2. Optical

a. Provide test data from an independent laboratory to verify that the performance of the product meets current ITE requirements.

b. Verify that the individual LEDs are wired such that a catastrophic failure of one LED will result in the loss of not more than 5% of the signal module light output.

c. The failure of a single LED in a string or cluster of LED’s causes loss of light from only that LED, not the entire string or indication.

d. Provide control circuitry that prevents the current flow through the LEDs in the off state to avoid false indications as may be perceived by the human eye during daytime and nighttime hours.

e. Verify that the LED signal module is operationally compatible with existing or new conflict monitors (Model 208, Model 2018, and ITS Cabinet CMU and AMU)

f. Verify that the LED signal module is operationally compatible with existing or new load switches.

3. Electrical

a. Verify that the power factor is 90% or greater, at nominal rated voltage, at 77°F (25°C), after 60 minutes of operation.

b. Provide modules that do not exceed the maximum power consumption as shown in Table 20.

<td>12 W</td>
</tr>
</tbody>
</table>

c. Verify that the total harmonic distortion (THD) is less than 20%, at rated voltage, at 77°F (25°C).
d. Provide LED traffic signal modules that meet FCC noise regulations.
e. Verify that the LED signal modules operate on line voltage, 120 VAC nominal, and can operate over the voltage range of 80 VAC to 135 VAC.
f. Power supply must be integral to the module.
g. Provide transient voltage suppression rated at 1,500 W for 1 ms and fusing with a maximum rating of 2A to minimize the effect and repair cost of an extreme over-voltage situation or other failure mode.

4. Lens
   a. Provide lens of the modules that are polymeric and are not frosted and have a surface coating to provide front surface abrasion resistance.
   b. Supply lenses that are made of UV stabilized polycarbonate.
   c. Provide smooth external lens surface with no raised features, to minimize the collection of dirt, diesel smoke, and other particulate contaminants, and to facilitate periodic cleaning.
   d. Provide red and yellow LED modules with tinted lenses are tinted that correspond with the wavelength (chromaticity) of the LED.
   e. Provide green modules with clear (transparent) lenses.

5. Light Output
   a. Provide ability to reduce light output in response to an input from the traffic signal controller.
   b. Verify the minimum light output when dimmed is not less than 30% of the minimum maintained luminous intensity as defined in the applicable traffic signal face module.

6. Circular Signal Modules
   a. Before delivery of modules, supply certification that module follows these specifications.
   b. Supply substantiating documentation from an independent test laboratory to show the product has passed design qualification testing in accordance with Section 6.4 of the ITE Vehicle Traffic Control Signal Heads: LED Circular Signal Supplement.
   c. Verify the report includes a Minimum Maintained Luminous Intensity chart for the module uses the same horizontal and vertical angles as shown in Table 1 of the ITE Vehicle Traffic Control Signal Indications: LED Circular Signal Supplement.
   d. Provide modules with a signed copy of the production, test, and inspection as detailed in Section 6.3 of the ITE Vehicle Traffic Control Signal Indications: LED Circular Signal Supplement.
   e. Verify that Circular Signal Modules have prominent and permanent markings to designate the orientation of the signal module in the traffic signal housing. The marking should be an up arrow or the word UP or TOP.
   f. Verify Circular Signal Module meets the photometric requirements as indicated and described in the ITE Vehicle Traffic Control Signal Indications: LED Circular Signal Supplement.
g. Supply red and yellow LEDs that utilize AlInGap technology, either AS (Absorbing Substrate) or TS (Transparent Substrate) and do not exhibit degradation of more than 30% of their initial light intensity following accelerated life testing (operating at 185°F [85°C] and 85% humidity, for 1,000 hours). AlGaAs technology is not acceptable.

h. Supply green LEDs that utilize gallium nitride technology.

7. Vehicle Arrow Signal Modules
   a. Provide Arrow Signal Modules that are omni-directional and marked as omni-directional so that they may be rotated at any angle.
   b. Before delivery of modules, supply certification that module follows these specifications.
   c. Supply substantiating documentation from an independent test laboratory to show the product has passed design qualification testing in accordance with Section 6.4 of the ITE Vehicle Traffic Control Signal Indications: LED Circular Signal Modules Supplement.
   d. Verify the report includes a Minimum Maintained Luminous Intensity chart for the module if uses the same horizontal and vertical angles as shown in Table 1 of the ITE Vehicle Traffic Control Signal Indications: LED Vehicle Arrow Traffic Signal Modules Supplement.
   e. Provide modules with a signed copy of the production and test and inspection as detailed in Section 6.3 of the ITE Vehicle Traffic Control Signal Indications: LED Vehicle Arrow Traffic Signal Supplement.
   f. Supply red and yellow LEDs that utilize AlInGap technology, either AS (Absorbing Substrate) or TS (Transparent Substrate) and do not exhibit degradation of more than 30% of their initial light intensity following accelerated life testing (operating at 185°F [85°C] and 85% humidity, for 1,000 hours). AlGaAs technology is not acceptable.
   g. Supply green LEDs that utilize gallium nitride technology.
   h. Bi-modal traffic signal faces shall meet the standards for both yellow and green LED arrows.
   j. Verify the LED arrow modules meet the required luminous intensity as shown in Table 21.

</tbody>
</table>
A. General

1. Provide LED traffic signal modules designed as a retrofit replacement for the message bearing surface of nominal 16 in. x 18 in. (400 mm x 450 mm) traffic signal housing built to the PTSCI Standard.

2. The message bearing surface of the module consists of an overlapping **UPRAISED HAND** and **Walking Person** symbols with a numerical display of numbers from 00 to 99.

3. Verify that the pedestrian indications for the **UPRAISED HAND** and **Walking Person** are filled in to provide a solid indication. Do not supply outlines or hollow pedestrian indications for the UPRAISED HAND and Man.

B. Equipment

1. General
   a. Verify that the message numbers 00 to 99 are a minimum of 9 in. (228 mm) in height and consist of two rows of LEDs.
   b. Verify the module fits in the pedestrian signal housing without modification to the housing and requires no special tools for installation.
   c. Supply LED signal modules that are weathertight when mounted in the traffic signal housing.
   d. Supply life data from the LED Signal Module manufacturer to calculate the expected useful life.
   e. Supply modules with permanent markings of the date of manufacture and date of installation.
   f. Verify that Pedestrian Signal Modules have prominent and permanent markings to designate the orientation of the signal module in the pedestrian signal housing. The marking shall be an up arrow or the word **UP** or **TOP**.

2. Optical
   a. Provide test data from an independent laboratory to verify that the performance of the product meets current ITE requirements.
   b. Supply Portland Orange LEDs that utilize AlInGap technology, either AS (Absorbing Substrate) or TS (Transparent Substrate) and do not exhibit degradation of more than 30% of their initial light intensity following accelerated life testing (operating at 185°F [85°C] and 85% humidity, for 1,000 hours). AlGaAs technology is not acceptable.
   c. Verify that the individual LEDs are wired such that a catastrophic failure of one LED will result in the loss of not more than 5% of the signal module light output.
   d. The failure of a single LED in a string causes loss of light from only that LED, not the entire string or indication.
   e. Provide control circuitry that prevents the current flow through the LEDs in the off state to avoid false indications as may be perceived by the human eye during daytime and nighttime hours.
   f. Verify that the LED signal module is operationally compatible with existing or new conflict monitors (Model 208, Model 2010, Model 2018, ITS Cabinet CMU and AMU).
   g. Verify that the LED Signal Module is operationally compatible with existing or new load switches.
   h. Verify that the intensity of the LED signal module does not vary by more than 10% over the voltage range as specified in Table 21.
   i. Verify that the LED signal modules maintain not less than 90% of the required intensity, as defined by the ITE intensity standards for LED traffic signal modules.
   j. Verify that each module provides an average luminosity of at least 3,750 candela per square meter of lighting surface for the **UPRAISED HAND** and 5,300 candela per square meter for the man symbol.
Section 925 — Traffic Control Signal Equipment

k. Verify over the temperature range of –40°F to 165°F (–40°C to +74°C) at 120 VAC when new and after 4 years of field installation.

l. Provide an exterior lens that is uniform and frosted to reduce sun phantom effect.

3. Electrical

a. Verify that the power factor is 90% or greater, at nominal rated voltage, at 77°F (25°C), after 60 minutes of operation.

b. Verify that the THD is less than 20% at rated voltage, at 77°F (25°C) and that all LED traffic signal modules follow FCC noise regulations.

c. Verify that the LED signal modules operate on line voltage, 120 VAC nominal, and can operate over the voltage range of 80 VAC to 135 VAC.

d. Provide transient voltage suppression rated at 1,500 W for 1 ms and fusing with a maximum rating of 2 A to minimize the effect and repair cost of an extreme over-voltage situation or other failure mode.

e. Verify the modules enable a reduction of the intensity of the light output in response to an input from the traffic signal controller.

f. Verify the minimum light output when dimmed is not less than 30% of the minimum maintained luminous intensity as defined in the applicable ITE Traffic Signal Face Module.

4. Operation

a. Supply LED modules that start counting when the flashing UPRAISED HAND indication starts and will countdown to 0 when the steady UPRAISED HAND signal turns on.

b. Verify that the countdown numbers remain continuously illuminated through the flashing UPRAISED HAND interval.

c. Verify that the unit maintains a consistent countdown during a short power failure (i.e., traffic controller does not restart).

d. Verify that if traffic controller restarts that the countdown timer display is turned off until one full pedestrian clearance cycle is timed.

e. Verify that the unit will turn off the counter if the steady UPRAISED HAND display starts while the countdown timer is displaying a number other than 00.

925.2.16 LED Ramp Meter Enforcement Device Requirements

A. General

1. For each metered lane, provide one ramp meter enforcement device mounted on the back of one signal per lane and wired directly to the red signal display.

2. This installation shall include a Red 44 LED Array (allInGaP), pixel housing, 6061 aluminum powder coated swivel bracket, 2 in. (51 mm) lens, with an aluminum hood.

3. Mount and adjust per the Contract.

925.2.17 Vehicle Traffic Signal Face Requirements

A. General

1. Supply vehicle traffic signal faces that are 12 in. (305 mm) in diameter for traffic signal control applications.

2. Verify that 12 in. (305 mm) polycarbonate vehicle traffic signal faces meet the current ITE Vehicle Traffic Control Traffic Signal Faces specification with the following modifications or clarifications:

a. Unless otherwise approved by the Department or noted in the Contract, supply traffic signal faces with the following exterior color scheme:
i. Front face, including doors and visors, flat black with Highway Yellow signal housing (back).

ii. All flat black face, doors, visors, and signal housing.

b. Provide housing and housing door that are one-piece injection-molded UV and heat-stabilized polycarbonate resin with the color impregnated in the material.

3. Provide the vehicle signal LED in all sections either circular or arrow modules per the Contract.
4. Provide a weathertight seal with the LED module.
5. Provide traffic signal faces that provide a positive method of holding the lens preventing rotation.
6. Lens clips that do not apply firm pressure to the lens gasket to avoid rotation are not acceptable.

B. Traffic Signal Face Visor Requirements

1. Typically, visors are one-piece tunnel type and removable unless specified otherwise in the Contract.
2. Unless otherwise specified by the Department, provide black traffic signal face visors.
3. Verify that visors are polycarbonate and at least 9 in. (225 mm) deep for 12 in. (305 mm) heads.
4. Special angle visors are full circle with the long side at least 18 in. (450 mm) deep.
5. Verify that visors provide a positive method of attaching to the door of the traffic signal face and do not enable rotation. An acceptable method is to provide tabs that use stainless steel screws.

C. Universal Closure Kit Requirements

1. Supply a universal signal closure kit to seal the traffic signal face at either the top or bottom.
2. Verify that the kit will fit any manufacturer’s traffic signal face (top or bottom) without the use of special tools or modification.
3. Verify that the gasket is 60-70 durometer neoprene.
4. Verify that the closure cap is injection molded ABS plastic.
5. The plastic is to be loaded with UV stabilizers.
6. Verify that the adapter bar is made so that it will secure the closure cap and compensate for varying thickness of traffic signal faces.
7. Provide two #10 (9 mm) screws to fit any manufacturer’s traffic signal face. Verify that one screw is 0.75 in. (19 mm) in length and the second screw is 1 in. (25 mm) in length.
8. Pack each assembly in a clear plastic bag. Mark the bag with the manufacturer’s name and part number.
9. Include the universal signal closure kit in a package containing the span wire clamp and Tri-Stud wire entrance fitting.
10. Verify that the closure cap is molded to closely match the color of the traffic signal face (highway yellow).
11. The adapter bar and screws are to be zinc plated steel.

D. Traffic Signal Face Backplate Requirements

1. Provide backplate that is designed to shield a traffic signal face from background distractions.
2. Provide backplate with louvers.
3. Fabricate the backplates from UV stabilized polycarbonate, ABS plastic, or aluminum material.
4. Thickness
   a. Polycarbonate backplates minimum of 0.15 in. (4 mm) thick.
   b. ABS backplates minimum of 0.05 in. (1 mm) thick.
   c. Aluminum backplates minimum of 0.06 in. (1.5 mm) thick.
Section 925 — Traffic Control Signal Equipment

5. Color
   a. Provide backplate constructed with a finished color of flat black.
   b. Aluminum backplates should be finished with a durable, flat black colored powder coat.

6. Perimeter
   a. Design the backplates to extend beyond the traffic signal face to a minimum of 4 in. (100 mm) and a maximum of 6 in. (150 mm) on all sides and have all corners rounded with minimum 2 in. (50 mm) radii.
   b. To provide a rectangular appearance at night, apply 2 in. (50 mm) yellow fluorescent TP IX retroreflective strip along the backplate perimeter.

7. Mounting
   a. Design the backplates with predrilled holes to provide for simple attachment to the specified brand, size, and configuration of traffic signal face with all mounting hardware included.
   b. Verify that the backplates do not interfere with the signal mounting hardware.

E. Hardware for Mast Arm Mounting Requirements

1. Verify that traffic signal faces are rigidly mounted to the mast arm.

2. Fabrication
   a. All aluminum parts shall have a chromate finish.
   b. All steel parts shall have a galvanized finish.
   c. This item will be approved upon submittal of catalog cuts.
   d. Refer to Standard Detail Drawings for additional information.

3. Provide mounting hardware that is in accordance with the following:
   a. Adjustability
      i. Provide rotational adjustment about the bracket axis.
      ii. Provide vertical adjustment.
      iii. Provide rotational adjustment about the mast arm.
      iv. Provide rotational adjustment from the vertical plane.
   b. Attachment
      i. Verify the bracket is provided with aircraft-grade galvanized steel cables with stainless steel fastening hardware and make a minimum of two wraps around to fasten the bracket to the arm.
      ii. Verify the bracket is easily adjustable to fit all sizes of round, elliptical, or other shaped structure without special tools or equipment.
   c. Signal/Sign Accommodations
      i. Verify the bracket attaches to the signal or sign to ensure maximum rigidity.
      ii. When clamping the signal top and bottom, verify a standard bracket accommodates all major signal manufacturer’s signal for three, four, and five section traffic signal face configurations.
   d. Wiring
      i. All electrical wiring shall be completely concealed with the bracket.
      ii. The vertical support shall be a gusseted C-shaped extruded aluminum tube to accommodate the signal cable regardless of vertical positioning of the tube.
e. Materials
   i. The upper and lower arms shall be cast 319 aluminum or equivalent.
   ii. The lower arm shall be internally threaded to accommodate the threaded vertical support tube.
   iii. Verify the lower arm is furnished with plastic covers that slide and snap into place.
   iv. Both arms shall have 72 tooth serrations cast into the arm to ensure a positive lock with signal housing and shall be secured about their rotational axis with sets crews.
   v. Verify the arms have a tri-bolt arrangement for attachment to the signal housing.

4. Provide gusseted tube vertical support that is extruded from 6063-T6 aluminum.
5. Verify the tube includes a vinyl closure strip.
6. Verify the mast arm clamp assembly is cast from 713 aluminum alloy or equivalent.
7. Provide an assembly that enables 360 degrees of rotation with no internal bracing obstructing the center opening.
8. Provide two aircraft-grade galvanized steel cables that have minimum tensile strength of 100,000 psi (690 mPa).
9. Verify that each bracket is complete with necessary bolt, washers, gaskets, and miscellaneous items to enable assembly of the signal to the bracket and the bracket to the mast arm.

F. Traffic Signal Face Louver Requirements
   1. Verify that the units can be installed and programmed in accordance with the manufacturer’s instruction on visors that are recommended by the manufacturer.
   2. Have the programmable louver display approved by the Department prior to placing the signal in stop and go operation.
   3. If special tools are required for louver adjustment, provide one set per project to the District Signal Manager.
   4. If special tools are required for visor adjustment, provide one set per project.
   5. Coordinate delivery of tools with the District Signal Manager.
   6. Verify that louvers (with the vanes oriented vertically) are directional with a 7-degree cutoff right of center.
   7. Rotating the louver 180 degrees will produce a 7-degree cutoff left of center.
   8. Provide 12 in. (300 mm) louvers with 5 vanes.
   9. Finish all louvered surfaces in flat black.
   10. Verify that programmable louvers are directional with a 7-degree cutoff and that all louver surfaces have a flat black finish.

G. Hardware for Traffic Signal Face Pole Mounting Requirements
   1. Verify this item consists of hardware adequate for the specific mounting.
   2. Verify that this item consists of hardware as shown in the standard details.
   3. This item will be approved upon submittal of catalog cuts.
   4. At a minimum provide the following hardware: 1.5 in. (38 mm) pipe nipples of die cast aluminum that are a minimum of 12 in. (305 mm) and threaded with 1.5 in. (38 mm) NPS threads on either end.
   5. On the upper and lower arm there shall be a serrated 72 tooth boss with set screw.
   6. Use a tri-stud adaptor to attach the signal housing to the mounting hardware.
   7. The upper arm shall have a neoprene gasket to provide weathertight fit.
   8. Provide hub plates for pole mounting that are appropriate for the mounting (round or flat).
   9. Hardware shall die cast aluminum alloy 380 or extruded.
10. All die cast parts shall be cleaned in an alkaline cleaning compound.
11. Extruded parts shall have a chromate conversion coating to provide proper base for paint adhesion.
12. The assembly shall be coated with two coats of oven baked enamel in addition to the primer coat.
13. All other hardware shall be stainless steel.

925.2.18 Optically Programmed Traffic Signal Face Requirements

A. General

1. Supply traffic signal faces that permit the visibility zone for the red, yellow and green indications to be determined optically and require no hoods or louvers. The projected indication may be selectively visible or veiled anywhere within 15 degrees of the optical axis.
2. Verify that the projected indication conforms to ITE transmittance and chromaticity standards.
3. Verify no indication results from external illumination and that one light unit does not illuminate a second. The components of the optical system include the lamp, lamp collar, optical limiter-diffuser, and objective lens.
4. Verify that the optical system accommodates projection of diverse selected indications to separate portions of the roadway such that only one indication will be simultaneously apparent to any viewer.

B. Equipment

1. Fabrication
   a. Provide an LED lamp module that is a direct replacement for the incandescent lamp.
   b. Verify the lamp modules are on the CalTrans QPL for LED programmed visibility modules.
   c. Provide unit that operates over the voltage range of 80 to 135 VAC.
   d. Verify the unit provides a minimum luminous intensity of 500 candela and does not exceed 18 W at 25°C (77°F).
   e. Couple the lamp to the diffusing element with a collar including a specular inner surface. The diffusing element may be discrete or integral with the convex surface of the optical limiter.
   f. Supply an optical limiter with an accessible imaging surface at focus on the optical axis for objects 900 to 1,200 ft. (270 to 360 m) distance and permit an effective veiling mask to be variously applied as determined by the desired visibility zone.
   g. Provide optical limiter with positive indexing means and composed of heat-resistant glass.
   h. Verify that the objective lens is a high-resolution, planar incremental lens hermetically sealed within a flat laminate of weather resistant acrylic or approved equal.
   i. Supply a lens that is symmetrical in outline and that may be rotated to 90-degree orientation about the optical axis without displacing the primary image.

2. Mounting
   a. Supply signals that mount to standard 1.5 in. (38 mm) fittings as a single section, as a multiple section face, or in combination with other signals.
   b. Provide signal sections with an adjustable connection that permits incremental tilting from 0 to 10 degrees above or below the horizontal while maintaining a common vertical axis through couplers and mounting.
   c. Verify that terminal connections permit external adjustment about the mounting axis in 5-degree increments.
   d. Verify that the signal is mountable with ordinary tools and capable of being serviced with no tools.
   e. Supply attachments such as backplates or adapters that conform and readily fasten to existing mounting surfaces without affecting water and light integrity of the signal.
   f. Supply traffic signal faces with tri-studs for mounting.
Section 925 — Traffic Control Signal Equipment

3. Electrical
   a. Supply lamp fixtures that comprise a separately accessible housing and integral lamp support indexed ceramic socket and self-aligning, quick release lamp retainer.
   b. Verify that electrical connection between case and lamp housing can be accomplished with an interlock assembly that disconnects lamp holder when opened.
   c. Include a covered terminal block for clip or screw attachment of lead wires for each signal section.
   d. Use concealed No. 18 AWG, stranded and coded wires to interconnect all sections to permit field connection within any section.

4. Photo Controls
   a. Verify that each signal includes integral means for regulating its intensity between limits as a function of the individual background illumination.
   b. Verify that lamp intensity is not less than 97% of uncontrolled intensity at 10,750 lux and reduces to 15% +/-2% of maximum at less than 10,750 lux.
   c. Verify that response is proportional and essentially instantaneous to detectable increase of illumination from darkness to 10,750 lux and damped for a decrease from 10,750 lux.
   d. Verify that the intensity controller is comprised of an integrated, directional light sensing and regulating device interposed between lamp and line wires.
   e. Verify that intensity controller is compatible with 60 Hz input and responsive within the range 105 to 135 VAC.
   f. Output may be phase controlled but verify that the device provides nominal terminal impedance of 1,200 W open circuit and a corresponding holding current.

925.2.19 Blank-Out Sign Requirements

A. General
   1. Provide sign with a clearly visible and definable legend at a distance of 500 ft. (152 m).
   2. Provide hardware to mount the sign on standard 1.5 in. (38 mm) pipe brackets or to mount directly to signal mast arms or span wire or as outlined in the contract.
   3. Supply blank-out signs capable of displaying one message at a time in one direction.

B. Equipment
   1. Sign Enclosure
      a. Use a case formed from aluminum extrusion F1-6-E and a special aluminum door frame angle.
      b. For Alloy 6063-T5, verify that the wall is at least 0.075 in. (2 mm) thick and the corners and joints are at least 0.080 in. (2 mm) thick.
      c. Use filler arc for all welding.
      d. Verify all hinges and fastening hardware, nuts, bolts, fasteners on the housing, and internal components are stainless steel.
      e. Use a BR-type take-apart door hinge and draw bolt.
      f. Furnish one P-15 1.5 in. (38 mm) hub on the top surface and bottom if mounted to a mast arm.
      g. Prime the entire case with zinc chromate, bake the inside with two coats of non-yellowing white, and paint the outside with two coats of highway yellow or flat black as specified in the Contract.
   2. Electrical
      a. Verify that all blank-out signs are LED and conform to current ITE standards.
      b. Supply all signs with the necessary mounting hardware to provide for mounting as shown in the contract.
Section 925 — Traffic Control Signal Equipment

c. Provide mounting for one-way or two-way configurations.
d. Obtain approval for messages and letter dimensions from the Department.

3. Sun Phantom Screen
   a. Attach to each sign a heavy-duty aluminum louver-type sun phantom screen covering the entire sign face.
   b. Slant the louver down enough to eliminate the sun glare without obstructing the view of the sign face.

4. Painting
   a. Paint the signal surfaces, inside and out, with two coats of oven-baked enamel in addition to the primer coat.
   b. Paint the non-illuminated portions of the signal face black.
   c. Paint the housings, brackets, fittings, etc., highway yellow.

5. Lens
   a. Use a fabricated, three-section Plexiglas lens clear face, with or without legend, that can accept a silk-screened legend on the first surface.
   b. Provide a thickness of at least 0.31 in. (8 mm).

925.2.20 Lane-Use Control Signal Requirements

A. General
   1. Verify that all lane-use control signals are LED and conform to current ITE publication Traffic Control Signal Indicators—Light Emitting Diode (LED) Signal Modules.
   2. Supply all lane-use control signals with the necessary mounting hardware to provide for mounting as shown in the contract.
   3. Provide mounting for one-way or two-way configurations.

B. Equipment
   1. Weight
      a. Provide one-way lane-use control units that do not exceed 50 lb. (23 kg).
      b. Provide two-way lane-use control units that do not exceed 60 lb. (27 kg).
   2. Color
      a. Verify that the color of lane-use control signal indications is always visible for 0.25 mile (0.38 km) under bright sunny conditions.
      b. Provide lane-use control signals with a visibility angle of a minimum of 60 degrees.
   3. Housing
      a. Verify that the housing of each signal is polycarbonate or a one-piece corrosion-resistant aluminum alloy die casting or equal and meets current related ASTM specifications.
      b. Verify that all configurations are balanced to provide a plumb hanging unit.
      c. Verify that all components are readily and easily accessible from the open door.
   4. Housing Door
      a. Verify that the housing door is one-piece corrosion-resistant aluminum or polycarbonate and meets current related ASTM specifications.
      b. Provide two substantial door hinges with stainless steel hinge pins.
      c. Verify hinges are on the left side of each section with a latch boss on the right side.
d. Provide stainless steel dual eye bolt latches or similar approved devices to securely close and latch the housing door.

e. Equip the housing or door with a continuous molded neoprene gasket to make the interior of the unit dustproof and weathertight.

5. Wiring
a. Provide each signal housing with a complete terminal board.
b. Verify that one side of the terminal strip accommodates socket leads and the other side accommodates field wires.
c. Verify that the terminal board provides separate wiring of each symbol.
d. Verify each lamp is separately wired to a terminal block located in each housing.
e. Provide each lamp holder socket with color-coded leads.
f. For combination symbols, color-code socket leads separately to distinguish between red X, yellow X, or downward arrow symbols.
g. Provide leads that are No. 14 AWG type THW, 600 VAC, and fixture wire with 194°F (90°C) thermoplastic insulation.

6. Visors
a. Provide visors not less than 12 in. (305 mm) long for multiple unit and 7 in. (175 mm) long for single unit signals for each signal face.
b. Verify that the visors are constructed of sheet aluminum or polycarbonate and encompass the top and sides of each section.

7. Painting
a. Paint all signal surfaces, inside and out, with two coats of oven baked enamel in addition to the primer coat.
b. Paint the insides of the visors flat black.
c. The non-illuminated portions of the signal face black or dark gray and all housings, brackets, and fittings highway yellow.

8. Hardware and Fittings
a. Supply all necessary fittings, pipe brackets, hangers, hubs, etc., for the type of mounting specified.
b. Verify all fittings are aluminum or galvanized coated to prevent rust and corrosion.

9. Sun Phantom Screen
a. Provide each signal face with a screen that substantially counteracts the sun phantom effect.

10. Signal Display
a. Verify that the symbols, which are on an opaque black or dark gray background, meet ITE requirements and are blacked out when not illuminated.

11. LED Optical System
a. Verify that each separate color indication in a sign face is illuminated by independent LEDs.
b. Verify that the green arrow indication does not utilize the same termination points as the X indication.
c. Verify that total power required for single indication does not exceed 250 W.
d. Verify that all modules are contained behind a weathertight signal face or lens assembly.
e. Verify that the entire optical system is weathertight and is not vulnerable to extremes in temperature or moisture.
Section 925 — Traffic Control Signal Equipment

925.2.21 Pedestrian Traffic Signal Face Requirements

A. General

1. The illumination, the UPRAISED HAND, and WALKING PERSON shall meet the color, luminosity, dimensions and other specifications in the ITE publication Pedestrian Traffic Control Signal Indicators—Light Emitting Diode (LED) Signal Modules.

2. Provide each section with a visor encompassing the top and sides of the signal face of a size and shape to shield the lens from external lighted sources. An acceptable option is a Z-crate or louver type visor for mounting over the pedestrian signal face.

3. Verify that pedestrian indications are distinguishable to the pedestrian both day and night and at all distances from 10 ft. (3 m.) to the full width of the areas to be crossed.

4. Use only internal illumination.

5. Verify that an opaque material obscures all areas of the face or lens, except for the message.

6. Verify that when not illuminated, the symbols are not to be distinguishable by pedestrians at the far end of the crosswalk they control.

B. Equipment

1. Fabricate the housing of one-piece cast aluminum alloy with two integrated hinge lugs, screw slots, and openings at each end.

2. Fabricate the door of one-piece cast aluminum alloy with two hinge lugs cast on top of the door and two latch points cast on the bottom.

3. Provide hinge pins of stainless steel to attach the door to the housing and two eye bolts and wing nuts on the other side of the door.

4. Provide door with a neoprene gasket creating a weathertight, dustproof seal when closed.

5. Supply pedestrian traffic signal faces with a black face and a yellow body, unless otherwise specified in the contract.

C. Pedestal Pole Requirements

1. Furnish pedestal poles according to type and overall length shown in the Contract.

2. Poles are made of one continuous piece of bare finish spun aluminum from top to base connection for the entire height of the pole.

3. Pedestal pole mounting adapter shall rigidly attach to the sign case’s structural bracing.

4. Cable entrance to the sign case shall be through the inside of the pole.

5. The shaft, of appropriate shape, may or may not be uniformly tapered from butt to tip.

6. A pole used to support only a traffic signal may be tapered.

7. Fabricate pole caps, when required, of cast material, and secure in place with set screws.

D. Pedestal Pole Base Requirements

1. Verify that the base meets current AASHTO breakaway requirements.

2. Provide test reports from an FHWA approved independent laboratory certifying that the base has been tested and meets applicable requirements.

3. Supply a statement of certification from the FHWA stating such tests have been accepted and approved.

4. In order to prove structural soundness, provide certification from a recognized independent structural laboratory that the base will withstand a bending moment of 10,750 ft.-lb. (14,575 N-m).

5. Verify that all design radii are smooth and intact.
6. Verify that the exterior surface finish is smooth and cosmetically acceptable by being free of molding fins, cracks, and other exterior blemishes.

7. Fabricate from new aluminum ingot.

8. Minimum requirements are provided in Table 22.

9. Verify this item consists of square cast aluminum with bare finish and has a minimum weight of 21 lb. (9.5 kg).

10. Thread the upper end to receive a 4 in. (100 mm) National Pipe Thread (NPT) pipe shaft.

11. Design the base so that it may be fastened to a foundation with four 0.75 in. (19 mm) anchor bolts located 90 degrees apart on the bottom of the base.

12. Provide slots in the bottom of the base 1.5 in. (38 mm) wide and 2.5 in. (63 mm) long measured along the circumference of the bolt circle, enabling a proper fit even if the bolts are placed slightly off center.

13. Design the base to accommodate bolt circles of a minimum of 12 in. (305 mm) through a maximum of 14.5 in. (363 mm) and anchor bolts with a minimum of 0.63 in. (16 mm) through 1.0 in. (25 mm) diameter.

14. Provide a plastic door that meets the following requirements:
   a. Attach the door to the base using one socket button head screw to prevent unauthorized entry.
   b. Verify that the door opening is free of burrs and sharp edges and is no less than 8.5 in. (213 mm) square.
   c. Verify that the door is injection molded from ABS plastic to deter vandalism and theft, and has the following properties provided in Table 23.

<table>

15. Verify that the door exhibits the following properties:
   a. Has an edge thickness of 0.25 in. (6 mm) and a minimum thickness of 0.156 in. (4 mm).
   b. Contains flame-retardant material, meeting or exceeding UL 94 test H.B.
   c. Bare aluminum tone, unless otherwise specified.
   d. Contains UV inhibitors and stabilizers for protection against UV degradation.
Section 925 — Traffic Control Signal Equipment

e. Is injection molded with a smooth front finish.
f. Has flat and straight surfaces without blisters, buckling, or warping.
g. Has reinforcing ribs.
h. Contains two injection molded lugs on the bottom of the door with slots of the proper width and depth to fit the base door opening.

16. Supply the base with a set of four anchor bolts, 0.75 in. (19 mm) diameter by 18 in. (450 mm) in length, with material per ASTM 572 and galvanized per ASTM 153.

17. Supply one hex nut and one flat washer with each bolt.

E. Pedestal Pole Foundation Anchor Assembly Requirements

1. Provide baseplate that is steel and conforms to ASTM A 36 material.
2. Provide pipe with helical blade that is manufactured from ASTM A-53 ERW Grade B Steel.
3. Provide foundation anchor assembly that is 4 in. (100 mm) in diameter by 56 in. (1,400 mm) with a single helical blade and a square fixed baseplate with combination underside bolt-head retainer and dirt scrappers enabling flush-mount with the ground.
4. Verify 4 in. (100 mm) pipe has 2 in. (50 mm) by 3 in. (75 mm) entrance hole 18 in. (450 mm) below the steel plate.
5. Verify the anchor assembly is hot dipped galvanized finish after fabrication and complies with ASTM A 123.
6. Verify baseplate has four slotted mounting holes to fit bolt circles from 7.75 in. (195 mm) to 14.75 in. (375 mm).
7. Provide four slotted mounting holes with a 0.75 in. (20 mm) keyhole slot to permit bolt installation and replacement from the top surface without digging under the baseplate.
8. Verify assembly is furnished with:
   a. Four 0.75 in. (20 mm) -10NC x 3 in. (75 mm) square head galvanized ASTM A 325 anchor bolts
   b. Four 0.75 in. (20 mm) plain flat galvanized washers
   c. Four 0.1875 in. (5 mm) thick galvanized plate washers
   d. Four 0.75 in. (20 mm) galvanized hex nuts

925.2.22 Messenger and Guy Strand (Span Wire) Requirements

A. General

1. Verify that all messenger and guy strand (span wire) conforms to ASTM A 475 extra high strength grade or better with a Class A coating, 7-wire span wire.
2. Verify 0.25 in. (6 mm) messenger and guy strand are used to support interconnect cable or as tether spans.
3. Messenger and guy strand 0.31 in. (7 mm) shall be used only where it is essential to match an existing 0.31 in. (7 mm) span wire that will not be replaced as part of a new installation.
4. Verify all span wire for traffic signal faces, blank-out sign, optically programmed heads, lane control signs, standard, aerial, or sidewalk guys uses a minimum messenger and guy strand 0.38 in. (9 mm) as a minimum size.

B. Bull Ring Requirements

1. Provide bull rings that are galvanized weldless steel 0.63 in. (16 mm) diameter.
2. Submit catalog cuts for approval.
C. Balance Adjuster Requirements

1. Verify the balance adjuster consists of hardware that is cast from 316 Stainless Steel or 65-45-12 Ductile Iron or equivalent.
2. Verify castings are free of voids, pits, dents, molding sand, and excessive grinding marks.
3. Exterior surface shall be cosmetically acceptable and free of molding fins, cracks, and other exterior blemishes.
4. All hardware shall be supplied and be stainless steel or galvanized.

D. Lashing Rod Requirements

1. Verify that all lashing rods are sized in accordance with messenger and cable diameters to be supported.
2. Provide lashing rods that are of the same material as the messenger or guy strand.

E. Stainless Steel Lashing Wire Requirements

1. Provide lashing wire that is Type 316 stainless steel with 0.045 in. (1 mm) diameter.

F. Cast Aluminum Span Wire Clamp Requirements

1. Provide an exterior surface finish that is smooth and cosmetically acceptable, free of molding fins, cracks, and other exterior blemishes.
2. Verify that all design radii are smooth and intact.
3. Equipment
   a. Provide span wire clamps that are cast from Aluminum Alloy 713 or equivalent, free of voids, pits, dents, molding sand, and excessive foundry grinding marks.
   b. Verify that span wire clamps are fabricated from aluminum ingot with minimum requirements in Table 24.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

   c. Verify that the span wire clamp can accommodate cables 0.25 in. (6 mm) to 0.63 in. (16 mm) diameter.
   d. Verify that the weight is less than 1.75 lb. (0.8 kg) with hardware.
   e. Verify that the span wire clamp has a minimum overall length of 7 in. (175 mm).
   f. Verify that the span wire clamp has a centerline dimension from cable to clevis pin of 2 in. (50 mm) [±0.5 in. (13 mm)].
   g. Verify that the span wire clamp has a cast aluminum cable bar to protect the cable when tightening the U-bolts.
   h. Verify that the span wire clamp has a mounting opening of 0.75 in. (19 mm) [±0.03 in. (0.8 mm)].
   i. Verify that the span wire clamp has 0.5 in. (13 mm) 13 NPT U-bolts with 0.5 in. (13 mm) lock washers and nuts.
j. Verify that the clevis pins are 0.63 in. (16 mm) diameter with a length of 2.25 in. (56 mm) and secured with a hump back stainless-steel cotter pin.

k. Verify that the clamp and cable bar have a chromate conversion coating to help resist oxidation.

l. Verify that the clevis pin and hardware are galvanized per ASTM A 123/A 123M or stainless steel.

G. Cast Aluminum Tri-Stud Span Wire Entrance Fitting Requirements

1. Verify that the all hardware is galvanized or stainless steel.

2. Verify that the exterior surface finish is smooth and cosmetically acceptable, free of molding fin, cracks, and other exterior blemishes.

3. Equipment
   a. Verify that the Tri-Stud Span Wire Entrance Fittings are cast from Aluminum Alloy 713 or equivalent, free of voids, pits, dents, molding sand, and excessive foundry grinding marks.
   b. Verify that the all design radii are smooth and intact.
   c. Verify that the Tri-Stud Span Wire Entrance fitting has a mounting support at the top of the wire entrance 0.69 in. (17 mm) thick [±0.07 in. (1.5 mm)].
   d. Verify that the Tri-Stud Span Wire Entrance fitting weight is not less than 1.75 lb. (0.8 kg) with hardware.
   e. Verify that the mounting support has at least six clevis openings for adjustment with suspension bracing between every two openings.
   f. Verify that the Tri-Stud Span Wire Entrance has a minimum of 0.5 in. (13 mm) diameter throughout for wire access and that wire access is free of burrs and casting webs.
   g. Verify that the wire entrance opening is recessed and has a neoprene grommet with sealed membrane sections.
   h. Verify that the traffic signal face attachment end is serrated and has a minimum of 3-traffic signal face centering bosses extending 0.19 in. (5 mm) from the serrations.
   i. Verify that the serrations have a 72-tooth design to match the traffic signal face.
   j. Verify that three stainless steel studs are cast into the wire entrance fitting.
   k. Verify that the studs are 0.31 in. (7 mm) and extend 1.5 in. (38 mm) [±0.13 in. (4 mm)] beyond the serrations.
   l. Provide each Tri-Stud span wire entrance fitting with a Tri-Stud hardware kit.
   m. Verify that the Tri-Stud Span Wire Entrance Fitting has a chromate conversion coating to provide a proper base for paint adhesion.
   n. Verify that the assembly matches the display housing and baked in a drying oven after painting.

925.2.23 Timber Pole Requirements

A. General

1. Verify that all timber poles meet the requirements of Section 861.

2. Poles must be inspected and tested by the Department’s Office of Materials and Testing and hammer stamped by the inspector.

B. Equipment

1. Verify that all poles have a brand or stamp 10 ft. (3 m) from the butt that notes the type wood, date of manufacture, manufacturer, class, and length.

2. Verify that all timber poles that have guy attachments or support span wire or arms that suspend traffic signal faces over the roadway or sidewalk are Class II.
3. Poles that support loop lead-in, messenger, or communications cable that does not have guy attachments may be Class IV size.

4. Verify that all poles meet the requirements in Table 25 unless otherwise noted in the Contract.

C. Guy Guard Requirements

1. Verify that all guy guards are high-impact-resistant PVC with UV stabilizers added for retention of color.
2. Verify that insulators attach to the guy so that they cannot easily be removed.
3. Use guy guards that are yellow unless otherwise directed.

D. Guy Strain Insulator Requirements

1. Verify guy strain insulators are protected from the environment, including the effects of voltage, UV rays, and acid rain by a fully bonded, electrically tack-free, and impenetrable silicone rubber sheath.
2. Each insulator shall be UL proof tested, and permanently marked to show date of test.

925.3 Construction

Construction for installation of Traffic Control Signal Equipment shall be according to Section 647.

925.4 Measurement

Measurement for the installation of Traffic Control Signal Equipment shall be according to Section 647.

925.5 Payment

Payment for installation of Traffic Control Signal Equipment shall be according to Section 647.
Section 926—Wireless Communications Equipment

926.1 General Description
Furnish, install, test, and provide warranty and training for wireless communications equipment comprised of equipment and materials as specified herein and shown in the Contract documents.

926.1.01 Definitions, Acronyms, and Abbreviations

A. Definitions
   1. **Wireless System, Type 1**: a 900 MHz, 2.4 GHz, or 5 GHz wireless Ethernet radio transceiver and associated equipment.
   2. **Wireless System, Type 2**: a 2.4 GHz or 5 GHz broadband wireless Ethernet transceiver and associated equipment.
   3. **Wireless System, Type 3**: a 2.4 GHz or 5 GHz broadband wireless Ethernet transceiver and associated equipment.
   4. **Wireless System, Type 4**: a broadband cellular wireless Ethernet router and associated equipment.

B. Acronyms and Abbreviations
   Refer to Sections 101.01 and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

Section 926 — Wireless Communications Equipment

926.2 Materials

926.2.01 Wireless Communications System Requirements

A. General

1. Comply with ISO 9001 or Six Sigma quality manufacturing requirements.
2. Provide only equipment and materials that are of new and of like kind and function provided by one manufacturer, using the same model, part number, and revision.

B. Overall System

1. Provide wireless system that supports the following site configuration types: PtP, PtMP (access point / subscriber unit) and repeater as shown in the Contract documents.
2. Provide a single-band or dual-band radio that is either integrated with an antenna unit or as an alternative a single radio with an external antenna.
3. Provide capability for the user to select transmit power output level in incremental steps up to the maximum transmit output power.
4. Provide maximum transmit power, antenna gain that provides an EIRP as permitted by FCC Part 15 for unlicensed frequencies. Select final transmit power and antenna gain based on manufacturer’s recommendation and distance and signal strength.
5. Provide a wireless link with path availability of 99.99% in worst-case weather conditions for the area where it is installed.
6. Provide wireless system with a minimum MTBF of 200,000 hours using Telcordia SR-332, latest version, or MIL-HDBK-217F standards.
7. Provide wireless system with dynamic frequency and channel selection capability based on interference detection, with a manual override option.
8. Provide wireless system with adaptive or automated modulation and space diversity capability for maximum throughput.
9. Provide wireless system with receive sensitivity that is adaptive.
10. Provide wireless system with a VSWR value not exceeding 2.0:1 for the specified radio frequency.
11. Design equipment for ease of maintenance. Ensure that all component parts are readily accessible for inspection and maintenance using hand tools. Provide test points for checking essential voltages, waveforms, signals, and similar data
12. Provide support for the following minimum network and security requirements:
   a. Comply with IEEE 802.3 standards for Ethernet.
   b. Comply with IEEE 802.1D (Ethernet Bridging) standard.
   c. Comply with IEEE 802.1p (Traffic Prioritization/Quality of Service) standard.
   d. Comply with IEEE 802.1q (Virtual LAN [VLAN]) standard.
   e. Comply with IEEE 802.1d (Spanning Tree Protocol) and IEEE 802.1w (Rapid Spanning Tree Protocol) standards.
   f. Comply with IEEE 802.3x (Full Duplex and Flow Control) standard.
g. Provide at a minimum AES-128-bit (AES-128) encryption capability, FIPS197, keys set through password-protected browser interface for PtP backhaul network. Minimum security for communications with WiFi units is WPA2.

h. Provide support for internal MAC address control list and RADIUS networking protocol for authentication, authorization, and accounting.

13. Provide wireless system that meets the following minimum radio configuration and management software requirements:
   a. Provide programming and software to make operational and support the wireless system with the following minimum features: radio and network configuration, diagnostic routines (i.e., bandwidth test, spectrum scan, and ping test), and alarm management.
   b. Provide capability to display or provide status information of indicators that include data port link activity, data port speed, and link status.
   c. Provide capability to display the following alarm features:
      i. Provide 24 hour monitoring capability for user-selected alarms.
      ii. Provide optional alarm notifications via email or text messages.

14. Provide wireless system with bi-directional communications.

15. Provide wireless system including connectors that are IP67 weathertight rated and UV stabilized.

16. Provide wireless system with alignment tool for aligning the antenna system. Provide alignment tool that consists of audible indicators, or as recommended by the manufacturer.

17. Equip wireless system with a minimum of one shielded Ethernet-port, using an IP67 rated RJ-45 weathertight connector or other Ethernet-compatible locking shielded and weathertight connector.

18. Comply with FCC Part 15.247 (ISM) requirements.

C. Type 1 Wireless System

Meet the following system requirements, in addition to the requirements specified in Section 926.2.01.B:

1. Provide a system that operates in the FCC unlicensed (license-exempt) ISM band of 900 MHz, 2.4 GHz, or 5 GHz.

2. Provide aggregate system throughput of up to 10 Mbps in a LOS environment.

3. Provide a flat panel type, single (H or V) or dual polarized (H+V), narrow beam-width antenna, Yagi, or omnidirectional or as recommended by the wireless radio manufacturer.

4. Provide wireless system with minimum channel bandwidths of 5 MHz, 10 MHz, and 20 MHz.

5. Provide wireless system with OFDM or DSSS modulation technology.
D. **Type 2 Wireless System**

Meet the following system requirements, in addition to the requirements specified in Section 926.2.01.B:

1. Provide a system that operates in the FCC unlicensed (license-exempt) ISM band of 2.4 GHz or 5 GHz.
2. Provide aggregate system throughput of up to 50 Mbps in a LOS environment.
3. Comply with IEEE 802.11a/n standard.
4. Provide a 2x2:2 MIMO flat panel type, dual polarized (H+V), narrow beam-width antenna or alternative parabolic or as recommended by the radio manufacturer.
5. Provide wireless system with minimum channel bandwidths of 5 MHz, 10 MHz, 20 MHz, and 40 MHz.
6. Provide wireless system with OFDM modulation with BPSK, QPSK, QAM16, and QAM64.
7. Provide wireless system that supports MCS with dynamic data rate selection.
8. Provide wireless system with full support of SSL technology.
9. Provide wireless system that supports the following network requirements:
   a. Provide forward error correction capabilities with automatic retransmission.
   b. Provide dynamic allocation of uplink and downlink bandwidth.
   c. Provide capability for jitter correction to avoid delay fluctuation in video streams.
   d. Provide data burst transmission capability so that fragmented packets are transmitted together.
   e. Provide the capability to use a polling protocol to reduce packet loss due to RF collisions.
   f. Provide support for Layer 2 features including QoS and IGMP snooping to reduce un-needed multicast traffic.
10. Provide local and remote management capabilities through HTTP, Telnet, SSH, and SNMP.

E. **Type 3 Wireless System**

Meet the following system requirements, in addition to the requirements specified in Section 926.2.01.B:

1. Provide a system that operates in the FCC unlicensed (license-exempt) ISM band of 2.4 GHz or 5 GHz.
2. Provide aggregate system throughput of up to 100 Mbps in a LOS environment.
3. Comply with IEEE 802.11a/n standard.
4. Provide a 2x2:2 MIMO flat panel type, dual polarized (H+V), narrow beam-width antenna or alternative parabolic or as recommended by the radio manufacturer.
5. Provide wireless system with minimum channel bandwidths of 5 MHz, 10 MHz, 20 MHz, and 40 MHz.
6. Provide wireless system with OFDM modulation with BPSK, QPSK, QAM16, and QAM64.
7. Provide wireless system that supports MCS with dynamic data rate selection.
8. Provide wireless system with full support of SSL technology.
9. Provide wireless system that supports the following network requirements:
   a. Provide forward error correction capabilities with automatic retransmission.
   b. Provide dynamic allocation of uplink and downlink bandwidth.
   c. Provide capability for jitter correction to avoid delay fluctuation in video streams.
Section 926 — Wireless Communications Equipment

d. Provide data burst transmission capability so that fragmented packets are transmitted together.

e. Provide the capability to use a polling protocol to reduce packet loss due to RF collisions.

f. Provide support for Layer 2 features including QoS and IGMP snooping to reduce un-needed multicast traffic.

10. Provide local and remote management capabilities through HTTP, Telnet, SSH, and SNMP.

F. Type 4 Wireless System

1. Provide an integrated broadband cellular wireless router only as listed on the GDOT QPL and as approved by the Department’s current cellular telecommunications service provider. No other devices are permitted.

2. Provide wireless system meeting the following general requirements:

   a. Provide 4G LTE or greater throughput as specified in the Contract documents or directed by the Department.

   b. Provide a broadband cellular wireless router that meets the following minimum network standards and protocols:

      i. Comply with IEEE 802.3 standards for 10/100/1000 Mbps Ethernet.

      ii. Provide full support for SSL.

      iii. Provide full support for IPsec and VPN functionality.

      iv. Provide at a minimum AES-128 encryption capability.

      v. Support MAC address filtering and ACL.

   c. Provide capability for network traffic to be accessible via a public or private IP connection, via VPN tunnel with SSL, IPsec, and IP pass-through.

   d. Equip wireless system with a minimum of one 10/100/1000 Base-T/TX, shielded Ethernet-port, outdoor-rated RJ-45 connector or other Ethernet-compatible weathertight connector.

   e. Provide wireless system with visual status indicators that include Power, Signal, Ethernet Link, and Activity.

3. Provide wireless system meeting the following antenna requirements:

   a. Provide an external ruggedized antenna for broadband wireless operations meeting the following minimum requirements:

      i. A minimum gain of 4 dBi, vertical polarized.

      ii. Omnidirectional pattern.

      iii. Up to 100W power.

      iv. Multiband support including the 698 to 960 MHz and 1,700 to 2,700 MHz bands.

   b. Provide mounting hardware as recommended by the manufacturer.

   c. Provide RF coaxial cable as specified in Section 926.2.01.J.3 between the wireless router and the antenna.
Section 926 — Wireless Communications Equipment

G. Mechanical
1. For non-integrated types provide a wireless radio that is capable of being rack- or shelf-mounted in a secure manner.
2. Provide wireless equipment that is modular in design such that it can be easily replaced in the field.
3. For Types 1 to 3 only, unit dimensions and weights shall be as follows:
   a. Maximum dimensions shall be 16 in (0.4 m) by 16 in (0.4 m) by 12 in (0.3 m) for integrated units, not including the antenna.
   b. Maximum weight shall not exceed 35 lb (16.9 kg).
4. Use external screws, nuts, and locking washers that are stainless steel. Do not use self-tapping screws unless specifically approved by the Department.
5. Use mounting hardware and parts made of stainless steel.
6. Use materials in construction that are protected from fungus growth and moisture deterioration.
7. Separate any dissimilar metals by an inert dielectric material.

H. Electrical
1. Provide wireless radios and routers that meet all specified requirements when the input power is 120 VAC ±20%, 60 Hz ±3 Hz.
2. Provide appropriate voltage conversion, PoE injectors, or other power supply hardware if the radio equipment or any radio-related ancillary devices require operating voltages other than 120 VAC or rely on PoE or PoE+.
3. Provide voltage converters or PoE injectors that accept an input voltage of 120 VAC as noted above.
4. Provide any required PoE or PoE+ devices that are 802.3af or 802.3at compliant, meeting the power requirements of the radio equipment.
5. Provide PoE injector that can be either wall/panel mounted, or DIN-rail mounted within the field cabinet.
7. Provide devices that meet the requirements of Section 2.1.6, "Transients, Power Service," of NEMA Standard TS 2.

I. Mounting and Support Structure
1. Provide wireless equipment mounting hardware that is designed to mount to the support structure as shown in the Contract documents.
2. Provide pole mounting attachment hardware that meets the requirements of the wireless system survey and the wireless manufacturer.
J. Cabling and Surge Protection

1. Provide antenna coaxial cables as specified herein for external antenna (non-integrated radio and antenna) sites or outdoor-rated Category-6 cables for integrated radio/antenna sites.

2. Provide outdoor-rated, shielded Category-6 cabling from the PoE injector to the wireless radio meeting the following minimum requirements:
   b. Comply with ICEA S-56-434 standard or equivalent industry standard as approved by the Department for communications cables for outdoor use including weathertight, outdoor CMX UV-rated, abrasion-resistant jacket.
   c. Provide cable that is UL 444 sunlight resistant listed.
   d. Provide insulated No. 22 to 23 AWG, solid bare copper conductors with polyolefin insulation, arranged in four color-coded shielded twisted-pairs with drain wire incorporating a cross-web separator design.
   e. Provide modular IP67-rated shielded RJ-45 8P8C male push-pull connectors with eight-position non-keyed and eight gold anodized pins or other Ethernet-compatible locking weathertight connector.

3. Provide an RF coaxial cable meeting the following minimum requirements.
   a. Provide a cable that is flexible, low-loss, outdoor-rated and weathertight.
   b. Provide nominal impedance that is matched to the antenna’s impedance to minimize the VSWR.
   c. Provide a cable with a black UV-resistant polyethylene jacket.
   d. Provide a cable with a dual shield consisting of 100% foil and 88% braided.
   e. Provide shielding effectiveness of >90 dB.
   f. Provide solid bare, copper center conductor.
   g. Provide a characteristic impedance of 50 ohms, nominal.
   h. Provide a cable with maximum frequency of 6 GHz.
   i. Provide an attenuation of 3.9 dB/100 ft. (at 900 MHz) or better. If cable length is shorter than 20 ft. (6.1 m), the cable can be smaller in diameter with a maximum attenuation of 9.9 dB/100 ft.
   j. Provide a capacitance (conductor to shield) of 23.9 pF/ft. or better, nominal.
   k. Provide an inductance of 0.060 µH/ft or better, nominal.
   l. Provide Type N connectors or as recommended by the manufacturer that are weathertight and factory installed on both ends with a maximum insertion loss of 0.2 dB.
   m. Provide maximum cable length of 10 ft. (3.05 m) from radio to antenna (if not integrated) when radio is mounted on an external structure. Provide 100 ft. (30.5 m) maximum length from radio to antenna when radio is mounted in the field cabinet and antenna is mounted on the structure.
4. Provide wireless system with surge protection that meets the following minimum SPD requirements.

   a. Category-6 Ethernet PoE Surge Protection
      i. Provide SPD that is listed per UL 497B.
      ii. Comply with TIA-568-B.
      iii. Comply with IEEE 802.3af or IEEE 802.3at as required.
      iv. Support 10Base-T, 100Base-T, and 1000Base-T transmission speeds.
      v. Provide a peak surge current rating (I_{\text{max}}) of a minimum of 10 kA (8/20 µs waveform).
      vi. Provide a clamping voltage of up to 90V ±20% for L-G and 20V ±20% for L-L.
      vii. Provide surge protection for all connector pins.
      viii. Provide input and output connections with shielded RJ-45 connectors.
      ix. Provide an in-line, series-connected configuration.
      x. Provide system capable of being either wall/panel or DIN-rail mounted.
      xi. Provide an SPD that is constructed of aluminum metal housing.

   b. RF Coaxial Surge Protection
      i. Provide SPD that is listed per UL 497E.
      ii. Provide a rated nominal surge current (I_{\text{n}}) per UL 497E of 10 kA (8/20 µs waveform).
      iii. Provide a rated power/current (RF, DC) per UL 497E: VHF 375W, UHF (low) 250W, 800 MHz to 1 GHz 125W.
      iv. Provide a protection level of <1000V for up to 375W SPD.
      v. Provide an insertion loss of ≤0.2 dB over wireless system frequency range.
      vi. Provide SPD that supports a VSWR of 1.3:1.
      vii. Provide SPD with field replaceable gas discharge tube for maintenance.
      viii. Provide SPD with minimum environmental protection rating of IP65.
      ix. Provide SPD with mating connectors per antenna type.

   c. Provide hardware and materials to bond SPDs to the field cabinet ground buss bar.
Section 926 — Wireless Communications Equipment

K. Environmental

1. Provide wireless equipment and components as specified herein that meet the following minimum operating ambient temperature range and humidity levels:
   a. \(-4^\circ\text{F} (-20^\circ\text{C})\) through \(131^\circ\text{F} (55^\circ\text{C})\)
   b. Up to 95\% relative humidity (non-condensing)

2. Comply with NEMA 250, Type 4X corrosion requirements.

3. Comply with IEC EN 61000-4-5 surge immunity testing requirements.

4. Comply with NEMA TS 2 Sections 2.2.8 (vibration) and 2.2.9 (shock) test requirements.

5. Provide wireless system that is capable of withstanding wind speeds of 100 mph (161 kph) with a 20\% gust factor.

926.3 Construction

The construction and installation of the wireless system equipment, materials, components, and assemblies as specified herein shall meet the requirements in this section and the wireless system manufacturer’s installation requirements and recommendations.

926.3.01 Construction Requirements

A. General Construction

1. Provide, install, and test equipment and materials to provide a fully operational and functional wireless radio system. This includes installation of radio wireless radio equipment, mounting attachment hardware, power and data cables, test equipment, grounding and bonding, lightning suppression, and surge protection systems.

2. Prior to beginning installation, inspect each site to verify suitability of the design for installation, grounding, and lightning protection.

3. Adjust antenna polarities and channel plans on equipment to minimize interference from other sources, as applicable and determined by the wireless system survey.

4. Provide equipment that is modular in design such that it can be easily replaced in the field.

5. Label equipment with UV-resistant methods to identify each unit with name, model number, and serial number.

6. Provide connectors and harnesses that meet the following requirements:
   a. Provide external connections using weathertight connectors.
   b. Provide connectors that are keyed to preclude improper mating or coupling.
   c. Provide wires to and from the connectors that are color-coded or marked.
   d. Provide pins and mating connectors that are corrosion resistant.
   e. Provide solder type connections that are covered and protected by heat shrink tubing.
B. Wireless System Survey

1. Conduct wireless system survey if required by the Contract documents and upon approval of wireless system equipment and test equipment submittals.

2. Provide test equipment to conduct wireless system survey. Submit a list of equipment to the Department for approval prior to conducting the survey.

3. For Type 1, 2, and 3 only, survey wireless locations and provide a site-by-site analysis and overall system survey field report.
   a. Verify that the path is clear and provide calculations to show that there is sufficient fade margin to achieve the path availability and to meet overall network performance as specified herein under the expected weather events.
   b. Include an interference analysis of local RF conditions and a path analysis for each wireless node as shown in the Contract documents.
   c. Provide an interference analysis for each wireless node location to identify potential sources of interference. If the interference analysis shows possibility for interference at sites identified in the Contract documents, conduct in-field monitoring to determine whether actual interference exists.
   d. Include a field evaluation of the feasibility of using existing poles or structures for mounting the integrated wireless radio/antenna system.
   e. Recommend based on the survey whether a single or dual-band radio is required to meet performance requirements.
   f. Determine whether repeaters are required as part of the field survey and report the results.

4. For Type 4 only, determine and verify broadband cellular coverage for each proposed site. Each site shall have sufficient signal strength to provide full performance of the wireless link.

5. Submit the wireless system survey report to the Department for review and approval. Do not purchase or install equipment related to the wireless network prior to the approval of the wireless system survey report. Refer to Section 942.1.04 for details on submittal requirements.

C. Radio Mounting

1. Provide and install corrosion resistant radio mounts, standoffs, brackets, hardware, and grounding assemblies for the mounting surface shown in the Contract documents.

2. Install radios as recommended by the manufacturer at specified locations as shown in the Contract documents.

D. Antenna Mounting

1. Install antennas as recommended by the manufacturer. Permitting for attachment of wireless equipment on existing poles, if required, shall be the responsibility of the Contractor.

2. Provide and install antenna mounts, standoffs, brackets, hardware, transmission line, hanger kits, grounding kits, and lightning suppressors for the mounting surface shown in the Contract documents.

3. Impact of wind loading on wireless performance mounted on poles shall take into account vibration, swaying, and bending of poles.

4. Align antenna for each path and compare measured signal strengths with path calculations.

5. For Type 4 only, mount the antenna on the field cabinet. Use threaded stub mount on the cabinet for vandal-resistant mounting.
E. System Power and Grounding

1. Provide all power supplies and PoE injectors required and recommended by the wireless manufacturer.

2. Coordinate with the Department to establish electrical utility service according to the NEC and as specified in Section 682.
   a. Verify with the local power service provider to ensure that the provided equipment is compatible with the installed equipment.
   b. Contractor shall be responsible for paying for electrical service as required from the time of testing up to the issuance of the MAL by the Department at which time the service provider account shall be transferred to the Department.

3. Supply and install any additional equipment required for proper operation of the wireless system per the design.

4. Comply with grounding and bonding requirements in Section 682 for wireless system, structure, and field cabinet, and as required and recommended by the wireless manufacturer.

5. If the field cabinet and associated entry port is not collocated on the same support structure as the radio, provide grounding and lightning protection at the bottom of the support structure.

F. System Optimization

Finalize equipment alignment and settings at each site to provide a complete and operational system.

G. Cabling

1. Provide conductors and wiring that meet NEC requirements.

2. Provide copper-based Ethernet cables that do not exceed IEEE 802.3 distance limitations.

3. Cut conductors to the proper length before assembly. It is not permissible to "double-back" conductors to take up slack inside the field cabinet.

4. Lace conductors neatly with nylon lacing or plastic straps.

5. Organize conductors neatly inside the field cabinet and secure cables with clamps.

6. Provide rubber grommets for drilled entrance holes in field cabinets, poles, conduit openings, and structures.

7. Provide service loops at connection points when connecting to hardware inside the field cabinet. No splicing of cables or exposed conductors is permitted.

8. Label cabling with weathertight and UV-resistant methods to identify conductors.

926.3.02 Equipment Configuration and Integration Requirements

Refer to Section 942.3.03 for equipment configuration and integration requirements.

926.3.03 Testing Requirements

Refer to Section 942.3.04 for testing requirements.

926.3.04 Training Requirements

Refer to Section 942.3.05 for training requirements.
926.3.05 Warranty and Maintenance Support Services

A. Warranty Requirements
   1. Provide a minimum warranty length of two years for the wireless system and associated components. If the manufacturer’s warranties for the components are for a longer period, those longer period warranties shall apply.
   2. Refer to Section 942.3.02 for general warranty requirements.

B. Maintenance Support Services
   Refer to Section 942.3.02 for maintenance support services requirements.

926.4 Measurement

The wireless system and training that are complete, in place, accepted, and of the kind, size, and type specified will be measured as follows:

A. Wireless System, Types 1, 2, and 3
   The wireless IP-based Ethernet system will be measured for payment by the number installed, complete, functional, tested and accepted. Unless otherwise specified in the Contract, furnish and install the following minimum items as part of a wireless system: a radio transceiver, antennas, antenna coaxial cables, Category-6 outdoor-rated cables, PoE injectors, power supplies, surge protection, attachment hardware, any pole attachment permit fees, and work, equipment, and appurtenances to provide a fully functional wireless communications system. The price bid shall also include radio configuration and management software, any licenses, programming, device cabling, and system documentation to be turned over to the Department, including shop drawings, operations and maintenance manuals, wiring diagrams, block diagrams, and other material necessary to document the operation of the applicable wireless radio system.

B. Wireless System, Type 4
   The broadband cellular wireless system will be measured for payment by the number installed, complete, functional, tested and accepted. Unless otherwise specified in the Contract, furnish and install the following minimum items as part of a broadband wireless system: a cellular wireless router, antennas, cabling and associated components, and work, equipment, and appurtenances as required, to provide a fully functional broadband cellular wireless communications system. The price bid shall also include system documentation to be turned over to the Department and other material necessary to document the operation of the applicable broadband cellular wireless radio system. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

C. Wireless System Survey
   Wireless system survey will be measured as a lump sum for wireless measurement tools, supplies, equipment, materials, development of report and recommendations, travel, and subsistence necessary to conduct the wireless system survey.

D. Training
   Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the wireless training.

926.5 Payment

926.5.01 Wireless System

Wireless systems of the types specified in the Contract documents will be paid for at the Contract unit price. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary to complete the wireless communications system.
Payment Notes:

**Submittal**
Submittal requirements are included in Section 942.1.04 and will not be paid for separately. It will be considered incidental to the wireless system pay item.

**Testing**
Testing is defined in Section 942.3.04 and will not be paid for separately. It will be considered incidental to the wireless system pay item.

**Wireless Field Cabinets**
New wireless field cabinets and enclosures will be paid for separately under Section 939.5 pay items.

**GDOT Central Software Integration**
GDOT Central Software integration is included in Section 942.3.03 and will be paid for separately under the Section 942.5 pay item.

Payment for the wireless system will be made under:

UL 1598 - UL Standard for Safety Luminaires

927.2 Materials
Use luminaires that are complete, including driver, LED, surge protection device (SPD), and associated hardware and wiring.

927.2.01 Luminaires
A. Requirements
Ensure that LED luminaires meet the following requirements:

1. Certified by Nationally Recognized Testing Laboratories (NRTL) as defined by the U.S. Department of Labor. The testing laboratory must be listed by OSHA in its scope of recognition for the applicable tests being conducted as required by this specification. A list of recognized testing labs for products sold in the United States may be found on the U.S. Department of Labor’s web site:

2. Certification mark by a NRTL as being in compliance with UL 1598, 8750 and suitable for use in wet locations.

3. LED light source(s) and driver(s) are RoHS compliant.

4. ANSI C136.25 Ingress Protection (IP) rating of IP66 or greater is used for all luminaires.
5. Comply with Electro Magnetic Interference (EMI) requirements as defined by FCC 47 Sub Part 15; CISPR15, CISPR22 Class A (120Vmin).

6. Tested according to the Illuminating Engineering Society of North America (IESNA) LM-79 and LM-80
   a. Supply testing and data in compliance with LM-79 from a National Institute of Standards and Technology (NIST) National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory.

7. Listed by Design Lights Consortium (DLC) in its QPL. Contractor shall submit a copy with submittal documents for verification. The documentation submitted for the photometric distribution shall correspond to the items listed by the NRTL.

B. Housing

Ensure the housing for LED luminaires meet the following requirements:

1. Aluminum housing shall be die cast and A360 or A380 compliant.

2. Luminaire housing is to be a completely sealed optical system with a (IEC) (IP) rating of 66 or greater.

3. Anodized and/or painted or powder coated with a minimum thickness of 2.0 mil to increase corrosion resistance. Finish color to be gray unless otherwise specified on Contract. Luminaire finish to be tested to withstand a 2000-hour salt spray test in accordance with ASTM B117. The luminaire coating system shall exceed a rating of six per ASTM D1654 after 2000 hours of testing per ASTM B117

4. All hardware on the exterior of the housing including cover and latch to be stainless steel, zinc or steel with zinc alloy electroplate and chromate top coat.

5. Roadway luminaires are easy to open when properly mounted or when sitting on its top side when placed on the ground without the use of tools, unless specifically approved in writing. Ensure underpass luminaires are vandal-proof.

6. Have readily accessible internal parts.

7. Provisions for a slip fitter type mounting on nominal 2 in. (2-3/8” OD) pipe brackets or as indicated in ANSI C136.37.

8. Slip fitter mount is to allow a minimum 4 in, of the tenon on the pole or arm to be inserted in the luminaire mounting assembly.
   a. The mounting assembly is to permit any necessary adjustment to orient the luminaire with the roadway for proper light distribution. The luminaire fitter assembly must be approved by the Engineer.

9. The total weight of luminaire(s) and accessories in addition to the wind on the effective projected area (EPA) do not exceed the load capacity of the pole and arm.

11. Provide luminaires with a flat area on the top of the housing to allow a level to be used for proper orientation of the luminaire, or supply luminaires with an integral bubble level. Luminaires are to be installed parallel with grade of roadway below.

12. Provide luminaires that are capable of accommodating a photo-electric control receptacle (PECR). When used (see Contract for applicability) the PECR to be rotatable up to 359 degrees. Housing is to provide 360 degree stop to prevent the internal twisting of PECR wire assemblies resulting in potential electrical short. Seal the housing effectively and permanently around the PECR to prevent moisture ingress to the luminaire.
13. Designed to allow water shedding and prevent accumulation of debris on the luminaire or within the external cooling fins.

14. Passive cooling method to be employed with no energized or moving components to manage thermal output of LED light engine and power supply.

A. Electrical Requirements

Ensure that LED luminaires meet the following electrical requirements:

1. Electronic components capable of fully operating in a temperature range -40°C to +40°C (-40°F to 104°F).

2. Have an integral power supply.

3. Equipped with 7 pin photocell receptacle, even if unused. All wires shall be properly terminated and all pins connected so future wiring inside the fixture housing is not required.

4. Equipped with a power supply that operates within the voltage range specified in the Contract.

5. Equipped with a power supply that has a power factor of .90 or greater at full load.

6. Equipped with a power supply that has total harmonic distortion of 20 percent or less at full load.

7. Provide lumen output sufficient to meet the lighting criteria as specified in the Contract.

8. Equipped with an isolated power supply output for units under 100 watts.

9. Equipped with a power supply that has overheat protection and temperature foldback feature in driver such that as driver temperature approaches its operational limit, driver output is incrementally reduced until driver critical temperature stabilizes or reduces. As driver temperature returns to an acceptable value, driver output will return to set value.

10. Equipped with a power supply that is self-limited short circuit protected and over load protected.

11. Equipped with a power supply that is terminated with quick disconnect wire harnesses for easy maintenance. Wire nut termination is not acceptable.

12. Equipped with a terminal block for terminating pole wiring to the luminaire. The terminal block is to be a 3 station, tunnel lug terminal board that accommodates up to #8 AWG wire.

13. Have a life rating on all electrical components of 100,000 hours or greater when operating at a continuous 25°C ambient.

14. Electrical components protected per ANSI standard C136.2; test waveform is to be as described in ANSI C62.41.2; and type Category C environments as defined in ANSI C62.41.1.

15. Equipped with a UL-labeled, 3-wire surge protective device (SPD) that provides common and differential mode protection and an inductive filter circuit that reduces the amount of energy passed through to the electronics during a surge event. SPD to be thermally fused and have failure mode such that luminaire is off if SPD fails. SPD to provide ANSI C136.2-2015 Extreme (20kV/10kA) level of protection for the entire luminaire. The SPD shall be wired in series with the driver or as required to disconnect power to the luminaire in the event of SPD failure.
Section 927 — Luminaries, LED

B. LED Performance Requirements

Ensure that LED luminaires meet the following performance requirements:

1. Fully operate in a temperature range -40°C to +40°C (-40°F to 104°F).
2. Over its life, the luminaire shall experience no more than a 15% reduction in LED’s lumen output due to the operating temperature of the luminaire, compared to the LED’s lumen output when it is operating at 25°C.
3. Shall deliver no less than an average 80 percent of initial delivered lumens after 100,000 hours of operation when operated at 25°C.
4. Deliver a minimum rated life of 70,000 hours when operated at 25°C (77° F).
5. Deliver a luminaire efficacy of a minimum of 100 lumens/watt.
6. Meet the Chromaticity requirements as follows:
   a. The colors conform to the following color regions based on the 1931 CIE chromaticity diagram.
      1) Color Temperature: 4000K (3710-4260K)
      2) Color Rendering Index (CRI): greater than or equal to 70
   b. Intensity and Chromaticity as stated above must be confirmed by an independent test lab.

E. Optical Requirements

Ensure that LED luminaires meet the following optical requirements:

1. The light distribution pattern at the road surface is to have an evenly dispersed appearance.
2. Provide the IES pattern as identified on the Contract.

F. Fabrication

General Provisions 101 through 150.

G. Acceptance

1. General Provisions 101 through 150.
2. Each Luminaire to be evaluated by the Department for proper operation under a 30-day burn-in period after installation. If any failures are found in the first 30 days after installation, the Luminaire is to be replaced at no cost to the Department and be evaluated for another 30 days from the time of its installation. The system is acceptable when all luminaires pass the 30-day burn-in period with no failures.

H. Materials Warranty

1. General Provisions 101 through 150.
2. The entire Luminaire assembly including material, finish, workmanship, power supply, LED modules and lumen maintenance is to have a minimum of ten (10) year warranty from the date of installation. On-site replacement includes transportation, removal and installation of new products. Finish warranty includes deterioration such as blistering, cracking, peeling, chalking or fading.
3. The warranty must be transferrable from the contractor to the Department and to the final local jurisdiction having responsibility for operation and maintenance.
Section 934—Rapid Setting Patching Materials for Portland Cement Concrete

934.1 General Description
This section includes the requirements for rapid setting patching materials used in Portland cement concrete.

Federal Hazardous Products Labeling Act
QPL 27

934.2 Materials
934.2.01 Rapid Setting Patching Materials
A. General Requirements
   1. Use rapid setting patching materials that have the following characteristics:
      - Are nonmetallic.
      - Have a color similar to Portland cement concrete.
      - Can be mixed and placed like concrete.
      - Have accelerated hardening characteristics.
      - Yield a permanent patch in concrete that can withstand traffic within 2 hours.

   For a list of sources, see QPL-27.

   2. Type I
      Use Type I to patch reinforced or nonreinforced horizontal Portland cement concrete surfaces.

   3. Type II
      Use Type II to patch only nonreinforced horizontal Portland cement concrete surfaces.

   4. Type III
      Use Type III to patch reinforced vertical or overhead Portland cement concrete surfaces.

   5. Classify Type I, Type II, and Type III as follows:
      a. Class A, Premixed: Use these materials as received by adding water or an activator solution, according to the manufacturer’s instructions.
Section 934 — Rapid Setting Patching Materials for Portland Cement Concrete

NOTE: Do NOT add extra aggregate to Class A patching material without approval from the Office of Materials and Research.

b. Class B, Non-Premixed: These materials contain no aggregate. Add aggregate (fine and/or coarse) according to the manufacturer’s recommendations.
c. Class B, Non-Premixed: These materials contain no aggregate. Add aggregate (fine and/or coarse) according to the manufacturer’s recommendations.

6. Type IV
Use elastomeric patching material to patch nonreinforced horizontal Portland cement concrete surfaces.

7. Type V
Use two-component cross linked resins to patch nonreinforced horizontal Portland cement concrete surfaces.

8. Type VI
Use cementitious, rapid setting, structural repair mortar to patch nonreinforced horizontal Portland cement concrete surfaces.

B. Physical Requirements

1. Use Type I, Type II, and Type III patching materials that have been evaluated by the National Transportation Product Evaluation Program (NTPEP) or other approved test facility, and meet the following requirements.

C. Fabrication

1. Packaging
   a. Package this material in strong, moisture-proof paper bags or other suitable containers that can withstand shipping, normal handling, and storage without breaking.
   b. Clearly label each container of the components of a patching system with the following information:
      - Component designation, if two components.
      - Manufacturer’s batch number.
      - Mixing ratio and directions.
      - Potential hazards and precautions displayed according to the Federal Hazardous Products Labeling Act.

D. Acceptance

1. Follow the mixing instructions of the manufacturer to create test specimens.
2. Air-cure all test specimens except for the 7-day moisture cure cubes.
3. Test Types I, II, and III using the following methods:

<table>
<thead>
<tr>

</tbody>
</table>

4. Shear Bond Strength
   a. Place a Type II epoxy resin adhesive meeting the requirements of Section 886 on the surface of a cured mortar bar 16 x 3 x 3 in. (400 x 75 x 75 mm).
   b. Cast a 16 x 2 x 0.5 in. (400 x 50 x 13 mm) rapid-setting material patch in the center of the mortar base.
   c. Air-cure the test sample for 24 hours.
   d. Saw the mortar bar base and the cured rapid setting material patch into 2 in. (50 mm) segments for testing.
   e. Use a holding device and plunger to apply a load at a rate of 0.05 in. (1.3 mm) per minute to the patch until the patch fails.
   f. Read the load in pounds (newtons) on the plunger.
   g. Calculate the shear bond strength in pounds per square inch by dividing the load in pounds by the interfacial area of the patch in square inches. Calculate the metric equivalent for shear bond strength in MPa by dividing the load in newtons by gravitational acceleration (9.81 m/s²).

5. Use Type IV, Type V and Type VI patching materials that have been evaluated by NTPEP, and received a subjective field rating of ≥ 4 on an ascending scale from 1 to 5.
6. The Department will reject a patching system that meets all the requirements of this specification, but does not work as required in actual use.
E. Materials Warranty

Ensure that the material has a minimum storage life of at least 1 year under conditions of 40° to 90° F (4° to 32° C) and maximum relative humidity of 90 percent.
Section 935 — Fiber Optic System

935.1 General Description
This work includes the installation of fiber optic cable and equipment including but not limited to cable, interconnect, patch cords, FDC interconnect cables/pig tails, any cable related hardware, connectors, splices, closures, temporary systems, testing, training, or any other fiber optic product as specified on the plans, or noted in any other Section of these specifications. Provide all equipment and materials of like kind and function to be of the exact same manufacture, model, revision, firmware, etc.

935.1.03 Submittals

Prior to any work, obtain approval from the Engineer for the products and procedures to be used on the Project.

Use only equipment and materials that meet the requirements of these minimum specifications and are on the Department’s Qualified Products List (QPL). Products appearing on the Qualified Products List (QPL) are exempt from normal submittal requirements. These products have been evaluated by the Office of Traffic Operations and have proven their capability of meeting the appropriate Georgia Department of Transportation Specification. Any of these products may be used without submitting catalogue cuts, sampling or pre-testing. The Contractor shall submit a letter to the Engineer, stating which QPL items they will use. The Engineer and/or department designee must ascertain that the construction item is the same material identified on the appropriate QPL and will acknowledge receipt of these items in the project diary or as required by the Construction Manual.

Submit submittal data for test procedures, and routine maintenance procedures required for the items furnished under this specification within sixty (60) calendar days after the Notice to Proceed and prior to any installation, unless noted otherwise in the Contract Documents.

Submit to the Engineer service and maintenance documentation for each item furnished under this specification. Provide two (2) bound hard copies and an electronic copy as pdf documents.

A. Cable Certification

Prior to installing any fiber optic cable on the Project, provide detailed information for the cable type, cable manufacturer, fiber content, design and installation procedure to the Engineer. Request approval by certification from an independent testing (third party) laboratory that certifies the fiber optic cable is the same as that on the Department’s QPL.

B. Aerial and Underground Splice Closures Certification:

Provide certification from an independent testing laboratory that certifies that the splice closures are identical to those on the Department’s QPL.
C. Fiber Distribution Center (FDC) Certification

Provide certification from an independent testing laboratory that certifies that the Fiber Distribution Centers provided are identical to those on the Department’s QPL.

D. Fiber Optic Test Documentation

Within 60 days from the NTP, provide the date, time and location of any tests required by this specification (see 935.3.06) to the Engineer at least 72 hours before performing the test. Provide two copies of documentation of the test results to the Engineer within 5 working days of completion of the test for review and approval, or else retest the represented fiber optic cable and provide the documentation within 5 working days of the retest. Bind the test documentation and include the following:

1. OTDR Set-Up: Cable & Fiber Identification
   a. Cable ID
   b. Cable Location - begin and end point
   c. End-to-end cable length in kilometers calculated from cable markings
   d. Fiber ID, including tube and fiber color
   e. Operator Name
   f. Date & Time

2. OTDR Test Parameters: Information to be recorded on each trace
   a. Wavelength
   b. Pulse width
   c. Refractory index
   d. Range
   e. Scale

3. Test Results
   a. OTDR Test
      • Total Fiber Trace distance in kilometers
      • Splice Loss attenuation in dB per km
      • Events > 0.01 dB
      • Trace analysis detailing all events exceeding 0.01 dB

Provide OTDR traces meeting Telcordia GR-196-CORE (Issue 2) data format requirements. With advance approval by the Engineer, an alternative format may be used, providing a licensed copy of the software is provided to the Department at no additional cost to the Department.

Provide all traces in electronic format to the Engineer.

At a minimum, ensure the data includes: cable ID, fiber number, buffer tube, FDC port, fiber distance, test wave length, attenuation in dB per km. Obtain data requirements for each project from the Engineer.

b. Power Meter End – To – End Attenuation Test
   • Perform this test on each fiber link using test procedures described in document EIA/TIA 526 sections 7 & 14A.
   • For each test, document length, number and type of splices and connectors
   • For each test, document link attenuation
   • Provide test data to the Engineer in Excel or compatible spreadsheet form and on a CD.
4. As-Built Documentation

The as-built documentation shall meet all requirements in the Section 940 specifications. In addition to those requirements, the as-built documents shall include final splicing and fiber allocation details for every splice location.

935.2 Materials

Furnish and install all fiber optic parts, materials, components, and equipment consistent and compliant with the latest version or edition of the standards and industry practices specified in Section 935.1.02.B. If a conflict of difference exists between the requirements contained in the specified standards and practices and the requirements contained in these Specifications, use the most stringent material requirement for this contract. Notify the Engineer of any such conflicts or differences prior to procurement of materials and components.

A. Fiber Optic Cable

Ensure all fiber optic related products conform to this specification. Install, apply, inspect, and use those products in accordance with the manufacturer’s standard operating and installation procedures and this Specification.

Ensure optical fiber used in both outside and inside plant cable conforms to the requirements specified herein as well as the industry standards and practices listed in Section 935.1.02.

Ensure all fiber optic cable on this project comes from a currently ISO9001 certified manufacturer who is regularly engaged in the production of this material using the processes noted within this Specification. All outside plant fiber optic cable used on each individual project shall be from only one manufacturer and manufacturer production batch.

Use only cable that is new (manufactured no more than eight months prior to the project Notice to Proceed) and of current design and manufacture.

Ensure that all optical fibers in the cable are usable fibers.

The fiber optic cable type, configuration, and installation method will be detailed on the Plans, Drawings, Details, Specifications and in the pay items. Ensure cable and cable installation conforms to all requirements within the Plans and Specifications.

B. Outside Plant (OSP) Cable

This section sets forth the general standards for fabrication and design of outside plant fiber optic cable.

1. OSP Cable Construction

   a. General Requirements: Ensure OSP cable is an accepted product of the United States Department of Agriculture Rural Utilities Service (RUS) as meeting the requirements of 7 CFR 1755.900. Only use optical fibers that are placed inside a loose gel-free buffer tube.

   b. Buffer Tubes: Ensure each buffer tube contains 12 fibers for all fiber optic cables unless specified otherwise. Ensure fibers cannot adhere to the inside of the buffer tube. Ensure the fibers utilize dry water-blocking materials and construction. Ensure the fiber optic cable includes loose buffer tubes that isolate internal optical fibers from outside forces and provides protection from outside forces and provide protection from physical damage as well as water ingress and migration.

   c. Cable Core: Protect the cable core with a water blocking material. Ensure water blocking material is non-nutritive to fungus, electrically non-conductive and homogenous.

   d. Strength Members: Use a central anti-buckling member consisting of a glass reinforced plastic rod to prevent buckling of the cable. Use high tensile strength aramid, fiberglass, or a combination of aramid and fiberglass yarns to provide tensile strength.
Section 935 — Fiber Optic System

e. Ensure color scheme meets EIA/TIA-598-B, *Color Coding of Fiber Optic Cable*.

f. Cable Jacket: Include in the cable at least one ripcord under the sheath for easy sheath removal.

g. Helically strand the high tensile strength yarns evenly around the cable core.

h. Sheath all dielectric cables with medium density polyethylene. Ensure the minimum nominal jacket thickness is 0.06 in. (1.5 mm). Apply jacketing material directly over the tensile strength members and water-blocking compound. Ensure the polyethylene contains sufficient carbon black to provide ultraviolet light protection and prevent the growth of fungus.

i. Ensure the jacket or sheath is free of holes, splits, and blisters.

j. Ensure the cable jacket contains no metal elements and is of a consistent thickness.

k. Marking: Mark cable jackets using the following template, unless otherwise shown in the plans:

l. Manufacturer’s Name - Optical Cable - Year - Telephone Handset Symbol – GA DOT - Description

m. For Description of Single-Mode Cable use: XXF SM where XX denotes the fiber count

n. Mark the cable length every meter, every 2 ft. if marking the cable in English units. Ensure the cable length markings are within -0/+1% of the actual cable length.

o. Provide cable marking that is contrasting in color to the cable jacket. Provide cable marking with character heights of approximately 0.10 in. (2.5 mm).

2. Additional Requirements for Loose Tube Cable

a. Use only cable that is all dielectric, loose tube design. Ensure buffer tubes are stranded around a central member using the reverse oscillation, or “SZ”, stranding process.

3. Cable Performance

Ensure all OSP cable meets or exceeds the requirements of the Fiber Optic Test Procedure (FOTP) criteria referenced in 7 CFR 1755.900. Upon the request of the Department, provide certification from an independent testing laboratory certifying the cable conforms to the specifications and test procedures.

a. Pulling Tension: Ensure the cable can withstand a maximum pulling tension of 600 lbf (2.7 kN) during installation (short term) and 200 lbf (890 N) installed (long term).

b. Temperature Range: Provide only OSP cable designed to endure exposure to shipping, storage, and operating temperatures of -30 °F to +158 °F (-34 °C to +70 °C). Provide only OSP cable designed to endure exposure to installation temperatures of -20 °F to +140 °F (-30 °C to +60 °C).

C. Inside Plant (IP) Cable

This section sets forth the general standards for fabrication and design of inside plant fiber optic cable.

1. IP Cable Construction

a. Strength Members: For the strength member, use a high modulus U.S. manufactured aramid yarn. Ensure non-toxic, non-irritant talc is applied to the yarn to allow the yarns to be easily separated from the fibers and the jacket. For all IP cables used in plenum structures, use only IP cable that meets NEC UL-910 requirements for plenum rated cables.

b. Cable Jacket: Ensure the jacket to be continuous, free from pinholes, splits, blisters, or other imperfections. Ensure the jacket is smooth, as is consistent with the best commercial practice. Ensure the jacket provides the cable with a tough, flexible, protective coating, able to withstand the stresses expected in installation and service.

c. Use yellow cable jackets for single mode.
Section 935 — Fiber Optic System

d. Design the cable jacket for easy removal without damage to the optical fibers by incorporating a ripcord under each cable jacket. Ensure that a non-toxic, non-irritant talc is applied to the aramid/fiberglass yarns to allow the yarns to be easily separated from the fibers and the jacket.

e. Ensure the nominal thickness of the cable outer jacket is sufficient to provide adequate cable protection while meeting the mechanical, flammability, and environmental test requirements of this document over the life of the cable.

f. Color: Use color coded individual fibers for identification. Ensure color coding complies with EIA/TIA-598-B Optical Fiber Cable Color Coding as stated in 935.2.B.1.e.

g. Marking: Mark the outer cable jacket at least every 3 ft. (1 m) with the manufacturer's name or UL file number, date of manufacture, fiber type, flame rating, UL symbol, and sequential length marking (e.g. 62.5/125 MICRON Type OFNR - UL). Use print color that contrasts to the color of the jacket and is permanent and legible for the life of the cable.

2. Fabrication by Cable Type

a. Interconnect Cables: Use interconnect cable to connect the distribution panels of a fiber optic cable plant with the actual electronic devices. Fabricate interconnect cable by surrounding the 900 \( \mu \)m tight buffered fibers with layered U.S. manufactured aramid yarns and a jacket of PVC or Copolymer depending on NEC requirements. Use the aramid yarns as tensile strength members.

b. FDC Interconnect Cable: Use this cable to splice a factory connectorized multifiber pigtail cable on to an OSP cable end, routing that cable within an FDC and its splice cabinet, and connecting to the termination panels of the FDC. Construct FDC interconnect cable of 900 \( \mu \)m tight buffered fiber (single mode or multi-mode optical fiber) surrounded with U.S. manufactured aramid fibers, and jacketed with flame retardant jacket material. Match the fiber count and buffer tube configuration of the FDC interconnect cable to be exactly equivalent to the OSP cable being terminated in the FDC, unless additional fibers (using other buffer tube colors) are required for an FDC that is larger than the OP cable. Use a yellow exterior jacket for the FDC interconnect cable for single-mode.

3. Temperature Range

a. Ensure the cable is designed to endure exposure to a storage temperature range of -30°F to +158°F (-34°C to +70°C) while stored on the original shipping reel. Ensure riser cables are designed to endure an operating temperature range of 0°F to +158°F (-18°C to +70°C). Ensure plenum cables are designed to endure an operating temperature range of 32°F to +160°F (0°C to 71°C).

4. Crush Resistance Requirements

a. Ensure the cable can withstand a minimum compressive load of 0.061 plf (0.89 N/m) applied uniformly over the length of the compressive plate. Use only cable that has been tested in accordance with FOTP-41, Compressive Loading Resistance of Fiber Optic Cables.

5. Impact Resistance Requirements

a. Use only cable that can withstand a minimum of 20 impact cycles. Use only cable that has been tested in accordance with FOTP-25, Repeated Impact Testing of Fiber Optic Cables and Cable Assemblies.

6. Flammability

a. Use only cables that are UL-listed in accordance with NEC, Article 770. Use only Riser cables (OFNR) that pass UL-1666. Use only Plenum cables (OFNP) that pass UL-910.
Section 935 — Fiber Optic System

D. Patch Cords and FDC Interconnect Cables/ Pig Tails

1. Patch Cords

Use patch cords consisting of a length of fiber optic cable terminated on both ends. For all IP cables used in plenum structures, use only IP cable that meets NEC UL-910 requirements for plenum rated cables.

a. Fabrication: Ensure all factory preconnectorized assemblies adhere to the applicable cable, cordage, and fiber specifications stated in these Specifications.

b. Ensure all inside plant (IP) patch cords meet NEC jacketing requirements.

c. Use orange outer jackets for multimode and yellow jackets for single mode.

d. Use connector boots of two (2) colors for all duplex patch cords, zip cord or round. Use white or off white for one leg of the duplex cord (non-printed zip leg) and red for the opposite leg (printed zip leg) of the duplex cord.

e. For all assemblies for outside plant (OSP) where loose tube is used, include a fan-out kit installed at each connectorized end.

f. No splices of any type are allowed within a patch cord assembly.

g. Factory testing: Fully test each assembly and place those test results on a test tag for each mated pair of connectors. Attach the tag to one end of each pair within the assembly.

h. Individually package each assembly within a plastic bag and clearly mark on the outside of that bag the submitted manufacturer’s part number.

2. Factory Connectorized FDC Interconnect Cables/Pig Tails

a. Use FDC interconnect cables/pig tails consisting of a length of fiber optic cable of one single fiber terminated on one end. Use only FDC interconnect cables/pig tails with factory installed connectors in accordance with Subsection 935.2.F. Provide FDC interconnect cables/pig tails with 900 micron tubing or 3 mm fan out tubing as required for the application. Use FDC interconnect cables/pig tails with 900 micron tubing only when fully enclosed within an FDC. Ensure that the other end of the cable is properly prepared for splicing to another cable. Provide FDC interconnect cable/pig tail in conformity with the same construction and testing requirements as patch cords.

E. Drop Cable Assembly – Outside Plant

Drop cable assembly is defined as a connectorized fiber optic cable (drop cable) and appropriate fan out (if required) used for connectivity between a primary fiber trunk or feeder cable and field devices such as signal controllers, closed circuit television cameras, video detection system cameras, changeable message signs, etc.

1. General Requirements

Provide a loose tube design drop cable in the drop cable assembly meeting the requirements for outside plant cable as specified in Subsection 935.2.B. Provide the drop cable assembly type (multimode, single-mode or hybrid) and fiber count specified in the plans.

2. Assembly Fabrication

Provide a drop cable assembly as specified in the plans and meeting the following requirements. Use only drop cables that are factory pre-terminated, use splice-on factory-connectorized pigtails/FDC interconnect cables, or are included in pre-terminated FDCs. For factory pre-terminated drop cable assemblies, label each individual fiber with its drop cable fiber number ("1," "2," etc.) on a self-laminating clear overwrapping label on the fan-out tubing within 2 in. (50 mm) of the terminating fiber connector.

a. Pre-terminated Drop Cable Assembly: Install pre-terminated drop cable assemblies with loose tube design fiber optic cable, factory-installed fiber optic connectors in accordance with Subsection 935.2.F on each drop cable fiber, and factory-assembled fan outs with 3 mm fan out tubing.
Section 935 — Fiber Optic System

b. Field-spliced Drop Cable Assembly: Install field-spliced drop cable assemblies with loose tube design fiber optic cable, fusion spliced factory-connectorized pigtails/FDC interconnect cables, in accordance with Subsection 935.2.D and Subsection 935.2.F on each drop cable fiber.

c. Fan Out - Loose Tube Cable Design: Install field-installed fan outs with 3 mm fan out tubing in accordance with Subsection 935.3.05.J. Additionally, secure the fan out tubing to the main cable sheath in a hard epoxy plug transition that extends a minimum of 2.0 in (50 mm) onto the cable and 2.0 in (50 mm) onto the 3 mm tubing.

F. Fiber Optic Connectors

Furnish and install LC compatible connectors unless otherwise specified. Use ceramic ferrule ultra polish connectors (UPC) for single-mode applications for all connector types. Install connectors as per manufacturer application and recommendations, including proper termination to the outer-tubing.

Use UPC connectors rated for an operating temperature of -40 °F to +167 °F (-40 °C to +75 °C).

Use only factory-installed UPC connectors for all applications except where shown in the plans for specifically permitted applications in accordance with 935.2.E.2. Use factory-installed UPC connectors installed with a thermal-set heat-cured epoxy and machine polished mating face. Do not use field-installed fiber optic connectors.

Where barrel couplers are used in passive termination applications such as FDCs, use only ST compatible ceramic-insert couplers. Use only manufacturer recommended single-mode couplers for single-mode connector applications. Provide dust caps for both sides of couplers at all times until permanent connector installation.

Provide connectors listed below that do not exceed the maximum loss listed for each connector.

<table>
<thead>
<tr>
<th>Connector Type</th>
<th>Installation</th>
<th>Max. Loss</th>
<th>Typical Loss</th>
<th>Optical Return Loss</th>

G. Splice Closure - Underground

1. Use

Provide closures designed for use under the most severe conditions such as moisture, vibration, impact, cable stress and flex temperature extremes. Ensure splice closures meet or exceed minimum physical requirements listed in the following subsection:

2. Physical Requirements

a. Use cylindrical closures or rectangular dome type closures with cable entries at one end only and sealed one-piece high-density polyethylene dome bodies.

b. Ensure splice closures are suitable for ECB or pull box applications as shown in the plans.

c. Ensure splice closures prevent the intrusion of water without the use of encapsulate.

d. Ensure splice closure cable entry ends have flexible thermoplastic rubber end seals with pre-template cable ports.

e. The closure size shown in the plans specifies the number of splices to be accommodated by the closure. With the closure, provide all materials to accommodate the number of splices specified by the closure size, including splice tray, storage, and organizing materials.

f. Provide splice closures capable of accommodating splice organizer trays that accept mechanical, fusion, or multi-fiber array splices. Use splice closures having provisions for storing fiber splices in an orderly manner, mountings for splice organizer assemblies, and space for excess or non-spliced fiber. Use splice organizers that are re-enterable and re-sealable.
g. Use only UL rated splice cases. Where high fiber count (144 to 432) splice cases are required, use cases that have an external pressurization port for optional pressurization.

h. Provide splice closures that do not require the use of specialized tools, equipment, or additional parts for re-entry and subsequent reassembly.

i. Provide splice closures with provisions for controlling fiber bend radii to a minimum of 1.5 in. (38 mm).

H. Splice Closure - Aerial

1. Use
   a. Provide splice closures designed for use in aerial applications and conform to the requirements below:

2. Physical Requirements
   a. Use cylindrical closures or rectangular dome type closures with cable entries at one end only and sealed one-piece high-density polyethylene dome bodies. Provide splice closures designed for free breathing splice protection without the use of encapsulate. Provide splice closures designed as fully assembled weather tight closures. Ensure splice closure cable entry ends have flexible thermoplastic rubber end seals with pre-template cable ports.

   b. Provide splice closures utilizing corrosion resistant aluminum or stainless steel hardware. Provide splice closures designed in such a way as to allow complete splice access after closure placement, without requiring removal of the closure or electrical bonds from the cable. Provide splice closures suitable for straight, butt or branch splices. Provide splice closures that include provisions for strain relief, both around the cable jacket and to internal cable strength members. Provide aerial closures designed in such a manner that shall eliminate the need for drip collars and sealing collars.

   c. The closure size shown in the plans specifies the number of splices to be accommodated by the closure. With the closure, provide all materials to accommodate the number of splices specified by the closure size, including splice tray, storage, and organizing materials.

   d. Ensure all closures are the appropriate size to accommodate the number and type of fiber cables used and fit within the space available.

3. Optical Fiber Organizer
   The fiber organizer is a system that holds splice or organizer trays in such a way as to protect and support cable splices within an environmentally protected area. Provide organizer trays capable of storing all common splices; fusion and mechanical, in all configurations; butt, inline and branch (with up to four branch cables). Ensure all trays are completely re-enterable. Ensure organizers themselves accept a minimum of four trays, and provide bonding and grounding hardware.

I. Mechanical Lab Splice

Insertion Loss:
Single Mode < 0.30 dB
Operating Temperature:
-23 °F to 77 °F (-31 °C to 25 °C)

J. Fiber Distribution Center (FDC)

1. Use rack-mount, wall-mount, or pre-terminated FDCs as specified in the plans. Use rack-mount, wall-mount, or pre-terminated FDCs in all field cabinets, including all types of ITS and traffic signal cabinets, unless specifically excepted in the plans.

2. Use rack-mount and wall-mount FDCs and FDC splice cabinets with enclosures and mounting components of metallic construction. Use FDC interconnect cable for all OP cable terminations in rack-mount and wall-mount FDCs unless otherwise specified in the plans.
3. Use FDCs that fit standard 19 in. EIA equipment racks or cabinets.

4. Use rack-mount FDCs of specified sizes 6-fiber through 24-fiber having front-opening swing-out drawers for access to fiber splicing trays and fiber termination couplers. When closed, ensure swing-out drawers provide dust-tight seals completely enclosing fiber splicing trays, fiber termination couplers, and connecting ends of fiber patch cords connected to couplers.

5. Use rack-mount FDCs of specified sizes 36-fiber through 60-fiber having fixed-mounted front-facing fiber termination couplers accessible behind a removable transparent plastic dust cover.

6. Use FDC’s that are sized to fit within the available space of the cabinet.

7. Use rack-mount FDCs of specified sizes 60-fiber through 144-fiber that include a separate FDC splice cabinet installed adjacent to the FDC. Alternately, rack-mount FDCs with splice cabinets integral to the overall FDC enclosure but contained in a separated compartment either above or below the FDC termination couplers.

8. Provide rack-mount or wall-mount FDCs with appropriate quantities of couplers, panels, splice trays, organizers, factory-connectorized pigtails/FDC interconnect cables, and ancillary materials to terminate the number of fibers as specified by the FDC size, regardless of the cable size to be terminated as shown in the plans. Use only FDC interconnect cables for FDCs 30-fiber and larger. Where factory pre-terminated drop cable assemblies are permitted and to be used, do not provide splice trays.

9. Use pre-terminated FDCs that are factory manufactured assemblies of fiber optic drop cable with factory-installed fiber connectors and integral ruggedized fiber connector enclosures. Use pre-terminated FDCs of the sizes specified in the plans. Use ruggedized fiber connector enclosures of thermally stable rigid plastic housings fully potted with a thermally stable epoxy filling that encapsulates the drop cable fan out, fibers and connector bodies. Use permanent labels on the enclosure with contrasting color to identify each connector body by its associated fiber number.

10. For FDCs of all types, provide couplers with dust caps in accordance 935.2.F. Use only LC compatible couplers unless otherwise specified.

K. Fiber Optic Snowshoes

Use industry standard fiber optic snowshoes that are factory-manufactured fiber optic cable storage brackets designed for aerial installation on messenger wire cable support spans.

935.2.01 Delivery, Storage, and Handling

Package the cable for shipment on reels. Each package shall contain only one continuous length of cable. Construct the packaging so as to prevent damage to the cable during shipping and handling.

Seal both ends of the cable to prevent the ingress of moisture.

Attach to each reel, a weatherproof reel tag identifying the reel and cable in such a manner to ensure the manufacturing history of the cable and the fiber can be traced by the manufacturer.

Include with each cable a cable data sheet containing the following information:

- Manufacturer name
- Cable part number
- Factory order number
- Cable length
- Factory measured attenuation of each fiber
- Bandwidth specification (where applicable)
- Index of refraction
935.3 Construction Requirements

Ensure all fiber optic parts, materials, components and equipment installed on this contract are consistent and compliant with the latest version or edition of the standards and industry practices specified in Section 935.1.02.B. If a conflict of difference exists between the requirements contained in the specified standards and practices and the requirements contained in these Specifications, use the most stringent material requirement for this contract. Notify the Engineer of any such conflicts or differences prior to procurement of materials and components.

935.3.01 Personnel

General Provisions 101 through 150.

935.3.02 Equipment

Furnish a portable fiber optic light source and power meter test set for testing the fiber optic cable. Provide a test set matched, calibrated and referenced to work as a synchronized test system.

Retain ownership of this equipment.

935.3.03 Preparation

General Provisions 101 through 150.

935.3.04 Fabrication

General Provisions 101 through 150.

935.3.05 Construction

A. OSP and IP Cable Installation

Secure from the cable manufacturer the construction and installation procedures to be used on the project. Produce a detailed construction and installation procedure (SOP) covering all aspects of the construction and installation process for each and all specific cable to be used on this project. Submit the SOP to the Engineer for review and approval.

B. Cable Installation Procedures and Standards

1. Safety Precautions

   Follow all appropriate OSHA and industry standards related to safety when working in manholes or underground vaults and when handling optical fibers.

2. Cable Handling

   Install all fiber optic cable according to the manufacturer’s recommended procedures and these specifications.

3. Pulling Tension

   Do not exceed the maximum recommended pulling tension during installation as specified by the cable manufacturer.

4. Allowable Bend Radius

   Do not violate the minimum recommended bend radius during installation as specified by the cable manufacturer. Unless the manufacturer’s recommendations are more stringent, use the following guidelines for minimum bend radius:

<table>
<thead>
<tr>
<th>Radius Type</th>
<th>Minimum Radius</th>
</tr>
</thead>
<tbody>
<tr>
<td>Short Term - During Installation</td>
<td>20 X Cable Diameter</td>
</tr>
<tr>
<td>Long Term - Installed</td>
<td>10 X Cable Diameter</td>
</tr>
</tbody>
</table>

5. Cable Installation Guidelines

   Before the installation begins, carefully inspect the cable reels for imperfections such as nails that might cause damage to the cable as it is unreeled.

   Take all necessary precautions to protect reeled cable from vandals or other sources of possible damage while unattended. Any damage to the cable sections may require replacement of the entire section.
Whenever unreeled cable is placed on the pavement or surface above a manhole, provide means of preventing vehicular or pedestrian traffic through the area in accordance with Section 150 of the specifications.

Use the "figure-eight" cable lay configuration to prevent kinking or twisting when the cable is unreeled or backfed. Do not coil fiber optic cable in a continuous direction except for lengths of 100 ft. (30 m) or less. When "figure-eighting" cable, exercise care to relieve pressure on the cable at the crossover of the eight. This may be done by placing cardboard shims at the crossover or by forming a second "figure-eight".

Keep the cable continuous throughout the pull. Cable breaks are allowed only at designated splice points.

Where messenger cable is required, as shown in the plans, lash aerial fiber optic cable to a steel strand wire messenger cable of the size specified in the plans that conforms to Georgia Department of Transportation specification 915.02.

6. Cable End Sealing

Where a cable ends without termination in a fiber optic closure, seal the end of the cable by re-using a cable end cap shipped with a cable reel, or use a cap that is size-matched to the cable to be sealed. Clean the end of the cable. Partly fill the cap with a waterproof silicone adhesive sealant and press the cap fully onto the cable end, rotating the cap to fully encapsulate the cable end with the sealant in the cap. Apply a full sealant bead between the end of the cap and the cable jacket.

C. Cable Storage

At designated intervals throughout the cable plant, pull and store excess cable for slack for future terminations or splicing.

Properly store all cable to minimize susceptibility to damage. Maintain proper bend radius, both short and long term, during cable storage.

Communication and Pull Boxes: Store the excess or slack cable in the pull box or communication box in accordance with the plans details.

Hub/TMC/TCC: Properly store the cable in cable troughs and plenum applications which meet NEC requirements.

Aerial Installations: Store the excess or slack cable at storage loops in a "bow tie" configuration on the messenger strand using two fiber optic snowshoes (aerial fiber cable storage brackets) that maintain the proper bend radius in the fiber cable. Install one fiber optic snowshoe for drop cable and trunk cable storage at aerial splice closures to maintain the proper bend radius in the fiber optic cable.

In Cable Storage Requirements - Underground (OSP) & IP

Unless otherwise noted on the plans, the following are the requirements for cable storage for underground and IP applications:

a. Pull Box – (Types 4, 4S, 5, 5S, 6, and 7) Apply the following storage requirements for the indicated cable/closure situations.

- Drop cable with no closure – 10 ft. (3 m)
- One or more trunk cables with no closure – 110 ft. (34 m) of each cable
- Two or more trunk cables with one closure – store 55 ft. (17 m) of each trunk cable so that the closure can be removed from the pull box approximately 55 ft. (17 m). If a drop cable is spliced to the trunk cable at this point, store 55 ft. (17 m) of each drop cable.
- One trunk cable with one closure – 110 ft. (34 m) Install closure in the center of the 110 ft. (34 m) cable loop, so that the closure can be removed from the ECB approximately 55 ft. (17 m). If a drop cable is spliced to the trunk cable at this point, store 55 ft. (17 m) of each drop cable.
- One trunk cable with one closure and trunk cable ends – 95 ft. (30 m). Install closure on the trunk cable at 55 ft. (17 m) from the pull box. If a drop cable is spliced to the trunk cable at this point, store 55 ft. (17 m) of each drop cable.
- Trunk cable ends with no closure – 95 ft. (30 m)
b. Hub Building (interior) – Do not store slack cable inside the hub building.

c. Hub Building (exterior adjacent ECBs) – 180 ft. (55 m)

d. Traffic Control Center & Transportation Management Center (OSP splice vault) – 180 ft. (55 m)

e. Traffic Control Center & Transportation Management Center (IP at equipment room) – cable entrance to distribution panel bay plus 20 ft. (6 m)

f. Electrical Communication Box (ECB) - (Types 3, 4, 5, and 6) Apply the following storage requirements for the indicated cable/closure situations. More than one situation may occur in a single electrical communication box, in which case apply each appropriate requirement.

- Trunk cable with no closure – 110 ft. (34 m)
- Trunk cable with one closure – 110 ft. (34 m). Measure the storage amount from the top of the ECB manhole opening. Install closure in the center of the 110 ft. (34 m) cable loop, so that the closure can be removed from the ECB approximately 55 ft. (17 m). If a drop cable(s) is spliced to the trunk cable at this point, store 55 ft. (17 m) of each drop cable.
- Trunk cable with one closure and trunk cable ends – 95 ft. (30 m). Install closure at 55 ft. (17 m) from the ECB on the trunk cable. If a drop cable(s) is spliced to the trunk cable at this point, store 55 ft. (17 m) of each drop cable.
- Trunk cable ends with no closure – 95 ft. (30 m)

7. Minimum Cable Storage Requirements - Aerial Applications

Unless otherwise noted on the plans, the following are the minimum requirements for cable storage for aerial applications:

a. Install a minimum 150 ft. (45 m) storage loop approximately one half the distance between every equipment drop or as shown in the plans. Where equipment drops are greater than 1000 ft (300 m) apart, install a minimum 150 ft. (45 m) storage loop for every 1000 ft. (300 m) of uninterrupted cable length.

b. At aerial splice closures, install 75 ft. (23 m) of drop cable storage and 150 ft. (45 m) of trunk cable storage, unless otherwise noted in the plans, to allow the fully assembled closure, including the trunk cable and drop cable, to be lowered to ground level for maintenance purposes.

D. Cable Splicing

Splice together each individual reel of fiber optic cable to provide the continuous length of installed cable called for on this Project. Splice cable only at splice points designated on the plans or at locations approved by the Engineer. Make no splices within a patch cord assembly or drop cable.

E. Mid Span/Drop Access

At points where mid span/drop access is required, keep all fibers intact except those being accessed for the equipment drop. Use a suitable tool for removing fibers from the buffer tube to prevent damage to the fibers remaining intact.

F. Connector Termination Procedures

Only use procedures for the termination of the connectors meeting the process set out in that connector manufacturer’s standard operating procedure (SOP) for the field installation.

G. Cable Marking

1. Materials

a. Use 2-1/2 in. (63.5 mm) wide, 4 in. (100 mm) long, wrap-around type cable markers suitable for underground and aerial use. Use UV stabilized marker material and printing inks to provide an aerial durability of at least five years.
b. Print text in bold black type on orange or yellow PVC markers, as specified in Section 935.3.05.G.2. Fabricate markers from PVC base material with a minimum thickness of 0.015 in. (0.38 mm). Pre-print the following text, or alternate text shown in the plans, legibly on markers used for all cables:

c. Cable ID: XXXXXXX
   GA DOT
   Optical Cable

d. Where XXXXXXX is the appropriate cable ID as defined in the plans. Print the text specified above twice on every cable marker with the text of the second image reversed and abutting the first image, in such a manner to ensure the text “reads right” when either short edge of the cable marker is held horizontally upright.

2. Installation

   a. Clean the installed cable of all dirt and grease before applying any marker. Follow the marker manufacturer’s recommended procedure for applying cable markers. Mark all cables in or at every communications hub, electrical communications box, pull box, handhole, equipment cabinet, aerial or underground splice closure, pole attachment, aerial storage bracket, and pole conduit riser entrance. At every trunk cable termination, reel end-to-reel end splice, electrical communications box, pull box, handhole, equipment cabinet, aerial splice closure, and aerial storage bracket, record the cable distance markings from the printline for the cable entry and exit, along with the exact location by Station Number or location name. Record the cable distance markings in a tabular format approved by the Engineer or on a documentation form provided by the Department.

   b. Place cable markers in the following locations:

   - within 18 in. (460 mm) of every cable entry to a pull box, handhole, ECB and hub building
   - within 6 in. (150 mm) of every cable entry or termination in an equipment cabinet
   - within 18 in. (460 mm) of every splice closure at cable entry points
   - within 6 in. (150 mm) of every FDC or splice cabinet in a hub building in which a cable terminates or enters
   - every 20 ft. (6 m) for the length of a cable in maintenance coils in electrical communications boxes or pull boxes
   - within 12 in. (0.30 m) of every pole attachment, aerial storage bracket, and pole conduit riser entrance

   c. Use orange markers at all locations, except as noted below:

   d. Where a trunk cable enters and leaves a closure (mid-span cable entry or end-to-end splice), use orange markers for one leg of the trunk cable and yellow for the other leg, placing corresponding color labels at the closure end of a leg and at the conduit entrance (underground installation) or span attachment (aerial installation).

   e. Where two drop cables terminate in a closure, use orange markers for one drop cable and yellow markers for the other drop cable, throughout the entire drop cable’s length to its other termination.

H. Fusion Splicing

1. Use

   a. Unless otherwise noted, fusion splice all fiber optic splices in accordance with industry codes and the latest version of the manufacturer’s recommended guidelines.

2. Procedure

   b. Perform all fusion splicing and install all splice enclosures according to the manufacturer’s recommended guidelines.
3. Splice Protection

4. Adequately protect all fusion splices in splice trays or organizers in an enclosure. When splicing inside a building; use a splice center where rack or wall space is available.

5. Provide the splice with strain relief and protection of the stripped fiber splice in a manner recommended by the splice tray or organizer manufacturer. Use splice types compatible with the tray design.

6. Protect fusion splices with a heat shrink tubing that protects the splice and extends over the fiber coating. Do not leave bare fiber exposed.

I. Mechanical Splicing

1. Use

   Do not use mechanical splices for any purpose other than a temporary connection to fiber optic test equipment. Obtain the Engineer’s prior approval for any other use of a mechanical splice.

2. Procedure

   Make all mechanical splices as strain relief/locking types requiring no adhesive or polishing of the fiber ends. Ensure the fibers are self-aligning upon the closing of the mechanical splice. Ensure the splice consists of one piece construction. Ensure there is no stress on the fiber in the alignment area.

   Install all splice closures according to the manufacturer’s recommended guidelines.

3. Lab Splice

   Use a mechanical fiber optic lab splice when a temporary joining of two fibers is required, such as in the testing of non-terminated fiber. Ensure the lab splice is re-usable for up to 50 matings. Ensure the lab splice accommodates optical fibers with cladding diameters between 120 and 145 µm.

J. Splice Closures

   Install splice closures according to all manufacturers’ recommendations. Install splice closures where shown in the plans and in the approximate center of fiber cable storage coils. Securely mount all splice closures in ECBs or pull boxes to cable rack hooks or mounting brackets.

K. Fiber Optic Cable Fan Out

1. Inside Plant

   Provide all inside plant cable with a fan out in accordance with the manufacturer’s recommended guidelines.

L. Temporary Fiber Optic Cable

1. Furnish and install temporary fiber optic cable systems as shown in the plans. Furnish temporary fiber optic cable as continuous length cable; do not splice remnant cables together. Terminate cables and patch cords as required in the plans. Splice the cable along cable route at the points indicated in the plans.

M. External Transceivers

1. Shelf mount external transceivers in a manner that does not restrict the replacement of other components in the cabinet housing. In Type 170 traffic cabinets, mount the transceiver on an aluminum shelf permanently attached to the EIA 19 in. cabinet rack in the rear of the cabinet.

N. Fiber Distribution Center (FDC)

1. Do not install mechanical splices or field installed connectors. Equip unused panel slots with blank panels. Provide inter-cabinet and inter-bay bend radius and jumper management on each side of the FDC. Install all hardware according to the manufacturer’s recommended procedures and Department standards. Determine specific hardware sizing from the project documents.

2. For rack-mount and wall-mount FDCs, array connectors in a vertical pattern with number one being at the top left position.

3. Prior to manufacture of pre-terminated FDCs, verify the final installed location of all portions of each drop cable route from the splice closure to the equipment cabinet (including but not limited to the cabinet location,
all conduit and pullboxes, and the splice closure location) to determine the required length of drop cable, including all splice closure and storage coils, to be factory manufactured with each FDC. Mount the pre-terminated FDCs with the connectors horizontal or facing downward, and route the drop cable up or down as necessary. Route and secure the drop cable beside or behind the cabinet side panel such that it is fully strain-relieved, does not violate the manufacturer’s recommended bending radius, and does not interfere with the operation of or access to any cabinet equipment or electrical components.

935.3.06 Quality Acceptance

A. Fiber Optic Cable

1. Installation Test
   a. Test the fiber optic cabling installed on this project according to the fiber’s assigned use as shown in the plans and as specified below:
   
   b. Upon completion of the cable installation, splicing, and termination, and a minimum of fourteen days before equipment hookup, test all terminated fibers and spare fibers for continuity, events above 0.10 dB, and total attenuation of the cable. In the event that fiber optic cable installed on the project is connected to existing fiber optic cable, perform installation testing on both terminated fibers and spare fibers of the new cable and existing fibers to which the new fibers are spliced or connected. Submit both printed and electronic optical time domain reflectometer (OTDR) traces as specified in Subsection 935.1.03.

2. Test Requirements
   a. OTDR Test: For all fiber links, test and document the installation using OTDR testing.
   
   b. Conduct installation testing with a certified technician using an optical time domain reflectometer (OTDR) and optical source/power meter. The technician is directed to conduct the test using the standard operating procedure as defined by the manufacturer of the test equipment. Use an OTDR capable of performing standard OTDR functions, including the ability to display individual loss/gain in dB per km, as well as display all 2-point dB loss cursors to allow isolating and viewing any and all points along a given fiber distance.
   
   a. Use a factory patch cord of a length equal to the "dead zone" of the OTDR to connect the OTDR and the cable. Optionally, the Technician can use a factory "fiber box" of 325 ft. (100 m) minimum with no splices within the box.
   
   b. Conduct the tests at 1310/1550 nm for single mode cable.
   
   c. Attenuation Test: For all single mode and multi-mode fiber links, test and document attenuation by a standard power-meter test.
   
   d. For every fiber installed or connected to, perform end-to-end attenuation test. For the test, use a calibrated optical source and power meter using the standard three-stage procedure. Determine acceptable link attenuation by the cumulative value of standard losses based on length, number and type of splices and connectors.

3. Fiber Optic Cable Acceptance

   a. Use the following criteria for acceptance of the cable:
   
   b. Provide test results demonstrating the dB/km loss does not exceed +3% of the factory test or 1% of the cable’s published production loss. Consider the error rate for the test equipment in the test.
   
   c. No event can exceed 0.10 dB. If any event is detected above 0.10 dB, replace or repair that event point.
   
   d. The total dB loss of the cable, less events, cannot exceed the manufacturer’s production specifications as follows:
### Section 935 — Fiber Optic System

<table>
<thead>
<tr>
<th>Cable Type</th>
<th>Max. Attenuation dB/km</th>
<th>Test Wavelength</th>
</tr>
</thead>
<tbody>
<tr>
<td>Singlemode</td>
<td>0.30</td>
<td>1550 nm</td>
</tr>
<tr>
<td></td>
<td>0.40</td>
<td>1310 nm</td>
</tr>
</tbody>
</table>

- **e.** If the total loss exceeds these specifications, replace or repair that cable run and assume all expenses, both labor and materials. Elevated attenuation due to exceeding the pulling tension during installation will require the replacement of the cable run at no expense to the Department for either labor or materials.
- **f.** NOTE: The Department may allow the "bi-directional/averaging" process of OTDR testing, particularly when splice losses are being unfavorably affected by "mode field diameter misalignment," "core off-set" or "core misalignment."

### B. Fusion Splicing

Ensure that the maximum splice loss for any fusion splice does not exceed 0.10 dB.

### C. Mechanical Splicing

Ensure the maximum splice loss for mechanical splices does not exceed 0.70 dB. As noted in this specification, mechanical splicing is only allowed when approved by the Engineer for temporary applications.

### D. Fiber Distribution Center (FDC)

Test all completed and assembled pre-terminated FDCs at the point of manufacture and provide two copies of the manufacturer test documentation. Test each connectorized fiber in the pre-terminated FDC to demonstrate compliance with all requirements for cables and connectors as detailed in other subsections of these specifications. Include in the test documentation the location station number where the FDC is to be installed, the serial number of the pre-terminated FDC, the drop cable footage markings at each end of the drop cable, and the total drop cable distance. Place one copy of the manufacturer test documentation in the equipment cabinet drawer where the pre-terminated FDC is installed, and submit the other copy to the Engineer.

### 935.3.07 Contractor Warranty and Maintenance

Provide a one year manufacturer support (usual and customary warranties) period for all fiber optic cable materials furnished and installed as part of the fiber cable system. Include in warranty and support all contractor or manufacturer activities related to maintenance, removal and replacement of cabling, closures and other fiber optic system materials during the period of support. Begin the Manufacturer warranty support period upon successful completion of the Fiber Optic Quality Acceptance testing as outlined in Subsection of 935.3.06. Ensure all Manufacturer warranties are continuous throughout the period and state that they are subject to transfer to the Department.

### 935.4 Measurement

Fiber optic system, temporary fiber optic system, testing and training complete, in place, accepted and of the kind, size, and type specified is measured as follows.

#### A. Outside Plant Fiber Optic Cable

Outside Plant fiber optic cable is measured for payment by the actual number of linear feet installed, complete, functional, and accepted. Fiber optic cable shall include but is not limited to all required fiber optic connectors, fiber optic snowshoes, marking and labeling, patch cords and other ancillary items as required for a complete fiber optic installation.

#### B. Inside Plant Fiber Optic Cable

Inside Plant fiber optic cable is measured for payment by the actual number of linear feet installed, complete, functional, and accepted. Fiber optic cable shall include but is not limited to all required fiber optic connectors, marking and labeling, patch cords and other ancillary items as required for a complete fiber optic installation.
C. Closures

Underground splice closures, aerial splice closures, and FDCs are measured for payment by the actual number of units installed, complete, functional and accepted. Closures shall include but are not limited to all required mounting and fastening hardware, fiber optic connectors, FDC interconnect cables/pigtails, marking and labeling, patch cords and other ancillary items as required for a complete closure installation.

D. Fiber Optic Splice, Fusion

Fiber optic splices, fusion, are measured for payment by the actual number of splices made, complete, and accepted. Fiber optic splices associated with the use of factory-connectorized FDC interconnect cables/pigtails on drop cables, in accordance with Section 935.2, will not be measured separately for payment. Mechanical splicing for temporary applications shall be included in other work and will not be measured separately for payment.

E. Temporary Fiber Optic System

Payment for work on the Temporary Fiber Optic System will be a lump sum project bid price and will be considered full compensation for all installed materials and labor associated with the Temporary Fiber Optic System. Specific items include but are not limited to timber poles, guys, anchors, lashing, messenger cable, conduit directional boring, conduit, fiber optic cable, fusion splicing, hardware attachments, splice enclosures, equipment rentals, and disposal of materials.

F. Transceivers

External drop and repeat transceivers and external star transceivers are measured for payment by the number actually installed, complete, functional, and accepted.

For each unit installed, furnish and install all mounting and interconnection materials, including but not limited to card cages, hardware, fiber and RS-232 jumper cables, RS232/485 converters, and power supply cables at no separate cost to the Department.

935.4.02 Limits

General Provisions 101 through 150.
935.5 Payment
Outside and inside fiber optic cable, FDC interconnect cables/pig tails, splice closures, splices, temporary fiber optic system, transceivers, and testing are paid for at the Contract Unit Price for the various items. All other required items including; FDC interconnect cables/pigtails, fan-out kits, fiber optic connectors, fiber optic snowshoes, and other ancillary items for a completed fiber optic system shall be included as part of the below pay items. No separate payment shall be made for these items. Payment is full compensation for furnishing and installing the items complete and in place according to this specification.

Payment for all items of this Section is as follows:

Payment will be made under:

935.5.01 Adjustments
General Provisions 101 through 150.
Section 936—Closed Circuit Television (CCTV)

936.1 General Description
Furnish, install, test, and provide warranty and training for a CCTV camera system comprised of equipment and materials as specified herein and shown in the Contract.

936.1.01 Definitions, Acronyms, and Abbreviations
A. Definitions
Refer to Section 942.1.01.A for additional definitions used in this section.

1. **Camera Mounting Arm, Types 1, 2, 3, and 4**: A structural arm to which a CCTV camera system is mounted.
2. **Camera Lowering Device**: equipment that mechanically lowers the CCTV camera system to ground level.
3. **CCTV Camera System, Type 1**: an IP, PTZ, HD, dome type camera, non-pressurized.
4. **CCTV Camera System, Type 1P**: same as Type 1, except with pressurized housing.
5. **CCTV Camera System, Type 2**: an IP, PTZ, HD, turret/positioning type camera, non-pressurized.
6. **CCTV Camera System, Type 2P**: same as Type 2, except with pressurized housing.
7. **CCTV Camera System, Type 3**: an IP, fixed, HD, barrel or box type camera, non-pressurized.
8. **CCTV Camera System, Type 3P**: same as Type 3, except with pressurized housing.
9. **CCTV Camera System, Type B**: a legacy analog, PTZ, dome type camera (pressurized or non-pressurized).
10. **Video Encoder, Type B**: a legacy external stand-alone encoder for a single video signal.
11. **Video Encoder, Type C**: a legacy high-density encoder unit that supports multiple video signals and is suitable for control center use.

B. Acronyms and Abbreviations
Refer to Sections 101.01 and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

936.1.02 Related References
A. GDOT Standard Specifications

B. Referenced Documents
1. Refer to Section 942.1.02.B for a list of standards and documents referenced in this section.

936.1.03 Submittals
Refer to Section 942.1.04 for submittal requirements. Requirements for CCTV camera equipment, materials, and components are specified herein.
936.2 Materials

936.2.01 IP-Based CCTV Camera Requirements

A. General

1. Comply with ISO 9001 or Six Sigma quality manufacturing requirements.

2. Provide only equipment and materials that are new and of like kind and function provided by one manufacturer, using the same model, part number, revision, and firmware as shown and specified in the Contract.

3. Support an open and published application programming interface or software development kit that provides the necessary information for integration of functionality into third party applications and the users’ central control system environment.

B. CCTV Camera

1. Provide camera system with a progressive scan digital CMOS or CCD image sensor.

2. Provide camera system with an HDTV user-configurable image resolution of 1080P (1920 x 1080) to 352 x 240-pixel array.

3. Provide camera system that allows user-configurable frame rate from 5 up to 30 frames per second (fps) with a default of 30 fps.

4. Provide camera system that has removable IR-cut filter, providing day (color) and night (monochromatic) functionality.

5. Provide camera system that supports a width to height aspect ratio of 16:9.

6. Provide camera system that meets the following image processing requirements.
   a. Automatic and manual electronic shutter speed setting that is user selectable from 1/2 second to 1/30,000 second at 60 Hz.
   b. Automatic and manual automatic gain control that is user selectable.
   c. Automatic and manual white balance control that is user selectable.
   d. On/off backlight compensation operation with user control.
   e. On/off wide dynamic range operation with user controls and manual override option.
   f. Automatic and manual defog mode that is user selectable.
   g. On/off EIS algorithms integrated within the camera assembly system, including:
      1) Compensation algorithms based on those particular movement wavelengths associated with vibrations present at the roadside or pole movement (e.g., 5 Hz and 10 Hz sinusoidal frequencies at a minimum).
      2) EIS function that automatically pauses while PTZ functions are occurring and restores when no PTZ is occurring.
      3) Stabilization such that standard Department of Transportation placards with a size of 1 ft. (0.3 m) by 1 ft. (0.3 m) are continuously legible in conjunction with viewing specification and maximum zoom level at a distance of 500 ft. (150 m).
Section 936 — Closed Circuit Television

7. Provide a camera system with a lens that meets the following requirements:
   a. Types 1, 1P, 2, and 2P: provide camera with an integrated zoom lens assembly for each camera with the following features:
      i. Aperture f-stop of f/1.6 (wide) or better zoom lens with variable focal lengths.
      ii. Minimum 30X optical zoom and 2X digital zoom.
      iii. Automatic switching from optical zoom to digital when optical zoom range is exceeded.
      iv. Adjustable zoom speed.
      v. Automatic and manual user selectable focus control.
      vi. Automatic and manual user selectable iris control to compensate for changes in scene illumination to maintain constant video-level output within sensitivity specifications.
   b. Types 3 and 3P: provide camera with a varifocal lens for each camera with the following features:
      i. Aperture f-stop of f/1.4 (wide) or better.
      ii. Horizontal angular field of view of approximately 46 degrees (wide angle) to 9 degrees (telephoto).
      iii. Adjustable zoom remotely through the camera’s web interface. Final focus shall be adjustable through camera’s web interface.

8. Provide camera system sensitivity that has useable video at the following ambient low light conditions:
   a. Scene Illumination; F-stop set at wide open at 50% video (50 IRE)
   b. 1.0 Lux (0.1 fc) at 1/30 shutter, color mode
   c. 0.1 Lux (0.01 fc) at 1/30 shutter, monochromatic (black and white) mode

C. Pan/Tilt (P/T) Positioning Drive

1. Types 1, 1P, 2, and 2P: provide P/T Range and Speed that meet the following requirements:
   a. Provide camera system that has an integrated P/T unit that meets the following minimum requirements:
      i. Pan Range: 360 degrees, full endless or continuous rotation movement.
      ii. Pan Manual Speed: variable up to 90 degrees per second (minimum), user adjustable through the full speed range.
      iii. Pan Preset Speed: minimum 180 degrees per second.
      iv. Preset Pan Repeatability: ±0.36 degree, or <0.10% or better.
      v. Tilt Range: minimum of 90 degrees total tilt range for Type 1 and 1P cameras and minimum 180 degrees total tilt range for Type 2 and 2P cameras.
      vi. Tilt Manual Speed: variable up to 90 degrees per second (minimum), user adjustable through the full speed range.
      vii. Tilt Preset Speed: minimum 180 degrees per second.
      viii. Preset Tilt Repeatability: ±0.36 degrees, or <0.10% or better.
b. Provide camera system with automatic electronic image inversion or “auto flip” functionality that can automatically rotate the image 180 degrees electronically when following a moving object passing under the camera. No mechanical stops are permitted.

c. Provide camera system with proportional zoom control allowing variable P/T speeds based on “zoom” position. This is to scale the maximum P/T speed, while maintaining variable speed capability throughout the zoom range of the camera.

2. Types 1, 1P, 2, and 2P: provide camera system that has P/T presets that meet the following minimum requirements:
   a. Minimum of 64 presets for PTZ and focus settings.
   b. Minimum of eight tours (sequences) that allow the camera to automatically move between selected presets using an individual speed and viewing dwell time for each preset.
   c. Minimum of eight programmable blackout privacy masks or zones.

D. Video Encoding

1. Provide camera system that complies with the following video encoding standards:
   a. ISO/IEC 14496-10, Advanced Video Coding (H.264), Baseline, Main and High Profiles
   b. Motion JPEG (MJPG)

2. Provide camera system that complies with the following HDTV video standards in regard to resolution, frame rate, aspect ratio, and color fidelity:
   a. SMPTE 296M (HDTV 720P)
   b. SMPTE 274M (HDTV 1080P)

3. Provide camera system that meets the following video stream format and configuration requirements.
   a. Simultaneous unique video streams that are independently and individually configurable and meet the following minimum requirements:
      i. Stream 1: H.264 Baseline, Main or High Profile
      ii. Stream 2: H.264 Baseline, Main or High Profile
      iii. Snapshot: JPG full-frame capture

   b. Encoding parameters for minimum ranges and operation that can be independently and individually configurable by the user for each stream:
      i. Target multicast address, port and time-to-live setting
      ii. Video compression technology and levels of H.264 Baseline, Main or High Profile for video and JPG/MJPG for snapshot captures or full-frame captures from a video stream.
      iii. Image resolution of 1080P (1920 x 1080) to 352 x 240 or 720P (1280 x 720) to 352 x 240.
      iv. Frame rate that is adjustable 5 to 30 fps (North American, 60 Hz).
      v. Bandwidth and encoding bit rate control that is variable bit rate or constant bit rate/maximum bit rate selectable from 256 Kbps to 6 Mbps.
      vi. Group of Pictures length.
c. Simultaneous and continuous encoding and streaming for a minimum of three video streams. The activation of one, two, or three simultaneous and continuous streams shall not result in a performance degradation of any video stream, video image, control function, or device management interface. The video streams shall meet the following minimum requirements:
   i. Stream 1: 4 Mbps/1920 x 1080/Main Profile/30 fps/RTP
   ii. Stream 2: 384 Kbps/720 x 480/Main Profile/15 fps/RTP
   iii. Snapshot: 1920 x 1080/120 second capture interval

4. Provide camera system with encoded streams that are fully compatible with the GDOT Central Software video decoding system and with VLC (Video LAN Client) Version 2.1.3.

5. Provide camera system that meets the following video snapshot requirements:
   a. JPG snapshots from either a dedicated stream or from any of the video streams and image transfer via FTP either by push or pull at a user-defined interval between 60 and 300 seconds.
   b. OSD capabilities in the snapshot images.
   c. Target FTP server settings including connection credentials for push function.
   d. A minimum space for 32 characters for the snapshot filename for push function.

6. Provide management system and user interface that meet the following requirements:
   a. Manage encoder through HTTP and HTTPS.
   b. Provide a built-in web server user interface making video, status, and configuration available to multiple clients in a standard operating system and browser environment using HTTP, without the need for any additional software of any kind, except video player plugins solely for displaying a live image stream of the video output.
   c. Provide web server user interface that supports access to all configurable parameters in the CCTV camera system, without the need for any separate textual or line commands of any kind.
   d. Provide user-configurable password-protected accounts with at least one full administrative and one read/view permissions profile.
   e. Provide capability to reset or reboot and upload firmware via the management system requirements.
      i. Update the firmware in the encoder from a network connection.
      ii. Access the firmware number, IP address, and equipment configuration.

7. Provide camera system that meets the following minimum OSD requirements:
   a. Static text insertion on streams and snapshots inserting a minimum of two lines of user configurable text messages with support for date, time and cardinal angle/compass of at least 30 ASCII characters in length.
   b. Text insertion that scales appropriately or is independently configurable for different video image size and snapshot resolutions.
   c. JPG, BMP, GIF, or PNG image insertion on streams and snapshots in the upper portion of the image, using image file(s) uploaded by the user and stored in the encoder’s memory and configuration. Text display on the side of the image is prohibited.
   d. Image insertion that scales appropriately for different video image size and snapshot resolutions, or the ability to insert a different image file for each stream and snapshot.
8. Provide configuration backup providing automatic recovery from an over or under voltage condition when prime power has returned to the tolerance values specified herein.
   a. Store configuration parameters in non-volatile memory.
   b. Provide a camera system that requires no reprogramming or manual adjustments upon power recovery.

E. Communications and Network

1. Provide a network format that complies with IEEE 802.3, 802.3u, and 802.3x; 10/100 Mbps or higher, auto sensing full and half-duplex operations.

2. Provide network hardware interface including a minimum of one 10BASE-T/100BASE-TX PoE Ethernet-port using an IP66 rated RJ-45 weathertight connector and coupler or other Ethernet-compatible locking weathertight connector and coupler.

3. Provide video encapsulation of each of the video streams in UDP packet and TCP packets, depending on stream configuration, for network transmission.

5. Support communications protocols including NTCIP 1205 and ONVIF requirements.

6. Provide video network transmission that meets the following requirements:
   a. Support both unicast (one-to-one) and multi-cast (one-to-many) streams simultaneously.
   b. Allow for video to be transported over:
      i. RTP (Unicast and Multicast)
      ii. RTP over RTSP (Unicast)
      iii. RTP over RTSP over HTTP (Unicast)
      iv. HTTP/HTTPS tunneling (Unicast)

7. Provide network IP addressing capabilities that meet the following requirements:
   a. Support both fixed IP addresses and dynamically assigned IP addresses provided by a DHCP server.
   b. Support static management interface IP addressing (classes A, B, and C).
   c. Support static IP addressing of the multi-cast group individually and independently for each stream.
F. Mechanical

1. General
   a. Mount CCTV camera and other required components on a single existing or new support structure or pole, unless otherwise specified in the Contract.
   b. Provide new support brackets, mounting hardware, and ancillary materials to mount CCTV camera and components.
   c. Provide housing that protects the camera and housing against water, dust, corrosive elements, and insect intrusion into the camera casing or housing.
   d. Provide housing that is secure from unauthorized entries and vandals.
   e. Provide a camera assembly that secures to the camera mounting arm with a completely weathertight system with no water penetration into any enclosure of the camera assembly.

2. Types 1, 2 and 3: Provide non-pressurized camera casing or enclosure that meets the following requirements:
   a. Provide a casing or enclosure that is manufactured in compliance with IEC 60529 IP66, NEMA 4X, and IK08 ratings or greater.
   b. Provide camera assembly that meets or exceeds the requirements stated above without the need for additional components such as mounting brackets and hardware to achieve the stated ratings.
   c. Provide a light-colored external casing or enclosure.
   d. Provide high-impact, non-metallic UV-stabilized material or an aluminum material with a heat-cured paint coating or powder coating.
   e. Protect interior of casing by providing weathertight glands or grommets for cabling to maintain IP rating.

3. Types 1P, 2P, and 3P: Provide pressurized camera casing or enclosure that meets the following requirements:
   a. Meet the casing or enclosure requirements specified in Section 936.2.01.F.2.
   b. Meet the following minimum pressurization requirements:
      i. Schrader inlet valve for pressurized extra dry nitrogen.
      ii. Operating pressure range of 3 to 7 psi (21 to 48 kPa).
      iii. Pressure relief valve for protection against overpressure.

4. Provide protection of viewing windows against degradation of materials and yellowing due to prolonged exposure to UV rays:
   a. Optically correct material with infused inhibitors.
   b. Material that is scratch resistant.
   c. Polycarbonate, acrylic, or nylon material for the viewing windows.
5. Provide camera system with heating and ventilation that meets the following requirements:
   a. Provide a heater and blower function to maintain internal temperatures within the manufacturer’s operating temperatures for temperature ranges internal to the camera unit not conforming to the environmental requirements in Section 936.2.01.K.
   b. Types 1 and 1P: provide a conventional mechanical thermostat-controlled heater and circulating blower fan system that is designed to keep the camera equipment within the required operational temperature range and to prevent condensation to maintain a clear viewing window.
   c. Types 2, 2P, 3, and 3P: an alternative method may be provided to prevent dust and humidity build-up and to keep internal camera casing temperatures to within operational tolerances defined by the manufacturer as approved by the Department.

6. Provide CCTV camera system with mounting bracket that meets the following requirements:
   a. Attach the CCTV camera system to the camera mounting arm as shown in the Contract and in compliance with the camera manufacturer’s recommendations.
   b. Provide the Type 1 and 1P CCTV camera system enclosure with a mounting coupling with 1-1/2 in. male pipe thread coupling in compliance with the camera manufacturer’s recommendations to attach to the camera mounting arm.
   c. Provide the Type 2 and 2P CCTV camera system enclosure with a mounting base plate mechanism that bolts to a mating plate on the camera mounting arm, in compliance with the camera manufacturer’s recommendations.
   d. Provide the Type 3 and 3P CCTV camera system enclosure with a mounting equivalent to either the Type 1 or Type 2, in compliance with the camera manufacturer’s recommendations. If equivalent to the Type 1, use a 1-1/2 in. male pipe thread coupling in compliance with the camera manufacturer’s recommendations.
   e. Allow for cabling to be routed inside the poles and mounting hardware and protected from exposure to the outside environment.
   f. Provide stainless steel mounting hardware and straps in accordance with MIL-STD-810F (3) Method 509 Procedure 1 for exterior salt atmospheres.
   g. Provide opening in mounting bracket that fully encloses the cables. Provide non-metallic cable protection grommets for cable entrances.
   h. Provide camera casing mounts that can accommodate a weight load capacity of no less than 40 lb. (18 kg).

7. Provide mechanical CCTV camera components including attachment and mounting hardware that meet the corrosion protection following requirements:
   a. Stainless steel external screws, nuts, and locking washers. Self-tapping screws are not permitted.
   b. Parts that are made of corrosion resistant material; examples include plastic, stainless steel, anodized aluminum, or brass.
   c. Protect materials used in construction from fungus growth and deterioration due to sustained moisture.
   d. Separate dissimilar metals by an inert dielectric material.
G. Electrical

1. Provide a standalone PoE injector. PoE service through the use of a PoE capable Ethernet switch is not permitted.

2. Select PoE injectors that are based on power requirements of the camera system as recommended by the CCTV camera manufacturer conforming to the following PoE standards:
   a. PoE+ in compliance with IEEE 802.3at
   b. PoE++ in compliance with IEEE 802.3bt

3. Mount PoE injectors to wall or panel or DIN-rail mount within the field cabinet as approved by the Department.

H. Field Cabinet: Provide system components that are compatible with the field cabinets shown in the Contract. The field cabinet is not included in the pay items defined in Section 936.5.

I. Cabling and Surge Protection

1. Provide outdoor-rated, shielded Category-6 cabling from the PoE injector to the internal camera encoder that meets the following minimum requirements:
   b. Comply with ICEA S-56-434 standard or equivalent industry standard as approved by the Department for communications cables for outdoor use including weathertight, outdoor CMX UV-rated, abrasion-resistant polyethylene jacket.
   c. Provide cable that is UL 444 sunlight resistant listed.
   d. Provide insulated No. 22 to No. 23 AWG, solid bare copper conductors with polyolefin insulation, arranged in four color-coded twisted-pairs with drain wire incorporating a cross-web separator design.
   e. Provide modular IP66-rated weathertight RJ-45 8P8C male push-pull connectors and couplers with eight-position non-keyed and eight gold anodized pins or other Ethernet-compatible locking weathertight connector and coupler.

2. Provide category-6 Ethernet PoE surge protection that meets the following minimum SPD requirements:
   a. Provide SPD that is listed per UL 497B.
   b. Comply with TIA-568-A/B.
   c. Comply with IEEE 802.3af and IEEE 802.3at or 802.3bt.
   d. Support 10Base-T, 100Base-T, and 1000Base-T transmission speeds.
   e. Provide a peak surge current rating (Imax) of a minimum of 10 kA (8/20 µs waveform).
   f. Provide a clamping voltage of up to 90V ±20% for line-ground (L-G) and 20V ±20% for line-line (L-L).
   g. Provide protection for all connector pins.
   h. Provide input and output connections with shielded RJ-45 connectors.
   i. Provide an in-line, series-connected configuration.
   j. Provide system capable of being either wall/panel or DIN-rail mounted.
   k. Provide an SPD that is constructed of aluminum metal housing.

3. Provide bonding for SPDs, hardware, and other components within the field cabinet to the field cabinet ground buss bar.
Section 936 — Closed Circuit Television

J. Environmental

1. Provide equipment that meets the following operating ambient temperature range and humidity levels:
   a. Camera Assembly, Power Supplies and PoE Injectors
      i. −4°F (−20°C) through +140°F (+60°C, maximum).
      ii. Up to 95% relative humidity (non-condensing).
   b. Category-6 PoE Surge Protector
      i. −40°F (−40°C) to +149°F (+65°C, maximum)
      ii. Up to 95% relative humidity (non-condensing).
   c. SPD
      i. −30°F (−34°C) to +165°F (+74°C, maximum)
      ii. Up to 95% relative humidity (non-condensing).

2. Provide a camera assembly that meets the following environmental and emission requirements:
   a. Comply with NEMA TS 2 Sections 2.1.9, 2.2.3, and 2.2.8 and meet the specified requirements during and after being subjected to a vibration of 5 Hz to 30 Hz up to 0.5 g applied in each of three mutually perpendicular planes for 30 minutes.
   b. Comply with NEMA TS 2 Sections 2.1.10, 2.2.4, and 2.2.9 and do not yield permanent mechanical deformation or any damage that renders the unit inoperable when subjected to a shock of 10 g applied in each of three mutually perpendicular planes for 30 minutes.
   c. Comply with IEC 60529 Section 14.2.6 for IP66 or greater rating.
   d. Comply with NEMA 250, Type 4X corrosion requirements for salt environments (i.e., coastal regions).
   e. Provide CCTV camera system installed on a camera pole that has a maximum allowable pole top deflection of 1 in. (25 mm), with camera(s) and CLD (if required) installed and a 0.5 in. (12 mm) ice coating under sustained 30 mph (48 kph) wind gusts. Provide CCTV camera system including the CLD system (if required) that can withstand wind forces of 100 mph (161 kph) with a 20% gust factor with a 1.65 safety factor.
   f. Provide the following EMC emission approvals:
      ii. IEC EN 61000-6-4
Section 936 — Closed Circuit Television

936.2.02 Type B Analog CCTV Camera Requirements

A. Provide downward-looking circular dome-shaped enclosure assembly.

B. Provide camera unit that has a progressive scan digital CMOS or CCD image sensor.

C. Provide camera unit with an integrated camera sensor and zoom lens assembly.

D. Provide camera unit that has a minimum resolution of 720 horizontal by 480 picture elements.

E. Provide camera unit that includes on/off selectable automatic gain control and manual/automatic selectable white balance.

F. Provide camera unit that includes an electronic shutter mode with user-selectable speeds of a minimum range from 1/60 second to 1/10,000 second.

G. Provide camera unit that has an on/off selectable day/night function where the image sensing and output automatically switch between color and black-and-white imaging. Fixed color or black-and-white imaging shall be user-controllable.

H. Provide camera unit with sensitivity that is no less than 3.0 lux in color mode (1/60 second) and 0.5 lux in black-and-white mode (1/60 second, IR cut removed).

I. Provide camera unit with an integrated zoom lens of a minimum of 20X optical zoom and a minimum of 4X digital zoom. The camera shall not employ any digital zoom functionality unless the lens is at the full limit of optical zoom and the zoom command continues to be applied, in which case the camera unit shall automatically switch from optical to digital zoom.

J. Provide camera unit that includes on/off selectable automatic focus and manual/automatic selectable iris control.

K. Provide pan/tilt drive for the camera unit that is fully-contained within the enclosure assembly.

L. Provide P/T drive that is capable of 360 degree panning and at least 0 degree horizontal to 90 degree vertical looking downward tilting.

M. Provide camera unit and P/T drive that have automatic 180-degree image output flip at the bottom of the tilt travel.

N. Provide camera unit and P/T drive that have a minimum of eight privacy blackout zones, each zone being individually programmable to be on/off by the user.

O. Provide camera system with panning speed, when a pan-left or pan-right command is applied by the user, up to 40 degrees per second.

P. Provide camera system with tilting speed, when a tilt-up or tilt-down command is applied by the user, up to 40 degrees per second.

Q. Provide system control interface to the camera system assembly that physically and logically supplies the user commands to and monitoring from the camera system assembly, including but not limited to pan, tilt, zoom, focus, position reporting, and configuration.

R. Provide camera system with system control interface that physically connects the camera system assembly to the cabinet interface.

S. Provide camera system with system control interface that is in compliance with NEC and all of the physical and operational requirements specified for a camera system.

T. Provide camera system with the capability to set the communications through the system control interface or through the user control interface in the field cabinet. Do not require the opening/disassembly of the camera system enclosure to set the communications address.
Section 936 — Closed Circuit Television

U. Provide camera system that can store all user configurable settings in non-volatile memory that is retained indefinitely upon loss of power.

V. Provide camera system that produces an analog NTSC-compliant composite video output with a minimum signal-to-noise ratio of 50dB.

W. Provide camera system that can operate using 120 VAC (±10%) 50/60 Hz (±5%). Supply DC-to-DC or AC-to-DC conversion and power supplies as required and voltage converters for camera and components that require 12 or 24 VAC/DC (±10%). Do not use a dual voltage power supply.

X. Provide surge protection for power, video, and control as recommended by the manufacturer.

Y. Provide a camera system assembly mount that includes bracket, camera enclosure mount and disconnect, mounting straps, and incidental fastening hardware. All fastening and mounting hardware shall be stainless steel.

Z. Provide cabling and connectors between the camera system assembly and the cabinet interface assembly as shown in Contract. Label all cables. Provide cables that meet industry and manufacturer recommendations.

AA. When required for the camera application, provide coaxial video signal cables with labels attached at both ends of each cable.

BB. Provide coaxial cables that use BNC connectors with gold-plated center pins on the video signal cables. Use only connectors recommended by the cable manufacturer.

CC. Provide control cable with labels attached at both ends of the cable. Terminate control cable in the equipment field cabinet as shown in the Contract and as recommended by the CCTV system manufacturer.

DD. Ground or bond any pair shielding and any unused conductors in accordance with the CCTV system manufacturer’s recommendations.

EE. Provide camera system with housing that protects the camera and other internal components from rain, dust, corrosive elements meeting the environmental requirements in Section 936.2.01.K.

FF. Provide camera system that meets the mechanical requirements in Section 936.2.01.F.

GG. If non-pressurized CCTV camera system is provided, provide camera casing or enclosure that meets the following requirements:

1. Provide a casing or enclosure that is manufactured in compliance with IEC 60529 IP66, NEMA 4X, and IK08 ratings or greater.
2. Provide camera assembly that meets or exceeds the requirements stated above without the need for additional components such as mounting brackets and hardware to achieve the stated ratings.
3. Provide high-impact, non-metallic UV-stabilized material of a light color or an aluminum material with a heat-cured paint coating or powder coating of an equivalent color.
4. Protect interior of casing by providing weather tight glands or grommets for cabling.

HH. If pressurized CCTV camera system is provided, provide pressurized camera casing or enclosure that meets the following requirements:

1. Meet the casing or enclosure requirements specified in Section 936.2.02.GG.
2. Meet the following minimum pressurization requirements:
3. Schrader inlet valve for pressurized extra dry nitrogen.
4. Operating pressure range of 3 to 7 psi (21 to 48 kPa).
5. Pressure relief valve for protection against overpressure.
### 936.2.03 Camera Mounting Arm

A. Provide camera mounting arm that with the CCTV camera system attached can withstand wind forces of 100 mph (161 kph) with a 20% gust factor with a 1.65 safety factor.

B. Provide camera mounting arm with the proper mating mounting mechanism for the CCTV camera type shown in the Contract.

C. Provide camera mounting arm as shown in the Contract. Measure horizontal separation from the face of pole or mast arm to the centerline of the camera mounting mechanism.
   1. For Type 1, short arm, mount camera at a position between 1.5 ft. (450 mm) and 2.5 ft. (750 mm) horizontal separation from the pole, and less than 6 in. (150 mm) vertical change from the pole attachment point.
   2. For Type 2, long arm, mount camera mounting at a position between 15 ft. (4.6 m) and 20 ft. (6.1 m) horizontal separation from the pole, and less than 5 ft. (1.5 m) vertical change from the pole attachment point.
   3. For Type 3, short vertical extension, mount camera at a position between 2 ft. (0.6 m) and 4 ft. (1.2 m) of vertical change from the attachment point, and less than 2 ft. (0.6 m) of horizontal separation from the attachment point. The attachment point may be a vertical pole or horizontal pole with a dimension ranging between 2 in. (51 mm) and 24 in. (600 mm).
   4. For Type 4, long vertical extension, mount camera at a position between 4 ft. (1.2 m) and 8 ft. (2.4 m) of vertical change from the attachment point, and less than 2 ft. (0.6 m) of horizontal separation from the attachment point. The attachment point may be a vertical pole or horizontal pole with a diameter dimension ranging between 2 in. (51 mm) and 24 in. (600 mm).

### 936.2.04 Type B Video Encoder Requirements

A. Provide a Type B Video Encoder that meets Section 936.2.01.D, except as follows:
   1. Provide a standalone, environmentally hardened video encoder for a single video signal, suitable for field cabinet use.
   2. Provide new video encoders from the same manufacturer and ensure compatibility and interoperability with each type provided.
   3. Provide video encoders that have a minimum MTBF of 20,000 hours.
   4. Provide video encoder with end-to-end system latency between the encoder and decoder appliances of no more than 300 ms, not including network delays. The encoders shall support various frame adjustments to minimize latency.
   5. Provide video equipment that supports the NTSC signal format.
   6. Provide encoder with the following ports:
      a. Network: 10/100 Mbps RJ-45 or as directed by Department.
      b. Video Connector: BNC.
      c. Serial Data Interface: One (1) minimum RJ-45 port/connector.
      d. Serial port may utilize D-sub connectors or terminal block connections as approved by the Department.
   7. In locations where there is more than one video source and encoders with multiple video ports are approved by Department, each video input port shall meet all the video and data requirements of video encoder Type B independently.
8. Provide video encoder with video input performance measures that comply with NTSC and EIA requirements, including the EIA-170 standard, with a nominal composite video of 1-volt peak-to-peak (Vp-p). The equipment shall have an electrical impedance of 75 ohms.

9. Ventilation fans are not permitted.

10. Provide video encoders with LED status indicators for local status display of analog video input, serial data interface activity, network interface activity and power.

11. Provide cable connections (data/video/power) that require no tools for installation or removal and designed with positive locking devices such that they will not vibrate loose.

12. Provide external markings for all connectors and indicators. Replaceable components shall be permanently marked and traceable to the supplied documentation, including schematics and parts list.

13. Provide external markings with the product function name, model number, serial number, and manufacturer’s name.

14. Provide parts made of corrosion-resistant materials, such as stainless steel, anodized aluminum, brass, or gold-plated metal.

15. Provide individual video encoders that can be mounted on a field cabinet shelf, 19 in. (483 mm) equipment rack, rack-mounted chassis, or DIN rail. Other mounting options may be submitted for review and approval by the Department. Provide all mounting hardware.

16. Provide video encoder that supports nominal power input voltage of 120 VAC, 60 Hz. ±3 Hz.

17. If the device requires operating voltages of less than 120 VAC, the appropriate voltage converter shall be supplied. All voltage conversion devices shall also be temperature hardened as specified herein for location (field or central).

18. Provide equipment or voltage converter that operates within a voltage range of 90 VAC to 135 VAC.

19. Provide encoders that support automatic recovery from an over or under voltage condition when prime power has returned to the tolerance values specified herein. All configuration parameters shall be stored in non-volatile memory and no reprogramming or manual adjustments shall be required upon power recovery.

20. Provide video encoder that meets environmental requirements in Section 936.2.01.K.

21. Provide video encoder that meets video encoding requirements in Section 936.2.01.D.

22. Provide video encoder that meets communications and network requirements in Section 936.2.01.E.

23. Provide video encoder that meets the following serial data interface requirements:
   a. Provide bi-directional serial communications over Ethernet 10/100 Base-TX via the following methods:
      i. Encoder serial port to decoder serial port data stream.
      ii. IP socket to encoder serial port by TCP protocol.
   b. Provide full-duplex serial interface and data rates up to 115.2 Kbps (minimum) for each port.
   c. Provide serial port that is software configurable, locally or over the network, to EIA-232/422/485 mode of operation as defined by the EIA for data format, data rate, and data structure (e.g., baud rate, the number of bits, parity, stop bits, flow control, etc.) via the management software provided.
   d. No serial adaptors or interface converters are permitted.
   e. Provide video encoders that are capable of using the serial interface port to support PTZ camera control functions.
f. Provide video encoder serial port that provides IP addressing and socket number selection and provide the capability to establish an IP connection directly from an operator workstation or server to any encoder IP address and socket number to transport serial data, independent of whether any video stream for that video encoder is being viewed.

936.2.05 Type C-Card Video Encoder Requirements

A. Provide Type C-Card encoders that meet Section 936.2.03 video encoder requirements.

B. Provide Type C-Card encoders that are compatible with, and of the same make as, the Video Encoder, Type C – Chassis specified in Section 936.2.06.

C. Provide a high-density encoder unit (card) for multiple video signals, with one encoder per video signal, suitable for control center use in a slot based chassis.

D. Provide a minimum of four encoders per card with a corresponding number of BNC ports per encoder.

E. Provide Type C-Card with a minimum of one RJ-45 network port: 10/100 Mbps.

F. Provide Type C-Card that is fully contained and obtain power from the Video Encoder, Type C-Chassis.

936.2.06 Type C-Chassis Video Encoder Requirements

A. Provide Type C-Chassis that is compatible with, and of the same make as, the Video Encoder, Type C – Cards specified in Section 936.2.05.

B. Provide a high-density rack mount unit that supports multiple Video Encoder Type C cards suitable for control center use.

C. Provide support for up to 12 Video Encoder, Type C cards.

D. Provide a chassis that is seven rack units or less and 19 in. rack mountable.

E. Provide chassis that is capable of operating on one internal power supply.

F. Provide chassis that is capable of supporting a minimum of two internal power supplies.

936.2.07 Camera Lowering Device (CLD)

A. General

1. Provide CLD system that includes, but is not limited to, the following components: camera junction connection box, electrical and disconnect unit, self-aligning divided support arm, pole top aluminum housing with access panel mounted to the pole, lowering cable, external conduit mounted to existing camera pole for lowering cable, and mounting attachment hardware.

2. Provide CLD system as a retrofit to an existing CCTV camera pole as shown in the Contract.

3. Provide CLD system that is capable of lowering the camera to the ground without contacting the pole or anything attached to the pole.

4. Provide CLD system design that does not cause damage or degradation of camera operations or viewability.

5. Provide the capability for connecting and disconnecting video, communications and electrical connections between the field cabinet and the camera assembly installed on the CLD.

6. Provide CLD system that provides electrical and signal connections between the fixed and movable CLD components to support Category-6 Ethernet-based PoE camera operations.

7. Provide aluminum housing with access panel mounted to existing camera pole to house cable strain relief and provide access to all cables.
8. Provide CLD system including lowering tool and all other external components that are corrosion-resistant powder-coated, galvanized materials, stainless steel, or otherwise protected from the environment by industry-accepted coatings that can withstand exposure to a corrosive environment in accordance with NEMA 250 Section 5.10 or MIL-STD-810F for exterior salt atmospheres.

9. Provide all mounting hardware, clamps, straps, and parts made out of stainless steel or corrosion-resistant galvanized materials.

10. Provide a pulley mechanism for the lowering tool that are sealed with self-lubricating bearings.

11. Provide 120 VAC electrical power for the complete CLD assembly per the manufacturer’s recommendations.

12. Provide CLD that meets the environmental requirements as specified in Section 936.2.01.K.

13. All materials, components and mechanisms of the CLD system shall be provided by or in compliance with the CLD system manufacturer’s recommendations.

B. Lowering Cable

1. Provide a lowering cable that consists of a minimum 1/8-in. diameter (3.25 mm) marine-grade Type 316 stainless steel aircraft cable with a minimum breaking strength of 1,740 lb. (790 kg) with seven strands of No. 19 AWG wire each.

2. Provide lowering cable that is located inside an external CCTV pole-mounted GRS conduit to avoid cable twisting. Only the lowering cable shall be in motion when the CLD is operated. All other cables are to remain separate from the lowering cable and stable and secure during lowering and raising operations.

3. Provide lowering cable that is designed so that the lifting cable does not come into contact with the camera cables.

4. Provide lowering cable accessories, such as connecting links that have a minimum workload rating that meet or exceed that of the lowering cable.

5. Provide weights or counterweights so that the alignment for the camera connection can be raised into position without binding and it can be lowered.

C. Disconnect Unit

1. Provide a disconnect unit with a minimum load capacity of 200 lb. (90.7 kg) with a 4:1 safety factor.

2. Provide locking mechanism between the fixed and movable components of the disconnect unit.

3. Provide minimum of two mechanical latches for the movable assembly to remove all weight from the lowering cable when latched.

4. Provide the fixed unit with a heavy-duty cast tracking guide and a means for latching in the same position each time.

5. Provide capability of securely holding the CLD and the equipment installed on the CLD.

6. Provide weathertight suspension contact unit with a gasket to seal the interior from dust and moisture without the use of pressurization.

7. Provide connectors that are resistant to UV light degradation.

8. Provide disconnect unit that will not twist under high wind conditions.

9. Provide male and female matched parts that mate together to make a weathertight, non-corrosive electrical connection between the cable and the camera housing when the camera is fully raised and locked.

10. Provide cable and wire leads from both the male and female contacts that are permanently fastened into a weathertight, non-corrosive body.
11. Provide disconnect unit that is designed to keep contacts protected or provide a method to displace surface contaminants.

D. Divided Support Arm
   1. Provide a divided arm that separates control and electrical / signal wires.
   2. Provide divided support arm and receiver brackets that are designed to self-align the contact unit during installation.

E. Lowering Tool
   1. Provide CLD with a permanent mount lowering tool with winch in a pole-mounted heavy-duty aluminum enclosure as recommended by the manufacturer meeting the material requirements in Section 939.
      a. Enclosure sized to house lowering tool and winch.
      b. Enclosure to hinge down to allow cabinet to be mounted to the right or left of pole.
      c. Operates 90 degrees from camera mounting arm.
      d. Provide key lock as approved by the Department.
   2. Provide an adapter to allow the lowering tool to operate the lowering device by a portable drill using a clutch mechanism.
   3. Provide winch with a minimum 3:1 gear reduction to reduce the effort required to raise and lower the camera assembly.
   4. Equip lowering tool with a positive locking or breaking mechanism to secure the cable reel during the raising and lowering operations and to prevent freewheeling or freefall.

F. Drill Motor with Clutch
   1. Provide an industrial-grade portable drill with clutch using an adjustable safety clutch mechanism.
   2. Provide a drill that is heavy-duty, reversible variable speeds with “D” handle.
   3. Equip drill with a 0.5 in. (12.7 mm) key chuck size with key.
   4. Provide drill with a minimum of 0.5 horsepower (0.49 metric horsepower).

936.3 Construction
The construction and installation of the CCTV camera equipment, materials, components, and assemblies as specified herein shall meet the requirements in this section and the CCTV manufacturer’s requirements and recommendations.

936.3.01 Construction Requirements

A. General Construction
   1. Mount the camera system assembly and the mounting bracket arm at the cardinal direction and height as shown in the Contract, and so that the pole is not obstructing the camera’s view of the roadway or traffic signals.
   2. Install cables between the camera system assembly and the CCTV camera field cabinet inside new hollow steel or metal or concrete support poles unless otherwise specified. Where devices are installed on existing wood poles, install cabling on the wood poles in conduit risers of a minimum 2 in. (51 mm) diameter.
   3. Provide wiring and cabling that meets the following minimum requirements:
      a. Provide between 3 ft. (0.9 m) and 5 ft. (1.5 m) of coiled slack cable in the bottom of the field cabinet.
Section 936 — Closed Circuit Television

b. Route CCTV cables in the cabinet separate from any 120 VAC power wiring or surge suppressor ground wiring.
c. Provide CCTV cables of 330 ft. (100 m) maximum length in accordance with IEEE 802.3
d. Neatly arrange and dress wiring, firmly lace or bundle it, and mechanically secure the wiring without the use of adhesive fasteners.
e. Organize cables neatly inside the field cabinet and secure cables with clamps to minimize movement in the wind and chafing against the pole, device, or bracket.
f. Provide service loops at connection points when connecting to hardware inside the field cabinet.
g. No splicing of cables or exposed wiring is permitted.
h. Provide wiring entry to the camera casing or enclosure that uses weathertight fittings.
i. Provide wiring entry and exits that are made at the side or underneath components; no exposed top entry or exits are permitted. This requirement extends to enclosures, junction boxes, support arms, or any other externally exposed devices.
j. Route and secure wiring and cabling to avoid sharp edges and to avoid conflicts with other equipment or cabling.
k. Label all wiring with printed, legible, and water-resistant labels firmly attached to the wire.

4. Coordinate with the Department to establish electrical utility service according to the NEC and as specified in Section 682.
   a. Verify with the local power service provider to ensure that the provided equipment is compatible with the installed equipment.
   b. Contractor shall be responsible for paying for electrical service as required from the time of testing up to the issuance of the Maintenance Acceptance Letter (MAL) by the Department at which time the service provider account shall be transferred to the Department.

5. Comply with NEC requirements and Section 682 for grounding and bonding requirements.

6. Dress and route grounding wires separately from other field cabinet wiring and with the minimum length possible between the surge protector and the ground buss-bar.

7. Do not splice any cable, shield, or conductor used for CCTV camera operation, communications signaling, power supply, or grounding.

B. Camera Lowering Device
   1. Install CLD and lowering tool in accordance with manufacturer’s installation instructions.
   2. Provide and install external GRS 1.5 in. (38mm) minimum conduit as recommended by the CLD manufacturer mounted externally to the existing camera pole using conduit stainless steel clamps.
   3. Provide and install enclosure for permanent housing the lowering tool and winch strapped to the existing camera pole using stainless steel straps and other hardware as required or needed.
   4. Install materials in a neat and professional manner.
   5. Coordinate with the Department to determine actual mounting height and azimuth. Typically, the CLD azimuth shall be perpendicular to the mainline lanes.

936.3.02 Equipment Configuration and Integration Requirements
Refer to Section 942.3.03 for equipment configuration and integration requirements.
936.3.03 Testing Requirements
Refer to Section 942.3.04 for testing requirements.

936.3.04 Training
Refer to Section 942.3.05 for training requirements.

936.3.05 Warranty and Maintenance Support Services

A. Warranty Requirements:
   1. Provide a minimum warranty length as follows. If the manufacturer’s warranties for the components are for a longer period, those longer period warranties shall apply.
      a. CCTV camera assembly and associated components: three years.
      b. Category-6 PoE surge protector: five years.
      c. CLD system: five years.
   2. Refer to Section 942.3.02 for general warranty requirements.

B. Maintenance Support Services:
   Refer to Section 942.3.02 for maintenance support services requirements.

936.4 Measurement
The CCTV camera system and training that are complete, in place, accepted, and of the kind, size, and type specified will be measured as follows:

A. CCTV Camera System, Types 1, 1P, 2, 2P, 3, 3P
   The CCTV camera system will be measured for payment by the type and number installed, complete, functional, tested, and accepted, including IP-based camera assembly with internal video encoder, camera lens, P/T positioning drive, camera casing or enclosure, sunshield, and mounting bracket. CCTV camera system shall also include ITS field cabinet components, including but not limited to, PoE injector, outdoor-rated cabling and associated wiring, network patch cable, connectors, terminal blocks, surge protector, weather heads (as required or needed), grounding to site ground, and video encoder configuration.

B. Camera Mounting Arm, Types 1, 2, 3, 4
   The CCTV camera system mounting arm will be measured for payment by the mounting method or type and number installed, complete, functional, tested and accepted. Mounting arm will include the mounting arm, attachment and mounting hardware, work, and all other required or needed materials and incidentals to mount the CCTV camera system.

C. Camera Lowering Device
   The CCTV CLD will be measured for payment by the number installed, complete, functional, tested and accepted. The CLD will include the camera connection box, electrical and signal disconnect unit, self-aligning divided support arm, an adapter for attachment to the camera pole, pole top junction box, lowering cable, attachment and mounting hardware, permanent camera lowering tool, work, and all other required or needed materials and incidentals to provide a complete CLD system.

D. CCTV Camera System, Type B
   The Type B CCTV system will be measured for payment by the number actually installed, complete, functional, tested, and accepted, including camera lens, P/T positioning drive, camera casing or enclosure, sunshield, and mounting bracket. CCTV camera system shall also include ITS field cabinet components, including but not limited to, outdoor-rated cabling and associated wiring, network patch cable, connectors, terminal blocks, surge protector, weather heads (as required or needed), grounding to site ground, and video encoder configuration.
Section 936 — Closed Circuit Television

E. Video Encoder, Type B

The Type B video encoder with mounting hardware will be measured for payment by the number actually installed, complete, functional, tested and accepted.

F. Video Encoder, Type C

The Type C video encoder with mounting hardware will be measured for payment by the number actually installed, complete, functional, tested and accepted.

G. Training

Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the training.

936.5 Payment

936.5.01 CCTV Camera System

CCTV camera systems of the type specified in the Contract documents will be paid for at the Contract unit price. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary to complete the CCTV camera system.

Payment Notes:

Submittal

Submittal requirements are included in Section 942.1.04 and will not be paid for separately. It will be considered as incidental to the CCTV camera system pay item.

Testing

Testing is defined in Section 942.3.04 and will not be paid for separately. It will be considered as incidental to the CCTV camera system pay item.

CCTV Camera Field Cabinets

New CCTV camera field cabinets will be paid for separately under Section 939.5 pay items.

CCTV Camera Support Structure

CCTV camera support structure including poles will be paid for separately under Section 639.5 pay items.

GDOT Central Software Integration

GDOT Central Software integration is included in Section 942.3.03 and will be paid for under the Section 942.5 pay item.

Payment for the CCTV camera system will be made under:

<table>
<thead>
<tr>
<th>Item No. 936</th>
<th>CCTV Camera System, Type ___</th>
<th>Per each</th>
</tr>
</thead>
<tbody>
<tr>

1917
Section 937 — Detection Systems

937.1 General Description

Furnish, install, test, and provide warranty and training for detection systems comprised of equipment and materials as specified herein and shown in the Contract.

For traffic signal and ramp meter applications, follow Section 647 for submittal requirements, construction procedures, maintenance guidelines, warranty, acceptance, and training requirements.

For ITS and continuous count station applications, follow Section 942 for submittal requirements, construction procedures, maintenance guidelines, warranty, testing, acceptance, and training requirements.

Verify the firmware and software furnished and installed as part of any detection system is the most current and approved releases or versions, unless otherwise requested by the Department.

937.1.01 Definitions, Acronyms, and Abbreviations

A. Definitions

1. **Controller Cabinet**: a cabinet for traffic signal or a ramp meter applications.

2. **Cabinet Input File**: a standardized chassis within a CalTrans cabinet that has slots for detector cards that provide detector output (contact closure) to the controller through an edge card connector.

3. **Field Cabinet**: a cabinet for ITS applications.

4. **Inductive Loop Detection System**: a rack-mounted card inserted into the cabinet input file that supplies an electric current to a coil of wire embedded in the travel lane, which measures changes in the inductance (magnetic field) when vehicles pass over the coil of wire.
   a. **Type A**: a rack-mounted inductance loop detector card that sends a contact closure to the controller.
   b. **Type B**: an IP addressable rack-mounted vehicle detector card.

5. **Maintenance of Vehicle Detection System**: provides the project a means of updating detection zones during multiple lane relocations that may occur during construction phases. A vehicle detection system can be repositioned and/or the detection zones can be redefined to support the maintenance of traffic. When identified as a project pay item, the maintenance of detection shall begin when existing detectors or detection system is rendered inoperable by construction activities until final acceptance. For projects installing new traffic signals, actuation shall be fully operable at the time of signal activation.

6. **Microwave Vehicle Detection System (MVDS)**: uses low power microwave radar beam technology to detect vehicle presence, volumes, occupancy and speed.
   a. **Type A**: a microwave radar unit used for ITS mainline freeway installations.
   b. **Type B**: a microwave radar unit used for traffic signal and ramp meter applications.

7. **Pedestrian Detection System**: A manual pushbutton positioned at pedestrian crossings that actuates a traffic control device controller.
   a. **Type A**: a piezo driven solid-state switch used to send pedestrian actuations (contact closures) to the traffic signal controller.
   b. **Type B**: an accessible pedestrian detector with electronic control equipment, wiring, mounting hardware, pushbuttons, and pedestrian actuation signs designed to provide a pushbutton with a raised, vibrating tactile arrow and audible indications for differing pedestrian signal functions.
8. **Temporary Vehicle Detection System**: provides temporary actuation via a non-invasive vehicle detection system for projects such as resurfacing projects. The contractor will be responsible for installing and removing the temporary vehicle detection system.

9. **Traffic Monitoring Program**: the Department’s state-wide vehicle traffic data collection system, which includes continuous count stations; the program includes data collection of vehicle classification, vehicle volume, vehicle speed, and vehicle weight.

10. **Video Detection System (IVDS)**: captures and processes video images to detect the presence of vehicles, vehicle counts, vehicle classification, detector occupancy, and/or speed information.
   a. **Type A**: a visual spectrum camera capable of capturing the images within the range of wavelengths of electromagnetic radiation normally visible to the human eye, which is typically between 380 nm and 760 nm.
   b. **Type B**: an infrared sensor that detects and converts infrared energy (heat) into an electronic signal and processed as a thermal image (video).

11. **Wireless Magnetometer Detection System (WMDS)**: a wireless in-pavement sensor that analyzes changes in the magnetic field to detect the presence of vehicles, collect vehicle counts, roadway occupancy, vehicle classification, or speed information.
   a. **Type A**: provides vehicle actuation (contact closure) and data collection functions such as vehicle counts, occupancy and classification.
   b. **Type B**: provides vehicle presence actuation only.

B. **Acronyms and Abbreviations**

Refer to Sections 101.01, 647.1.01.B and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

Section 937 — Detection Systems

937.1.03 Submittals
For ITS and continuous count station applications, follow Section 942 for submittal requirements.
For traffic signal and ramp meter applications, follow Section 647 for submittal requirements.

937.1.04 System Requirements
A. General

1. All equipment and equipment applications shall meet MUTCD requirements.
2. All vehicle and pedestrian detection systems shall be supplied with wiring diagrams to convey proper installation of equipment. The drawings shall be provided with the project documentation to the Department.
3. Application Function Definitions
   a. Traffic signal and ramp meter applications
      i. Detection: Identification of a motor vehicle passing over an in-pavement sensor or equivalent non-intrusive system actuation zone and delivery of a contact closure or SDLC data input to the controller.
      ii. Pulse Mode: The actuation starts with the arrival of the vehicle to the detection zone and ends after a fixed duration contact closure.
      iii. Presence Mode: The actuation starts with the arrival of the vehicle to the detection zone and ends when the vehicle leaves the detection zone.
   b. Freeway applications
      i. Volume: number of vehicles crossing a detector within a user-selected period of time.
      ii. Occupancy: time that a detector held a presence call as a percentage of the total time within a user-selected period of time.
      iii. Speed: calculated average value of vehicle velocity that crossed a detector within a user-selected period of time.
   c. Continuous count station applications
      i. Vehicle classification: assignment of vehicle type to each vehicle that crosses a detector, as defined by the Traffic Monitoring Guide, FHWA, Appendix C.
      ii. Vehicle Volume: number of vehicles crossing a detector within a user-selected period of time.
      iii. Vehicle Speed: calculated average value of vehicle velocity that crossed a detector within a user-selected period of time.
      iv. Gross Weight: the total vehicle weight as derived from the measured sum of all tire loads of a single vehicle.
      v. Axle Weight: the measured sum of all tire loads of a vehicle axle.
4. Emergency Vehicle and Railroad Pre-emption
   a. When traffic signal pre-emption is used, coordinate with the railroad, fire department, or any other agency that uses pre-emption to obtain pre-emption output and route output cable to the signal controller operating the intersection to be pre-empted.
   b. Obtain all permits and approval for crossing at-grade or grade-separated railroad facility.
### Section 937 — Detection Systems

#### B. Accuracy Requirements

1. Provide detection system that meets the accuracy requirements listed in Tables 2, 3, and 4.

2. At the Department’s request, complete the following steps:
   a. Submit an Accuracy Test Plan to the Department for review and approval, including the following elements:
      i. For vehicle detection systems, the test plan shall consider roadway types (freeway, arterial), locations (urban, rural), and traffic conditions (free flowing, congested) to determine testing length and sample size.
      ii. Provide data collection site for accuracy testing, including a minimum of two intersections of varying attributes.
      iii. Perform minimum sample size calculations for accuracy testing, including a variety of external lighting (daylight, dawn, dusk, darkness) and pavement conditions (dry and wet). Regardless of the calculated minimum sample size, the minimum sample size is 1,000 data points for each lighting, pavement, and temperature condition.
   b. Address comments provided by the Department regarding the Accuracy Test Plan.
   c. Complete the Accuracy Test Plan and submit the results to the Department for review and approval.
   d. Address comments provided by the Department regarding the Accuracy Test Plan results.

3. The definition of accuracy is provided in this section for each system function.
   a. Vehicle Detection
      i. The total number of detected vehicles identified and tabulated as individual events, for stop bar and set back detectors or detection zones.
      ii. The total number of unique actuation events, identified and tabulated as individual events, shall not deviate from the number of actuation events by more than the minimum system accuracy percentage. The deviation represents the total of the over-counting and the under-counting actuation events, representing the absolute value of the deviation.
   b. Vehicle Binned Data Collection Functions
      i. Each vehicle shall be defined as an individual event.
      ii. The total number of unique events, identified and tabulated as individual events, shall not deviate from the actual events by more than the minimum system accuracy percentage. The deviation represents the total of the over-counting and the under-counting actuation events, representing the absolute value of the deviation.
      iii. Speed shall be defined as the measured velocity of each event in mph.
      iv. Occupancy shall be defined as the measured amount of time each event occupied the detector or detection zone.
   c. Vehicle Classification
      i. Each vehicle shall be defined as an individual event and assigned to a vehicle classification as defined by FHWA.
      ii. The total number of unique events, identified and tabulated as individual events, shall not deviate from the actual events by more than the minimum system accuracy percentage. The deviation represents the total of the over-counting and the under-counting actuation events, representing the absolute value of the deviation.
d. Vehicle Weight
   i. Gross weight: see Section 691 for accuracy requirements.
   ii. Axle weight: see Section 691 for accuracy requirements.

20. Network System Requirements
   a. Applications
      i. Traffic signal and ramp meter applications work include devices or subsystems of the network and the Department’s traffic signal system platform.
      ii. Freeway applications work includes devices or subsystems of the network and the Department’s ATMS platform.
      iii. Continuous count station applications work includes devices and the Department’s Traffic Monitoring Program system platform.
   b. General network requirements include:
      i. Provide a networking functionality that complies with IEEE 802.3, 802.3u, and 802.3x; 10/100 Mbps or higher, auto sensing full or half-duplex operations.
      ii. Provide network hardware interface including a minimum of one 10BASE-T/100BASE-TX PoE Ethernet-port using an IP66 rated RJ-45 weathertight connector and coupler or other Ethernet-compatible locking weathertight connector and coupler.
   c. Include an RJ-45 Ethernet port on the front panel to program the equipment.

C. Network IP addressing Capability Requirements
   1. For detection systems that require IP addressable devices per Section 937:
      a. Provide Domain Name System (DNS) capability.
      b. Support both fixed IP addresses and dynamically assigned IP addresses provided by a DHCP server.
      c. Support static management interface IP addressing.
      d. The vehicle detection system shall be IP-addressable and communication addresses shall be user-programmable.
      e. The vehicle detection system processor shall enable a remote user with a standard web browser to gain remote access, collect data, and control and configure the vehicle detection system.
   2. For detection systems that are not required to provide IP addressable devices per Section 937:
      a. The Contractor may elect to provide IP addressable devices. An example is self-tuning vehicle detectors for inductance loops. In these cases, the IP addressing capability requirements apply.
      b. See Contract for additional project requirements.
   3. Continuous count station system
      a. Provide IP addressable device that complies with the networking requirements for the Department’s Traffic Monitoring Program.
      b. See Contract for additional project requirements.
Section 937 — Detection Systems

D. System Software Requirements

1. For detection systems that are not required to provide system software per Section 937:
   a. The Contractor may elect to provide system software. In these cases, the system software requirements apply.
   b. See Contract for additional project requirements.

2. For detection systems that require system software per Section 937:
   a. Provide capability to operate on a Microsoft Windows operating system.
   b. Provide software and firmware updates through an Ethernet or USB port. Verify that data can be retrieved from the system locally and remotely.
   c. Provide system that provides an open API and SDK for the Department to integrate with the network or other third-party software and systems.
   d. Provide software that has the capabilities for the user to automatically and manually reset, reprogram, calibrate, operate, and view status of system features.
   e. Provide software capable of performing tasks using direct connection or network-connected workstation.
   f. Provide software that communicates concurrently between multiple users and multiple detection processors on the same network without interruptions or conflicts with the normal polling cycle.
   g. Provide software with administrative capabilities including creation of user accounts and passwords for access to device setup and settings.
   h. Provide processor with non-volatile memory enough to store all system detection zones settings and two weeks of binned data.
   i. Provide capability to create detection zones of varying size and shape to provide the best coverage of the viewable roadway lanes and ramps.
   j. Provide the following capabilities for the user to view the currently active detector zones via the software:
      i. Confirmation: When viewing real-time vehicle actuations on the monitoring device, indicate the passage or presence of each vehicle detected for each detection zone by changing the color or intensity of that zone.
      ii. Detection During Reconfiguration: The detection system shall be able to continue detecting vehicles on existing zones during reconfiguration, and switch to updated zones upon saving new settings.
      iii. Enable the user to define the contents of binned data that is transmitted through the network.
      iv. User-selected settings for detector count periods and detector zone sensitivity.
      v. Verify the vehicle detection system configuration data can be uploaded and saved to a computer over the network for later re-loading to the video detection processor, if necessary.

3. Continuous count station system
   a. Provide system that is compatible with the Department’s Traffic Monitoring Program platform.
   b. Verify that the data generated by the continuous count station is displayed correctly and seamlessly integrated with the Department’s Traffic Monitoring Program platform.
937.2 Materials

937.2.01 General

A. Cabinet and Controller Interface

1. For vehicle actuation, provide one of the following interface methods:
   
   a. Provide system with edge card equipment that provides contact closures to the controller, in conformance with the traffic signal controller specifications in Section 925.
   
   b. Provide SDLC interface that provides the traffic signal controller with vehicle actuation data.

2. For pedestrian actuation, provide system with edge card equipment that provides contact closures to the controller, in conformance with the controller cabinet assembly standards in Section 925.

3. Continuous count station applications shall not require an interface with a traffic signal cabinet or controller.

B. Environmental

1. Provide devices that meet performance requirements before, during, and after being subjected to the environmental requirements detailed in NEMA Standard Publication TS 2-2016, Section 2.

2. All equipment assemblies outside of the controller or field cabinet shall be placed in a NEMA Type 3R or 4x enclosure, unless specified otherwise in this section.

3. All equipment shall meet or exceed the temperature and humidity limits per NEMA TS2-2003 requirements.

C. Frequency

1. Provide device that complies with the limits of a Class A digital device, pursuant to FCC Part 15.

2. Verify that the detector system meets FCC requirements.

D. Electrical

1. Provide equipment located inside the cabinet that operates on nominal 120 VAC. If a device does not operate on 120 VAC, the converter shall be included at no cost to the Department.

2. Equipment external to the cabinet shall operate at 50 V or less.

937.2.02 Inductance Loop Detection System

A. General

1. The inductance loop detection system shall include components needed for the applications and locations shown in the Contract.

2. If testing is required, provide the Department with a test unit and software within 10 calendar days of the request.

3. Detector Card Types

   a. Type A: a rack-mounted inductance loop detector card that sends a contact closure to the controller; detector card does not have an IP address.

   b. Type B: an IP addressable rack-mounted vehicle detector card.
B. Environmental

1. Provide documentation from an independent laboratory certifying the unit complies with environmental tests, transient tests, and size requirements of:
   a. NEMA Standard TS I Section 15.
   b. TS 2 Section 6.5.
   c. CalTrans Type 2070 Specifications.

C. Equipment

1. Configure for rack mount insertion into a CalTrans Type 2070 cabinet input file.

2. Loops
   a. Typical loop configurations are:
      i. 6 ft x 6 ft (1.8 m x 1.8 m) [dipole]
      ii. 6 ft x 20 ft (1.8 m x 6.1 m) [dipole]
      iii. 6 ft x 40 ft [(1.8 m x 12.2 m) [dipole or quadrupole]
   b. Loop lead-in cable lengths range between 5 ft (1.5 m) to 1,500 ft (457 m).

3. Splices
   a. Use materials compatible with the sheath and insulation of the loop cable.
   b. Insulate inductance loop splices in accordance to standard detail drawings.

D. Electrical

E. Requirements

1. Each channel shall include two indicators: one for the detect state and the second to indicate the status of the fault monitor.

2. Tuning
   a. Supply units that are fully digital and self-tuning.
   b. Each channel shall automatically tune the loop and lead-in combination within 2 sec of application of power or reset signal.
   c. The tuning circuit shall not be affected by drift, caused by environmental changes or changes in applied power, and cause false actuations.

3. Scanning
   a. Units shall sequentially scan each channel (only one channel energized at any given time) to:
      i. Eliminate crosstalk from multiple loops in adjacent lanes.
      ii. Enable overlapped loops for directional control.
      iii. Enable use of multi-conductor homerun cable connected to the same detector unit.

4. Each channel shall be equipped with front panel selectable sensitivity settings for presence and pulse modes.

5. Units shall have a minimum of three switch selectable operating frequencies.

6. Each channel shall tune to an inductive load from 50 to 2,000 µH with a Q factor >5.
7. Each channel shall continue operating with poor quality loop systems (Q>2) including those that have a single point short to ground.

8. Fault Monitoring
   a. Units shall continuously monitor the operation of each channel.
   b. The unit shall detect shorted loops, open circuit loops, or sudden changes in inductance (>25% of nominal).
   c. Verify that each type of fault is indicated on a fault LED by a unique sequence of flashes until the fault is rectified.
   d. Verify that while the channel is in the fault condition the channel output remains in the detect state.
   e. When the fault is rectified, the fault LED continues to emit the sequence signifying the last fault detected, but the detect LED and output returns to normal operation.

9. Failsafe Output
   a. Verify that each channel output generates a continuous solid-state output to the controller when power to the detector is removed.

10. Operational Modes
    a. Supply units with each channel selectable for either pulse or presence modes and that meet the following requirements:
       i. Pulse Mode
          a. This setting provides a single output pulse (125 ms ±25) in response to a vehicle entering the loop.
          b. If a vehicle remains in the sensing zone in excess of 2 sec, the unit “tunes out” said vehicle.
          c. The channel is then capable of detecting another vehicle entering the same detection zone.
       ii. Presence Mode
          a. The presence hold time is a minimum of 4 minutes for small vehicles (motorcycles) and a minimum of 60 minutes for automobiles.
          b. Unit shall tune out continuous peak hour traffic over long or multiple small loops if there is vehicle motion in the sensing zone every 10 minutes.

11. Resets
    a. Verify that the channels are manually resettable by removing the power momentarily.
    b. Verify that the channels reset remotely when the voltage on Pin C falls below 8 VDC for a period >15 ms, and that the unit resumes normal operation within 4 sec after the application of power or after a reset signal of 15 ms.

12. Field Tuning
    a. Verify that field adjustments to the operation of the detector do not require the use of a meter, circuit changes, special software or substitutions, modifications, or additions to the unit.
Section 937 — Detection Systems

F  Functional Requirements

1. Provide capability of detecting passage and holding presence and accurately counting all types of licensed motor vehicles when connected to a 6 ft. x 6 ft. (1.8 m x 1.8 m) loop and lead-in without detecting vehicles in adjacent lanes.

2. Provide capability of responding to an inductance change of 0.02% and sensing vehicles at speeds of up to 80 mph (130 kph).

3. Provide capability to not detect vehicles, moving or stopped, at distances greater than 3 ft. (0.9 m) for the loop perimeter.

937.2.03 Pedestrian Detection System

A. General

1. The pedestrian detection system shall include components needed for the applications and locations shown in the Contract.

2. Pushbutton Types
   a. Type A: standard
   b. Type B: accessible

3. IP addressable device capabilities or software are not required unless specified in the Contract.

B. Environmental

1. Provide housing that meets NEMA 250-6P for prevention of water and dust intrusion.

C. Equipment

1. Housing
   a. Provide housing free of voids, pits, dents, and excessive grinding marks. Exterior surface shall be smooth and cosmetically acceptable, free of molding fins, cracks, and other exterior blemishes.
   b. Provide housing and cover with a chromate conversion coating to provide a proper base for paint adhesion. The housing shall be finished with baked enamel finish power coating or paint in highway yellow.
   c. Provide mounting assembly that can be mounted to a flat or curved surface.
   d. Provide stainless steel and vandal proof screws and/or bolts. The unit with a 0.5 in. (13 mm) threaded opening shall have a plug furnished.
   e. Route all wiring within the pole and through the assembly bracket.

2. Pushbutton (all types)
   a. Provide pedestrian pushbuttons with a piezo driven solid-state switch in a vandal resistant cast aluminum housing.
   b. Provide button that is pressure activated with no moving parts.
   c. Provide switch that meets the following requirements:
      i. Switch rated for 100 million cycles.
      ii. Pushbutton shall be actuated by a force of 3 lbs. (1.36 kg) or less.
Section 937 — Detection Systems

3. Pushbutton Station
   a. Screws or bolts shall be stainless steel and vandal proof.
   b. Provide the unit with a 0.5 in. (13 mm) threaded opening with plug.
   c. Verify that the assembly is weathertight.
   d. Assembly shall have transient surge protection compliant with NEMA TS2.

4. Pushbutton Sign
   a. Provide MUTCD signs as shown in the Contract.
   b. Provide sign adapter plate that has a separate, die-cast aluminum part that is interchangeable.
   c. Sign adaptor plates shall be provided with one of the following configurations as specified in the Contract:
      d. A 9 in. (229 mm) by 15 in. (381 mm) cast aluminum plate adapter for upgrading existing pushbutton stations with 9 in. (229 mm) by 12 in. (305 mm).
      e. A 9 in. (229 mm) by 15 in. (381 mm) cast aluminum plate adapter to upgrade existing pushbutton station, 5 in. (127 mm) by 7 in. (178 mm).
      f. A 9 in. (229 mm) by 15 in. (381 mm) sign with round pushbutton adapter for new installations at traffic control signals, except for RRFB installations.
      g. A 9 in. (229 mm) by 12 in. (305 mm) sign with round pushbutton adapter for RRFB applications only.
   h. The pedestrian pushbutton sign adapter assembly shall be attached, prior to shipping.

D. Electrical

1. Provide transient suppression that meet IEC 61000-4-4 and IEC 61000-4-5.

2. Provide lightning and power protection that meets the following:
   a. GR-1089-CORE
   b. 6000v-400A, 25 reps 120 VAC-15 minutes

E. Requirements

1. Type A pushbutton
   a. Provide button cap that is 2 in. (52 mm) in diameter and made of 316 stainless steel.
   b. Provide pushbutton with audible response upon actuation.
      i. Audible actuation confirmation tone for push actuation shall be between 3.2 and 3.8 kHz.
      ii. If an audible actuation confirmation tone for button release is available, it shall be between 2.2 and 2.7 kHz.
      iii. Audible actuation confirmation tones shall last a minimum of 50 ms and not exceed 150 ms.
      iv. Audible actuation confirmation tones shall not exceed 75 dB at 3.3 ft. (1.0 m).
   c. Provide pushbutton with actuation confirmation light.
      i. Detection confirmation light shall be red.
      ii. Detection confirmation light shall have a viewable angle greater than 120 degrees.
      iii. Detection confirmation light shall have momentary and latching options.
Section 937 — Detection Systems

d. Detection confirmation light shall luminosity shall be a minimum of 0.25 Lux measured at 3.3 ft. (1.0 m).

2. Type B pushbutton
   a. Provide accessible pedestrian detector electronic control equipment, wiring, mounting hardware, pushbuttons, and pedestrian actuation signs designed to provide a pushbutton with a raised, vibrating tactile arrow and audible messages and locator tone for differing pedestrian signal functions.
   b. Electronic Control Equipment
      i. Install in a traffic controller cabinet or pedestrian signal housing.
      ii. Provide up to 16 detectors (4 maximum per channel) in a single traffic controller cabinet.
   c. Audible Messages
      i. Provide capability for programmable audible messages.
      ii. All audible messages and tones shall emanate from the accessible pedestrian pushbutton housing.
      iii. Accessible Pedestrian Detector shall use digital audio technology.
      iv. Provide a minimum of three programmable locator tones.
      v. Provide Accessible Pedestrian Detector with independent minimum and maximum volume limits for the locator tone, walk, and audible beaconing features.
      vi. Provide the annunciated “Wait” message once per actuation.
   d. Pushbutton Locator Tone
      i. Provide Accessible Pedestrian Detector independent ambient sound adjustment for the locator tone feature.
      ii. Locator tone have a volume range of 30 to 90 dB measured at 3 ft. (0.9 m) from unit.
      iii. Provide capability to deactivate the Accessible Pedestrian Detector locator tone.
   e. Vibrating Tactile Button
      i. Provide a single assembly containing an ADA-compliant and vibrating tactile directional arrow button, weatherproof audible speaker, and pedestrian actuation sign with optional placard Braille messages.
      ii. Provide tactile arrow that is 2 in. (52 mm) in length and field adjustable to two directions.
   f. Conflict Monitoring
      i. Provide monitoring for the Accessible Pedestrian Detector “Walk” condition for conflict operation.
      ii. Provide capability to disable the “Walk” functionality if a conflict is detected.
   g. Cabinet Control Unit
      i. Provide interface and connection to the traffic signal controller.
      ii. Provide LED indicators for each channel operation.
      iii. Provide capability to automatically reset upon loss of internal communication.
937.2.04 Video Detection System

A. General

1. Provide video detection system for the application as shown in the Contract.

2. Types
   a. Type A: visual spectrum camera
   b. Type B: infrared sensor

B. Environmental

1. Provide a provision at the rear of the camera enclosure for a weathertight power and video signal cable connection over a single weathertight connector.

2. Power and video connections may be provided on the bottom of the camera enclosure as an alternative.

C. Equipment

1. Camera types
   a. Type A, Visual Spectrum Camera
      i. Video camera sensor optics shall compensate for variations in lighting and weather conditions, including blooming caused by headlights and minor vibration caused by wind.
      ii. IVDS shall enable user to select video resolution with a minimum of 720P (1280x720 lines) video output.
   b. Type B, Infrared Sensor
      i. The camera shall be capable of sending a thermal video image from the thermal video camera sensor to the processor for real-time vehicle actuation.
      ii. IVDS shall enable user to select video resolution with a minimum of 480P (640x480 lines) video output.

2. Camera Assembly
   a. CMOS shall comply with Advanced Television Systems Committee Standard H.264 or NTSC standards with a H.264 or H.265 option. Camera provides full color/motorized zoom focus control with auto focus and manual focus override.
   b. The camera shall have a minimum 10x optical and minimum 1.5x digital zoom.
   c. The camera shall have a direct, real-time iris, and shutter speed controlled by the integrated processor.
   d. The camera shall operate at 30 frames per second (fps) regardless of resolution.
   e. It shall be possible to adjust lens zoom remotely over the network for temporary traffic surveillance operations or to inspect the faceplate cleanliness.
   f. The sensor shall have provisions to prevent ice and condensation. Condensation prevention equipment shall not interfere with the video camera sensor operation or cause video signal interference.
3. **Cabinet**
   
a. **Freeway Field Cabinet Mounting**
   
i. The IP-addressable IVDS processor shall be shelf or rack mountable.
   
   ii. IVDS processor shall support mounting and operation in an enclosed field cabinet or hub building without blower fans and without insulation from other electronic devices such as power supplies and communications equipment.
   
   iii. Verify video inputs are provided on the IVDS processor such that signals from one video camera sensor or other synchronous or non-synchronous video source can be processed in real time.

b. **Traffic Control Signal or Ramp Meter Controller Cabinet Mounting**
   
i. Provide an IP addressable processor module that performs video image processing and encoding.
   
   ii. Processor shall fit standard CalTrans cabinet input file and provide a standard contact closure (input) to the controller.
   
   iii. Provide one to four detector outputs through the processor module that communicate through the edge card connector. Use a module that is no wider than two standard input file slots.

D. **Electrical**
   
   1. Provide power from the controller or field cabinet power source through a manufacturer supplied or recommended surge suppressor to the video camera sensor.

E. **Requirements**
   
   1. Mount the processor and expansion modules in the traffic signal or ramp meter controller cabinet input files using the edge card connector for power and to provide contact closure outputs.
   
   2. **Detection zones**
      
a. Provide capability to emulate the output of consecutive 6 ft. by 6 ft. (1.8 m by 1.8 m) in-pavement loops spaced 8 ft. (2.4 m) apart for stop bar applications at traffic signals and ramp meters.
      
   b. Provide capability to emulate the output of in-pavement loops ranging from 6 ft. by 20 ft. (1.8 m by 6.1 m) to a 6 ft. by 50 ft. (1.8 m by 15.2 m) for stop bar applications at traffic signals and ramp meters.
      
   c. Provide a minimum of 16 detection zones with one video camera sensor.
      
   d. Enable multiple detection zones to be combined onto a single channel.

   3. **Provide IVDS processor front panel that includes the status of the following:**
      
a. IVDS processor (online).
      
b. Network communications (transmit/receive).
      
c. IVDS processor to camera assembly communications.
      
d. Active detections for each video camera assembly.
F. Functional Requirements

1. Provide processor with non-volatile memory enough to store all system detection zones settings and two weeks of binned data.
2. Provide capability to display detection zones superimposed on the camera sensor images on a monitoring device and centralized video system.
3. Provide vehicle presence, speeds, counts, and roadway occupancies on a lane-by-lane basis based on the application as shown in the Contract.
4. Verify that the system responds with the accumulated binned traffic data collected since the last data request with no gap in data.
5. Provide processor equipped with video stabilization to compensate for camera movement attributable to temperature effects, wind shifting, pole sway, pole expansion, or vibration.

937.2.05 Microwave Vehicle Detection System Requirements

A. General

1. The MVDS shall include components needed for the applications and locations shown in the Contract.
2. Types
   a. Type A: Typically applied for ITS mainline freeway installations.
   b. Type B: Typically applied for traffic signal and ramp meter installations.
3. Frequency
   a. Provide device that transmits on a 24 GHz frequency or another approved spectral band.
   b. Provide device that does not interfere with known equipment or coverage area.

B. Environmental

1. Provide device that is resistant to vibration in accordance with NEMA TS-2 2003 requirements.
2. Provide device that is resistant to shock in accordance with NEMA TS-2 2003 requirements.
3. Provide cables with weather-proof connections and shielded as required by manufacturers recommendations.

C. Equipment

1. Mounting assembly
   a. Provide mounting assembly that is constructed of coated steel, stainless steel, or aluminum.
   b. Provide mounting assembly capable of supporting a minimum load of 20 lbs. (9.1 kg).
   c. Provide mounting assembly with a mechanism that can be tilted on both axes and locked into place.
2. Cables
   a. Provide connection between the MVDS and the controller or field cabinet equipment using a single cable.
   b. No splices are permitted in any cable. The cable shall, at a minimum, provide power and the data interface to the MVDS unit.
   c. Twisted pairs shall be identified by separate insulation colors. Communications pairs shall be individually or commonly shielded.
d. Low-voltage power conductors shall not be shielded together with the communications pairs.

e. MVDS units shall communicate via serial RS-485 or ethernet protocol.

D. Electrical

1. The MVDS shall be operable from 12 to 24 VDC.

2. Power supply shall be provided from the MVDS communications wiring module in the controller or field cabinet.

3. Alternative power sources and adapters shall be submitted to and approved by the Department.

4. The MVDS unit shall include power management features enabling remote shutdown and cyclical shutdown.

5. Electrical Isolation and Surge Protection

   a. The equipment shall meet specified requirements during and after subjecting it to a power surge of ±1 kV (rise time = 1.2 µs, hold = 50 µs) applied in differential mode to lines, power, and output as defined by IEC 1000-4-5 and EN 61000-4-5 standards or NEMA TS2-2003, 300V Transient Voltage Protection.

   b. Power cables, contact closures, and the serial port shall have a surge protector that meets the manufacturer’s recommendations.

   c. Isolate the contact closures and the communications port.

E. Requirements

1. General (All Types)

   a. Provide MVDS with presence indication of vehicles in its detection zones.

      i. Transmit traffic data, periodically accumulated over user-defined time customizable intervals between 10 to 600 sec.

      ii. Data shall be available simultaneously with detection zone contact closures and network communications. Supply modules as necessary for simultaneous communications.

      iii. Vehicle classification by length in a minimum of three user defined classes. Supplemental detection zones, not used for vehicle actuation, may be used to collect this data.

      iv. Enable the user to define the contents of transmitted data.

   b. Provide hardware suitable for mounting on roadside poles or on overhead structures at a mounting height determined by the manufacturer.

2. MVDS Type A

   a. Provide capability of a 200 ft. (61 m) range and can accurately detect up to eight lanes of traffic in a single direction.

   b. Provide capability in which the data shall include the following in each of a minimum of eight lanes in one direction and a minimum of sixteen detection zones (lanes) for bi-directional travel:

      i. Volume

      ii. Lane occupancy

      iii. Average speed
3. MVDS Type B
   a. Provide capability of meeting zone requirements as shown in the Contract and provide actuation outputs that meet the specifications of the controller.
   b. Provide capability for a minimum of eight detection zones in a single direction where the farthest lane at ideal mounting height can detect at a minimum distance of 100 ft. (30.5 m).

F. Functional Requirements

1. Provide processor with non-volatile memory enough to store all system detection zones settings and two weeks of binned data.

2. Verify that the traffic data collected by the microwave detection system is stored in internal non-volatile memory.
   a. Verify the MVDS enables local and remote configuration and monitoring including data retrieval using computers on the network.
   b. Verify that the system configuration data and software are also stored within internal non-volatile memory in repeaters.

3. Verify the system enables the user to view live actuations from the microwave detector with the programmed detectors overlaying a representation of the roadway.

4. Verify the microwave detection system configuration data can be uploaded and saved to a laptop or performed over the network to re-load to the processor, if necessary.

5. Verify no periodic adjustments or fine-tuning is required except in the case of physical roadway changes such as lane-shifts, new construction, or closures.

937.2.06 Wireless Magnetometer Detection System Requirements

A. General

1. The WMDS shall include components needed for the applications and locations shown in the Contract.

2. Types
   a. WMDS Type A shall provide traffic sensor functions with data collection functions.
   b. WMDS Type B shall provide presence actuation only.

B. Environmental

1. The in-pavement sensor shall be placed in a NEMA Type 6P enclosure.

2. All other components outside the controller cabinet assembly shall be placed in a NEMA Type 4x enclosure and comply with IEC IP67 standards, including radio and repeater components.

3. The WMDS components shall be resistant to vibration in accordance with IEC 68-2-30 (test Fc), NEMA TS-1 (Section 2.1.12), or approved equivalent.

4. The WMDS components shall be resistant to shock in accordance with IEC 68-2-27 (test a), NEMA TS-1 (Section 2.1.13), or approved equivalent.
Section 937 — Detection Systems

C. Equipment

1. The mounting assembly shall meet the following requirements:
   a. Constructed of coated steel, stainless steel, or aluminum.
   b. Support a load of a minimum of 20 lbs. (9.1 kg).
   c. Assembly shall have an approved mechanism that can be tilted on both axes and locked into place.

2. Cables
   a. Connection between the WMDS and the controller or field cabinet equipment shall be provided by a single WMDS unit harness cable with a military-style connector.
   b. No splices are permitted in any cable. The cable shall, at a minimum, provide power and the RS-485 serial data interface to the WMDS unit.
   c. Military-style connector pins shall be crimped to the cable conductors, assembled, and tested by the manufacturer prior to installation and on-site cable pulling.
   d. RS-485 signal ground shall be provided by the shield drain wire, an additional conductor, or an additional shielded pair in accordance with the manufacturer’s recommendations.
   e. Twisted pairs shall be identified by separate insulation colors. Communications pairs shall be individually or commonly shielded.
   f. Low-voltage power conductors shall not be shielded together with the communications pairs.

D. Electrical

1. The WMDS cabinet components shall be operable from 12 to 24 VDC. Power supply shall be provided from the WMDS communications wiring module in the controller or field cabinet. Alternative power sources and adapters shall be submitted to and approved by the Department.

2. The WMDS in-pavement sensors and wireless repeaters shall have a minimum battery life of seven (7) years.

3. The WMDS unit shall include power management features enabling remote shutdown or cyclical shutdown.

4. Electrical Isolation and Surge Protection
   a. The equipment shall meet specified requirements during and after subjecting it to a power surge of ±1 kV (rise time = 1.2 µs, hold = 50 µs) applied in differential mode to lines, power, and output as defined by IEC 1000-4-5 and EN 61000-4-5 standards or NEMA TS2-2003, 300V Transient Voltage Protection.
   b. Power cables, contact closures, and the serial port shall have a surge protector that meets the manufacturer’s recommendations.
   c. Isolate the contact closures and the serial port.
Section 937 — Detection Systems

E. Requirements

1. Provide the following devices as necessary:
   a. Battery-powered wireless sensors installed in-pavement in each traffic lane with reusable enclosure.
   b. Roadside radios and antennas, including associated cables and mounting hardware, for communication with in-pavement sensors and wired connections to associated systems.
   c. Repeaters and associated mounting hardware that extend the primary roadside radio range.
   d. Expansion cards to provide detector outputs additional signal phases on the same intersection approach.
   e. Isolation modules to provide surge protection, isolation, and signal conditioning.
   f. I/O modules to provide additional communication options, memory options, and a battery-backed, real-time clock.

2. Master Radio Receiver
   a. A radio shall support a minimum of 48 sensors with a maximum 0.125-second latency.
   b. The radio shall include an Ethernet interface and CAT5e or higher Ethernet cable.
   c. The radio shall have a weathertight Ethernet connector on the bottom of the radio housing, which shall not require specialized tools for installation.
   d. The Ethernet connector shall be shipped with a cover firmly attached to provide protection from the elements.

3. Repeater
   a. A repeater communicating directly to an access point shall support a minimum of 20 sensors.
   b. A repeater communicating to an access point via an intermediate repeater (i.e., tandem operation) shall support a minimum of 12 sensors.

4. Contact Closure Interface Card
   a. Each interface card shall communicate with a minimum of two (2) radios.
   b. Interface and expansion cards shall be user configurable from one to four (1–4) channels each.
   c. The interface and expansion cards shall be configurable via front panel switches or a computer software interface to provide:
      i. Switch between presence and pulse mode.
      ii. Delay timing.
      iii. Extension timing.

5. Isolator Module
   a. Shall enable the interface card to be connected to a radio operating up to 2,000 ft (610 m) away.
   b. Shall provide electrical isolation of 1500 VAC.
   c. Shall provide surge protection of up to 1500 VAC.
   d. Shall provide AC power cross protection.
Section 937 — Detection Systems

6. Antenna
   a. Shall operate in an FCC approved 900 MHz frequency band that is compatible with the detection equipment and shall not interfere with known equipment.
   b. Furnish an antenna that will interface with associated detection equipment. Include necessary cables and connectors per manufacturer’s specification.
   c. Furnish mounting hardware to secure the antenna to the pole as recommended by the antenna manufacturer and as approved by the Department.
   d. Antenna cable attenuation shall be respective and sized to the frequency being attenuated at industry standard.

F. Functional Requirements

1. Provide processor with non-volatile memory enough to store all system detection zones settings and two weeks of binned data.

2. Provide real-time vehicle actuation information to a traffic signal controller using contact closures and transmit volume, occupancy, speed, and classification data over the Department's network.

3. Sensors
   a. Detect all types of motor vehicles.
   b. Communicate time-stamped ON and OFF vehicle actuation events.
   c. Automatically recalibrate in the event of a detector lock.
   d. Communicate wirelessly to a nearby radio, access point, antenna, or repeater.
   e. Automatically re-transmit a detected event if no acknowledgement is received from the access point.
   f. Respond within 100 ms when the access point is powered on and transmitting.
   g. Provide sensor that is capable of being individually configured with its own sensitivity level.
   h. Provide sensor that is capable of being configured with a sensitivity level that approximates the detection zone of a standard 6 ft. by 6 ft. (1.8 by 1.8 m) inductance loop.
   i. Provide sensor that is capable of being configured with relatively higher or lower sensitivity levels, so that the system is capable of detecting a motorcycle and a light rail vehicle.
   j. Provide interface card that is capable of supporting the sensor actuation data relay through several interfaces.

4. The radio links between each sensor and associated communication link shall conform to the following:
   a. The center frequencies, bandwidths, and transmit power levels of the radio links shall allow operation in an unlicensed frequency band.
   b. Frequency channels shall be employed by the sensors, access points, antenna and repeaters to avoid interference with other devices operating in the unlicensed band.
   c. Frequency channels shall be user-configurable when using WiFi frequencies.
   d. A minimum of 16 frequency channels shall be supported.
Section 937 — Detection Systems

5. The data collection capabilities shall include:
   a. Vehicle volume (count) per lane over a specified time interval.
   b. Lane occupancy (percent) over a specified time interval.
   c. Vehicle speed (mph or kph) when more than one sensor is deployed in a lane.
   d. Per-vehicle speed.
   e. Median speed over a specified time interval.
   f. Mean speed over a specified time interval.
   g. Distribution of speeds over a specified time interval.
   h. Vehicle classification when more than one sensor is deployed in a lane.
   i. Per-vehicle length.
   j. Report distribution of vehicle lengths over a specified time interval.
   k. The time interval for measurements shall be selectable from 30 seconds to 24 hours.

937.2.07 Continuous Count Station System

A. General
   1. The continuous count station system shall include components needed for the applications and locations shown in the Contract.
   2. Coordinate with the Department for approval of continuous count station system components not included on the QPL.
   3. If weigh-in-motion application is shown in the Contract, see Section 691 for additional requirements.

B. Environmental
   1. If in-pavement detection devices are used, the components shall be resistant to vibration in accordance with IEC 68-2-30 (test Fc), NEMA TS-1 (Section 2.1.12), or approved equivalent.
   2. If in-pavement detection devices are used, the components shall be resistant to shock in accordance with IEC 68-2-27 (test a), NEMA TS-1 (Section 2.1.13), or approved equivalent.

C. Equipment
   1. For in-pavement detection devices, provide a detector minimum design life of seven (7) years.
   2. Communication
      a. Provide an integrated cellular wireless router only as listed on the GDOT QPL and as approved by the Department’s current cellular telecommunications service provider.
      b. See Section 926 for cellular wireless router requirements.
   3. Cabinet
      a. Provide NEMA Type 3R cabinet that provide suitable space, ventilation, and light for the equipment that occupies the cabinet, including consideration for system maintenance.
      b. Provide clear identification on cabinet with contact details for the maintenance provider and the Department.
Section 937 — Detection Systems

4. Access
   a. Provide key that is compatible with other continuous count station cabinets.
   b. Provide 3 copies of the key to the Department.

D. Electrical
   1. If in-pavement sensors are used that require battery power, provide a minimum battery life of seven (7) years.
   2. Provide power service per Section 647 or solar power service per Section 925.
   3. Provide grounding per Section 647 and 682.

E. Requirements
   1. Coordinate with Office of Transportation Data to confirm detector spacing for vehicle speed measurements.
   2. If weigh-in-motion application is shown in the Contract, see Section 691 for additional requirements.
   3. For pavement loop applications, see Section 937.02.02 for additional requirements.

F. Functional Requirements
   1. Provide detection types that provide continuous count station applications and the associated accuracy requirements.
   2. Provide detection configuration that supports the continuous count station applications.

937.2.08 Temporary Vehicle Detection System
Furnish a Temporary Vehicle Detection System that meets the requirements of this Section.

937.2.09 Maintenance of Vehicle Detection System
Furnish a Maintenance of Vehicle Detection System, if different than the final vehicle detection system specified in the Contract, that meet the requirements of this Section.

937.3 Construction
For ITS and continuous count station devices, additional construction requirements are referenced in Section 942.

937.3.01 General
A. For all detection systems:
   1. Provide personnel that are certified by the manufacturer to test and pre-configure the components, including assigning channels and sensors to repeaters and access points.
   2. Record all detection component ID numbers on a project plan drawing or intersection detail prior to installation, and supply all drawings showing the recordings as part of the as-builts at the end of the project.

B. Submit information as part of the project documentation to the Department.
937.3.02 Inductance Loop Detection System

A. General Installation Requirements

1. Loop wire from the roadway shall be spliced at the first (nearest) pull box to the saw slot. No other splices are allowed.

2. Place the top stop bar loop 2 ft. (600 mm) behind (upstream) the stop bar unless otherwise shown in the Contract.

3. Do not place a portion of the loop within 3 ft. (900 mm) of a conductive material in or above the pavement such as a manhole cover, water valves, grates, metal gates, etc.

4. Verify that the ambient pavement surface temperature in the shade is a minimum of 40 °F (4 °C) before cutting roadway and placing sealant into saw cuts.

5. Wind loop wire clockwise in the saw slot and connect the lead wire to the black wire to make the loop phasing in one direction and connect to the controller or field cabinet input panel to the appropriate detector channel on all odd-numbered terminals.

6. Follow wiring color coding shown in Tables 6 and 7 for traffic control signal and ramp meter applications.

Section 937 — Detection Systems

B. Saw Cuts

1. Outline the loop on the pavement to conform to the specified configuration.

2. Verify each loop has a separate saw cut with a minimum distance between saw cuts of 6 in (150 mm) to the side of the road and its own drilled hole through the curb.

3. Saw cutting a loop lead across a pedestrian ramp or intersection corner radius is prohibited.

4. Use wet saw only cutting inductance loop slots.

5. Cut the detector loop in a saw slot a minimum of 4 in. (100 mm) deep to provide a minimum of 3 in. (75 mm) of depth to the top of the wire.

6. Verify that the slot is a minimum of 0.25 in. (6 mm) wide for stranded No. 14 AWG loop wire, XLPE or XHHW-2, and a minimum of 0.31 in. (8 mm) wide for polyethylene or PVC-encased No. 14 AWG loop wire.

   a. Drill a 2 in. (50 mm) diameter hole or make miter saw cuts in the pavement at the slot intersection, as directed by the Department.

   b. Overlap miter saw cuts at the saw cut intersection so that the slots have a full-depth and smooth bottom. Do not make a full triangle cut. Depth shall be uniform.

   c. Prevent the wire from bending sharply.

Number of three-pair shielded cables (n)
Note: Lane numbering shall begin at the median for mainline travel lanes. Lane numbering for ramp meter lanes shall begin with the lane adjacent to the mainline travel lanes.
Section 937 — Detection Systems

d. Do not install detector loop wire unless sawed slots are completely dry and free of debris. Pressure wash the slot to guarantee adhesion of the loop sealant. Use compressed air to thoroughly clean out and dry the sawed slot with a minimum of 125 psi (8.8 kg/cm²). Handheld or backpack blowers shall only be used to dry the pavement or remove debris away from the saw cut edge.

e. Install the loop wire starting at the nearest pull box or conduit around the loop in a clockwise direction for the specified number of turns, and back to the pull box or conduit.

f. All quadrupole loops shall be wrapped in a clockwise figure eight configuration.

g. Refer to Standard Detail Drawings for the number of turns to install in the saw slot.

7. Press the wire in the slot without using sharp objects that may damage the jacket.

8. Hold the loop in place every 5 ft. (1.5 m) with 1 in. (25 mm) strips of rubber, neoprene, flexible tubing, or foam backer rod as approved by the Department.

9. Leave the hold down strips in place when filling the slot with loop sealant.

10. Where encased loop wire is used, apply a weathertight seal to the ends of the polyethylene tubing that encases the wire to prevent moisture from entering the tube.

11. Where the loop wires cross pavement joints and cracks, protect the loop wires using the method specified in the Standard Detail Drawings. When crossing expansion joints, drill a 2 in. (50 mm) diameter hole a minimum 4 in. (100 mm) deep or to bottom of saw cut. Do not install loop wires in an expansion joint.

12. Twist loop lead-in four to six turns per foot from the curb to the loop lead-in cable splice or directly to the cabinet. When possible, start the twist of loop wires from the loop’s edge in the saw cut to the loop lead-in cable splice, or directly to the cabinet.

C. Saw Cut Sealing

1. After successfully testing each loop, fill the slots with sealant to fully encase the conductors using a one-part loop sealant mixture that requires a caulk gun or similar device. See Section 833.2.09.

2. Seal the slot only when the pavement is completely dry.

3. Verify that the sealant is a minimum of 3 in. (75 mm) thick above the top conductor in the saw cut.

4. Apply the sealant so that subsequent expansion does not raise the sealant material above the pavement surface.

5. In case of accidental spill, remove surplus sealant from the adjacent road surfaces without using solvents or epoxy sealants before the sealant sets.

6. Remove excess loop sealant to prevent distorting pavement marking reflectivity, color, or shape.

7. When the Department determines that the loop sealant can accommodate traffic, but the surface is tacky, dust the sealer on the pavement surface with cement dust before opening the roadway to traffic.

8. Dispose of the solvents used to clean loop installation equipment according to the manufacturer’s specifications and local, state, and federal regulations.
Section 937 — Detection Systems

D. Inductance Loop Connections

1. Connect loop conductors to a shielded lead-in cable that runs from the pull box adjacent the pavement edge or conduit to the controller or field cabinet input panel, unless otherwise specified in the Contract.

2. Use a continuous 3-pair, 14 AWG shielded lead-in cable from the pull box or conduit to the controller or field cabinet input panel. The 3-pair cable shall not be spliced.

3. Do not bond or ground the shield in the loop lead-in cable at the controller cabinet unless induced voltage is present. If voltage is present, then the shield in the loop lead-in cable shall be bonded to controller cabinet equipment bus bar per NEC.

4. Completely tape back all ground shields inside the shielded lead-in cable on both ends of the cable.

5. Connect each loop to an individual detector channel as specified in the Contract.

6. If the Contract specifies that two or more loops will be operated on the same detector channel or detector amplifier unit, wire them in series to their loop lead-in at the pull box or conduit.

7. Use series-parallel connections when series connections do not meet the manufacturer’s specified operating range for the detector amplifier unit.

8. Leave 6 ft. (1.8 m) of wire coiled up in a pull box and make sure the lead wire of each loop is identified inside the pull box.

9. Make weathertight loop wire splices using pill boxes with loop sealant or tape with the following specifications:
   a. Verify electrical tape used is flame retardant, and cold and weather resistant.
   b. Provide tape that is rated for 600 V and for use between 0°F (−18°C) and 176°F (80°C).
   c. Verify tape is 0.0085 in. (0.2 mm) thick and meets the requirements of UL 510 and Mil-I-24391.
   d. Provide tape that remains flexible with abrasion resistance.

10. Splice the loop wire to loop lead-in cable only after the detector system has been tested and demonstrated under live traffic conditions. See standard detail drawings for splicing details.

E. Inductance Loop Maintenance

1. Locate all existing loops, determine the operational status of all loop assemblies, and notify the Engineer prior to commencing loop construction activities at the intersection.

2. Maintain all existing, operational loops, unless otherwise notified by the Engineer. Repair of an existing, non-operational loop prior to beginning work will be considered as extra work.

3. Locate points of conflict between new loops and existing loops and install all new loops and saw cuts so as not to cut existing loop lead-ins and loop wires that are to be retained.

4. If an existing operational loop that is not scheduled for replacement fails during the construction time frame, notify the Engineer and complete the replacement of the damaged loops immediately.

5. Loops that are removed or destroyed as part of a construction, rehabilitation, or maintenance project shall be replaced and returned to full operation.

6. All costs associated with the replacement of the loops damaged during construction shall be the responsibility of the Contractor.
F. Inductance Loop Testing

1. Test each loop after installing the conductors in the slots cut in the pavement and before sealing.
2. Test the loop wire from the controller cabinet assembly spliced to the shielded lead-in wire.
3. If there are no splice points, such as in direct entry to the controller cabinet assembly, test wire at the cabinet.
4. Only perform the tests at the controller cabinet assembly.
5. Record the test results on the Loop Installation Data Sheet in Table 8. Make copies of the data sheet as needed.
6. Include the data sheets in the records and place a copy in the controller cabinet assembly.

Comments
7. Conduct the following tests to evaluate each inductance loop installation before sealing the loop in the pavement:
   a. Induced AC Voltage Test: Read 0.05 VAC or less on a digital voltmeter or no deflection on the pointer of an analog meter.
   b. Leakage Resistance to Ground: The resistance to ground shall be 5 MΩ or more.
   c. Loop Resistance: The resistance reading on an ohmmeter is approximately within 10% of the calculated value. See Table 9 for wire resistance values.

</tr>
</tbody>
</table>

Note: Loop Q at 50 kHz shall be greater than 5.

d. Inductance: Inductance (I) is measured in microhenries (mH), and the total inductance is equal to the inductance of loop plus inductance of the loop lead-in. Acceptable inductance is within 10% of the calculated value for a single loop with the design criteria listed in Tables 10 and 11.

| 6 ft. x 6 ft. (3 turns) [1.8 m x 1.8 m] | I = 76 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 30 ft. (2 turns) [1.8 m x 9 m] | I = 126 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 40 ft. (2 turns) [1.8 m x 12 m] | I = 165 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 50 ft. (2 turns) [1.8 m x 15 m] | I = 205 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 70 ft. (2 turns) [1.8 m x 21 m] | I = 285 mH + 23 mH per 100 ft (30 m) lead-in cable |

| 6 ft. x 30 ft. (2, 4, 2 turns) [1.8 m x 9 m] | I = 269 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 40 ft. (2, 4, 2 turns) [1.8 m x 12 m] | I = 349 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 50 ft. (2, 4, 2 turns) [1.8 m x 15 m] | I = 429 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 60 ft. (2, 4, 2 turns) [1.8 m x 18 m] | I = 509 mH + 23 mH per 100 ft (30 m) lead-in cable |
| 6 ft. x 70 ft. (2, 4, 2 turns) [1.8 m x 21 m] | I = 589 mH + 23 mH per 100 ft (30 m) lead-in cable |

8. Report to the Department an out-of-range reading on any of the above tests. If a test is unacceptable, remove and install new wire. Repeat the test procedure.

9. Include in the test results:
   a. Type and model number of the equipment used (shall be ohmmeter having a high resistance scale of R x 10 kW or greater)
   b. The last calibration date of the equipment and the scale used

10. Check the loop using an impedance tester to determine the natural operating frequency and impedance.

11. Verify that the completed units detect vehicles in accordance with prescribed accuracy requirements.

12. Loop Q
   a. Q at 50 kHz is greater than 5.
Section 937 — Detection Systems

b. Report to the Construction Manager or designee an out-of-range reading on any of the above tests. If a test is found unacceptable, remove the loop, install new wire, and repeat the test procedure.

c. Include in the test results:
   i. Type and model number of the equipment used (must be ohmmeter having a high resistance scale of R x 10 KW or greater)
   ii. The last calibration date of the equipment and the scale used

d. Check the loop using an impedance tester to determine the natural operating frequency and impedance. Ensure that the completed units detect all motor vehicles. If the loop detection system does not meet the above test requirements, payment will not be made for work on the signal installation until corrections are completed.

937.3.03 Pedestrian Detection System (All Types)

A. Pedestrian Pushbutton

1. Install the pushbutton with a pedestrian instruction sign as illustrated in the Standard Detail Drawings and according to the Contract.

2. Seal all openings to prevent moisture from entering the pushbutton.

B. Pedestrian Pushbutton Cable

1. Use 3-pair shielded lead-in cable for pedestrian pushbuttons. Install one 3-pair shielded lead-in cable to each pedestrian pushbutton station(s) location to operate either one or two pushbuttons.

2. Do not ground the shield for the pushbutton lead-in cable at the controller cabinet.

3. Do not splice the cable at any point. A direct connection from the control cabinet assembly to the pushbutton shall be made.

4. Do not use the same 3 pair cable for inductance loops and pedestrian detectors.

5. The wiring color code for pedestrian pushbuttons presented in Table 12.

| Table 12 – Wiring Standards for Pedestrian Pushbuttons |
|---------------------------------|-----------------|-----------------|
|                                 | 3-Pair Shielded Cable |
|                                 | Phase 2 and 6     | Phase 4 and 8   |
| 2 Wire Pushbutton               | Green and Black Pair | Red and Black Pair |
| 3-Wire Pushbutton*              | Green and Black Pair plus White | Red and Black Pair plus White |

*Each 3-wire button will require a dedicated 3-pair shielded cable.

C. Testing Requirements

1. Verify circuit continuity for each pedestrian pushbutton.

2. Verify pedestrian countdown is displaying the correct pedestrian clearance time (Flashing Upraised Hand).

3. For audible pedestrian pushbuttons, verify:
   a. The street name is correct and clearly pronounced.
   b. The street names are announced with the proper pedestrian phase.
4. Locator tones are set approximately 15 decibels above the ambient noise of the area, as measured 1 ft. (0.3 m) from device.

937.3.04 Video Detection System

A. General Installation Requirements

1. Install all video camera sensors, IVDS processors, output expansion modules, and associated enclosures and equipment at the locations specified in the Contract and per manufacturer recommendations to provide optimum actuation accuracy.
   a. For traffic control signal cabinets and ITS field cabinets, mount the processor and output expansion modules within the input files, or at a location designated by the Department.
   b. Physical changes to the traffic control signal cabinets input files are not permitted.
   c. Make all necessary adjustments and modifications to the detection system prior to obtaining recommendation for system acceptance testing.
   d. For freeway mainline detection applications, install all rack-mounted equipment with one rack unit space between adjacent equipment in the freeway controller or field cabinet.

2. Verify installation, surge protection, and all cabling complies with manufacturer’s recommendation, specifications, and as specified in the Contract.
   a. All equipment, cables, and hardware shall be designed by the manufacturer to fully interoperate with all other system components and be fully protected from all surge potential.
   b. Connectors installed outside the controller or field cabinets and enclosures shall be manufacturer-terminated and corrosion resistant and weathertight.

3. Unless otherwise noted in the Contract, all wiring and cables shall be continuous (without splices) between the video camera sensor and processor, except for surge protection connections between sensor and cabinet, so that both the camera and processor are protected.

4. Coil a minimum of 6 ft. (1.8 m) of slack in the bottom of the controller or field cabinet.
   a. Tape ends of unused and spare conductors to prevent accidental contact to other circuits.
   b. Label conductors inside the controller or field cabinet for the functions depicted in the approved detailed diagrams of the cabinet and IVDS documents.

5. Furnish an as-built cabinet wiring diagram, identified by location, for each vehicle detection system controller or field cabinet.
   a. Include all wiring, cabling, connections, and camera mounting height.
   b. Place all documentation in a weathertight holder in the cabinet.

6. For freeway applications, install IVDS power supply or transformer on a standard DIN rail and wire power conductors to terminal blocks in the controller or field cabinet.

7. All metal camera detection components, including mounting hardware, shall be grounded and bonded per manufacturer’s recommendations and NEC.

B. Video Camera Sensor Installation

1. Include a video camera sensor mounting bracket as recommended by equipment manufacture and all associated hardware and materials.
Section 937 — Detection Systems

2. Mount the video camera sensor on a mounting bracket assembly that meets the following requirements unless otherwise specified in the Contract:
   a. Mount the camera on the specified pole or structure for that location as shown in the Contract.
   b. Mount the video camera sensor on a mounting bracket so that its height and position provide a clear view of the approach or lanes.
   c. Use stainless steel fastening hardware with lock washers on threaded fasteners.
   d. Use a video camera sensor enclosure mounting bracket as recommended by equipment manufacture
   e. Provide a mounting bracket that permits vertical and horizontal adjustment of the video camera sensor.
   f. Provide a mounting bracket that fastens to the video camera sensor enclosure and mounts to the nipple pipe by threading onto the pipe or as a slip-fit, using a set-screw fastener in either above method.
   g. Use a 1.5-in (38 mm) aluminum nipple pipe threaded on both ends.
   h. Fasten the nipple pipe to the mast arm using a cable mount nipple clamp with minimum two 5/16 in. U bolts. Use aircraft-grade galvanized steel cables with stainless steel fastening hardware and that make a minimum of two wraps around the mast arm. Do not use banding straps.

3. Align all cameras to exclude the horizon in the video image.

4. Label cables for IVDS cameras by numbering and naming all terminal blocks, terminal strips, circuit breakers, and buss bar breakers according to function. Labels shall be weather and wear resistant.

C. IVDS Surge Protection

1. Protect all copper wiring and cabling entering the controller or field cabinet housing by surge protection devices as specified in this section and UL 1449.

2. Furnish and install a surge suppressor for each data and video signal cable as required in UL 1449.

3. Terminate all wiring between controller and field cabinet and the transient surge protection devices except for the video signal coaxial feed on terminal strips.

4. Label all surge protection devices with silk-screened lettering on the mounting panel.

5. Furnish and install all surge protection to protect the controller, field cabinet processor, and video camera sensor from ground rise potential (i.e., surge up to the video camera sensor).

6. Provide the following documentation in a weathertight documentation pouch in each controller or field cabinet:
   a. One operation manual with programming instructions.
   b. One maintenance manual with schematics.
   c. Three legible wiring prints showing all IVDS components, model and serial number, and connections with the controller or field cabinet.

D. IVDS Cabinet Equipment

1. Fasten all components of the controller or field cabinet assembly to be mounted on cabinet side panels with hex-head or Phillips-head machine screws.

2. Install the screws into tapped and threaded holes in the panels. These components include, terminal blocks, buss bars, panel and socket mounted surge protection devices, accessory and equipment outlets, and DC power supply chassis.
3. Fasten all other cabinet components with hex-head or Phillips-head machine screws insulated with nuts (with locking washer or insert) or into tapped and threaded holes.

4. All fastener heads and nuts (when used) shall be fully accessible within a complete controller or field cabinet assembly, and any component shall be removable without requiring removal of other components, panels, or mounting rails.

5. Do not use self-tapping or self-threading fasteners.

6. For Type 336S controller or field cabinet applications:
   a. Locate the IVDS power termination panel on the equipment rail in the lower left portion of the rear of the cabinet as shown in the Contract and Standard Detail Drawings.
   b. Adjust the panel as close to the sidewall as possible while still providing access to the circuit breaker.
   c. Notify the Department immediately if there are conflicts with existing cabinet equipment in this position.
   d. Verify that there are no conflicts with door-mounted components when the door is closed.

7. For Type 332 and 334 controller or field cabinet applications:
   a. Locate the IVDS coax termination panel in the lower open section of the front of the cabinet equipment rack as shown in the details.
   b. Verify that there are no conflicts with door-mounted components when the door is closed.
   c. Notify the Department immediately if there are conflicts with existing cabinet equipment in this position.
   d. Dress, label, and secure all coaxial cabling to and from the coax termination panel so that the panel can be hinged open a minimum of 90° without binding or stressing any coaxial cable.

8. Label IVDS cables and components for operation and vehicle actuation on one intersection approach leg. Used as a prefix, it identifies the individual IVDS components used for signal and freeway ramp metering as follows for “nnn” direction of traffic flow, type of detection, and lane assignment:
   a. IVDSnnnPOE: power over ethernet cable from controller cabinet to the video camera.
   b. IVDSnnnCC: coaxial cable from the video camera to the controller cabinet.
   c. IVDSnnnPC: video camera sensor power cable from the video camera to the controller cabinet.
   d. IVDSnnnCSS: coaxial cable surge suppressor in the controller cabinet.
   e. IVDSnnnCJ: coaxial jumper cable from the coaxial surge suppressor in the controller cabinet to the processor module or detector panel.

C. Testing Requirements

1. Perform IVDS testing after installation, configuration and calibration of detection zones, and communicating on the network.

2. Submit test plan for Department approval.

3. Include the following items on the test plan:
   a. Provide checklist for field component installation and cable terminations.
   b. Verify that installation is completed as specified in the Contract.
   c. Verify the quality of grounding, bonding, and surge protector connections.
d. Record power supply voltage and outputs and verify that device connections are as specified in the Contract.

e. Verify the installation of cables and connections between detectors and controller or field cabinets comply with the manufacturers’ recommendations.

f. Demonstrate each video detection system is fully operational and gathering any specified data at the appropriate interval. Perform the test from the hub building where the detection system is connected.

4. Upon satisfactory completion, the Department will integrate the new video detection system onto the network.

937.3.05 Microwave Vehicle Detection System

A. General Installation Requirements

1. Install all detectors and associated equipment at locations specified in the Contract.

2. Installation shall comply with manufacturer’s recommendation.

3. Verify height requirements based on manufacturer’s recommendations and notify the Department if the mounting height varies from the information provided in the Contract.

4. All detector equipment, cables, and hardware shall fully interoperate with all other microwave detection system components.

5. Install surge protection devices that are manufacturer-recommended and approved for all equipment.

6. Ground and bond all metal microwave detection components, including mounting hardware, per manufacturer recommendations and NEC requirements.

7. Obtain approval from the Department for all field adjustments.

B. Controller or Field Cabinet Equipment

1. Wiring, Conductors, and Terminal Blocks

   a. Furnish and install a manufacturer-terminated cable long enough for detector installation.

   b. Use only cables provided by the detection system’s manufacturer. Cables shall be splice free.

   c. The detector end-connector shall be manufacturer-assembled and tested prior to installation. Connections shall be watertight.

   d. Use cabling that is UV rated for outdoor and underground use.

   e. Route MVDS control wiring and 120 VAC power wiring separately to prevent transient voltage bleeds over to the detector cable.

   f. Terminate all wiring on a terminal block, strip, buss bar, or device clamp or lug. Do not splice wiring from the detector unit to the terminal blocks.

   g. Number and label all cables, wires, terminal strips, circuit breakers, and buss bar breakers, and have each item and terminal position numbered and named by function with weather and wear resistant labels.

2. Component Installation

   a. Fasten all components of the controller or field cabinet assembly mounted on cabinet side panels with hex-head or Phillips-head machine screws.

   b. The components include terminal blocks, buss bars, panel and socket mounted surge protectors, terminal servers, Ethernet switches, circuit breakers, and accessory and equipment outlets.
c. Fasten stud-mounted components to a mounting bracket providing complete access to the studs and mounting nuts.

d. All fastener heads and nuts shall be fully accessible in a complete controller or field cabinet assembly. Removing any component shall not require removing other components, panels, or mounting rails.

e. Do not use self-tapping or self-threading fasteners.

C. Testing Requirements

1. Perform MVDS testing after installation, configuration and calibration of detection zones, and communicating on the network.

2. Submit test plan for Department approval.

3. Provide the following on the test plan:
   a. Provide checklist for field component installation and cable terminations.
   b. Verify that installation is completed as specified in the Contract.
   c. Verify quality of grounding, bonding, and surge protector connections.
   d. Record power supply voltage and outputs and verify that device connections are as specified in the Contract.
   e. Verify that the installation of cables and connections between detectors and controller or field cabinets comply with the manufacturers’ recommendations.
   f. Demonstrate that each microwave detection system is fully operational and gathering any specified data at the appropriate interval. Perform the test from the hub building where the detection system is connected.

4. Upon satisfactory completion, the Department will integrate the new microwave detection system onto the network.

937.3.06 Wireless Magnetometer Detection System

A. General Installation Requirements

1. WMDS installation shall include one or more sensors in the center of each traffic lane, avoiding sources of magnetic noise such as underground power cables, overhead high-tension power cables, light rail or subway tracks, electronic gates, power generation stations, and sub-stations.

2. Install each sensor in the roadway per manufacturer’s recommendations.

3. Types
   a. Install Type B sensors for stop bar detection only, where presence is only required.
   b. Install Type A sensors for all other detection applications.

4. Surge protection shall be manufacturer-recommended for all equipment used in the WMDS.

5. Spacing of WMDS sensors shall follow Table 13.

<table>
<thead>
<tr>
<th>Speed</th>
<th>&gt;25 mph</th>
<th>25 &lt; 45 mph</th>
<th>&lt; 45 mph</th>

</tbody>
</table>
Section 937 — Detection Systems

B. WMDS Contact Closure Interface

1. For Type A sensors, provide edge card that plugs into a standard input file.
2. For Type B sensors, provide shelf or DIN rail unit for freeway mainline detection applications. SDLC connections may be used.

C. Installation

1. Sensors
   a. Follow manufacturer’s recommendations for location and depth of sensors.
   b. For sensors to be installed where milling and resurfacing might occur, verify depth and sealing requirements are followed.
   c. The sensor shall be fully encapsulated by the epoxy, and the epoxy shall fill the pavement core hole up to the lip of the hole.
2. Sensor-to-Repeater and Sensor-to-Access Point Radio Installation
   a. Verify that the manufacturer’s recommended maximum distance requirements between a sensor installed in the roadway and repeater or access point are followed, with a clear line-of-sight.
   b. Verify that the manufacturer’s recommended maximum distance requirements for repeater-to-master access point distances and housing directions are followed.
   c. Use stainless steel bolts, locking nuts, washers, and screws for all exterior hardware.

D. Testing Requirements

1. Perform WMDS testing after installation, configuration and calibration of detection zones, and communicating on the network.
2. Submit test plan for Department approval.
3. Provide the following on the test plan:
   a. Provide checklist for field component installation and cable terminations.
   b. Verify that installation is completed as specified in the Contract.
   c. Verify the quality of grounding, bonding, and surge protector connections.
   d. Record power supply voltage and outputs and verify that device connections are as specified in the Contract.
   e. Verify that the installation of cables and connections between detectors and controller or field cabinets comply with the manufacturers’ recommendations.
   f. Demonstrate that each wireless magnetometer detection system is fully operational and gathering any specified data at the appropriate interval. Perform the test from the hub building where the detection system is connected.
4. Upon satisfactory completion, the Department will integrate the new microwave detection system onto the network.
937.3.07 Continuous Count Station System

A. General Installation Requirements

1. If weigh-in-motion application is shown in the Contract, see Section 691 for additional requirements.
2. For pavement loop applications, see Section 937.03.02 for additional requirements.
3. Install all detectors and associated equipment at locations specified in the Contract.
4. Installation shall comply with manufacturer’s recommendation.
5. Install surge protection devices that are manufacturer-recommended and approved for all equipment.
6. Ground and bond all metal detection components, including mounting hardware, per manufacturer recommendations and NEC requirements.
7. Obtain approval from the Department for all field adjustments.

B. Testing Requirements

1. Perform testing after installation, configuration and calibration of detection zones, and communicating on the network.
2. Submit test plan for Department approval.
3. Provide the following on the test plan:
   a. Provide checklist for field component installation and cable terminations.
   b. Verify that installation is completed as specified in the Contract.
   c. Verify the quality of grounding, bonding, and surge protector connections.
   d. Record power supply voltage and outputs and verify that device connections are as specified in the Contract.
   e. Verify that the installation of cables and connections between detectors cabinet comply with the manufacturers' recommendations.
   f. Demonstrate that each detector system is fully operational and gathering any specified data at the appropriate interval.
4. Upon satisfactory completion, the Department will integrate the new continuous count station onto the network.

937.3.08 Temporary Vehicle Detection System

A. General Installation Requirements

1. When identified with a pay item, the Contract shall identify the locations of a temporary vehicle detection system.
2. The Contract shall identify the time period for temporary vehicle detection system.
3. Install, remove, and retain the temporary vehicle detection system for temporary usage on construction projects such as resurfacing projects, where vehicle detection is temporarily interrupted by construction activities.
4. The Contract shall identify the locations for the temporary vehicle detection system.
5. The temporary vehicle detection system shall meet the requirements of this Section.
Section 937 — Detection Systems

B. Installation

1. Install temporary vehicle detection system with all necessary sensors and cabling to form a functioning system.

2. Install the temporary vehicle detection system in advance of construction activities.

3. Maintain the equipment during operation. Adjust the sensors and detection zones for the configuration of each phase of construction until the final configuration is constructed.

4. Remove the temporary detection system without damaging the existing traffic signal equipment.

937.3.09 Maintenance of Vehicle Detection System

A. General Installation Requirements

1. The Contract may include maintenance of traffic plans that detail the configuration of each phase of construction, and the maintenance of traffic plans will apply to the maintenance of vehicle detection system.

2. When identified with a pay item, the Contract shall identify the locations for the maintenance of vehicle detection system during multiple phases of construction.

3. Equipment

   a. The same equipment may be used for maintenance of traffic and permanent configurations.

   b. If Contractor-owned equipment is used for the maintenance of vehicle detection system, the maintenance of vehicle detection system equipment shall meet the requirements of this Section.

B. Installation

1. Install the maintenance of vehicle detection system to provide necessary vehicle actuation during the construction phase at the time of signal activation.

2. Coordinate the relocation and/or adjustment of the equipment as subsequent phases of construction are implemented with the Construction Manager.

3. Locate sensors and temporary detection zones as shown in the maintenance of traffic plans. If field adjustments are necessary to meet field conditions, the field adjustments shall be approved by the Construction Manager.

4. Adjust the sensors and detection zones for the configuration of each phase of construction until the final configuration is constructed.

5. Traffic shifts using temporary traffic control devices (e.g. cones and barrels) lasting less than 48 hours do not require resetting traffic detection zones.

6. The vehicle detection system shall be in the final configuration prior to beginning the Operational Test.

937.4 Measurement

A vehicle detection system, accepted by the Department after a successful 30-day burn-in period, is paid for at the Contract unit price. Payment is full compensation for the labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary for the vehicle detection system technology.

937.4.01 Inductance Loop Detection System

Inductance Loop Detection System for traffic signal or ramp meter projects is measured as lump sum per location (traffic signal or ramp meter) installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a traffic signal or ramp meter.
937.4.02 Pedestrian Detection System
Pedestrian Detection System is measured as lump sum per location installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect pedestrians.

937.4.03 Video Detection System
Video Detection System is measured as lump sum per location (traffic signal or ramp meter) installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a traffic signal or ramp meter.

937.4.04 Microwave Vehicle Detection System
Microwave Radar Detection System is measured as lump sum per location (traffic signal or ramp meter) installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a traffic signal or ramp meter.

937.4.05 Wireless Magnetometer Detection System
Wireless Magnetometer Detection System is measured as lump sum per location (traffic signal or ramp meter) installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a traffic signal or ramp meter.

937.4.06 Continuous Count Station System
Continuous Count Station System is measured as lump sum per location installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a continuous count station.

937.4.07 Continuous Count Station System, Weigh-in-Motion
Continuous Count Station System, Weigh-in-Motion is measured as lump sum per location installed, completed, functional, and accepted. Unless otherwise specified in the Contract, furnish, install, and test all components to detect vehicles as shown for a continuous count station that includes weigh-in-motion.

937.4.08 Temporary Vehicle Detection System
Temporary Vehicle Detection System is measured as lump sum per location (traffic signal or ramp meter) for the Contractor to install, configure, and remove a temporary vehicle actuation during construction. Payment shall be divided into equal payments based on the number of maintenance of traffic phases presented in the Contract. The final vehicle detectors or detection zone configuration shall be included in the work associated with Section 937.3, as appropriate.
Section 937 — Detection Systems

937.4.09 Maintenance of Vehicle Detection System

Maintenance of Vehicle Detection System is measured as lump sum per location (traffic signal or ramp meter) installed using the Maintenance of Vehicle Detection System pay item. Payment shall be divided into equal payments based on the number of maintenance of traffic phases presented in the Contract. Final configuration of the vehicle detection system shall be part of Section 937.3, as appropriate.

Training; Detection System

Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the training.

937.5 Payment

937.5.01 General

Payment is full compensation for furnishing and installing a detection system. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary to complete the work as described in this section. The total sum of all payments cannot exceed the original Contract amount for this item.

| Item No. 937 | Inductance Loop Detection System, No. - | Per lump sum |
| Item No. 937 | Pedestrian Detection System, No. - | Per lump sum |
| Item No. 937 | Video Detection System, No. - | Per lump sum |
| Item No. 937 | Microwave Vehicle Detection System, No. - | Per lump sum |
| Item No. 937 | Wireless Magnetometer Detection System, No. - | Per lump sum |
| Item No. 937 | Temporary Vehicle Detection System, No. - | Per lump sum |
| Item No. 937 | Maintenance of Vehicle Detection System, No. - | Per lump sum |
| Item No. 937 | Continuous Count Station System, No. - | Per lump sum |
| Item No. 937 | Continuous Count Station System, Weigh-in-Motion, No. - | Per lump sum |
| Item No. 937 | Training; Detection System | Per lump sum |

Payment Notes:

Submittal

Submittal requirements will not be paid for separately. It will be considered incidental to the individual detection system pay item.

Field Cabinet

Field cabinets for ITS and continuous count station applications will be paid for separately under Section 939.5 pay items.

Testing

Testing will not be paid for separately. It will be considered incidental to individual detection system pay items.

937.5.02 Adjustments

General Provisions 101 through 150.
Section 939—Communications and Electronic Equipment

939.1 General Description
Furnish, install, test, and provide warranty and training for communications and electronic equipment and materials as specified herein and shown in the Contract documents.

939.1.01 Definitions, Acronyms, and Abbreviations

A. Definitions
1. Field Cabinet, Type 1: a modification of the JC Standard ITS Cabinet Housing #2.
2. Field Cabinet, Type 2: JC Standard ITS Cabinet Housing #2.
3. Field Cabinet, Type 3: JC Standard ITS Cabinet Housing #1.
4. Field Cabinet, Type 4: JC Standard ITS Cabinet Housing #3.
5. Field Switch, Type A: Layer 2, minimum 6 copper ports and 2 SFP 1 Gbps fiber ports.
6. Field Switch, Type B: Layer 2, minimum 6 copper ports and 3 SFP 1 Gbps fiber ports.
7. Field Switch, Type C: Layer 2, minimum 1 copper port and 7 SFP 1 Gbps fiber ports.
8. Field Switch, Type D: Layer 2 or 3 upgradeable, minimum 4 copper ports and 4 dual-purpose 1 Gbps ports.
9. Field Switch, Type E: Layer 2 or 3 upgradeable, minimum 8 copper ports and 4 dual-purpose 1 Gbps ports.
11. Routing Switch, Hub, Type B: Layer 3, minimum 48 ports at 10/100/1 Gbps copper and 4 ports at 1 Gbps SF.
12. SFP Fiber Module, Type 1: LX optics for shorter distances.
13. SFP Fiber Module, Type 2: ZX optics for longer distances.
14. Security Lock: an electronic lock system that controls access to a field cabinet, and the cylinder can retrofit existing field cabinet mechanical lock hardware.

B. Acronyms and Abbreviations
Refer to Sections 101.01 and 942.1.01.B for a list of acronyms, abbreviations, and terminology used in this section.

939.1.02 Related References

A. GDOT Standard Specifications

B. Referenced Documents
   1. Refer to Section 942.1.02.B for a list of standards and documents referenced in this section.

939.1.03 Submittals
Refer to Section 942.1.04 for submittal requirements. Requirements for communications and electronic equipment materials are specified herein.

939.2 Materials

939.2.01 General
A. Comply with ISO 9001 or Six Sigma quality manufacturing requirements.
B. Provide only equipment and materials that are new and of like kind and function provided by one manufacturer, using the same model, part number, revision, and firmware as shown and specified in the Contract documents.

939.2.02 Field Switch Requirements
A. General
1. Provide one or more of the field switch types listed in Table 1 as specified in the Contract documents.

<table>
<thead>
<tr>
<th>Type</th>
<th>Layer Capability</th>
<th>Ethernet Port Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type A</td>
<td>Layer 2</td>
<td>Minimum 8 ports total including 2 Gigabit-Ethernet SFP ports and 6 10/100Base-T/TX ports</td>
</tr>
<tr>
<td>Type B</td>
<td>Layer 2</td>
<td>Minimum 9 ports total including 3 Gigabit-Ethernet SFP ports and 6 10/100Base-T/TX ports</td>
</tr>
<tr>
<td>Type C</td>
<td>Layer 2</td>
<td>Minimum 8 ports total including 7 Gigabit-Ethernet SFP ports and 1 10/100Base-T/TX port</td>
</tr>
<tr>
<td>Type D</td>
<td>Layer 2 or Layer 3 upgradeable</td>
<td>Minimum 8 ports total including 4 dual-purpose uplink or downlink ports that can be used for 10/100/1000BASE-T/TX ports or 100/1000 Mbps SFP ports, and 4 10/100/1000Base-T/TX ports</td>
</tr>
<tr>
<td>Type E</td>
<td>Layer 2 or Layer 3 upgradeable</td>
<td>Minimum 12 ports total including: 4 dual-purpose uplink or downlink ports that can be used for 10/100/1000BASE-T/TX ports or 100/1000 Mbps SFP ports, and 8 10/100/1000Base-T/TX ports</td>
</tr>
</tbody>
</table>

2. Provide field and routing switches that are compatible with the existing GDOT network by support of features and implementation of common standards that enable switches to work together and minimize integration effort.
Section 939 — Communications and Electronic Equipment

3. Provide field switches with the following interfaces:
   a. Provide fiber ports with 1000BaseSFP slot or 100/1000BaseSFP slot.
   b. Provide 10/100Base-T(X) or 10/100/1000Base-T(X) RJ-45 ports with auto negotiation speed and capable of being manually set to half-duplex or full-duplex.
   c. Provide console port along with any adapter cables as needed and approved by the Department.
   d. Provide LED indicators including power on/off and network status per port (transmit, receive, link, and speed).

4. Provide field switch that can operate with non-blocking, store and forward, switching at full wire speed.

5. Provide field switch that supports detecting and shutting down one-way link failures using auto-negotiation.

6. Provide field switch with a minimum MTBF of 200,000 hours using Telcordia SR-332, Method 1, Case 3 or MIL-HDBK-217F standards.

7. Provide field switch that complies with IEEE 802.3 for 10Base-T standard specifications.

8. Provide field switch that complies with IEEE 802.3u for 100Base-T(X) standard specifications.

9. Provide field switch that complies with IEEE 802.3ab for 1000Base-T(X) standard specifications.

10. Provide field switch that complies with IEEE 802.3z for 1000Base-X standard specifications.

C. Network Capabilities and Features

1. Provide field switch that supports multicast with IGMP v1/v2/v3 snooping and IGMP-filtering.

2. Provide field switch that complies with IEEE 802.3x (Flow Control) standard.

3. Provide field switch that complies with IEEE 802.1p (Class of Service or Priority Queuing) standard.

4. Provide field switch that complies with IEEE 802.1Q (VLAN tagging) standard per port.

5. Provide field switch that complies with IEEE 802.1D (Spanning Tree Protocol) and IEEE 802.1w (Rapid Spanning Tree Protocol) standards.

6. Provide field switch that complies with IEEE 802.3ad (Link Aggregation or Port Trunk) standard for a minimum of two groups of four ports.

D. Security

1. Provide field switch that can be configured for static MAC address access.

2. Provide field switch that can disable automatic address learning per ports; known hereinafter as Secure Port. Secure Ports only forward statically configured MAC addresses.

3. Provide field switch that can trap and provide an alarm upon any unauthorized MAC address and shutdown. Require administrator to manually reset the port before communications are permitted.

4. Provide field switch that complies with IEEE 802.1X Port Access Authentication.

5. Provide field switch that supports HTTP and HTTPS.

6. Provide field switch that supports SSL.
E. Network Management

1. Provide network management capabilities that are compatible with the existing GDOT network management consisting of Cisco Prime centralized enterprise management software supporting remote management.

2. Provide field switch that is password manageable with a minimum of one read-only profile and one full administration profile.

3. Provide field switch that fully implements SNMP v1/v2/v3.

4. Provide field switch that implements LLDP as defined in IEEE 802.1ab (Station and Media Access Control Connectivity Discovery).

5. Provide field switch that fully implements RMON I statistics, history, alarms, and events objects.

6. Provide field switch that can mirror any port to any other port within the field switch.

7. Provide field switch that can be managed remotely by an enterprise software/program for configuration, reporting, updates, and monitoring of alarms.

8. Provide field switch with environment monitoring capabilities.

9. Provide management capabilities via a serial maintenance/console serial port (local) and over the network (remote).

10. Provide field switch that supports HTTP (Embedded Web Server) with SSL.

11. Provide field switch that fully implements RFC 783 (TFTP) to allow remote firmware upgrades.

F. Additional Requirements for Field Switch Types D and E

1. Provide, in the quantity specified in the Contract documents, Gigabit-Ethernet Combo ports, where each Gigabit-Ethernet Combo port is defined as a single interface that can be used as a 10/100/1000Base-T/TX ports or 100/1000Base SFP GBIC socket.

2. Provide a card slot for a field removable SD read-write memory card (included) that can store switch operating system modules and switch configuration modules and is addressable/manageable from the switch’s management interface and built-in memory system.

3. Provide field switch that can boot from and load configuration from the removable memory card slot or from the built-in memory, as defined by the user.

4. Provide field switch that allows push/pull of switch operating system modules and switch configuration settings from the GDOT network management system.

5. Provide field switch that can convert from Layer 2 to Layer 3 switch and routing protocols, as specified in Section 939.2.03, with only a change in the switch operating system or license.

G. Mechanical and Cabling

1. Provide field switches that are capable of rack mounting and DIN rail panel mounting. Rack-mounted DIN rails may be installed if cabinet space is available. Shelf mounting is not permitted.

2. Provide hardware and materials for mounting the field switch within the field cabinet.

3. Provide rubber dust caps or covers with insertion and removal handles that completely seal the port opening for unused copper and SFP ports.

4. Provide field switch with a fan-less (no fan) design.
Section 939 — Communications and Electronic Equipment

H. Electrical

1. Provide field switch that is capable of operating over minimum input voltage range of 108 VAC to 132 VAC at 50/60 Hz (±5%, maximum).
2. Provide field switch with power conversion as specified herein and provide regulation necessary to support electronics operation.
3. Provide field switch that complies with IEC EN 61000-4-5 surge immunity for network equipment.
4. Provide power transformers with a “fastening mechanism.” No plug-in types are permitted. Corded transformers shall be mountable with neatly secured power cords.

I. Environmental

1. Provide hardened field switch including power supply that comply with NEMA TS 2 Sections 2.1.7, 2.1.8, and 2.1.9 temperature, humidity, vibration, and shock testing requirements.

939.2.03 Routing Switch Requirements

A. General

1. Provide one or more of the routing switch types listed in Table 2 as specified in the Contract documents.

<table>
<thead>
<tr>
<th>Type</th>
<th>Layer Capability</th>
<th>Ethernet Port Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type A</td>
<td>Layer 3</td>
<td>Providing a minimum 48 1/10/25 Gbps SFP+ ports + 6 40/100 Gbps QSFP28 uplink ports per switch</td>
</tr>
<tr>
<td>Type B</td>
<td>Layer 3</td>
<td>Providing a minimum 48 10/100/1000 Ethernet copper ports + 4 SFP 1 Gbps ports per switch, stackable</td>
</tr>
</tbody>
</table>

2. Provide routing switches that are compatible with the existing GDOT routing network consisting of Cisco Nexus 93180YC-FX Layer 3 routing switch (Type A) and Cisco Catalyst 2960XR Layer 3 routing switch (Type B) that can be managed by the Department’s existing network management software.
3. Populate routing switch with optical SFPs meeting the minimum SFP requirements in Section 939.2.04 and as required in the Contract documents.
4. Provide routing switch with a minimum MTBF of 200,000 hours using Telcordia SR-332, latest version, or MIL-HDBK-217J standards.
5. Provide routing switches for up to 4,096 VLANs.
6. Provide routing switch where modules are hot-swappable.
7. Provide routing switch that can be EIA 19 in (483 mm) rack mounted (one rack unit per routing switch, typical).

B. Network Standards and Protocols

1. Provide network that supports Layer 2 and 2+ protocols specified in Section 939.2.02.
2. Provide network that supports additional network Layer 3 protocols as follows:
   a. IPv4 and IPv6.
   b. Full implementation of IGMP v1/v2/v3.
   c. TACACS Plus (+).
Section 939 — Communications and Electronic Equipment

d. RADIUS protocol.
e. Full implementation of RIP.
f. Full support for BGP.
g. Full implementation of OSPF protocol.
h. Full implementation of GMRP.
i. Full implementation of GVRP.
j. Full implementation of PIM Sparse Mode.
k. Full implementation of VRRP.

C. Mechanical and Cabling
  1. Provide routing switches that are rack mountable.
  2. Provide hardware and materials for mounting within the equipment rack that are corrosion resistant.
  3. Provide rubber dust caps or covers with insertion and removal handles that completely seal the port opening for unused copper and SFP/QSFP ports.

D. Electrical
  1. Provide field switch that can operate over a minimum input voltage range of 108 VAC to 132 VAC at 50/60 Hz (±5%, maximum).
  2. Provide field switch that complies with IEC EN 61000-4-5 surge immunity testing requirements.
  3. Provide routing switch with dual redundant power supplies and fans, N+1 configuration, hot swappable, and configured for 120 VAC service.

E. Environmental
  1. Provide routing switch with power supply that meets following minimum ambient temperature and humidity requirements:
     a. Temperature range from +23°F through +113°F (−5°C to +45°C).
     b. Relative humidity from 10% through 95%, noncondensing.
     c. Comply with NEMA TS 2 Sections 2.1.8 and 2.1.9 vibration and shock testing requirements.
Section 939 — Communications and Electronic Equipment

939.2.04 SFP Fiber Module Requirements

A. General

1. Provide SM, dual-fiber SFPs with LC connectors.

2. Provide the following types of full duplex, SFP fiber optical modules as shown in the Contract documents or as required:
   a. Type 1: LX/LH optics for single-mode fiber that is >6.2 miles (10 km) in length (under ideal conditions).
   b. Type 2: ZX optics for single-mode fiber that is >43 miles (70 km) in length (under ideal conditions).

3. Provide SFPs that comply with IEEE 802.3x, 1000Base-LX/LH and 1000Base-ZX standards.

4. Provide fiber optic patch cords as specified in Section 935.2.01.G with integral optical attenuators if required for optical power control per the field switch manufacturer’s recommendations.

5. Provide SFPs that are 100% compatible with the field switch or network device in which the SFP is inserted, including any serial number or other identifying information. Only demonstrated proven SFPs that do not require non-default, switch configuration settings are permitted.

6. Provide SFPs that are hot-swappable.

7. Provide SFP that operates as its own switched port.

8. Provide a quantity of fiber optic patch cords that matches the number of populated SFP ports on the field switch, in accordance with Section 935.2.01.G, with ST connectors on one end (at the FPP/FDU) and an LC connector on the other end (at the field switch).

B. Environmental

Provide SFPs with extended temperature capabilities meeting the following minimum requirements:

1. Ambient temperature range from +23°F through +185°F (−5°C through +85°C).

2. Relative humidity from 10% through 95%, non-condensing.

939.2.05 Network Patch Cord Requirements

C. General

1. Provide field switch patch cords that meet ANSI/TIA requirements for Category 6, four-pair unshielded twisted pair cabling with stranded conductors and RJ-45 connectors.

2. Provide network patch cords that are factory assembled, connectorized, and certified by the manufacturer to meet the performance standards specified herein.

3. Provide network patch cords that comply with TIA-568-C.2 and UL 444 standards.

4. Provide network patch cords with eight (four STP) insulated No. 22 to No. 24 AWG, solid bare copper conductors arranged in four color-coded twisted-pairs.

5. Provide network patch cords with modular RJ-45 male connectors with eight-position non-keyed and eight gold anodized pins.

6. Provide network patch cord connectors that incorporate mechanical cable strain relief and protective boots.

7. Provide network patch cords that characterize to 600 MHz and design margin (headroom) beyond standard Near-End Crosstalk, Power Sum NEXT, Attenuation-to-Crosswalk Ratio, and Power Sum ACR.
8. Provide network patch cords with lengths of patching from field switch to equipment inside the field cabinet or equipment rack without strain. Provide custom or standard lengths as required or needed based on final equipment layout and configuration that permits future movement of equipment within the field cabinet or equipment rack.

9. Provide network patch cord that is riser-rated.

939.2.06 Field Cabinet Requirements

A. General

1. Provide one or more of the field cabinet types listed in Table 3 as specified in the Contract documents.

<table>
<thead>
<tr>
<th>GDOT Type</th>
<th>Joint Committee ITS Cabinet Standard</th>
<th>Minimum Cabinet Dimension Range</th>
<th>Number of Doors</th>

2. Unless otherwise specified in the Contract documents or directed and approved by the Department, construct all ITS cabinet (field cabinet) housing assemblies in conformance with this section and the JC ITS Cabinet Standard Specifications for Roadside Cabinets. Do not include with the field cabinet housing the following:

a. Police panel and associated wiring.

b. Power distribution assembly and associated flasher units, and signal power contactor.

c. DC power distribution assembly (12 VDC and 24 VDC).

d. Input file and associated sensor units, isolator units, and serial interface unit.

e. Output file and associated auxiliary monitor unit, serial interface unit, transfer relay unit, and switch pack unit.

f. Field cabinet monitor unit assembly.

g. Serial and control bus assemblies and wiring.
Section 939 — Communications and Electronic Equipment

3. Mount field cabinets in the following configurations:
   a. Unless otherwise specified in the Contract documents, configure Type 1 and Type 2 field cabinet housing assemblies for pole mounting and Type 3 and Type 4 field cabinet housing assemblies for ground or base-mounting.
   b. Reinforce the holes for pole mounting with metal plates of adequate size and strength welded longitudinally across the inside depth of the field cabinet.
   c. Where ground or base-mounting of field cabinets is specified, make the field cabinet bottom open and provide an approved concrete pad for mounting the field cabinet along with technician pad in front and back of cabinet doors and base mounting adapter, in accordance with Section 647 and the standard detail drawings.

B. Field Cabinet Components

1. Equip all field cabinet housings with the standard EIA 19 in (483 mm) rack cage as described in the JC ITS Cabinet Standard Specifications and as follows:
   a. Do not use unistruts or other rail types.
   b. For Types 1, 2 and 3, equip field cabinet housings with the standard EIA 19 in. (483 mm) rack cage.
   c. For Type 4, equip field cabinet housings with two standard EIA 19 in. (483 mm) rack cages.

2. Provide field cabinet with side mounting panel meeting the following requirements:
   a. Fabricate side mounting panels as described in the JC ITS Cabinet Standard Specifications for J Panels.
   b. Do not provide pre-punched terminal block/bar or component mounting holes, except holes for mounting the side panel to the rack cage.
   c. In all field cabinet types provide one side panel on one side of each rack cage that are the full depth of the rack cage and the rack cage height less 2 in (50 mm) at the top and bottom.

3. Provide field cabinet with cabinet shelf meeting the following requirements:
   a. Provide perforated and ventilated shelf meeting the following minimum requirements:
      i. Telescoping guides to allow full extension from the rack cage.
      ii. Construction that supports a weight of 25 lb. (11 kg) when extended.
      iii. A minimum non-slip work area measuring 12 in. (304 mm) by 12 in. (304 mm).
   b. For Types 2 and 3, equip field cabinet with one cabinet-sliding internal shelf.
   c. For Type 4, equip field cabinet with two sliding internal shelves.

4. Provide field cabinet with document pouch meeting the following requirements:
   a. Provide a plastic documentation pouch that is side-opening, resealable, opaque, and of a heavy-duty plastic material to store the field cabinet and equipment documentation.
   b. Provide a pouch that has metal or hard-plastic reinforced holes for hanging from hooks included on the field cabinet door.
   c. Provide a pouch has the size and strength to hold 200 sheets of 8.5 in. (215 mm) by 11 in. (279 mm) paper.
   d. Provide field cabinets with metal hooks welded to the inside of the front cabinet door, for hanging the plastic documentation pouch securely when opening and closing the front cabinet door.
5. Provide field cabinet with wiring, conductors, and terminal blocks that meet the following requirements:
   a. Provide component mounting DIN rail meeting the following requirements:
      i. Mount all 120 VAC service entrance, power distribution, grounding, and surge protection components on standard DIN rails mounted on recessed rack mounted panels or on rack side panels as shown in the standard detail drawings. Devices include terminal blocks, circuit breakers, and surge protection devices. Other components and devices that may be DIN rail mounted include network switches, power supplies, and PoE injectors.
      ii. Provide 1.38 in. (35 mm) wide by 0.3 in. (7.5 mm) high by 0.04 in (1 mm) thick standard DIN rails perforated and cut to length for flexible mounting.
      iii. Provide DIN rail that is burr free with no sharp edges or deformation from the standard profile.
      iv. Provide DIN rail that complies with IEC EN 50022 (NS35), IEC EN 60715, and DIN 46277.
      v. Provide nut, bolt, and start washers to mount to panel for low resistance electrical connection.
      vi. Provide an anti-corrosion paste to provide a solid and long-lasting electrical connection between the DIN rail and the mounting panel.
   b. Provide terminal blocks meeting the following requirements:
      i. Use terminal blocks with voltage and current ratings greater than the voltage and current ratings of the wires that are terminated on the blocks.
      ii. Terminate conductors on terminal blocks using insulated terminal lugs large enough to accommodate the conductor to be terminated.
      iii. Terminate field wiring terminal block screws using a terminal ring lug for termination when two or more conductors are terminated.
      iv. Use metallic terminal block connection hardware and components that are non-ferrous copper or nickel/tin-plated copper alloy or equivalent.
      v. Provide terminal blocks and wires that comply with the following colors:
         a) Black – Line
         b) White – Neutral
         c) Green or Green/Yellow – Ground
      vi. Provide a ground terminal that is the same size and pitch as the power terminals and provides positive electrical and mechanical connection to the mounting rail.
      vii. Provide terminal blocks that comply with UL 1059.
      viii. Provide terminal blocks that are capable of being DIN-rail mounted.
      ix. Provide the type and quantity of terminals as shown in the Contract documents.
   c. Provide service entrance terminal blocks meeting the following requirements:
      i. Make the terminal block for the 120 VAC field cabinet service entrance a 0.39 in. (10 mm) single level screw type device.
      ii. Provide a terminal block that accommodates No. 18 to No. 4 AWG wiring for terminating electrical inputs and outputs.
Section 939 — Communications and Electronic Equipment

d. Provide distribution terminal blocks meeting the following requirements:
   i. Make the terminal blocks for distribution of 120 VAC and ground a 0.24 in. (6 mm) single level screw type located on the protected side of the power service panel assembly.
   ii. Provide terminal block that accommodates No. 22 to No. 6 AWG wiring and provide in colors as specified herein.

e. Provide circuit breakers meeting the following requirements:
   i. Provide enclosed, thermal magnetic molded case circuit breakers of the types, sizes, and quantities listed in the Contract documents.
   ii. Provide a design that allows for an additional three circuit breakers.
   iii. Provide two-pole (2P) breakers for 120/240 VAC and single-pole (1P) for 120 VAC single-phase operating voltages.
   iv. Provide molded case circuit breakers that comply with and are listed with UL 489.
   v. Provide molded case circuit breakers that comply with NEMA AB-1.
   vi. Provide circuit breakers that have the amperage rating indicated on the face of the breaker or handle.
   vii. Provide circuit breakers that have a quick-make, quick-break over center toggle-type mechanism and a position between “ON” and “OFF” when tripped automatically.
   viii. Provide circuit breakers that are 120 VAC rated with a minimum symmetrical interrupting short circuit capacity of 10 kA.
   ix. Use only circuit breakers that are DIN rail mounted.

f. Provide fuses meeting the following requirements:
   i. Provide DIN rail-mounted switch or disconnect type fuse holders and fuses for low voltage AC and DC circuits in the proper capacity and configured.
   ii. Provide fuse with size rating labeled on the holder or on the panel adjacent to the holder.

g. Provide end brackets and spacers meeting the following requirements:
   i. Provide screw-clamp end brackets for DIN rail mounting.
   ii. Provide spacers or dividers between terminal blocks and other components as shown in the Contract documents for visual separation.
   iii. Provide spacers that snap on to DIN rail that are approximately 0.20 in. (5 mm) to 0.71 in. (18 mm) thick and match the size of the terminals they separate.

h. Provide safety cover meeting the following requirements:
   i. Provide safety covers on terminal blocks to prevent contact with exposed conductors or any metallic components. This cover will provide electrical and visual separation between terminal blocks and other rail-mounted devices.
   ii. Provide safety covers that are approximately 0.08 in. (2 mm) thick and sized to match the terminal blocks they protect or separate.

i. Provide internal wiring meeting the following requirements:
   i. Provide insulated wiring that is appropriately sized between terminal blocks and attached devices.
Section 939 — Communications and Electronic Equipment

ii. Utilize THHN-THWN, stranded, copper wiring for internal branch circuits. Wire size shall be compliant with the NEC.

iii. Use a minimum No. 12 AWG grounding of each SPD, or larger if recommended by the SPD manufacturer or indicated on the Contract documents.

iv. Use insulated green wire to connect the ground wire directly to the ground terminals.

v. Do not splice together different device grounding wires including surge protectors.

j. Provide GFI service outlet meeting the following requirements:

i. Provide one duplex, NEMA 15A, 5-15R, GFI duplex receptacle (convenience service outlet) with ground-fault circuit interrupters, box, and cover plate able to be accessed after equipment is installed within the field cabinet.

ii. Provide a UL-listed receptacle meeting Federal Specification #W-C-596.

k. Provide a ground buss bar of copper alloy material compatible with copper wire and provide at least two positions where a No. 2 AWG stranded copper wire can be attached.

l. Provide field cabinets that comply with the NEC and grounding and bonding requirements in Section 682 and as required and recommended by the cabinet manufacturer.

6. Provide field cabinet with surge protection meeting the following SPD requirements:

a. Provide a Type 1 SPD for the field cabinet’s main AC power input on the load side of the field cabinet circuit breaker. Other surge protection devices are covered under individual device specifications.

b. Provide SPD that is listed per UL 1449 4th edition, Open-Type 1, or latest edition. The SPD shall be listed by NRTL.

c. Provide SPD that meets the following minimum performance requirements:

i. Posted at UL.com under certification with 20 kA I-nominal rating.

ii. Does not exceed the VPR and MCOV requirements listed in Table 4.

<table>
<thead>
<tr>
<th>L-N</th>
<th>L-G</th>
<th>N-G</th>

</tbody>
</table>

iii. SCCR that equals or exceeds 100 kA.

iv. Maximum surge current rating (Imax) that equals or exceeds 50 kA per mode and 100 kA per phase (sum of L-N plus L-G).

d. Provide SPD that has no leakage current to ground.

e. Provide SPD that supports bi-directional operation.

f. Include directly connected thermally protected MOVs.

g. Provide pluggable SPD modules.

h. Provide SPD that complies with IEEE C62.45, C62.41.1, and C62.41.2 rated for NEMA TS 2 temperature and humidity requirements.
Section 939 — Communications and Electronic Equipment

i. Provide SPD enclosure with a NEMA 4 rating.

j. Provide SPD that can be either wall/panel or DIN rail mounted.

k. Provide SPDs that are equipped with a visual indicator for each MOV and remote alarm monitoring.

l. Provide parts that are made of corrosion-resistant materials, such as plastic, stainless steel, anodized aluminum, brass, or gold-plated metal.

7. Provide field cabinet with rack-mounted power strip meeting the following requirements:

a. Provide power strip with a maximum ampere rating of 15A, 120 VAC, 60 Hz.

b. Provide power strip with integrated surge protection meeting the following minimum requirements:
   i. Listed per UL 1449 4th edition, or latest edition.
   ii. Exceeds IEEE 587 Category A and B specifications.
   iii. Minimum UL 1449 let-through voltage rating of less than 330V (RMS).
   iv. Minimum AC suppression joule rating of 600 J.
   v. AC suppression surge current rating of 20,000A.
   vi. Minimum UL 1283 EMI/RFI noise filtering protection rating of 40 dB.
   vii. LED status indicators.

c. Provide minimum of eight NEMA 5-15R receptacles or as specified in the Contract documents. Provide spacing to accommodate a minimum of four plug-in power supplies without covering up remaining outlets.

d. Mount the power strip on the rear near the top of the standard TIA-310-D rack cage. Mount the power strip facing toward the back of the field cabinet providing a minimum spacing of 3 in. (76 mm) between the outlet's face and the field cabinet door when the door is closed.

e. Provide power strip that does not hinder accessibility to the back of existing electrical equipment.

8. Provide field cabinet with interior lighting meeting the following requirements:

a. Provide field cabinet with LED lights at the front and back.

b. Equip the field cabinet with a manual on/off switch for the LED lights that are connected to a door switch that allows the lights to be powered when the field cabinet door is open.

9. Provide field cabinet with mechanical locks meeting the following requirements:

a. Equip the main field cabinet door with mechanical locks that accept No. 2 Corbin keys. Provide two sets of keys with each field cabinet.

b. Provide door that has a lockable three-point latch mechanism and can accept a cyber lock with 3/8 in. shackle.

10. Provide field cabinet with temperature system meeting the following requirements:

a. Provide a thermostatically controlled ventilation blower fan(s) to maintain internal temperatures below the upper operating temperature thresholds for installed equipment and components that are operating continuously at full capacity.

b. Provide the field cabinet with the capability for the user to set temperature thresholds that automatically activate the fan(s) to turn on or off when the internal field cabinet temperature exceeds the threshold.
11. Provide field cabinet with ventilation and air filter system meeting the following requirements:
   a. Provide ventilation and air filter system that is designed so that openings prevent the entrance of dust, insects, and other foreign matter.
   b. Provide washable, removable, and reusable air filters.
   c. Provide ventilation and air filter system with bottom trough to drain any accumulated moisture to the outside of the field cabinet.
   d. For Type 1, provide one 100 cubic feet (2.83 cubic meters) per minute (cfm) (minimum) 120 VAC blower exhaust fan mounted near the top of the field cabinet.
   e. For Types 2, 3 and 4, provide two 100 cfm (2.83 cubic meters per minute) (minimum) 120 VAC blower exhaust fans mounted near the top of the field cabinet.

12. Provide field cabinet with cable and wire management system meeting the following requirements:
   a. Provide vertical and horizontal cable management as shown in the Contract documents or as approved by the Department.
   b. Provide field cabinet with a cable and wire management system for AC branch, low-voltage power, and communications/data wiring within the field cabinet.
   c. Provide cable and wire management components attached to the field cabinet/rack cage with screws. No adhesive or self-stick mounting is permitted.
   d. Provide separate wire management for power and other field cabinet low-voltage and communications wiring.
   e. Type 4 cabinet only, provide a minimum of four wiring pass-through holes on the inside side-mounting panels to permit patch cords to pass between the two cabinet sides:
      i. Provide 5 in. (127 mm) pass-through holes that are outfitted with grommets for patch cord protection, with the holes positioned with two in the cabinet front and two in the cabinet rear and aligning horizontally between the two side panels.
      ii. Provide plastic- or rubber-coated J-hooks or D-rings, minimum 1 in. (25 mm) depth and height, on the inside rails of the rack cabinet cages, to organize patch cords passing between the two cabinet sides.

939.2.07 Field UPS Requirements

A. General
   1. Provide an industrial-grade UPS that is a double-conversion, on-line type.
   2. Provide UPS that complies with UL 1778 standard.
   3. Provide one or more of the field UPS types listed in Table 5.

<table>

</table>
Section 939 — Communications and Electronic Equipment

B. Functional Requirements
   1. Provide UPS that is a buck / boost, line-interactive system.
      a. The buck / boost mode of the BBS shall have a minimum range of 90 – 150 VAC.
      b. Buck / boost mode shall not have a user configurable transfer set point.
      c. Buck / boost mode shall regulate the system output between 100 – 130 VAC.
      d. When the output of the system can no longer be maintained within that range, the UPS shall transfer to
         backup mode.
   2. Provide UPS output that is a pure sine wave at 120 VAC ±3% at 50/60 Hz (±0.3% maximum).
   3. Provide UPS with a total harmonic distortion of <3% (resistive load).
   4. Provide a minimum of four output receptacles type NEMA 5-15R.
   5. Provide UPS with an external, make-before-break maintenance bypass capability.
   6. Provide UPS with a minimum of 85% efficiency (AC-to-AC).
   7. Provide UPS that supports a minimum transfer time of 0 ms for line fails/recovers, and 5 ms or less for UPS to
      bypass and reverse.
   8. Provide UPS with LCD display for monitoring unit.
   9. Provide UPS with four dry contact closures.
   10. Provide UPS with automatic low-battery and high temperature shutdown features.
   11. Provide UPS that will return to normal operations without a manual reset.
   12. Provide UPS with a maximum audible noise of <50 dBA at 3 ft. (0.9 m).
   13. Provide UPS with battery bank(s) that mount on an EIA 19 in. (483 mm) rack using a maximum space of five
       rack units.

C. Battery System
   1. Provide maintenance-free sealed batteries that can be replaced separately from the UPS.
   2. Provide batteries that are rated for extreme temperatures that have been field proven and tested.
   3. Provide UPS batteries that maintain 70% of original capacity for a minimum of five years.
   4. Provide a maximum battery recharge time of 20 hours to 80% of full charge.
   5. Provide battery charger with a minimum of three-stage, temperature compensated charging and keeps the
      batteries above a minimum depth of discharge point of 50% or as recommended by the manufacturer.
   6. Provide user-replaceable and hot-swappable battery packs.
   7. Provide batteries with non-conductive terminal covers.
   8. Provide battery capacity to meet the following minimum runtimes:
      a. For Type 1 and 2 field UPS, minimum runtime of 1 hour under full load as shown in Table 5.
      b. For hub UPS only, minimum runtime of 4 hours under full load as shown in Table 5.
      c. Capability to be expanded for increased runtime using additional expansion battery banks or packs.
D. Environmental

Provide a UPS system including battery bank that meets following minimum requirements:

1. For Types 1 and 2 field UPS, ambient temperature range from −4°F through +131°F (−20°C through +55°C).
2. For hub UPS, ambient temperature range from +32°F through +104°F (0°C through +40°C).
3. Relative humidity from 10% through 95%, noncondensing.

E. Remote Monitoring Requirements

1. Provide UPS that supports local and remote monitoring and control via Ethernet port interface.

2. Provide remote environmental sensing hardware and software integrated with SNMP minimally capable of temperature and including generating alarms for low battery, over/under voltage, over/under frequency, and high temperature.

3. Provide an addressable SNMP command set including, at a minimum:
   a. UPS state.
   b. Battery condition (voltage, sampling temperature of one battery).
   c. Current AC input conditions (voltage, frequency).
   d. Current AC output conditions (voltage, AC amps, frequency).
   e. Diagnostic/self-test control and status.

939.2.08 Solar Power System Requirements

A. General

1. Provide solar power system that can be mounted in a permanent configuration or in a temporary portable type configuration.

2. Provide one or more of the solar power system types listed in Table 6 as specified in the Contract documents.

<table>
<thead>
<tr>
<th>Type</th>
<th>Application</th>

</tr>
</tbody>
</table>
Section 939 — Communications and Electronic Equipment

B. System Requirements
   1. Provide DC-to-DC and DC-to-AC conversion equipment, as specified herein.
   2. Provide grounding that meets NEC ampacity requirements.
   3. Provide system cabling that meets NEC ampacity requirements.
   4. Provide over-current protection devices (OCPD) between each of the solar array, solar controller, battery bank, inverter, and load for safety and maintenance.
   5. Provide system that maintains the battery depth of discharge (DoD) between 20% and 50% to maximize battery life using 3 days of autonomy (DoA).
   6. Recharge ratio
      i. ITS applications: minimum of 4 times
      ii. Lighting applications: minimum of 3 times

C. Solar Panel
   1. Provide high-efficiency, photovoltaic solar panel(s) made from tempered glass with an anodized aluminum frame, sized to provide full charging of batteries within a one day full sunlight cycle while under operation in December.
   2. Provide solar panels that deliver power for the equipment at the site such that it operates using the lowest average winter insolation values for the area in which the system is installed, accounting for system inefficiencies.
   3. Provide IP67-rated junction boxes on the backside of the panel.
   4. Provide bypass diodes to minimize power drop caused by shade and provide better performance in low-light conditions.
   5. Provide a power max rating of 70% minimum at nominal operating cell temperature (NOCT).
   6. Provide a 25-year degradation that has a minimum 80% efficiency rating.

D. Battery
   1. Provide batteries that are individually replaceable, completely sealed, and maintenance free, requiring no watering.
   2. Provide battery capacity (amp-hours) and type that will keep field cabinet equipment operating for a minimum of 72 hours without sunlight or charging of the batteries. Include a 20% safety factor to ensure operation in unseasonable weather conditions and battery degradation over time.
   3. Provide batteries based on the system constraints that maintain deep cycle capacity for a minimum of five years.
   4. Provide batteries with non-conductive terminal covers.
   5. Provide ventilated enclosure with positive and negative air flow for the batteries.
   6. Provide temperature sensors that are mounted to the side of the battery case and generally in the middle of the battery bank.
E. Charge Controller

1. Provide a minimum 30A rated maximum power point tracker (MPPT) charge controller that charges 12, 24, and 48V banks.

2. Provide charge controller that supports the selected battery type.

3. Provide charge controller with built-in energy LCD monitor to track and indicate the state of charge, voltage level of the batteries, and output of the solar panels.

4. Provide charge controller that keeps the batteries above the minimum depth of discharge point of 50% or as recommended by the battery manufacturer.

5. Provide charge controller with data logging capabilities that can be viewed over the network.

6. Provide charge controller that disconnects the equipment from the batteries at a variable percentage load and allows the batteries to reach a higher state of charge, commonly referred to as a low voltage disconnect feature.

F. Power Inverter

1. Provide power inverter as follows:
   i. ITS application: provide a true sine wave DC to 120 VAC ±5% rated for off-grid solar application.
   ii. Lighting application: 120 or 12/240 VAC.

2. Provide power inverter that meets the continuous power wattage (total load capacity) requirements of the field cabinet equipment and components.

3. Provide power inverter with a minimum surge rating that is double the continuous power wattage calculation to support equipment start-up power needs (peak power).

4. Provide power inverter with a power factor of 0.9 to 1.0.

5. Provide circuit breakers sized for the system and placed between the inverter and load, and between the inverter and battery bank.

6. Provide power inverter sized for the system criteria, and with a minimum of three NEMA 5-15R, 15A outlet receptacles.

7. Provide a power distribution panel in conjunction with the inverter.

G. Environmental

Provide solar panels, charge controller, inverter, and battery bank that meet the following minimum temperature and humidity requirements:

1. Ambient temperature range from −4°F through +131°F (−20°C through +55°C).

2. Relative humidity from 10% through 95%, noncondensing.

3. Provide battery bank that is ventilated with fans that push and pull air within the enclosure.

939.2.09 Field Power Controller Requirements

A. General

1. Provide field power controller that is IP-addressable (static) and accessible over a network.

2. Provide field power controller with a 10/100 autosensing, port selectable, RJ-45 Ethernet interface.
3. Provide field power controller that can reboot and control outlet receptacles in remote locations from a web browser.

4. Provide secure control through a user web interface, including SSL and multi-user password secure access.

5. Provide a minimum of 18 NEMA 5-15R, 15A outlet receptacles with eight switched pairs and two un-switched receptacles.

6. Provide a user-configurable automatic ping feature that monitors and automatically cycles power on one or more receptacles.

7. Provide a minimum surge protection using dual 3,600 J MOVs to clamp power surges and spikes.

8. Provide field power controller with configurable event data logging.

9. Provide field power controller that mounts on an EIA 19 in (483 mm) rack (maximum space of two rack units) inside a standard field cabinet or hub building rack.

B. Environmental

1. Provide field power controller including power supply that comply with NEMA TS 2 Sections 2.1.7, 2.1.8, and 2.1.9 temperature, humidity, vibration, and shock testing requirements.

939.2.10 Security Lock Requirements

C. Provide security lock that meets the following requirements:

1. Provide a wireless electronic key security lock system that is compatible with the Department’s existing programming equipment. The Department’s existing security lock system uses Cyberlock equipment.

2. Provide security lock system that controls access to specific field cabinet(s) on an individual basis.

3. Provide security lock system that has no pick-able keyway.

4. Provide cylinder that can retrofit existing field cabinet mechanical lock hardware.

5. Provide electronic key with key memory that stores access schedules and a list of locks it can open.

6. Provide cylinder and electronic key that are manufactured with a unique ID that cannot be changed or duplicated.

7. Provide rechargeable batteries.

939.2.11 Miscellaneous Equipment Requirements

A. Fiber Optic Video Transmitter and Receiver, Type A

1. Provide fiber optic video transmitters and receivers that meet the following requirements:
   a. Provide transmitter and receiver units with full-motion uncompressed video transmission or reception capability.
   b. Provide pulse frequency modulation.
   c. Provide external ST compatible fiber optic connector.
   d. Provide external female video 75-ohm BNC connector with gold-plated center pin.
   e. Provide external indicator LED for power.
   f. Provide operating wavelengths of 850 nm and 1,300 nm MM or 1,310 nm SM per project requirements.
g. Meet minimum 14 dB power budget.

h. Provide receiver dynamic range that is a minimum of 2 dB greater than the manufacturer’s specified power budget. The transceiver shall fully maintain all operational performance characteristics throughout the full receiver dynamic range, including a 0 dB path loss.

i. Comply with EIA/TIA RS-250C Medium Haul transmission.

j. Provide transmitter and receiver units that meet NEMA TS 2 environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.

2. Provide fiber optic video transmitters in the field cabinet assemblies that meet the additional following requirements:

a. Provide transmitters that operate from a plug-in 120 VAC external transformer, with mounting screw, plugged into an equipment outlet in the field cabinet.

b. Provide SM transmitter units that incorporate laser diode optical emitters.

c. Provide standalone metal enclosure capable of horizontal or vertical mounting.

d. Provide transmitter unit that operates in full compliance with the EIA/TIA RS-250C Medium Haul transmission from 0dB optical path loss to the maximum specified optical path loss over the full temperature range of the NEMA TS-2 environmental standard or other approved environmental standard.

e. Provide transmitter with maximum dimensions of 2.00 in. (51 mm) (H) x 5.5 in. (140 mm) (W) x 7.0 in. (180 mm) (L).

3. Provide fiber optic video receivers in the control center or communications hub that meet the additional following requirements:

a. Provide receivers that can be permanently rack mounted within a card cage with a self-contained rack power supply.

b. Provide card cage as required.

B. Fiber Optic Video/Data Transmitter and Receiver, Type B

1. Provide fiber optic video/data transmitters and receivers that meet the following requirements:

a. Provide asynchronous, full duplex RS-232 communications.

b. Provide one-way full-motion uncompressed video transmission or reception.

c. Provide pulse frequency modulation.

d. Provide external ST compatible fiber optic connector.

e. Provide external female DB25, DB9 or terminal block RS-232 connector.

f. Provide external female video 75-ohm BNC connector with gold-plated center pin.

g. Provide external indicator LEDs for video and control signals.

h. Provide wave division multiplexing with operating wavelengths: 850 nm and 1,300 nm MM (minimum 13 dB power budget) or 1,310 and 1,550 nm SM (minimum 23dB power budget) per project requirements.

i. Provide receiver dynamic range that is a minimum of 2 dB greater than the manufacturer’s specified power budget. The transceiver shall fully maintain all operational performance characteristics throughout the full receiver dynamic range, including a 0 dB path loss.
j. Comply with EIA/TIA 250C Medium Haul video transmission.

k. Provide transmitter and receiver units that meet NEMA TS 2 environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.

2. Provide video/data transmitters in the field cabinet assemblies that meet the additional following requirements:
   a. Operate from a plug-in 120 VAC external transformer, with mounting screw, plugged in to an equipment outlet in the field cabinet.
   b. Provide SM transmitter units that incorporate laser diode optical emitters.
   c. Provide standalone metal enclosure capable of horizontal or vertical mounting.
   d. Provide transmitter unit that operates in full compliance with the EIA/TIA RS-250C Medium Haul transmission from 0 dB optical path loss to the maximum specified optical path loss over the full temperature range of the NEMA TS-2 environmental standard or other approved environmental standard.
   e. Provide transmitter unit that meets NEMA TS 2 environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.
   f. Provide transmitter with maximum dimensions of 2.0 in. (51 mm) (H) x 6.5 in. (165 mm) (W) x 7.2 in. (183 mm) (L).

3. Provide video/data receivers in the control center or communications hub that meet the additional following requirements:
   a. Provide receivers that can be permanently rack mounted within a card cage with a self-contained rack power supply.
   b. Provide card cage as required.

C. Fiber Optic External Transceiver

1. Provide external transceivers that meet the following requirements:
   a. Provide daisy chained, linear multi-drop configuration.
   b. Provide asynchronous, full duplex RS 232 communication.
   c. Provide external female ST connectors with T1, R1, T2, and R2 ports for fiber connection.
   d. Provide external female DB-25, DB-9, or terminal block RS 232 connector.
   e. Provide external indicator LEDs for power, transmit and receive (each channel).
   f. Provide MM transceiver that operates at 1,300 nm (minimum 14 dB power budget).
   g. Provide SM transceiver that operates at 1,310 nm (minimum 21 dB power budget).
   h. Provide receiver dynamic range that is a minimum of 2 dB greater than the manufacturer’s specified power budget. The transceiver shall fully maintain all operational performance characteristics throughout the full receiver dynamic range, including a 0 dB path loss.
   i. Provide anti-streaming communications.
   j. Provide SM transmitter units that incorporate laser diode optical emitters.
Section 939 — Communications and Electronic Equipment

k. Provide internal, nickel-cadmium trickle charge battery for a minimum of six-hour backup operation. The battery shall be designed to have minimized degradation to reliability during extended periods of trickle charge operation. Use corrosion resistant battery contacts.

l. Provide metal housing with maximum dimensions of 8 in. x 5 in. x 2 in. (203 mm x 127 mm x 51 mm). The metal housing shall have flanged mounting brackets to allow for permanent mounting with screws.

m. Provide transceiver unit that meets NEMA TS 2 environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.

2. Do not use internal card-type units in field devices, such as traffic signal controllers, CCTV system controllers, and CMS controllers.

3. Provide external transceivers in the control center or communications hub that meet the additional following requirements:
   a. Provide transceivers that can be permanently rack mounted within a card cage with a self-contained rack power supply.
   b. Provide card cage as required.

D. Fiber Optic External Star Transceiver

1. Provide an RS232 data optical star transceiver that meets the following requirements:
   a. Provide star transceiver designed for multi-drop configuration with three optical data ports and one electrical equipment data connection port, to be applied in a drop-and-repeat optical three-way to “T” installation.
   b. Provide star transceiver that is fully compatible and operable with the linear drop-and-repeat transceiver specified herein.

2. Do not include internal battery for backup operation.

3. Provide transceiver unit that meets NEMA TS 2 environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.

E. Serial Data Terminal Server

1. Provide multiport Serial Data Terminal Servers (terminal servers) that are compatible with the existing GDOT Central Software serial port control system. The existing GDOT serial port control system consists of serial data terminal servers (Digiboard PortServer) addressed with the Digiboard RealPort system interface.

2. Provide terminal servers that meet the following requirements:
   a. Provide terminal servers that are compatible with the existing GDOT Central Software serial port control system.
   b. Provide IP addressable units supporting Ethernet 10/100Base-T/TX with RJ45 port.
   d. Provide management access by HTTP, telnet, and console ports, and password protected.
   e. Provide SNMP read/write management of terminal server and individual serial ports.
   f. Provide serial ports with individually configurable communication settings and TCP/UDP socket support.
Section 939 — Communications and Electronic Equipment

g. Provide RS-232/422/485 selectable serial connections.

h. Provide serial ports with minimum 230 Kbps throughput with 64 Kbps buffering and data capture.

i. Provide firmware that is upgradeable by FTP/TFTP.

j. Provide upload/download of configuration settings.

k. Provide diagnostic LEDs for Ethernet connection and unit status.

l. Provide terminal server units that meet NEMA TS environmental standards for power interruption, temperature and humidity, power service transients, non-destruct transients, vibration, and shock. Conformance with equivalent environmental standards by other entities may be submitted for consideration.

m. Provide terminal servers that are UL listed.

3. Provide Serial Data Terminal Server, 16 Port, that meets the following additional requirements:

a. Provide EIA 19 in. (483 mm) rack-mounted units with maximum vertical height of 1.75 in. (44.4 mm).

b. Provide 16 RS-232 ports mounted on the front of the unit.

c. Provide internal 120 VAC power supply.

4. Provide Serial Data Terminal Server, Type B, that meets the following additional requirements:

a. Provide units that have conformal-coated circuit boards.

b. Provide units that can be panel-mounted, rack-mounted, or shelf-mounted in field cabinets.

c. Provide minimum of two RS-232 ports mounted on the front of the unit.

d. Provide internal or external 120 VAC power supply.

5. Provide fiber optic patch cords that meet all requirements of Section 935.2.01.G.

939.3 Construction

The construction and installation of the network and field cabinet equipment, materials, components, and assemblies as specified shall meet the requirements in this section and the manufacturer’s installation requirements and recommendations.

939.3.01 Construction Requirements

A. General Construction

1. Install network switches, field cabinets and components, UPS and battery systems, and solar power components as required by the Contract documents and recommended by the manufacturer.

2. Install equipment in new or existing rack space in accordance with the equipment manufacturer’s recommendations, including mounting, interconnection wiring and electrical service.

3. Furnish and install mounting hardware and incidental materials, including fasteners and auxiliary supporting frames/brackets, as recommended by the manufacturer.

4. Furnish and install miscellaneous hardware, materials, wiring/cabling, configuration, and any other incidental items necessary for fully operational components and subsystems shown in the Contract documents and Section 942, except when specifically identified as existing or as work to be performed by the Department.

5. Coordinate access to Department buildings, hub buildings, and field cabinets for all work activities required in these locations with the Department 10 days before access is needed.
Section 939 — Communications and Electronic Equipment

6. Work on this Project requires system configuration and integration tasks to be performed by the Department before some Contractor-installed items can be brought online and completely system tested. Coordinate all work activities needing system configuration with the Department a minimum of 14 calendar days prior to any testing.

7. Provide properly sized electrical service, including grounding and current rating, in the equipment racks for all hardware installed. Furnish and install additional power outlet strips in new and existing equipment racks if needed for the new equipment.

8. Coordinate with the Department to establish electrical utility service according to the NEC and as specified in Section 682.
   a. Verify with the local power service provider to ensure that the provided equipment is compatible with the installed equipment.
   b. Contractor shall be responsible for paying for electrical service as required from the time of testing up to the issuance of the MAL by the Department at which time the service provider account shall be transferred to the Department.

9. Comply with grounding and bonding requirements in Section 682 for field cabinet and components, and as required and recommended by the field cabinet and equipment manufacturer(s).

10. For any equipment that is not rack mountable with "rack ears," provide perforated shelves and secure shelf-mounted equipment with rack mounting hardware.

11. Protect cable ends at all times with end caps. Never subject any cable to exceed its minimum bend radius as recommended by the manufacturer.

12. Terminate ground wiring for field cabinet surge protectors to the field cabinet ground buss bar that terminates the ground conductor to the field cabinet ground rod.

13. Dress and route grounding wires separately from all other field cabinet wiring.

14. Install grounding wires with the absolute minimum length possible between the surge protector and the ground terminals.

15. Provide grommets, guides, and strain relief material where necessary to avoid abrasion of or excess tension on wire and cable.

16. Neatly route, dress, and secure patch cords in the equipment racks and at both ends. Use all available cable management devices and trays. Route patch cords only vertically on the sides of the equipment racks or horizontally across the bottom or top of the racks; no diagonal routing is permitted. Follow manufacturer’s recommendations including bend radius requirements during patch cord installation.

17. Store uninstalled cable according to manufacturer recommended bend radius and cable reel requirements.

18. Inspect and test cables for continuity when received, with results compared with factory pre-shipping tests. If test results differ from factory pre-shipping tests by more than 10%, notify the supplier (or manufacturer) of discrepancies for immediate correction.

19. Bond all rack cages in field cabinets in accordance with the approved manufacturer’s installation specification.

20. Ground all field cabinet rack cages to the single-point ground for the site.

21. Provide grounding and lightning protection for all cable runs at the top of the ITS device support structures and at the field cabinet entry port.
Section 939 — Communications and Electronic Equipment

22. If the field cabinet and associated entry port is not collocated on the support structure, provide grounding and lightning protection at the bottom of the support structure.

23. Provide equipment with readily accessible, manually re-settable or replaceable circuit protection devices (such as circuit breakers or fuses) for equipment and power source protection.

24. Provide and size circuit breakers or fuses such that no wire, component, connector, PC board, or assembly must be subjected to sustained current in excess of their respective design limits upon the failure of any single circuit element or wiring.

B. Communications Subsystem

1. Install communications network equipment and materials necessary for a complete communications path from the field site to the TMC or communications hub building as shown in the Contract documents.

2. Furnish and install mounting and interconnection materials, including but not limited to mounting panels and rack hardware, fiber and Category-6 patch/jumper cables, surge protection, and power supply cables.

3. Mount field equipment in a manner so as to not restrict the replacement of other components in the field cabinet housing or hub building.

C. Uninterruptible Power Supply

1. Install UPS and battery bank or pack in the field cabinet rack and hub building equipment rack.

2. Furnish and install a dedicated electrical service branch circuit from the hub building main service panel for the UPS system.

3. Provide UPS system branch circuit that is in accordance with all recommendations of the UPS manufacturer, including the provision of a locking plug/receptacle connection.

4. Locate the branch circuit receptacle as close as possible to the UPS mounting position to minimize the UPS input line cord and to minimize tripping hazards.

5. Configure the electrical service inputs for network switches and other equipment to be supplied by the UPS.

6. Furnish and install line cords, power strips, and incidental materials to configure the UPS service to the above equipment.

D. Solar Power System

1. Install and mount the solar panel(s) with mounting bracket and the field cabinet on the ITS pole or structure at heights specified in the Contract documents or as directed by the Department.

2. The installation locations of poles and structures may require slight adjustments to maximize sun exposure for the solar panel assembly. Obtain approval of final site location and orientation from the Department prior to installation.

3. Install solar power system in accordance with the manufacturer’s recommended installation procedures and the Contract documents.

4. Mount and orient the solar panel(s) to maximize sun exposure in accordance with the manufacturer’s recommendations.

5. Mount panels at an angle to enable runoff of rain and snow.

6. Provide power from the solar power assembly to the controller cabinet by connecting to the UPS in the cabinet.

7. Provide no exposed wires from the solar panel(s) to the battery and from the battery to the charge controller.
8. Install wires in liquid tight flexible conduit, run inside a pole, or other method approved by the Department. The cost to furnish and install any conduit for the solar power assembly installation shall be included in the cost of the solar power assembly.

9. Electrically ground the solar power assembly in accordance with manufacturer recommendations.

E. Patch Cables and Labeling

1. Label wiring and cabling, including entrance cables, jumper and patch cords, and power supply cables. Cable labels shall consist of UV-protected, waterproof permanent ink printed or legibly written on self-laminating and over-wrapping label material.

2. Apply cable labels at each end and in the center of the cable. Cable labels shall consist of permanent ink printed or legibly written on self-laminating and over-wrapping label material.

3. Label patch cords using cable identification numbers shown in the Contract documents or provided by the Department.

4. Apply cable labels at each end and in the center of the cable.

F. Security Lock

1. For an existing cabinet, remove existing lock cylinder and install electronic lock.

2. Provide electronic key to the Department 30 calendar days prior to the installation of field cabinet(s) that require a security lock.

3. The Department will have 20 calendar days from the time that all keys and locks are provided to program the keys and locks.

4. Provide one electronic key per electronic lock. All electronic keys and locks will become the property of the Department at the end of the construction job. All keys shall be turned in to the Department’s ITS Project Manager prior to the issuance of the MAL by the Department.

939.3.02 Equipment Configuration and Integration Requirements
Refer to Section 942.3.03 for network equipment configuration and integration requirements.

939.3.03 Testing Requirements
Refer to Section 942.3.04 for testing requirements.

939.3.04 Training Requirements
Refer to Section 942.3.05 for training requirements.

939.3.05 Warranty and Maintenance Support Services

A. Warranty Requirements

1. Provide a minimum warranty length as follows. If the manufacturer’s warranties for the components are for a longer period, those longer period warranties shall apply.
   a. Field switch: five years.
   b. Routing switch: five years.
   c. Surge protectors: five years.
   d. UPS and battery system: three years.
   e. All other equipment and materials furnished and installed as part of this section: two years.

2. Refer to Section 942.3.02 for general warranty requirements.
Section 939 — Communications and Electronic Equipment

B. Maintenance Support Services

Refer to Section 942.3.02 for maintenance support services requirements.

939.4 Measurement

The network equipment, field cabinets and components, UPS battery back-up systems, solar equipment, surge protection, and communication cables defined herein and training that are complete, in place, accepted, and of the kind, size, and type specified will be measured as follows:

A. Field Switch

Field switches (all types) with mounting hardware will be measured for payment by the number installed, complete, functional, tested, and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

B. SFP Fiber Module

SFP fiber modules (all types) will be measured for payment by the number installed, complete, functional, tested, and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

C. Routing Switch

Routing switches (all types) with mounting hardware will be measured for payment by the number installed, complete, functional, tested, and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

D. Field Cabinet

Field cabinets will be measured for payment by the number actually installed, complete, functional, and accepted. For each unit installed, furnish all required items, including but not limited to; identification and documentation, cabinet shell, rack cage, cabinet lighting, electrical service, power strip, ventilation system including heater, locks, internal wiring, cabling, and wire management, surge protection, grounding and bonding, and all other components and materials specified herein and required for a complete field cabinet.

E. Solar Power System

Solar power system (all types) with all required components and materials as specified herein including panel mounting hardware will be measured for payment by the number installed, complete, functional, tested and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

F. Field UPS

Field UPS (all types) with all required components and materials as specified herein including panel mounting hardware will be measured for payment by the number installed, complete, functional, tested and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

G. Field Power Controller

Field Power Controller with all required components and materials as specified herein including panel mounting hardware will be measured for payment by the number installed, complete, functional, tested and accepted. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

H. Fiber Optic Video Transmitters and Receivers, Type A

Transmitters and receivers are measured for payment by the actual number furnished and installed. Provide all mounting and interconnection materials, including but not limited to card cages, hardware, fiber, RS-232 or video jumper cables, RS-232/485 converters and power supply cables at no separate cost to the Department.
Section 939 — Communications and Electronic Equipment

I. Fiber Optic Video/Data Transmitters and Receivers, Type B

Transmitters and receivers are measured for payment by the actual number furnished and installed. Provide all mounting and interconnection materials, including but not limited to card cages, hardware, fiber, RS-232 or video jumper cables, RS-232/485 converters and power supply cables at no separate cost to the Department.

J. Fiber Optic External Transceivers (mode)

External drop-and-repeat transceivers and external star transceivers are measured for payment by the actual number furnished and installed. Furnish all mounting and interconnection materials, including but not limited to card cages, hardware, fiber and RS-232 jumper cables, RS232/485 converters, and power supply cables at no separate cost to the Department.

K. Serial Data Terminal Server (16 Port and Type B)

Serial Data Terminal Servers (16 Port and Type B) will be measured for payment by the actual number furnished and installed. For each unit provided, furnish any required Serial Data Terminal Servers and serial port concentrators as specified at no separate cost to the Department.

L. Security Lock

Security lock will be measured for payment by the actual number furnished and installed. Provide lock cylinder and electronic key along with all other components and materials required or necessary for a complete security system. This price will be full compensation for labor, tools, materials, equipment, and incidentals necessary to complete the work.

M. Training

Training will be measured as a lump sum for supplies, equipment, materials, handouts, travel, and subsistence necessary to conduct the training.

939.5 Payment

939.5.01 Communications and Electronic Equipment

Communications and electronic equipment of the type specified in the Contract documents will be paid for at the Contract unit price. Payment is full compensation for furnishing and installing or delivering the communications and electronic equipment. This price will include full compensation for labor, materials, equipment, tools, test equipment, incidentals, installation, testing, and providing warranty necessary to complete the work as described in this section.

Payment Notes:

Submittal

Submittal requirements are included in Section 942.1.04 and will not be paid for separately. It will be considered incidental to the communications and electronic equipment pay items.

Testing

Testing is defined in Section 942.3.04 and will not be paid for separately. It will be considered incidental to the communications and electronic equipment pay items.

GDOT Central Software Integration

GDOT Central Software integration is included in Section 942.3.03 and will be paid for separately under the Section 942.5 pay item.
Payment for communications and electronic equipment will be made under:

Section 940—NaviGator Advanced Transportation Management System Integration

940.1 General Description
This work includes coordination and integration of the project into the Department’s NaviGAtor advanced transportation management system to provide a complete and fully operational expansion of the Department’s NaviGAtor system as shown in the Contract Documents.

Integration Requirements: All field devices, communications and network systems installed during the project shall be fully integrated into the existing NaviGAtor system and shall form a complete, usable and fully integrated system capable of being fully controlled and operated from the Transportation Management Center.

940.1.01 Related References

940.3.05 Construction
Contractors that need access to the GDOT hub buildings during the construction activity to complete their work shall purchase an electronic programmable key and key programmer. Contractors needing access to a hub building must submit a System Change Request (SCR) form if installation of new equipment is being performed, or a Maintenance and Repair Report (MARR) form for regular routine maintenance. These forms shall be submitted via email to GDOT at least 72 hours in advance. The system currently in use for Hub building access is CyberLock by Videx. To purchase keys, key programmers and get technical assistance on the GDOT CyberLock system, contact:

940.3.06 Quality Acceptance
A. Overall System Testing

While each individual device and subsystem requires specific testing, the overall system requires detailed testing to demonstrate that the system is fully integrated and forms a complete and usable system.

Acceptance of the overall system requires successful completion of all individual subsystem tests and then completion of an overall 30-day burn-in period of the complete system once it is fully integrated and functioning as a complete system.

Perform all acceptance testing in the presence of the Engineer. Notify the Engineer of a desired acceptance test no less than fourteen calendar days prior to beginning the testing except for testing using the NaviGAtor software and existing NaviGAtor control center and communications equipment. For acceptance testing using the NaviGAtor software and existing NaviGAtor control center and communications equipment, coordinate the testing schedule with the Engineer no less than 30-days prior to the start of this testing. Do not conduct any testing during any State or Federal holiday.

If, in the Department’s judgment, the Contractor is not demonstrating progress in solving any technical problem, the Contractor may be directed to supply Factory technical representation and diagnostic equipment at no cost to the Department until satisfactory resolution of those defined problems.

The Engineer may direct any completed or partially completed portions of the project to be placed in service. Such action cannot be deemed an acceptance of the project in whole or in part, nor shall such action be construed as a waiver by the Engineer of any provision of the specifications. Assume no right to additional compensation or extension of time for completion of the work. Fully maintain all equipment until final acceptance, which includes but is not limited to equipment configuration and communication systems that are being integrated.

Make the acceptance testing plan a detailed and thorough procedure that demonstrates that all equipment, hardware and work meet all requirements of the Contract. These requirements include but are not limited to all design, construction, materials, equipment, assembly, documentation of manufacturer’s certification of assembly and configuration, environmental, performance, communications, video and data communications signal strength and clarity, compatibility with the NaviGAtor software, and documentary requirements of the Contract.
B. **Burn-in Period**

Provide a 30-day burn-in period for all work and equipment included in the Contract. The burn-in period shall consist of full operation of the entire system from the Transportation Management Center or an alternate location designated by the Engineer.

Commence with the burn-in period upon written authorization by the Department to commence. Terminate the burn-in period 30 consecutive days thereafter unless an equipment malfunction occurs. Stop the burn-in period for the length of time any equipment is defective. After repairing the equipment, the Department shall determine that it functions properly.

Successful completion and acceptance of the burn-in period will be granted on the 30th day unless any equipment has malfunctioned during the burn-in period. If any equipment has failed during the 1st through 15th day, then the final acceptance shall be withheld until all the equipment is functioning properly for 30 consecutive days after repair. If any equipment has failed during the 16th through 30th day, final acceptance will be withheld until all the equipment is functioning properly for 15 consecutive days after repair.

When a specific piece of equipment has malfunctioned more than three times during the 30 day burn-in period, replace that equipment with a new unit and repeat the 30 day burn-in period.

C. **Contractor Responsibilities**

During the burn-in period, maintain all work under this Contract in accordance with the Specifications. Restore any work or equipment to proper operating condition within 12 hours after notification.

D. **Department Responsibilities**

Department responsibilities during the burn-in period will be as follows:

1. Expeditious notification of Contractor upon failure or malfunction of equipment.
2. In the event that the Contractor does not provide the services enumerated above under his contract responsibilities, the Department or its authorized agents may in the interest of public safety take emergency action to provide for adequate traffic control. Pay any costs incurred as a result of these emergency actions. Such action by the Department will not void any guaranties or warranties or other obligations set forth in the Contract.

E. **Burn-In Period Acceptance**

The Department will make burn-in period acceptance after satisfactory completion of the required burn-in period and on the basis of a comprehensive field inspection of the complete system in accordance with the Specifications. Upon burn-in period acceptance but prior to Final Acceptance of the entire Contract, maintain the system in accordance with all contract requirements.

F. **Ramp Meter Testing**

The Contractor shall submit to and obtain approval from the Engineer a ramp metering testing procedure for each specific ramp meter location. The testing procedure shall demonstrate that all components: hardware, cable, and connections furnished and installed by the contractor operates correctly and that all functions are in conformance with the specifications. Testing requirements are also outlined in Section 647.

The Department will provide controller firmware. The Contractor shall provide the controller to the Department. The Department will load the firmware into the controller and return to the Contractor.

At a minimum, the Contractor shall demonstrate to the Engineer:

1. The I-VDS and loop detectors at each location are functioning with expected accuracy as specified.
2. The ramp meter signals function properly at all stages, including non-metering, startup, metering and shutdown.
3. In multi-lane configurations, the ramp meter can operate a simultaneous release of vehicles from all lanes as well as an alternating or staggered release of vehicles from the two (or three) lanes.
4. Queue detectors are functioning as specified, including both queue detection and queue override.
5. The ramp meter functions properly for both local traffic responsiveness and time of day operations.
6. The advance warning sign can be clearly seen and can be activated and deactivated properly.
7. The ramp meter can communicate properly with the Hub/TMC.
8. The traffic enforcement heads are operating as per the plans and can be seen by enforcement personnel.

The Contractor shall coordinate closely with the NaviGAtor system integrator for conducting ramp meter operational tests. Note: Pretest should be performed prior to calling the Engineer for inspection. Pretest shall be defined as all tests that will be performed during the Engineer’s inspection. Begin operational tests after the Engineer is satisfied that all work has been completed. After the ramp meter has been placed in operation, the contractor, in coordination with the system integrator, shall demonstrate that all equipment furnished and installed by the Contractor operates with all software and firmware as specified.

After successful completion of the test procedure, each ramp meter assembly shall go through a burn-in period for 30 consecutive days of normal ramp metering operations. During the burn-in period, the Contractor shall ensure that all Contractor-supplied equipment operates without failures of any type. If any equipment component malfunctions or fails to provide the specified functionality during the 30-day burn-in period, the Contractor shall replace or repair the defective equipment within 48 hours of notification by the Engineer.

After the malfunctioning component(s) have been repaired or replaced to the satisfaction of the Engineer, the Contractor shall begin a new 30-day burn-in period. The new 30-day burn-in period shall apply only to equipment components supplied by the Contractor. In the event of a failure or malfunctioning of equipment furnished by others which prevents the 30-day burn-in test from continuing, the Engineer will suspend the burn-in test and resume when the other equipment failures are corrected.

G. As-Built Documentation

Submit as-built documentation of all work provided in accordance with this specification prior to Contract final acceptance. Include in the as-built documents the following documents as a minimum as they are applicable. Supply manuals and wiring diagrams at the time of installation. Deliver as-builts no later than 30 days after completion of installation or as otherwise specified in the Plans or Specifications. Provide complete and accepted as-builts, which shall be reviewed and approved by the Department prior to any final acceptance or payment.

1. Operator’s Manual
   a. Furnish a manual containing detailed operating instructions for each different type of equipment.
2. Maintenance Procedures Manuals
   b. Furnish a manufacturer’s manual containing detailed preventative and corrective maintenance procedures for each different type or model of equipment.
3. System Connection Diagrams
   a. Furnish diagrams showing fiber optic and electric system interconnection cables and terminations. Include a diagram showing the location of all equipment in the new equipment racks or frames in hubs. Include diagrams that clearly indicate the use of each fiber.
4. As Built Drawings
   a. Provide as-built drawings showing the final location of all new equipment and communications installed, including but not limited to CCTV and VDS support poles, new utility poles, new equipment cabinets, detection systems, CMS, and ramp meter support poles. Show all routes and locations of the final cable installation in-place and complete. For aerial cable installations show poles, pole attachment heights, spans, co-locations, splice closures, maintenance/storage coils, and vertical risers. For underground cable installations show conduit size, quantity and routes, pull boxes and ECBs, closures, and cabinet terminations. Provide the cable distance marking documentation required in 935.3.05.G.2. The as-built drawings shall also include any other device specific details that are required in the individual specifications.
   b. The location for all items noted above shall be indicated with the state-plane GPS coordinates shown on the plans beside each item. All markups on the plans shall be shown in red. A separate Excel file with the GPS coordinates for each item shall also be submitted with the as-built drawings.
c. Except for standard bound materials, bind all 8.5 in. x 11 in. documentation, including 11 in. x 17 in. drawings folded to 8.5 in. x 11 in., in logical groupings in loose-leaf binders of either the 3-ring or plastic slide-ring type. Permanently and appropriately label each such bound grouping of documentation.

d. Furnish five (5) copies of all bound documentation.

**940.3.07 Contractor Warranty and Maintenance**
Not applicable

**940.3.08 Training**
Not applicable

**940.4 Measurement**
The Department will pay all costs of coordination with and integration of the project into NaviGAtor under the integration pay item when the pay item is included in the Contract. The integration pay item is measured as a lump sum for all supplies, materials and subsistence it requires.

When the integration pay item is not included in the Contract, all costs of coordination with and integration of the project into NaviGAtor with all supplies, materials and subsistence it requires shall be included in other Contract items. The Department will make no separate payment for integration.

**940.4.01 Limits**
Not applicable

**940.5 Payment**
The Department will pay for integration that is complete, in place and accepted by the Department. Payment is full compensation for the work.

Payment for Section 940 is made under:

<table>

**940.5.01 Adjustments**
Not applicable
Section 941 — Macro-Synthetic Fibers for Concrete Reinforcement

941.1 General Description
This section includes the requirements for manufacturing macro-synthetic fibers which are permitted as reinforcement in lieu of steel reinforcement in the following selected precast concrete products:
- Precast concrete manhole riser sections
- Precast concrete flared end sections

941.1.01 Related References

941.2 Materials
For a list of sources, see QPL 86.

941.2.01 Macro-Synthetic Fibers for Concrete Reinforcement
A. Requirements
   1. Ensure that macro-synthetic fibers are manufactured from virgin polyolefins (polypropylene and polyethylene) and comply with ASTM C 1116.4.1.3. Fibers manufactured from materials other than polyolefins must show documentary evidence confirming their long term resistance to deterioration when in contact with the moisture and alkalies present in cement paste and/or the substances present in air-entraining and chemical admixtures.
   2. The minimum fiber length required is 1.50 in. (38 mm).
   3. Ensure that macro-synthetic fibers have an aspect ratio (length divided by the equivalent diameter of the fiber) between 45 and 150.
B. Acceptance
   1. Ensure that macro-synthetic fibers have a minimum tensile strength of 40 ksi (276 MPa) when tested in accordance with ASTM D 3822.
   2. Minimum dosage rate in pounds of fibers per cubic yard is established by determining a minimum average residual strength of no less than 150 psi (1034 kPa) when tested in accordance with ASTM C 1399. In all cases, ensure a minimum fiber dosage rate of 5 lbs./yd.³ (2.9 kg./m.³) and a maximum fiber dosage rate of 10 lbs./yd.³ (5.9 kg./m.³).
   3. Ensure that macro-synthetic fibers have a minimum modulus of elasticity of 400 ksi (2758 MPa) when tested in accordance with ASTM D 3822.
   4. The fiber manufacturer is required to obtain independently performed test results that confirm the requirements listed herein and submit those for approval by the Engineer.
Section 941 — Macro-Synthetic Fibers for Concrete Reinforcement

5. Approved fibers are listed on the Department’s Qualified Products List 86 (QPL-86), *Macro-Synthetic Fibers for Concrete Reinforcement*.

C. **Materials Warranty**

   General Provisions 101 through 150.
Section 942 — ITS General Requirements (CCTV)

942.1 General Description
This section includes general requirements in support of the ITS specifications and defines the following procedures: submittal process and requirements, construction management, maintenance support, testing, training, final inspection, and close-out. In addition, the pay item defined in Section 942 includes work related to equipment configuration and integration services for pay items included in their respective sections.

942.1.01 Definitions, Acronyms, and Abbreviations
A. Definitions

The following definitions are common to all ITS specifications:

1. Acceptance Test: consists of two sub-tests, including system operational test (all sections) and burn-in test (all sections). These tests verify full device and system functionality and performance over the network in day-to-day operations.

2. Authority Having Jurisdiction (AHJ): refers to GDOT districts, counties, or local municipalities.

3. Dead Zone: a “peak” or “blind spot” on an OTDR trace where no measurement can be made. Dead zones are prominent at the beginning of a trace or at any other high reflectance event.

4. End-to-End Segment: also called end-to-end link. The overall segment(s) of fiber optic cable being tested, including, connectors and splices, from patch panel to patch panel.

5. Failure: ITS device or ancillary equipment element becoming unable to comply with the Project requirements and applicable standards described in the Contract documents.

6. GDOT Central Software: software and hardware system that controls and monitors associated ITS devices in the Contract.

7. ITS Specifications: specifications that include materials, construction, measurement, and payment requirements for the following sections: 631, 694, 926, 935, 936, 937 (except material that applies to traffic signal, ramp meter installations and other applications as noted in the specification), and 939.

8. Maintenance Acceptance Letter (MAL): letter issued by the Department when acceptance test, final inspection, and close-out activities as specified herein, including all punch list items, have been completed by the Contractor and approved by the Department. The Department may also choose to issue a partial MAL for specific ITS devices.

10. Pre-Installation Test: consists of two sub-tests including (1) fiber optic reel test (Section 935) and (2) DMS test (Section 631). These tests verify setup, device inspection, basic DMS functionality, and fiber optic attenuation and continuity test on the reel.

11. Repair Time: the time it takes, exclusive of requirements for the coordination of any lane closures, to diagnose, repair, and re-establish full functionality and operations of the site(s).

12. Response Time: the time it takes the Contractor to mobilize repair technician(s) from the time they receive the problem notification from the Department and arrive at the site(s).
13. **Stand-Alone Test:** consists of three sub-tests including (1) field site test (all sections), (2) local operational tests (all sections), and (3) fiber optic post-installation test (Section 935 only). These tests verify device functionality locally prior to connecting to the network, and complete fiber optic testing from patch panel to patch panel.

14. **Submittal:** documentation required by the Contract that the Contractor must submit for the Department’s review, acceptance, or approval. Submittals may include product cut-sheets, shop drawings, working drawings, material test reports, material certifications, Project progress schedules, and schedule updates.

### B. Acronyms and Abbreviations

The following acronyms, abbreviations, and terminology are used throughout the ITS specifications:

1. **AASHTO** American Association of State Highway and Transportation Officials
2. **AC** Alternating Current
3. **ACR** Attenuation to Crosstalk Ratio
4. **ACEI** Association Connecting Electronics Industries
5. **ACL** Access Control List
6. **ACP** Auxiliary Control Panel
7. **AES** Advanced Encryption Standard
8. **AHJ** Authority Having Jurisdiction
9. **ANSI** American National Standards Institute
10. **ASCE** American Society of Civil Departments
11. **ASCII** American Standard Computer Information Interface (a text file format)
12. **ASTM** American Society for Testing and Materials
13. **ATMS** Advanced Traffic Management System
14. **AWG** American Wire Gauge
15. **AWS** American Welding Society
16. **BDPU** Bridge Protocol Data Unit
17. **BGP** Border Gateway Protocol
18. **BICSI** Building Industry Consulting Service International
19. **BMP** Bit Map
20. **BNC** Bayonet Neill-Concelman (a video connector)
21. **BPSK** Binary Phase-Shift Keying
22. **CAT** Category
23. **CCD** Charge-Coupled-Device
24. **CCTV** Closed Circuit Television
25. **CD** Compact Disc
26. **CEI** Construction Engineering and Inspection

2005
942 — ITS General Requirements (CCTV)

942.1.03 ITS General Requirements
A. Submit all submittals, questions, and work related documentation described in the ITS specifications to the Department.
B. The Department will respond to submittals with approval, comments that shall be addressed and require a re-submittal, and/or other direction to the Contractor.

942.1.04 Submittal Requirements
A. General Submittal

1. Submit to the Department for approval one electronic PDF of the submittals as specified herein.
2. All materials required for any pay item shall be contained in the submittal regardless of whether it was listed in the specifications.
3. Do not submit partial submittals. Partial submittals for any pay item will not be accepted.
4. Do not procure or install materials or components proposed on the Contract until material submittals or shop drawings are submitted for review and approved by the Department.
5. The Department will not be liable for any equipment or material purchased, work done, or delay incurred prior to the Department’s approval of said equipment or material through the materials submittal data process.
6. The Department will approve or reject all submittals within three weeks of receipt of a complete package, unless otherwise specified or indicated by the Department.
7. Do not interpret approval of the submittals as approval of any deviation unless such deviation is identified in writing in the submittal cover letter.
8. Any failure of the Department to discover or note any unsatisfactory material will not relieve the Contractor of his responsibility for providing a complete operable ITS device installation as called for under the terms of the Contract.

B. Submittal Exceptions

1. Provide product and material information that meets the minimum submittal requirements listed in Table 2. This table is to be used as a guide and does not relieve the Contractor from submitting additional information to form a complete submittal package.
2. For products available on the Department’s QPL, select prequalified materials. Consult the GDOT QPL website to also obtain pre-approval procedures.
3. Submit a letter to the Department stating which QPL items will be used. Include product identification, including QPL number, brand name, type, and part number, for the Department to clearly identify that the construction item/product being proposed is on the QPL.

$v =$ Submittal required  
$^*$ = See GDOT QPL; submittal not required if material is selected from the QPL

4. QPL-listed materials are exempt from selected submittal requirements since they have been previously evaluated and reviewed by the Department, including successful integration with the GDOT Central Software. If the material is not listed on the QPL and the material is not required to be selected from the QPL, then the additional submittals will be required.
5. The Department will ascertain that the construction item is the same material identified on the QPL and will acknowledge receipt of these items in the Project diary or as required by the construction manual.

C. Submittal

Submittal requirements are shown in Table 2 and categorized below as common submittal items or specific submittal items.

**Common Submittal Items**

1. Provide Materials Submittal Package Cover that meets the following requirements:
   a. Provide a materials submittal package cover that contains a complete list or index of materials being submitted as part of each pay item. Any data submitted without the cover or that is incomplete will be rejected.
   b. Submit the cover to the Department for review and approval prior to any submittals.
   c. Clearly identify in the submittals any deviations from the Contract requirements and specifications. Provide a detailed description of the deviation with the reason for the change. The Department reserves the right to reject any variation or change for any reason.
   d. Provide submittal data that is neat, legible, and orderly.
   e. Organize each package of submittal data by pay item and include materials and components that are required for a given pay item into a single package. It must be clear to the reviewer what exactly is being proposed and where the material will be used. If it is not clear what is being proposed, the submittal may be rejected by the Department.
   f. Clearly denote on the cut-sheets what is specifically being proposed. If multiple models/part numbers are contained on a submitted cut-sheet or brochure, clearly denote (mark) on the cut-sheet/brochure which model/part number(s) is being proposed.

2. Provide warranty certification letter that meets the following requirements:
   a. Submit manufacturer or supplier warranty information for proposed ITS equipment, materials, and components.
   b. Submit warranty information on official company letterhead containing the following: subject line with title using the same terminology used in the specifications to clearly identify the item, description of the product, and signature by a person legally responsible to bind the company.
   c. Obtain warranty length and start time from the governing specification.

3. Provide catalog cut-sheets or manufacturer specification sheets for proposed ITS equipment, components, and materials that clearly provide, describe, and document the performance and other technical characteristics of the proposed item.

4. Provide specification compliance matrix that meets the following requirements:
   a. Complete a Specification Compliance Matrix to confirm that the proposed ITS device or component complies with the established requirements detailed in the specifications.
   b. Request Specification Compliance Matrices from the Department or the Department's web site.
Section 942 — ITS General Requirements (CCTV)

c. Indicate compliance by providing the word “Comply” following each paragraph number. Should the proposed material not comply or not entirely comply with the requirements specified, but ultimately achieves the intent, explain fully the extent, or lack thereof, of compliance for the material proposed for consideration by the Department. Providing no indication of compliance will be considered non-compliant.

5. Obtain pre-testing by a third-party or independent laboratory independent from the Department or the manufacturer that verifies and certifies that the manufacturer’s product conforms to applicable specifications and requirements (i.e., NTCIP compliance, NEMA TS 4 environmental testing compliance, etc.).

6. Provide documentation on manufacturer/supplier letterhead with manufacturer signature verifying that the manufacturer’s/supplier’s quality management and control system is compliant with ISO 9001 or Six Sigma requirements.

7. Provide shop drawings and mounting details that meet the following requirements:
   a. Provide detailed drawings showing ITS device assembly and component layout as required in the specifications and recommended by the manufacturer to assemble or construct the item.
   b. Provide mounting details that clearly show the proposed mounting method, materials, and hardware being proposed for each ITS device.

8. Provide structural calculations prepared by a registered Professional Engineer, in the state of Georgia, that indicate that the ITS device assembly and mounting meets the requirements of these Supplemental Specifications, the Standard Specifications, and AASHTO for wind loading as applicable and required of the Contract.

9. Provide an Installation Plan with schematic drawings that meet the following requirements:
   a. Provide a document that clearly indicates the installation plan for the Project, including any staged deployment that is approved by the Department with construction methods and procedures for ITS and communications devices, components, infrastructure, sub-assemblies or assemblies, and materials.
   b. Include recommended manufacturer installation instructions and procedures in the installation plan.

10. Provide manufacturer operations and maintenance documentation that provides routine, emergency, and troubleshooting procedures for each ITS device installed.

11. Provide manufacturer ITS device user manual that describes how to operate the particular type of equipment, layout of controls, displays, and all other information required to correctly operate a fully functional unit.

12. Provide Test Plan and Schedule that meet the following requirements:
   a. Provide a test plan with procedures developed in conjunction with the manufacturer(s) for pre-installation tests, stand-alone tests, acceptance tests, and burn-in tests as specified herein.
   b. Complete and incorporate the specific ITS test forms and include as part of the test plan.
   c. Coordinate the development of the test plan and procedures with the ITS device manufacturer(s).
   d. Provide a written schedule for testing activities as specified herein.
   e. Provide test schedule updates as required or needed for the duration of the project.

13. Provide test report documentation that meet the following requirements:
   a. Provide test report documentation as specified herein including (1) ITS test documentation and (2) communications test documentation.
   b. Include test results data forms and calculated total loss budget (for fiber projects) as specified herein.
14. Provide Training Plan and Schedule that meet the following requirements:
   a. Provide a training plan including course content and course materials for each type of training session.
   b. Provide trainer’s certification and qualifications.
   c. Provide a training schedule that outlines the time for the required training sessions and coordinates with the overall progress schedule.
   d. Provide each training participant with a copy of the course material. Include in course material copies of both a comprehensive manual and the presentation material that will be used.
   e. Provide two additional copies to the Department. Provide the classroom, audiovisual equipment, demonstration equipment, and “hands-on” equipment required.

15. Provide as-built plans for materials and installation work as specified in Section 942.3.01.C.4, along with structural elements and assemblies that are related to the ITS device or system at a given location as specified herein.

Specific Submittal Items

1. Provide wireless test report documentation and test results from the wireless system survey as specified in Section 926.3.01.B providing path analysis and local RF conditions, determination of local sources of interference, and RF field strength and fade margin.

2. Submit the method of monitoring fiber optic cable stress during installation to prevent cable damage from exceeding safe pulling tensions as specified in Section 935.3.01.

3. Provide CLD system documentation that meets the following requirements:
   a. Provide mounting details of the CLD installed on new poles as specified in Section 936.2.02.
   b. Furnish from the CLD manufacturer, independent laboratory testing documents certifying adherence to the stated wind force criteria utilizing, as a minimum EPA, the actual EPA or an EPA greater than that of the camera system to be attached.
   c. Provide evidence that the CLD manufacturer has a minimum of two years of experience in the successful manufacturing of such systems.
   d. Provide documentation from the CLD manufacturer that certifies that the Contractor has been instructed on the installation, operation, and safety features of the lowering device.

942.2 Materials
Not Applicable

942.3 Construction

942.3.01 Construction Management Requirements

A. ITS Contractor Superintendent

1. Provide a competent ITS Contractor Superintendent on the project at all times work is in progress who shall have full responsibility for the prosecution of the work and act as a single point of contact in all matters on behalf of the Contractor.

2. Submit the name of the ITS Contractor Superintendent and a summary of the individual’s relevant experience and qualifications to the Department for approval.
3. Do not change the ITS Contractor Superintendent without the prior written approval of the Department at its sole discretion.

B. Utility Coordination

1. Establish the electrical power service required for each ITS device as specified in the Contract.

2. Furnish or install equipment and materials that shall become part of the regional utility facility.

3. Coordinate such work with the utility representatives and furnish equipment and materials and perform work in accordance with the Contract documents and applicable utility agency standards and procedures.

4. Meet standards required by utility companies as related to the ITS equipment, materials, and installation associated with attachment to related power service feeds or leased communication connections.

5. Test the power utility service to confirm voltage levels and current capacity and the serviceability of any circuit connected to the ITS equipment.

6. Power utility representatives are not authorized to revoke, alter, or waive any requirements or design of materials or facilities provided under the specifications.

7. The inspection of any of the Contractor’s work by the utility providers or the failure to inspect any of the Contractor’s work by the utility provider representatives shall not relieve the Contractor of any requirements of the specifications.

8. Coordinate work with the utility providers to permit inspection of said work.

9. Notify the Department and the utility providers’ representatives of planned work.

C. Project Documentation

1. Provide ITS Project Management Plan (PMP) that meet the following requirements for Department review:
   a. Submit within 14 calendar days following the issuance of the NTP or 30 calendar days prior to installation.
   b. Include the organization, authority, reporting relationships, and procedures to be implemented to manage and control the work.

2. Provide material submittals that meet the following requirements:
   a. Provide material submittals to the Department for review and approval prior to procurement and before work commences on the Project.
   b. Refer to Section 942.1.04 for the material submittal requirements.

3. Provide detailed as-built plans that meet the following minimum requirements:
   a. Submit as-built plans and drawings of ITS and communications work within 30 calendar days after completion of installation or as otherwise specified in the Contract documents.
   b. Prepare the as-built plans and show all changes and deviations from the original plans using electronic PDF, with markups shown in red text and lines.
   c. Submit a separate Microsoft Excel file with the GPS coordinates for each item with the as-built plans. The GPS coordinates shall be sub-meter or better positional accuracy.
   d. Include in the as-built plans all materials and installation work, along with all structural elements and assemblies that are related to the ITS device at a given location.
   e. Show final locations of new equipment and communications installed, including but not limited to, CCTV support poles, new utility poles, new field cabinets, DMS, and ESS support poles or structures.
Section 942 — ITS General Requirements (CCTV)

f. Provide the following information in regards to electrical service in the as-built plans:
   i. Address of the service pole
   ii. Power services from the meter base, including all cables from the service point.
   iii. The electric provider’s name, the account number and the meter base information.

g. Show routes and locations of the final cable installation.

h. For aerial cable installations show pole locations, pole attachment heights, spans, co-locations, splice closure locations, maintenance/storage coils, and vertical risers on the plans. Make-ready worksheets shall also be provided for aerial fiber installations.

i. For underground cable installations refer to Section 682 for additional as-built requirements.

j. Provide the cable distance marking documentation required in Section 935.2.01.C.

k. Include any other device-specific details that are required in the individual specifications.

D. Product Delivery, Handling, and Storage

1. Provide materials and components in protective packaging suitable for shipping and storage.

2. Label boxes with contents, including manufacturer name, model, serial numbers, and Project number.

3. Include shipping and handling fees in the Contractor’s base price.

4. Be responsible for equipment, components, and materials prior to installation and final acceptance.

5. Take precautions to protect materials from the following: theft, vandalism/tampering, dents, scratches, dust, temperature, weather, cutting, paint, and other hazardous conditions.

6. Replace any damaged or lost material as required by the Department.

E. Tools and Equipment

1. Furnish equipment, tools, and superintendence for the completion of the work to be done in accordance with the Contract documents.

2. Equipment and tools mobilized for the work shall be in 100% working order prior to placing it in commission for the project.

3. Equipment and tool operators shall be trained and qualified before operating equipment on the Project.
942.3.02 General Maintenance and Warranty Requirements

A. Hub Building Access

1. If needed for access to the hub buildings during the construction activity, purchase an electronic programmable key and key programmer.

2. Submit an SCR form if installation of new equipment is being performed, or a MARR form for regular routine maintenance.

3. Submit these forms via email to the Department at least 72 hours in advance of when access is needed.

4. The system currently in use for hub building access is CyberLock by Videx. To purchase keys, key programmers, and get technical assistance on the GDOT CyberLock system, contact:

   Peifer Companies LLC
   5287 Knight Arnold Rd.
   Memphis, TN 38118
   901-363-6396 phone
   901-363-6986 fax
   www.PeiferLock.com

B. Maintenance Support Services

1. Provide ITS maintenance support services and assume responsibility of existing ITS devices, ITS communications, ITS devices, and ancillary equipment that is damaged by the Contractor, including labor, equipment, and materials associated with the repair or replacement of said materials and equipment from the first day of field impact continually until issuance of the MAL by the Department. Refer to Section 105.14 for requirements.

2. Provide maintenance support services during construction between construction initiation and the issuance of the MAL by the Department as follows:

   a. See Section 105.14 for requirements. The Department reserves the right to deduct the cost of maintenance activity from monies due or to become due the Contractor if the Contractor fails to remedy unsatisfactory maintenance within 48 hours after receipt of such notice.

   b. During the construction period, the Department’s coordinator of maintenance or alternate will send a written problem notification of the issue.

   c. Provide a technical support phone line and the ability to provide replacement parts/material for both warranty and non-warranty repair.

   d. Provide full technical support, including material and labor, and consultation to the Department or a user that is responsible for maintenance for the period from the installation of the ITS devices in the Contract.

   e. Enter a precise description of repair work performed into the log book (supplied by the Department and located in the field cabinet and at the TMC or local agency control center facility).

   f. Identify clearly in writing the designated contact person and alternate for liaison with the Department. The Department will designate representatives and alternates as contact persons for the TMC and the field equipment and provide this information to the Contractor.

3. Provide maintenance support services during period following the issuance of the MAL and during the warranty period. The ITS equipment manufacturer(s) or the party designated by the manufacturer(s) shall be responsible for providing repairs or replacements for failed equipment as follows:
Section 942 — ITS General Requirements (CCTV)

a. During the warranty period, the Department’s coordinator of maintenance or alternate will send problem notification to the manufacturer(s) or the party designated by the manufacturer(s).

b. The manufacturer or designated party shall respond to the Department, the Department’s designee, or maintaining agency within one business day of receiving the problem notification.

c. As requested by the Department, the Department’s designee, or maintaining agency, perform remote diagnostic tests and provide a technical support phone line to assist with troubleshooting and repair activity.

d. Furnish replacements for any non-critical part or equipment found to be defective during the warranty period at no cost to the Department, the Department’s designee, or maintaining agency within 10 business days of notification by the Department.

e. Provide firmware or software updates provided by the manufacturer associated with the system at no cost to the Department, the Department’s designee, or maintaining agency during the warranty period.

f. Updates provided by the manufacturer or the party designated by the manufacturer shall not degrade the original functionality of the product warranted.

C. General Warranty

1. Materials and equipment shall have a manufacturer’s warranty (usual and customary) covering defects in assembly, fabrication, and materials. Warranty work shall include all activities required by the Contractor, manufacturer, or the party designated by the manufacturer including maintenance, removal, and replacement of parts and materials during the period of support.

2. Any material found to be in nonconformance shall be repaired or replaced without cost to the Department, the Department’s designee, or maintaining agency for all incidentals to the repair or replacement of the product.

3. Provide the minimum warranty lengths for the ITS equipment and materials as specified in the respective ITS specifications.

4. Warranty periods shall begin on the date of issuance of the MAL or a partial MAL by the Department.

5. The manufacturers’ warranties shall be continuous throughout the period and are fully transferable from the Contractor to the Department.

6. Provide maintenance support services and make any replacements required during the contract period and warranty period without additional charge for labor, equipment, parts, shipping, or other materials required.

7. Provide support for all system components notwithstanding any supplier’s warranties whether written or implied.

8. Any software or firmware upgrades associated with the product shall be supplied to the Department at no cost during the warranty period.

9. Any firmware or software upgrades shall not degrade the original functionality of the product warranted.

10. For furnish only items (which also applies to GDOT purchases for the GDOT warehouse), the warranty shall begin upon material delivery.
Section 942 — ITS General Requirements (CCTV)

942.3.03 Network Equipment Configuration and Integration Requirements

A. Network Equipment Configuration and Integration

1. Integrate all field devices, communications, and network systems installed during the project into the existing GDOT Central Software system and form a complete, usable, and fully integrated system that can be controlled and operated from the TMC.

2. Perform and have responsible charge for steps, work, and activities in the configuration and integration procedures below except when Department responsibility is expressly indicated.

3. Maintain equipment and materials, while equipment is being configured by the Department, and including but not limited to operation, communications, power service, warranties, and technical support.

4. Coordinate all aspects of the procedure through the Department.

5. Perform all network equipment configuration steps for a complete project at one time.

6. At the Contractor’s option for a staged equipment configuration progression, request in writing and provide a plan with schedule for the complete project that details the proposed stages and identifies network equipment and field sites for each stage. If the staging is approved by the Department, apply the requirements and conduct the procedure below independently and fully for each individual stage.

7. Make no requests regarding the initiation or conduct of the Network Equipment Configuration Procedure until material submittal reviews for network equipment, and related equipment, are successfully completed.

B. Network Equipment Configuration and Integration Procedures

1. Step 1: Request Network Addressing Information
   a. Request the Department to provide in writing network addressing (IP, mask, and gateway) information for the network equipment in the Contract documents.
   b. Submit the request for network addressing a minimum of 60 calendar days before the information is needed to maintain the Contract schedule.
   c. If a staged equipment configuration is desired, identify that request at this time and submit the staging plan for approval.

2. Step 2: Receipt of Network Addressing Information
   a. Once the Contractor’s completed request is received by the Department, the Department will provide the network address information within the time frame referenced above.
   b. The network address information will be provided in spreadsheet or document tabular form.

3. Step 3: Complete Initial Installation
   a. Complete installation of field equipment, including but not limited to support poles, field cabinets, power service, field and network devices, and fiber communications infrastructure.
   b. Complete equipment configuration.
   c. Furnish network routing switch SFPs to the Department.
   d. Furnish fiber patch cords needed in the hub building(s) but make no connections to the network routing switch.
   e. Configure the network addressing information into the network equipment.
   f. Provide network links that are active.
Section 942 — ITS General Requirements (CCTV)

g. Provide in the same tabular form the equipment model and serial numbers for each network equipment device in its installed location.

4. Step 4: Request Integration
   a. Request in writing for the Department to complete device configuration and systems integration of the network equipment in the Contract documents.
   b. Submit the request for configuration/integration and the location/model/serial number information for each device to be configured a minimum of 60 calendar days before the configuration is needed to maintain the Contract schedule.

5. Step 5: Complete Integration
   a. The Department will confirm network connectivity and addressing information in all devices prior to acceptance of the Contractor’s request in Step 4.
   b. Upon successful confirmation of network connectivity, the Department will have 60 calendar days to complete device configuration and systems integration of the network equipment in the Contract.
   c. Continue with remaining field construction that has no impact on any equipment or communications infrastructure associated with the network configuration.
   d. Any disruption of the equipment or communications infrastructure by the Contractor will result in resetting the 60-day period to allow the Department to complete the work related to modifying the device configuration and system integration.

6. Step 6: Provide Integration Completion Acknowledgement
   a. The Department will notify the Contractor when network configuration is successfully completed, at which time the Network Equipment Configuration Procedure will be considered completed.
   b. Continue with remaining Project activities, including the acceptance test.

942.3.04 Testing Requirements

A. Test Roles and Responsibilities

1. The Contractor shall be responsible for the following:
   a. Installation, basic network device configuration, and testing new ITS devices and fiber communications.
   b. Provide notice of testing and submit test results and as-built documentation to the Department.
   c. Include notification and review periods, testing periods, and burn-in time in the overall progress (construction) schedule.
   d. During the burn-in period:
      i. Maintain all work under the Contract in accordance with the specifications.
      ii. Restore any work or equipment to operating condition within one business day.

2. The Department will provide test support services including the following:
   a. The Department will observe, provide testing oversight, review, accept, and reject tests.
   b. During the burn-in period:
      i. The Department will notify the Contractor upon failure or malfunction of equipment.
ii. In the event that the Contractor does not provide the services enumerated above under the Contract responsibilities, the Department or its authorized agents may, in the interest of public safety, take emergency action.

iii. The Department will deduct any costs from the monies due or to become due the Contractor under the Contract as a result of these emergency actions.

iv. Such action by the Department shall not void any guaranties or warranties or other obligations set forth in the Contract.

B. ITS Test Plan

1. Develop an ITS Test Plan, test procedures, and test schedule for conducting tests as specified herein and submit it to the Department for review and approval prior to the start of any test activity.

2. Include the following test categories: (1) pre-installation test, (2) stand-alone test, and (3) acceptance test. Refer to Section 942.3.04.C for minimum test requirements.

3. Request ITS test forms from the Department, which shall be used as a starting point for the ITS Test Plan development. The test requirements for ITS design elements unique to the Contract documents shall be reflected in the ITS Test Plan.

4. As part of the ITS Test Plan:
   a. Submit a request in writing for a staged device or system installation progression and testing for groups of devices. Provide justification for the staged device or system installation, and a schedule for the complete project that details the proposed stages and identifies network equipment, ITS device(s), components, and field sites for each stage. The Department is not obligated to approve a staged device or system installation progression.
   b. If device test staging is not approved by the Department, test all ITS devices and components of a similar type as a single group.
   c. If device test staging is approved by the Department, the staged device or system installation shall apply to the payment milestones associated with the ITS Test Plan requirements and as specified herein independently and fully for each individual stage.

5. Testing shall demonstrate full compliance with the Contract documents.

6. Notify the Department a minimum of two weeks (14 calendar days) prior to the test date for each site.

7. The Department will be responsible for witnessing and signing off on testing.

8. Prior to performing local field testing with a Department, run through the local testing. If the site is not fully configured, functional, and ready for testing when the Department is there, reschedule the test date with the notification periods starting over.

9. Meet the following general ITS test plan requirements:
   a. Test each device by confirming physical location, verifying orientation of devices, checking for physical access to the field cabinet, voltage testing, local communication connectivity testing, grounding, cable management, and device-specific function testing as described in the following subsections.
   b. Demonstrate that furnished and installed hardware, cables, and connections operate correctly and that functions are in accordance with the requirements described in the specifications, manufacturer’s recommendations, and this section.
   c. Include items addressed in the specifications, manufacturer’s recommendations, and this section.
d. Perform local communication connectivity testing to ensure communication between each device and the respective local field switch or wireless router, and a link to the nearest hub building Layer 3 network routing switch.

e. Complete power and communications installation as required by the Contract documents to schedule the acceptance of a site.

10. Develop ITS Test Plan that includes the following minimum procedure requirements:

a. A step-by-step outline of the test procedures and sequences to be followed demonstrating compliance with the testing requirements for all ITS devices and components.

b. A description of expected operation, output, and test results (pass/fail criteria).

c. An estimate of the test duration and proposed testing schedule.

d. A test results data form used to record data and quantitative results obtained during the tests.

e. A description of any special equipment, setup, test software, manpower, or conditions required for each respective test.

f. The number of test cases shall reflect the complexity of each ITS device or subsystem and the content of test cases covers all functionalities and requirements.

11. Provide test documentation that meet the following requirements:

a. Provide ITS test documentation for ITS device testing to the Department for review and approval.

b. Provide a report that is indexed and sorted and includes tabulated test data to the Department in 8.5 in by 11 in page size PDF for review.

12. Provide test equipment that meet the following requirements:

a. Provide test cables and equipment for ITS related tests including, but not be limited to:
   i. Laptop with manufacturer test software with NTCIP, as applicable
   ii. Patch cables and adapter cables
   iii. Digital multi-meter and cable testers

b. Test equipment shall provide accuracy greater than that of the required parameters of the equipment being tested.

C. ITS Test

1. Provide and meet the following pre-installation test requirements:

a. Fiber Optic Reel Test (Section 935 only)
   i. Prerequisite for testing: Submit and obtain approval for the fiber optic cable and components submittal package(s).
   ii. Test description and requirements: Refer to Section 942.3.04.D.7 for fiber optic reel test description and requirements.
b. DMS Test (Section 631 only)
   i. Prerequisite for testing: Submit and obtain approval for the DMS submittal package(s).
   ii. Test description and requirements:
      a) Provide remote demonstration of message functionality of one DMS of each type shown in the Contract documents.
      b) Obtain 4G or greater wireless router and the current message alphabet, font, and margin requirements from the Department, and load into the DMS controller software located at the manufacturer’s facility.
      c) Before any DMS are shipped to the Project site, provide internet-based video conference system that is capable of remotely demonstrating to Department staff the full functionality of the DMS.
      d) While GDOT Central Software is used to control the sign message(s), arrange video conference with the Department for the express purpose of demonstrating full DMS message functionality.

2. Provide and meet the following stand-alone test requirements:
   a. Field Site Test (Sections 631, 694, 926, 936, 937, and 939)
      i. Prerequisite for testing: Approved ITS device and field cabinet submittal package(s).
      ii. Test description and requirements:
          a) Field Cabinets: Visually verify and inspect the installation of field cabinet, foundation, field cabinet interior components, electrical service, power supplies, ventilation fans, and lighting.
          b) ITS device(s): Shall be visually field-verified and tested.
   b. Local Operational Test (Sections 631, 694, 926, 936, 937, and 939)
      i. Prerequisite for testing: Completed and approved field site test results.
      ii. Test description and requirements: ITS device(s) shall be visually field-verified and tested. Any serial data terminal server or serial interface provided shall be tested as part of network testing.
   c. Fiber Optic Post-Installation Test (Section 935 only)
      i. Prerequisite for testing: Completed and approved fiber optic reel test results.
      ii. Test description and requirements: Refer to Section 942.3.04.D.9 for fiber optic post-installation test requirements.
3. Provide and meet the following acceptance test requirements:
   
a. System Operational Test (Sections 631, 694, 926, 936, 937, and 939)
   
i. Prerequisite for testing: Completed and approved fiber optic post-installation test, field site test, local operational test, and network connectivity test results as specified herein.
   
   ii. Test description and requirements: Demonstrate full central control, functionality, operations, and capabilities as follows:
      
a) Display of each CCTV camera image on workstations, video wall, or other CCTV software applications designated in the TMC.
      
b) Verify CCTV remote control functions and full PTZ functionality using GDOT Central Software.
      
c) Verify that CCTV video viewed at the TMC is of similar quality to the CCTV video approved as part of the stand-alone test.
      
d) Verify the operation of the auto iris feature.
      
e) Verify CLD operations according to manufacturer recommendations.
      
f) Verify that DMS messages displayed are unobstructed, clear, readable, and without distortions.
      
g) Verify DMS messages are clearly visible under all lighting conditions.
      
h) Verify DMS remote control functions, including the device status, brightness adjustments, and display of messages, graphics, logos, and test patterns using GDOT Central Software.
      
i) Verify ESS data are calibrated and accurately collected and presented to a central ESS data server.
      
j) Verify VDS data are accurately collected and presented in GDOT Central Software, and monitor detector devices.
      
k) Verify full integration of other ITS devices installed on the Project into GDOT Central Software, including the verification of control and monitoring capabilities with the GDOT Central Software and configuration parameters.
      
l) Verify remote monitoring and control of field devices, including network switches, UPS, and remote field power controllers.
b. Burn-in Test (Sections 631, 694, 926, 936, 937, and 939)
   i. Prerequisite for testing: Completed and approved system operational test results and approved as-built plans.
   ii. Test description and requirements:
      a) Demonstrate through burn-in of day-to-day full operations of the system from the TMC that all requirements defined in the Contract documents and the specifications, including, but not limited to, functional/system performance requirements, electrical requirements, data communication requirements, environmental requirements, documentation, and interface requirements with other components of the system are fully satisfied.
      b) Repair or replace any system failure or failed ITS device during any portion of the burn-in test without disrupting the system’s operation. After repairing the equipment the Department will determine that it functions properly.
      c) All costs associated with the maintenance, repair, or replacement of the ITS devices shall be the responsibility of the Contractor between the time the Contractor initiates actual work and the issuance of the MAL from the Department.
      d) The duration of the burn-in test will be maintained by the Department as follows:
         1) The test period shall be a minimum of 30 calendar days, which may be consecutive calendar days or non-consecutive calendar days. The test duration may be extended based on the issues or failures experienced during the test.
         2) The test period shall be paused in the event of a device or system failure, and restarted upon correction of the failure(s).
         3) Successful completion will be granted on the 30th day of the test period if no failures occur.
         4) If equipment failure occurs during the 1st through 15th day, then the final acceptance will be withheld until all the equipment is functioning properly for 30 consecutive calendar days after repair.
         5) If equipment failure occurs during the 16th through 30th day, final acceptance will be withheld until all the equipment is functioning properly for 15 consecutive calendar days after repair.
         6) If a specific piece of equipment has malfunctioned more than three times during the test period, replace the equipment with a new unit and continue the test period for an additional 30 calendar days.
      e) If any spare field-replaceable ITS devices supplied under the Project are used to replace failed ITS devices during the burn-in test, replace the required spare ITS device inventory with new unused spare ITS devices before final acceptance.
      f) Upon successful completion of the overall burn-in test, the entire Project will be eligible for maintenance acceptance and final inspection and acceptance as described in Section 942.3.04.G.
      g) The Department will determine burn-in period acceptance after satisfactory completion of the required burn-in period and on the basis of a comprehensive field inspection of the complete system in accordance with the specifications.
h) Upon burn-in period acceptance but prior to final acceptance of the entire Contract, maintain the system in accordance with Section 105.14.

D. Communications System Test Plan

1. Develop a Communications System Test Plan and test schedule for conducting tests as specified herein and submit it to the Department for review and approval prior to the start of any test activity.

2. Include the following test categories in the Communications System Test Plan: (1) fiber optic communications system test and (2) wireless system communications test. Refer to Sections 942.3.04.E and F for minimum test requirements.

3. Meet the following communications test documentation requirements:
   a. Provide communications test documentation for all communications (fiber or wireless) testing to the Department for review and approval.
   b. Provide a report that is indexed, sorted, and includes tabulated test data to the Department in 8.5 in by 11 in page size PDF for review.

4. Meet the following communications test equipment requirements:
   a. Provide and submit test equipment to the Department for review and approval.
   b. Test equipment shall provide accuracy greater than that of the required parameters of the equipment being tested.
   c. Meet the following minimum fiber optic test equipment requirements:
      i. Provide the test cables and equipment for fiber optic related tests.
      ii. Perform OTDR and optical source/power meter testing, as indicated herein. Submit test cables and devices to the Department for review and approval prior to conducting the tests.
      iii. Provide evidence that the OTDR and other test equipment to be used have been calibrated prior to testing.
      iv. OTDR and optical source/power meter testing technicians shall be certified and approved by the test equipment manufacturer. Provide proof of certification to the Department.
      v. OTDR devices shall include storage of fiber optic cable signatures. Transfer signatures of cables tested to a CD and provide to the Department.
      vi. Use a factory launch cable (“fiber launch box”) to address dead zone issues. Indicate the length of the launch cable in test reports.
      vii. Provide manufacturer recommended OTDR modules as required or necessary for long distance fiber testing.
      viii. Set the pulse width setting of the OTDR to the lowest possible setting while allowing the full length of fiber optic cable to be measured for faults or reflective events.
   d. Provide test cables and equipment for wireless system-related tests including, but not be limited to:
      i. Wireless spectrum analyzer
      ii. Laptop with test software
      iii. Cable and antenna testers including VSWR meters
**E. Fiber Optic Communications Test (Section 935 only)**

1. Provide fiber optic communications test plan that meet the following requirements:
   a. Develop and submit to the Department within 30 calendar days prior to any tests, a Fiber Optic Test Plan for review and approval, that details testing for new fiber optic cables and components, the manufacturer’s recommended test procedures, and industry standard practices.
   b. Include procedures and test result data forms for the Department's review and approval prior to the day the tests are to begin. Include the sequence in which the tests will be conducted in the Test Plan.
   c. Include testing covered in this section to demonstrate that the fiber is meeting the design intent and requirements.
   d. Develop test result data forms for documenting the test results.

2. Provide fiber optic test equipment that meet the following requirements:
   a. Provide the test cables and devices for the fiber optic related tests.
   b. Perform OTDR and optical source/power meter testing as indicated herein. Submit test cables and devices to the Department for review and approval prior to conducting the tests.
   c. OTDR and optical source/power meter testing technicians shall be certified and approved by the test equipment manufacturer. Provide proof of certification to the Department.
   d. OTDR devices shall include storage of fiber optic cable signatures. Transfer signatures of cables tested to a CD and provide to the Department.
   e. Use a factory launch cable (“fiber launch box”) to address dead zone issues. Indicate the length of the launch cable in test reports.
   f. Set the pulse width setting of the OTDR to the lowest possible setting while allowing the full length of fiber optic cable to be measured for faults or reflective events.

3. Provide fiber optic pre-test procedures that meet the following requirements:
   a. Turn on OTDR and optical source/power meters and allow them to warm up for a minimum of 10 minutes prior to test setup and testing. Allow testing devices to warm up every time the testing devices are cycled from off to on.
   b. Clean launch cord and test cable connectors prior to setup and testing. Clean launch cord and test cable connectors every time they are disconnected and reconnected to test devices. Clean launch cord and test cable connectors every time they are disconnected and reconnected to field installed connectors.
   c. Clean field installed cable connectors prior to testing. When a test connector has been disconnected, clean the field connector prior to the field connector being reconnected.

4. Provide manufacturer test and certification that meet the following requirements:
   a. Each reel of fiber optic cable shall be delivered to the Project site accompanied by the manufacturer’s test data. The manufacturer’s test data shall identify the factory-tested attenuation, in decibel per kilometer, of fiber optic cable strands for each furnished fiber optic cable type at the wavelengths shown in Table 3. The manufacturer’s maximum attenuation test values shall be met or better the attenuation requirements as specified herein.
<table>
<thead>
<tr>
<th>Fiber Type</th>
<th>Test Wavelengths</th>
</tr>
</thead>
<tbody>
<tr>
<td>Single-mode</td>
<td>1,310 nm and 1,550 nm</td>
</tr>
<tr>
<td>Multimode</td>
<td>850 nm and 1,300 nm</td>
</tr>
</tbody>
</table>

b. Include the following manufacturer test data as a minimum:
   i. Name of manufacturer
   ii. Cable product number
   iii. Cable mode
   iv. Cable type
   v. Manufacturer tested cable length
   vi. Cable ID and fiber ID including:
       a) Cable binder, tube, and strand colors
       b) Fiber strand number
   vii. Measured maximum attenuation results

5. Provide fiber optic reel test that meet the following requirements:
   a. At the direction of the Department, test the fiber optic cable at the site storage area prior to installation.
   b. Perform visual inspections and testing on each fiber optic cable delivered to the job site prior to any despooling or installation of the fiber optic cable. Notify the Department of any visual abrasions, cuts, defects, or other observed physical abnormalities.
   c. Include the following pre-installation testing criteria as a minimum:
      i. Randomly test three fiber optical fiber strands from each buffer tube for each furnished fiber optic cable type at the wavelengths shown in Table 3 with a compatible OTDR.
      ii. Test for continuity, length, anomalies, and approximate attenuation.
      iii. If the tested loss per kilometer exceeds the loss from the manufacturer’s test data, the Department will reject the cable.
   d. Include the following pre-installation testing data as a minimum:
      i. Name of testing company
      ii. Name/ID of testing technician
      iii. Date and time of testing
      iv. Name and model of testing device
      v. Shipped cable length
      vi. Cable ID and fiber ID including:
          a) Cable binder, tube, and strand colors
          b) Fiber strand numbers
      vii. Measured approximate attenuation results
viii. Measured fiber strand lengths

6. Provide splice test results that meet the following requirements:
   a. Record splice loss measurement test results from fusion splices and submit to the Department in an electronic format for evaluation.
   b. Include the following splice testing data as a minimum:
      i. Name of splicing company
      ii. Name/ID of splicing technician
      iii. Date and time of splicing
      iv. Name and model of testing device
      v. GPS location data for each fiber optic splice
      vi. Cable ID and fiber ID including:
         a) Cable binder, tube, and strand colors
         b) Fiber strand numbers
      vii. Measured splice loss values

7. Provide fiber optic post-installation test that meet the following requirements:
   a. The Department reserves the right to conduct tests on their own.
   b. Test all installed optical fibers bi-directionally using both an OTDR and optical source/power meter.
   c. Provide OTDR test that meets the following requirements:
      i. Perform a full bi-directional test (using bi-directional averaging) on spliced and terminated fibers in each cable using an OTDR. Test fibers for each furnished fiber optic cable type at the wavelengths shown in Table 3 for:
         a) Length
         b) Continuity
         c) Individual cable, connector, and splice losses
         d) Combined cable, connector, splice loss
         e) Reflective characteristics
      ii. The connection between the OTDR and each tested fiber shall be factory assembled patch cables, or launch cables equal to a length of 150% of the dead zone as published by the OTDR manufacturer. The launch cable shall have the appropriate connectors to allow for connection to the terminated fiber port without the use of additional couplers.
      iii. Provide and meet OTDR test and acceptance criteria as follows:
         a) Test for end-to-end attenuation of SM optical fibers at the wavelengths shown in Table 3. Inspect the subsequent traces for end-to-end attenuation and ensure the average loss (in dB/km) does not exceed the loss criteria specified in Sections 935.2.01.B.7.a and 935.2.01.B.7.b.
         b) Test for end-to-end attenuation of MM optical fibers at the wavelengths shown in Table 3. Inspect the subsequent traces for end-to-end attenuation and ensure the average loss (in dB/km) does not exceed the loss criteria specified in Sections 935.2.01.B.7.c and 935.2.01.B.7.d.
c) The measured combined segment end-to-end losses consisting of optical fiber losses, connector losses, and splice losses shall not exceed the calculated loss of total loss budget as specified herein.

d) Demonstrate performance as shown in Table 4.

<table>
<thead>
<tr>
<th>Table 4 – OTDR Test and Acceptance Criteria</th>
</tr>
</thead>
<tbody>
<tr>
<td>Test Parameter</td>
</tr>
<tr>
<td>Splice Loss Test</td>
</tr>
<tr>
<td>Connector Insertion Loss Test</td>
</tr>
<tr>
<td>Combined Total End-to-end Segment Loss Test</td>
</tr>
</tbody>
</table>

iv. Include the following OTDR test data at a minimum:

a) Name of testing company

b) Name/ID of testing technician

c) Date and time of testing

d) Name and model of testing device

e) OTDR test parameters used for testing: test wavelength, refractory index, test pulse width, test range, acquisition time, and scale

f) Starting and ending test points/locations

g) Cable ID and fiber ID including:

1) Cable binder, tube, and strand colors

2) Fiber strand numbers

h) Individual measured attenuation loss values

i) Combined measured attenuation loss values

j) Measured fiber segment/link length

v. Cable trace window shall be limited to the length of the tested fiber segment plus 25%. 
d. Provide and meet the following optical source/power meter test requirements:
   i. Perform a full bi-directional attenuation test on optical fiber segments using an optical source/power meter. Test optical fiber segments for each furnished fiber optic cable type at the wavelengths shown in Table 3 for the combined loss of optical fiber, connectors, and splices.
   ii. The measured segment loss of optical fiber, connectors, and splices shall not exceed the calculated loss of total loss budget.
   iii. Include the following optical source/power meter test data as a minimum:
       a) Name of testing company
       b) Name/ID of testing technician
       c) Date and time of testing
       d) Name and model of testing device
       e) Starting and ending test points/locations
       f) Cable ID and fiber ID including:
          1) Cable binder, tube, and strand colors
          2) Fiber strand number
       g) Measured attenuation loss values

8. Provide loss budget calculation and documentation that meet the following requirements:
   a. Calculate the total loss budget of the system according to the following calculations, and compare the actual loss in each segment of the system to the calculated budget.
   b. Submit the results for each segment of fiber optic cable in tabular format reporting if the total loss is within the limits of the specifications by noting “pass” or “fail” for each segment of fiber. A segment of fiber is defined as one that terminates at each end.
   c. Use the following calculations to determine the total loss budget for each segment:
      i. Splice loss budget = number of splices x 0.1 dB/splice
      ii. Connector loss budget = number of connectors x 0.4 dB/connector
      iii. Length loss budget = length of fiber optic cable (measured by OTDR) x manufacturer tested cable attenuation (dB/km) for each furnished fiber optic cable type and segment at the wavelengths shown in Table 3. Where no manufacturer cable attenuation data are provided or no existing cable attenuation data exist, calculate the length loss budget using industry standard cable attenuation values of 0.35 dB/km at 1,310 nm wavelength and 0.25 dB/km at 1,550 nm wavelength for SM and 3.4 dB/km at 850 nm wavelength and 1.0 dB/km at 1,300 nm wavelength for MM.
      iv. Total loss budget = splice loss budget + connector loss budget + length loss budget.
   d. Provide total budget calculation equations on test form(s) to be submitted as part of the test report documentation.
   e. Provide threshold calculations described above along with measured test results.
9. Provide supplementary fiber optic test documentation that meets the following requirements:
   a. Include fiber loss budgets of each fiber segment tested.
   b. Include installed cable lengths of each fiber segment tested.
   c. Include number of connectors in each tested fiber segment.
   d. Include number of splice in each tested fiber segment.

10. Provide fiber optic acceptance procedure that meet the following requirements:
    a. At the completion of pre- and post-installation fiber optic testing, provide documentation of the test results to the Department for review and approval as follows:
        i. Supply OTDR traces/signatures meeting Telcordia GR-196-CORE data format requirements for fiber optic cables installed on the Project.
        ii. Submit fiber optic test documentation in hard copy and electronic format as indicated herein and as approved by the Department.
        iii. Provide the OTDR data analysis software, as necessary or required, with any license required to the Department for their review and analysis of stored test results.
    b. Submit test results, including results of failed test and re-tests, to the Department.
    c. The test result data forms shall contain all of the data taken and quantitative results for all tests. The test result data forms shall be signed by an authorized representative (company official) of the Contractor.
    d. Submit at least one copy of the test result data forms to the Department within 10 calendar days of the test’s conclusion.
    e. Compare the results of each test with the requirements specified herein. Failure to conform to the requirements of any test will be counted as a defect, and the cable or component will be subject to rejection by the Department.
    f. Retest rejected cable or components, provided that all non-compliances have been replaced or repaired, retested, and evidence thereof submitted to the Department.
    g. Any delays in performing these tests may result in the Contractor paying the additional costs of providing the Department’s representatives for the additional testing time.
    h. If any event is detected above the allowable loss value, replace or repair that event point.
    i. If the total loss exceeds these technical requirements, replace or repair that cable run at the Contractor’s expense, to include both labor and materials.
    j. Provide indexed, sorted, and tabulated fiber optic test data to the Department in 8.5 in by 11 in page size PDF for review.

F. Wireless System Communications Test (Section 926 only)

1. Provide wireless Ethernet radio testing that meets the following requirements:
   a. Furnish test equipment required to install and test the wireless system in accordance with the parameters specified. Unless otherwise stated, the test equipment will not be considered part of the wireless system.
   b. Submit a system pre-test test plan for approval.
   c. Conduct the following system pre-testing:
Section 942 — ITS General Requirements (CCTV)

i. Calculate a link budget using the proposed radio equipment specifications, required bandwidth, receiver sensitivity signal level, and fade margin thresholds for the entire wireless link.

ii. Verify system integrity through built-in wireless equipment diagnostics or through external test equipment.

iii. Test each of the parameters in the system to verify that the installation was successful.

iv. Include the proposed radio equipment specifications to calculate the actual bandwidth, signal level, fade margin, and reliability between each end of the system.

v. Provide the calculated and measured values in a single table to the Department for acceptance.

vi. Measured values shall be within 10% of the calculated values. This will be considered the system pre-test.

d. Submit a final test plan a minimum of 30 calendar days prior to final Project completion to the Department for approval.

e. At a minimum, include the following items in the system acceptance test:

   i. All items performed in the approved pre-test.

   ii. Perform the following performance testing:

      a) Verify 10/100Base-T/TX interfaces and operations.

      b) Conduct bi-directional packet error test that demonstrates zero errors for duration of five minutes at full bandwidth.

      c) Conduct throughput test to demonstrate that maximum data rate or each point to point, point to multipoint, or repeater site (if needed) can be supported.

2. Conduct the following additional device testing, as applicable:

   a. Verify H.264 video unicast performance over the network is of similar quality to the CCTV video approved as part of the CCTV camera stand-alone test.

   b. Verify control data channel performance using PTZ control commands.

   c. Verify and demonstrate user programmable parameters and functions.

   d. Verify and demonstrate remote configuration using the CCTV camera web graphical user interface.

G. Final Inspection and Acceptance

Add to GDOT Standard Specifications Section 105.16 as follows:

1. Notification of substantial completion will be defined by the Department for the Project as 100% of the infrastructure and ITS devices and components have been furnished, installed, configured, integrated, and tested. When substantial completion has been met for the Project as determined by the Department, conduct final inspection and close-out activities.

2. Provide final inspection and project close-out that meet the following requirements:

   a. Conduct final inspection and close-out after successfully completing the burn-in test and providing written notification of substantial completion and receiving Department approval.

   b. The final inspection and close-out activities include but are not limited to:

      i. Demonstrate the overall system is fully operational.
ii. Verify ITS devices and components are in their correct final configuration.

iii. Verify submittals including test reports are submitted and approved by the Department.

iv. Verify final punch list items are completed.

v. Verify final cleanup requirements are completed and the field conditions are restored to their original condition.

vi. Verify final cleanup requirements are completed and the field conditions are restored to their original condition.

vii. Obtain approval of final as-built plans.

viii. Deliver spare parts and materials.

ix. Complete all training services.

x. Transfer all warranties to the Department.

c. Request in writing the Department’s approval to start the final inspection a minimum of 14 calendar days prior to the requested start date. The Department reserves the right to reschedule the start date if needed. The start date for the final inspection cannot be prior to the successful completion of the overall burn-in test.

d. Upon unsuccessful or incomplete final inspection, make the necessary corrections and conduct a new final inspection. Allow the Department up to 14 calendar days to conduct a final inspection.

e. The Department reserves the right to require, at no additional expense to the Department, the attendance of a qualified technical representative of the equipment or software manufacturers to attend a portion of a final inspection.

3. As part of the ITS Test Plan, request in writing for a staged device or subsystem installation progression and testing for groups of devices.

a. Provide justification for the staged device or subsystem installation, and a schedule for the complete project that details the proposed stages and identifies network equipment, ITS device(s), components, and field sites for each stage.

b. If the staging is approved by the Department, the staged device or subsystem installation will apply to the payment milestones associated with the ITS Test Plan requirements and as specified herein independently and fully for each individual stage.

c. During the burn-in test, the default test condition is that all ITS devices and components shall be tested simultaneously unless a staged plan is approved by the Department.

H. Surge Protection Devices

1. Protect all copper wiring and cabling entering the field cabinet.

2. Use a minimum of No. 16 AWG grounding for each surge protection devices, or larger if recommended by the surge protection device manufacturer.

3. Use insulated green wire and connect the ground wire directly to the ground buss bar.

4. Do not “daisy chain” the grounding wires of other devices, including other surge protection devices.

5. Label all surge protection devices with silk-screened lettering on the mounting panel.

6. Furnish and install all necessary transient surge protection device to protect field cabinet equipment.
I. Grounding

1. Ground the field cabinet, controller, poles, pullboxes, and conduit to reduce extraneous voltage to protect personnel or equipment.

2. Install grounding electrodes of size, length and material specified in Section 682.

3. Test electrodes according to Section 682. Report final test results.

4. Provide permanent and continuous grounding circuits with a current-carrying capacity high enough and an impedance low enough to limit the potential above the ground to a safe level.

5. Ground any pole-mounted equipment to the pole.

6. Use the shortest possible ground lead to the grounding source.

7. All components, including mounting hardware, shall be grounded and bonded per manufacturer’s recommendations and NEC. Dress and route grounding wires separately from all other controller cabinet assembly wiring.

8. Grounding Electrodes
   
   i. Install grounding electrodes adjacent to the traffic signal pole bases, preformed field cabinet bases, and in pullboxes to protect the grounding system.

   ii. Grounding electrode stacking may be permitted in areas where ground conditions allow. The contractor shall coordinate with the Construction Manager or designee to have a Department representative observe stacked electrode installation.

9. Field Cabinet
   
   i. Install a minimum of 3 grounding electrodes for each field cabinet.

   ii. Connect the power company neutral, conduit ground, and grounds of equipment housed in the field cabinet to the buss-bar.

   iii. Use a No. 6 AWG solid copper wire bonded between the buss and grounding electrode.

   iv. Connect neutral conductors to the field cabinet buss-bar and ground them at each terminal point.

   v. Ground the field cabinet with a No. 6 AWG solid copper wire between the buss-bar to the grounding electrodes. Bends shall not exceed 4 in (100 mm) radius.

   vi. Join the grounding electrodes and connect them to the grounding buss of the field cabinet with No. 6 AWG solid copper wire.

942.3.05 Training Requirements

1. Provide personnel trained by the equipment manufacturers and authorized by said manufacturer to perform the training unless otherwise specified.

2. Provide on-site manufacturer personnel to support the training sessions of the proposed device/system equipment and software.

3. Provide documentation of the trainer’s certification and experience as part of the submittal process.

4. Conduct training prior to final ITS acceptance.
5. Provide supplies, equipment, materials, handouts, operations and maintenance manuals, test equipment and tools, travel, and subsistence necessary to conduct the training.

6. Record all portions of all training sessions using the latest audio and video technology. All audio and video recordings shall become the property of the Department at the end of each course given.

7. Conduct training in half-day sessions. Two half-day sessions may be held on the same day, at the discretion of the Department.

8. Provide training for up to 12 people for each session. Limit in-shop and in-field training to group sizes of five people at a time. Training facility space for class-room type training sessions will be made available by the Department.

9. Provide an agenda/course outline for each training session as part of the submittal process.

10. Provide actual hands-on training of the equipment or software for each trainee depending on the training session type and topic.

11. Provide course content (as applicable depending on the type of training session) to include at a minimum:
   a. Description of the theory of installed equipment and software
   b. Discussion of operations of equipment and software including walk-through of features and capabilities
   c. Installation, setup, configuration and programming, device and user addition, and administration
   d. Explanation and measurement of signal levels, quality, and any encoding
   e. Discussion of diagnostics, troubleshooting, maintenance, performance tuning, and monitoring
   f. Discussion of warranty and maintenance, warranty process, and any annual maintenance support services

12. If, at any time during a training course, the Department or its designee determines that the course is not being presented in an effective manner, the training for the course will be suspended. Make the necessary changes to the course, resubmit the required training materials to the Department for approval, and reschedule the training course to be conducted prior to the final ITS acceptance.

### 942.4 Measurement

The equipment configuration and integration services, in place, and accepted will be measured as follows:

**A. Network Equipment Configuration and Integration**

The network equipment configuration and integration will be measured for payment by determining the percentage complete of the total number of unique devices in the Contract documents that are added to the GDOT Central Software or other central software as required by the Contract documents.

### 942.5 Payment

The Department will pay 100% of the total Contract bid amount upon issuance of the MAL for all devices in the system that require network equipment configuration and integration.

If the Department approves a staged device or system installation progression, then a partial payment will be paid for upon issuance of the MAL, based on the percentage complete of the total number of devices that require network equipment configuration and integration for which the partial MAL was issued.
Payment will be full compensation and include network equipment configuration and integration for all ITS devices and subsystems, labor, tools, test equipment, and incidentals necessary to complete the work. The total sum of all payments cannot exceed the original Contract amount for this item.

**Payment Notes:**

**Submittal**

Submittal requirements will not be paid for separately. It will be considered incidental to the individual ITS device or subsystem pay item.

**Testing**

Testing will not be paid for separately. It will be considered incidental to the individual ITS device or subsystem pay item.

Payment for equipment configuration and integration services will be made under:
