

GDT 7**A. Scope**

For a complete list of GDTs, see the Table of Contents.

Use this test method to determine the relation between moisture content and the theoretical or laboratory maximum dry density. Measure the density in a 1/30 ft³ (0.000943, \pm 0.000008 m³) (Reference ASTM D-698 Mold Volume Calibration) mold compacted by a 5.5 lb (2.5 kg) rammer.

B. Apparatus

The apparatus consists of the following:

1. Mold: Use a cylindrical metal mold with an approximate 4 in (101.6, \pm 0.408 mm) diameter, 4.6 in (116.43, \pm 0.1270 mm) high, and a volume of 1/30 ft³ (0.000943, \pm 0.000008 m³). The mold is fitted with a detachable base plate and a removable extension approximately 2.5 in (63 mm) high (WM-05) (see Figure 7-1).
This volume to be 1/30 cubic ft., 4.59 " (1.060 mm³, 116 mm) (Reference ASTM D-698 Mold Volume Calibration)
2. Rammer: Use a metal rammer with a 2 in (50.8, \pm 0.127 mm) diameter, flat circular face, and weighing 5.5 lbs. (2.49 kg). The rammer must be equipped with a suitable arrangement to control the height of drop to a free fall of 12 in (304.8, \pm 1.524 mm) above the soil (WR-1).
3. Scales and Balances: Use a scale of 20 kg capacity sensitive to and graduated in 0.1g, and a 500 g capacity balance sensitive to 0.1g.
4. Drying Device: Use a stove or oven capable of rapidly drying the moisture determination samples (WS-12).
5. Straightedge: Use a steel straightedge 12 in (300 mm) long (WS-13-1).
6. Pans or Dishes: Use pie pans or evaporating dishes suitable for drying soil samples (WP-01 or WD-3).
7. Sieve: Use a No. 10 (2.00 mm) sieve that conforms to the "Standard Specifications for Sieves for Testing Purposes," AASHTO M 92 (WS-08-#010).
8. Graduated Cylinder: Use a glass or plastic (WC-5-100) 3.4 oz. (100 ml) graduated cylinder used to measure the mixing water (Bit-04-100).
9. Mallet: Use a wooden mallet or rubber-covered pestle of suitable size (OH-06).
10. Cup: Use an 8 oz (237 ml), seamless tin cup (OC-11) for moisture-constant samples.
11. Extruder (optional): Use a cylindrical piston slightly less than 4 in (100 mm) diameter or similar device for removing compacted specimens from mold.

C. Sample Size and Preparation

1. Break all the soil aggregations without reducing the natural size of individual particles.
2. Select a representative test sample (about 10 lbs. (5 kg)) by quartering or by using a sampler.
3. Dry the sample only enough to sift over a No. 10 (2.00 mm) sieve. Do not sift yet.
4. Weigh the sifted sample and record the weight as the weight of the total sample.
5. Split the sample into two portions with the No. 10 (2.00 mm)sieve.
6. Grind the fraction retained on the No. 10 (2.00 mm) sieve with a rubber-covered pestle or wooden mallet until the aggregations of soil particles are broken up into separate grains.
7. Separate the ground soil into two fractions again with the No. 10 (2.00 mm)sieve.
8. Weigh the fraction retained on the No. 10 (2.00 mm) sieve after the second sieving.

- Record the weight as the weight of material retained on the No. 10 (2.00 mm) sieve.

D. Procedures

- Thoroughly mix both fractions that passed the No. 10 (2.00 mm) sieve in both sieving operations.
- Take a 6.6 lb (3000 g) sample from the minus No. 10 (2.00 mm) material by quartering or by using a sampler.
- Attach the extension to the cylinder.
- Compact the sample in the cylinder in three equal layers.
 - Compact each layer with 25 blows from the rammer dropped from 1 ft (304.8 mm) above the soil.
 - Rest the mold on a uniform, rigid foundation, such as a concrete block weighing at least 200 lbs (90 kg).
 - Uniformly distribute the blows over the surface of the compacted layer.
 - Remove the soil that adheres to the face of the rammer after every 25th blow.
- After compacting, remove the extension and base plate.
- Carefully level the compacted soil to the top and bottom of the cylinder with the straightedge.
- Weigh the cylinder and sample together.
- Calculate the wet weight of the compacted soil in pounds per cubic foot as follows:

$$\text{Wet Weight of Compacted Soil (lbs./ft}^3 = \frac{(W_s - W_c)/453.6}{V} \text{ or } \frac{(W_s - W_c) * \text{Mold Factor}}{453.6} \text{ or } (W_s - W_c) * \text{C.F.C}$$

V = Volume in lbs./ft³ of the Mold as calibrated Using (Reference ASTM D-698 Mold Volume Calibration)

Mold Factor = calculated 1/volume lbs./ft³

C.F.C = Correction Factor Conversion = Mold Factor/453.6

W_s = weight of the compacted soil and mold, in grams

W_c = weight of the mold, in grams

If you weighed in grams, dividing by 453.6 converts grams to pounds. This will give you the wet weight in pounds per cubic foot.

- Remove the compacted soil from the cylinder and slice it vertically through its center.
- Take a 100 g sample from the center and weigh it immediately.
- Dry the sample to a constant weight.
- Calculate the moisture content of the soil as follows:

$$13. \text{ Moisture (\%)} = \frac{A - B}{B} \times 100$$

where:

A = weight of the wet soil

B = weight of the dry soil

- Thoroughly pulverize the remaining material from the compacted sample.
- Add enough water to increase the moisture content of the soil in predetermined increments (1 percent to 2 percent for sandy soils, 2 percent to 3 percent for clay soils).
 - For a 5.94 lb (2.7 kg) sample, add 0.9 oz (27 ml) of water to increase the moisture content by 1 percent.
 - For a 6.6 lb (3000 g) sample, add 1 oz (30 ml) of water.
- Repeat steps 1 through 13 again, taking a moisture sample after each determination.

17. Repeat the procedure until the soil becomes very wet and the wet weight of the compacted soil substantially decreases.

E. Calculations

(CVP 7)

1. Calculate wet density:

$$\text{Wet Density} = \frac{(W_s - W_c)/453.6 \text{ or } (W_s - W_c) * \text{Mold Factor}}{V} \text{ or } \frac{(W_s - W_c) * \text{C.F.C.}}{453.6}$$

where:

V =	Volume of the Mold as calibrated Using (Ref. ASTM D-698, CVP 7)
Mold Factor =	Calculated 1/volume lbs/ft ³ (Ref. CVP 7)
C.F.C =	Correction Factor Conversion (GDOT Correction Factor) = Mold Factor/453.6 (Ref. CVP 7)
W _c =	Weight of mold in grams
W _s =	Weight of mold + wet soil in grams

2. Calculate percent moisture:

$$\% \text{ Moisture} = \frac{A - B}{B} \times 100$$

where:

A = Weight of wet soil

B = Weight of dry soil

3. Calculate the density (dry weight), in pounds per cubic foot (kilograms per cubic meter), of the compacted soil as follows:

$$\text{English—Dry Density (lb/ft}^3\text{)} = \frac{W_w}{M + 100} \times 100$$

where:

W_w = wet weight of the compacted soil, in pounds per cubic foot (Procedures, step D.8)

M = moisture content, in percent, at which the wet weight was determined (Procedures, step D.12)

4. Moisture-Density Relationship

- a. Calculate and record the percent moisture and dry density for each determination in the series.
- b. When using the moisture-density relationship for compaction control:

- i. Plot a moisture-density curve by plotting the dry densities against their respective moisture contents.
 - ii. Draw a smooth curve through the resulting points.
 - iii. The peak of the curve represents the maximum dry density of the material being tested, and the moisture content at this point represents the optimum moisture content.
- c. For classification purposes, interpret the maximum dry density as the highest density obtained in the test series, and the optimum moisture as the moisture content at that respective density.

5. Correction for Plus No. 10 (2.00 mm) Material

- d. If the soil contains material retained on the No. 10 (2.00 mm) sieve and the specifications show density requirements on the total sample, you must correct the maximum dry density to reflect the percentage of Plus No. 10 (2.00 mm) material.

- e. When determining maximum densities for compaction control, always correct the densities for the percentage of Plus No. 10 (2.00 mm) material.
- f. Use the conversion factors for correcting the density in Tables 1D - 7D, below.
- g. Use the conversion factors for correcting the moisture of Minus No. 10 (2.00 mm) for the Plus No. 10 (2.00 mm) in Tables 1M - 10M, below.

F. Report

1. Record the maximum dry density and the optimum moisture content of the material being tested as the theoretical or laboratory maximum dry density on Form 495.
2. Send the completed original form to the Office of Materials and Research in Forest Park.
3. Send copies of the form to the Branch Lab and the Area Engineer.
4. Notify the department head of any material that fails.
