1.0 INTRODUCTION

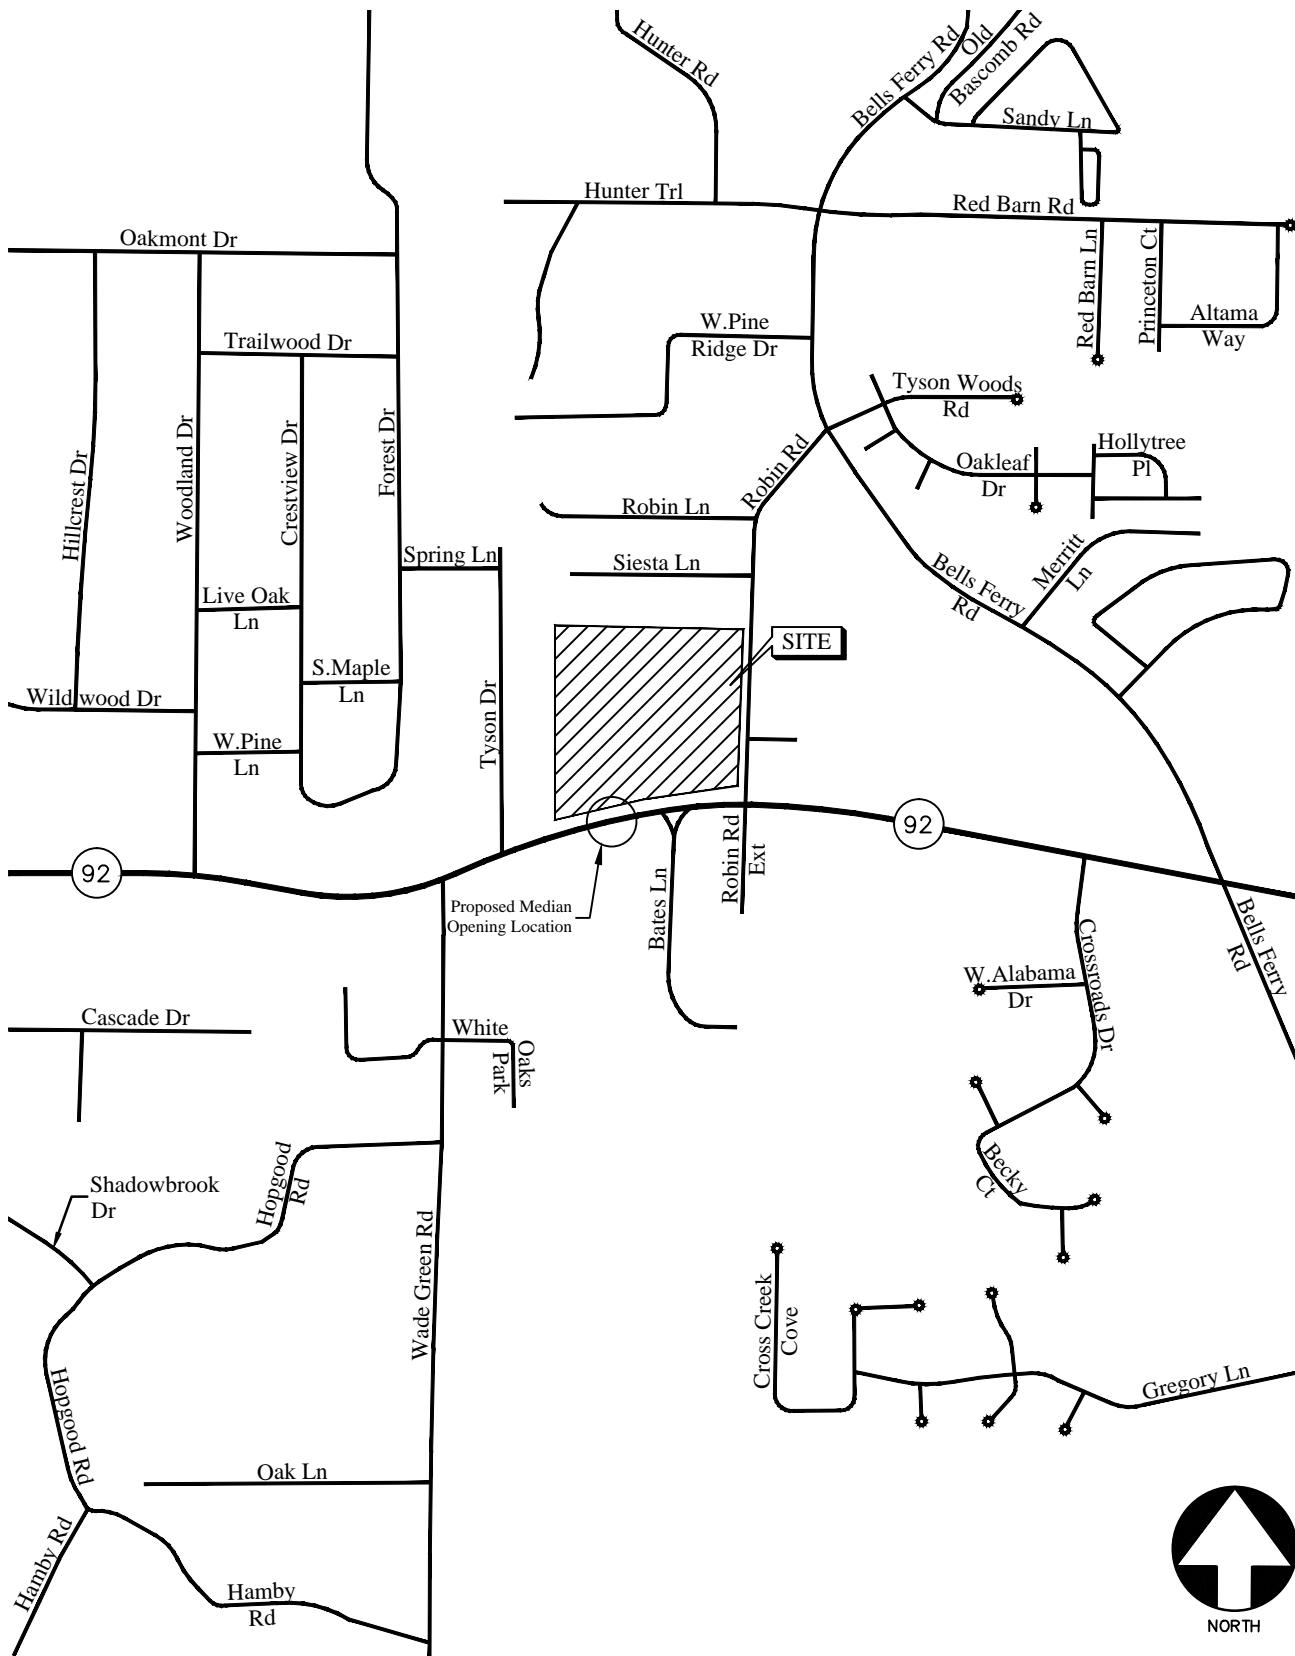

The purpose of this study is to evaluate the traffic impacts that will result from a proposed left-in only median break on SR 92 to serve the Cherokee Commons Shopping Center in Acworth, Georgia. The proposed median-break will be located approximately 615 feet west of the existing signalized intersection of SR 92 at Robin Road. The traffic analysis evaluates the existing and future operations with the traffic generated by 70 percent of the vacant retail space for the following two scenarios:

- Scenario 1: Evaluate anticipated operations with no median opening
- Scenario 2: Evaluate anticipated operations with left-in only median opening

The Cherokee Commons Shopping Center currently has four driveways: two full-access driveways on Robin Road and two right-in/right-out driveways on SR 92. The AM, Midday, and PM peak hours have been analyzed in this study. In addition to the site access points, this study includes the evaluation of traffic operations at the intersection of SR 92 at Robin Road.

Recommendations to improve traffic operations have been identified as appropriate and are discussed in detail in the following sections of the report. The location of the shopping center and the surrounding roadway network is shown in Figure 1.

LOCATION MAP

FIGURE 1
A&R Engineering Inc.

2.0 EXISTING FACILITIES / CONDITIONS

The following is a brief description of each of the roadway facilities located in proximity to the site:

2.1 SR 92

SR 92 is an east-west, four-lane, median-divided roadway with a posted speed limit of 45 mph in the vicinity of the site. GDOT traffic counts (Station ID 0570076) indicate that the daily traffic volume on SR 92 in 2016 was 41,400 vehicles per day east of Wade Green Road. GDOT classifies SR 92 as a Principal Arterial roadway.

2.2 Robin Road

Robin Road is a north-south, two-lane, undivided roadway with a posted speed limit of 30 mph.

3.0 STUDY METHODOLOGY

In this study, the methodology used for evaluating traffic operations at each of the unsignalized intersections is based on the criteria set forth in the Transportation Research Board's Highway Capacity Manual, 2010 edition (HCM 2010). Due to the presence of U-Turns at the signalized intersection, HCM 2000 was used instead. Synchro software, which utilizes the HCM methodology, was used for the analysis. The following is a description of the methodology employed for the analysis of un-signalized and signalized intersections.

3.1 Unsignalized Intersections

For unsignalized intersections at which the side street or minor street is controlled by a stop sign, the criteria for evaluating traffic operations are the level-of-service (LOS) for the turning movements at the intersection and the level-of-service for the overall intersection. Level-of-service is based on the average controlled delay incurred at the intersection. Controlled delay for un-signalized intersections includes initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. Several factors affect the controlled delay for un-signalized intersections, such as the availability and distribution of gaps in the conflicting traffic stream, critical gaps, and follow-up time for a vehicle in the queue.

Level-of-service is assigned a letter designation from "A" through "F". Level-of-service "A" indicates excellent operations with little delay to motorists, while level-of-service "F" exists when there are insufficient gaps of acceptable size to allow vehicles on the side street to cross safely, resulting in extremely long total delays and long queues. The level-of-service criteria for two-way stop-controlled and all-way stop-controlled (unsignalized) intersections are given in Table 1.

TABLE 1 — LEVEL-OF-SERVICE CRITERIA FOR UNSIGNALIZED INTERSECTIONS

Level-of-service	Average Delay (sec)
A	≤ 10
B	> 10 and ≤ 15
C	> 15 and ≤ 25
D	> 25 and ≤ 35
E	> 35 and ≤ 50
F	> 50

Source: Highway Capacity Manual

3.2 Signalized Intersections

For signalized intersections, it is necessary to evaluate both capacity and level-of-service in order to evaluate the overall operation of the intersection. The capacity analysis of an intersection is performed by comparing the volume of traffic using the various lane groups at the intersection to the capacity of those lane groups. This results in a volume/capacity (v/c) ratio for each lane group. A v/c ratio greater than 1.0 indicates that the volume of traffic has exceeded the capacity available, resulting in a temporary excess of demand. Although the capacity of the entire intersection is not defined, a composite v/c ratio for the sum of the critical lane groups within the intersection is computed. This composite v/c ratio is an indication of the overall intersection sufficiency.

Level-of-service for a signalized intersection is defined in terms of average controlled delay per vehicle, which is composed of initial deceleration delay, queue move-up time, stopped delay, and final acceleration delay. The level-of-service criteria for signalized intersections, based on average controlled delay, are shown in Table 2. Level-of-service "A" indicates operations with very low controlled delay, while level-of-service "F" describes operations with extremely high average controlled delay. Level-of-service "E" is typically considered to be the limit of acceptable delay, and level-of-service "F" is considered unacceptable by most drivers.

TABLE 2 — LEVEL-OF-SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

Level-of-service	Average Control Delay (sec)
A	≤ 10
B	$> 10 \text{ and } \leq 20$
C	$> 20 \text{ and } \leq 35$
D	$> 35 \text{ and } \leq 55$
E	$> 55 \text{ and } \leq 80$
F	> 80

4.0 EXISTING TRAFFIC ANALYSIS

Existing traffic counts were obtained at the following study intersections:

1. Robin Road at Kroger Driveway (N)
2. Robin Road at Kroger Driveway (S)
3. SR 92 at Robin Road
4. SR 92 at Kroger Driveway (E)
5. SR 92 at Kroger Driveway (W)

Turning movement counts were collected on Tuesday, July 10, 2018. All turning movement counts were recorded during the AM, Midday, and PM peak hours between 7:00 a.m. to 9:00 a.m., 12:00 p.m. to 2:00 p.m. and 4:00 p.m. to 6:00 p.m., respectively. The four consecutive 15-minute interval volumes that summed to produce the highest volume at the intersections were then determined. These volumes make up the peak hour traffic volumes for the intersections counted and are shown in Figure 2. Existing traffic operations were analyzed at the study intersections using existing signal timing and in accordance with the HCM methodology. The results of the analysis are shown in Table 3 and Table 4.

*Queues reported via HCM 2000

The results of existing traffic operations analysis indicate that the eastbound and southbound left turn lane queues at the intersection of SR 92 at Robin Road currently extend beyond the available storage during the PM peak hour. The intersection is also operating below an acceptable level-of-service ("D" or better) during the Midday and PM peak hours. These areas are addressed in the Future Traffic Operations section.

EXISTING WEEKDAY PEAK HOUR VOLUMES

FIGURE 2
A&R Engineering Inc.

5.0 PROPOSED NEW TRIPS

The Cherokee Commons Shopping Center is currently located in the northwest corner of the intersection of SR 92 at Robin Road. The shopping center currently has 14,500 square feet of vacant retail space and 5,000 square feet of vacant workshop space. The traffic analysis evaluates the future operations with the traffic generated by 70 percent (10,150 sf) of the vacant retail space, for the following two scenarios:

- Scenario 1: Evaluate anticipated operations with no median opening
- Scenario 2: Evaluate anticipated operations with left-in only median opening

The Cherokee Commons Shopping Center currently has four driveways: two full-access driveways on Robin Road and two right-in/right-out driveways on SR 92.

5.1 Trip Generation

Trip generation estimates for the vacant space were based on the rates and equations published in the 10th edition of the Institute of Transportation Engineers (ITE) Trip Generation report. This reference contains traffic volume count data collected at similar facilities nationwide. The trip generation was based on the following ITE Land Use: 820 – *Shopping Center*. Due to the nature of the development, pass-by reductions have been applied per ITE standards. The calculated total trip generation for 70 percent of the vacant retail space is shown in Table 5.

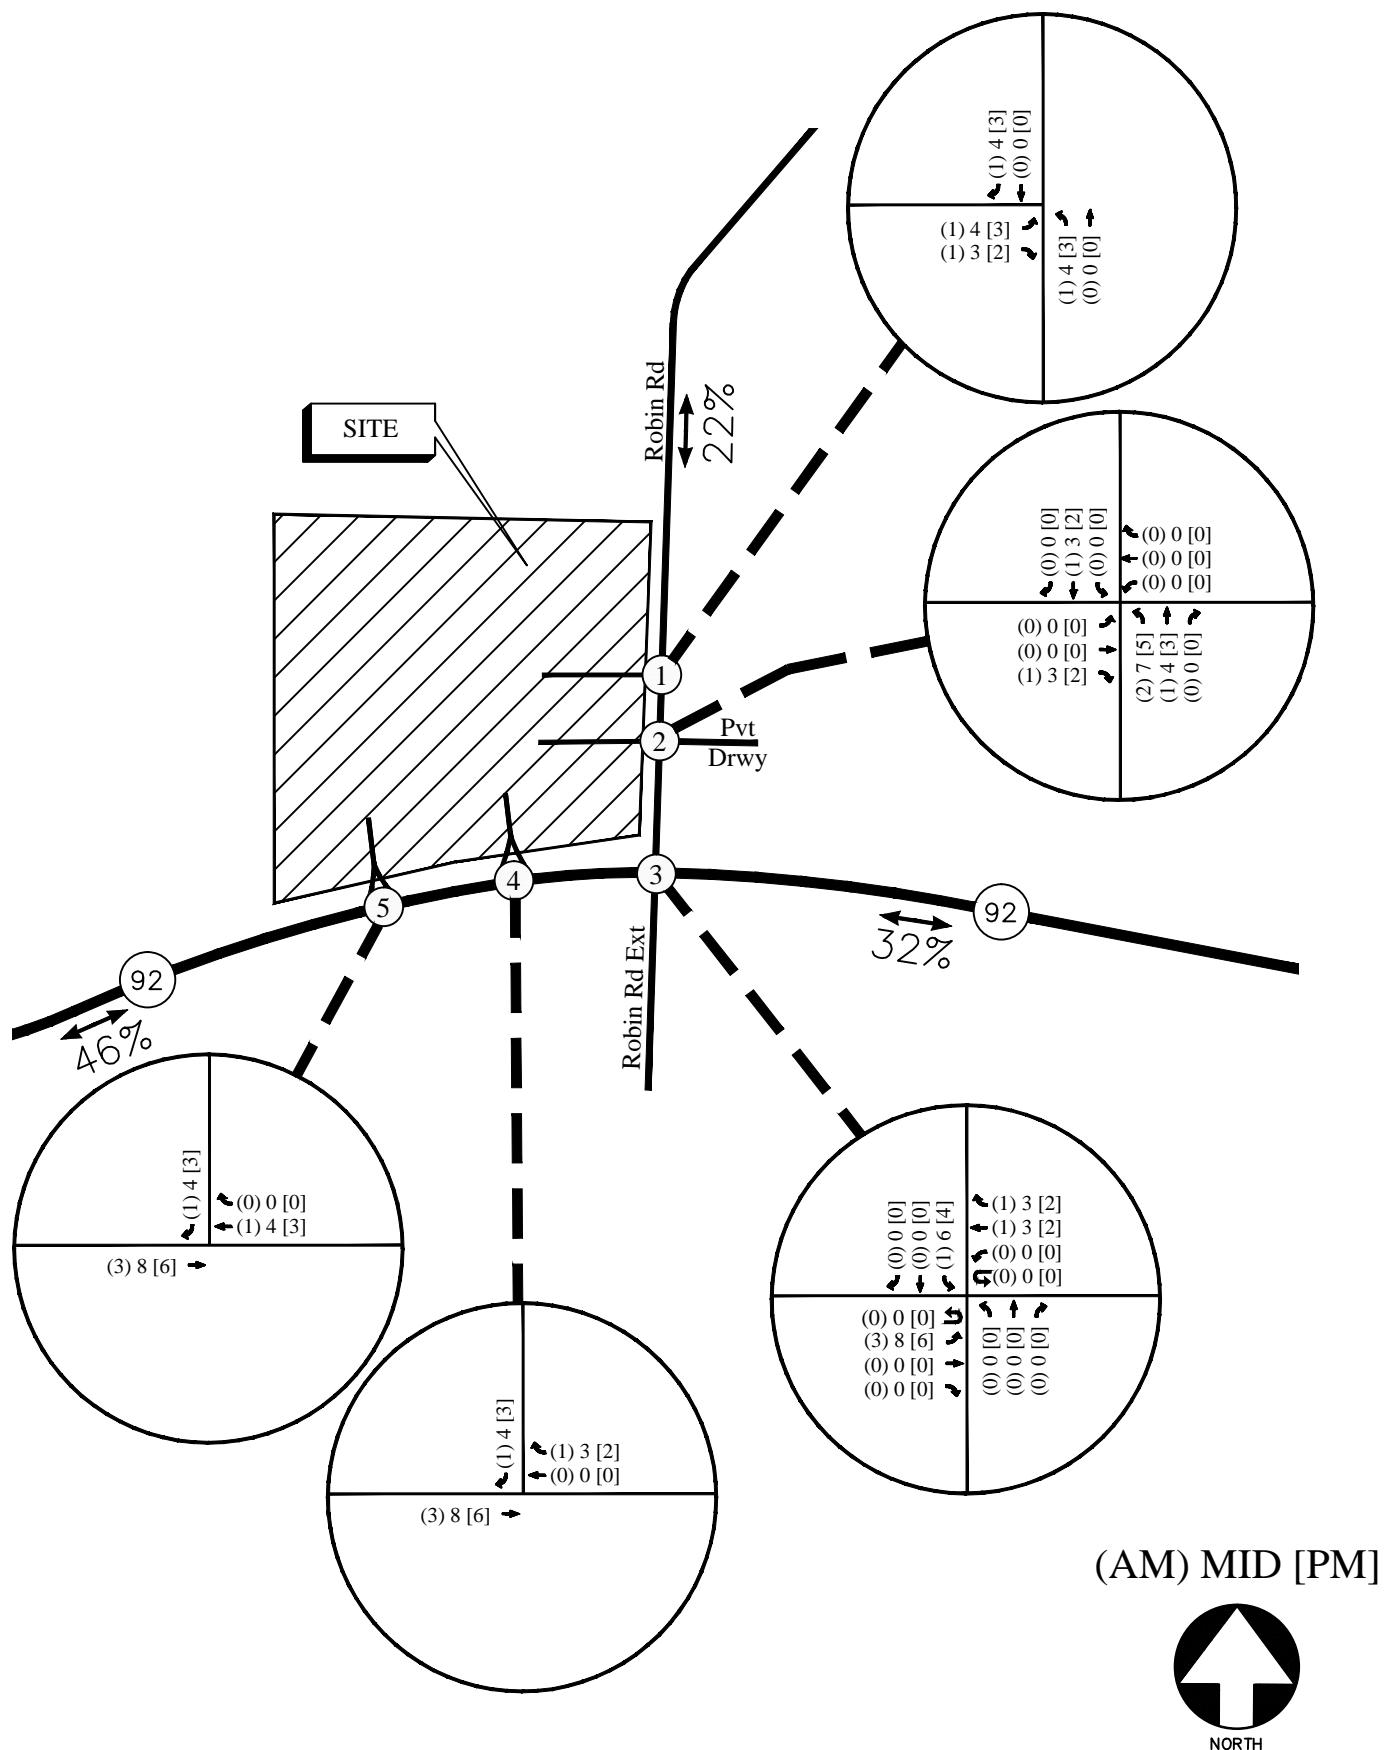

TABLE 5 – TRIP GENERATION

Land Use	Size	AM Peak Hour			Midday Peak Hour			PM Peak Hour			24-Hour
		Enter	Exit	Total	Enter	Exit	Total	Enter	Exit	Total	Two-way
Shopping Center	10,150 sf	6	4	10	21	22	43	19	20	39	383
<i>Pass-by Trips (0%) [17%]</i>	34%	0	0	0	-4	-4	-8	-6	-7	-13	-130
Total Trips (with Reductions)		6	4	10	17	18	35	13	13	26	253

*pass-by trips (AM) [MID] PM; 24-Hour pass-by trips estimated by considering PM pass-by as 10% of daily

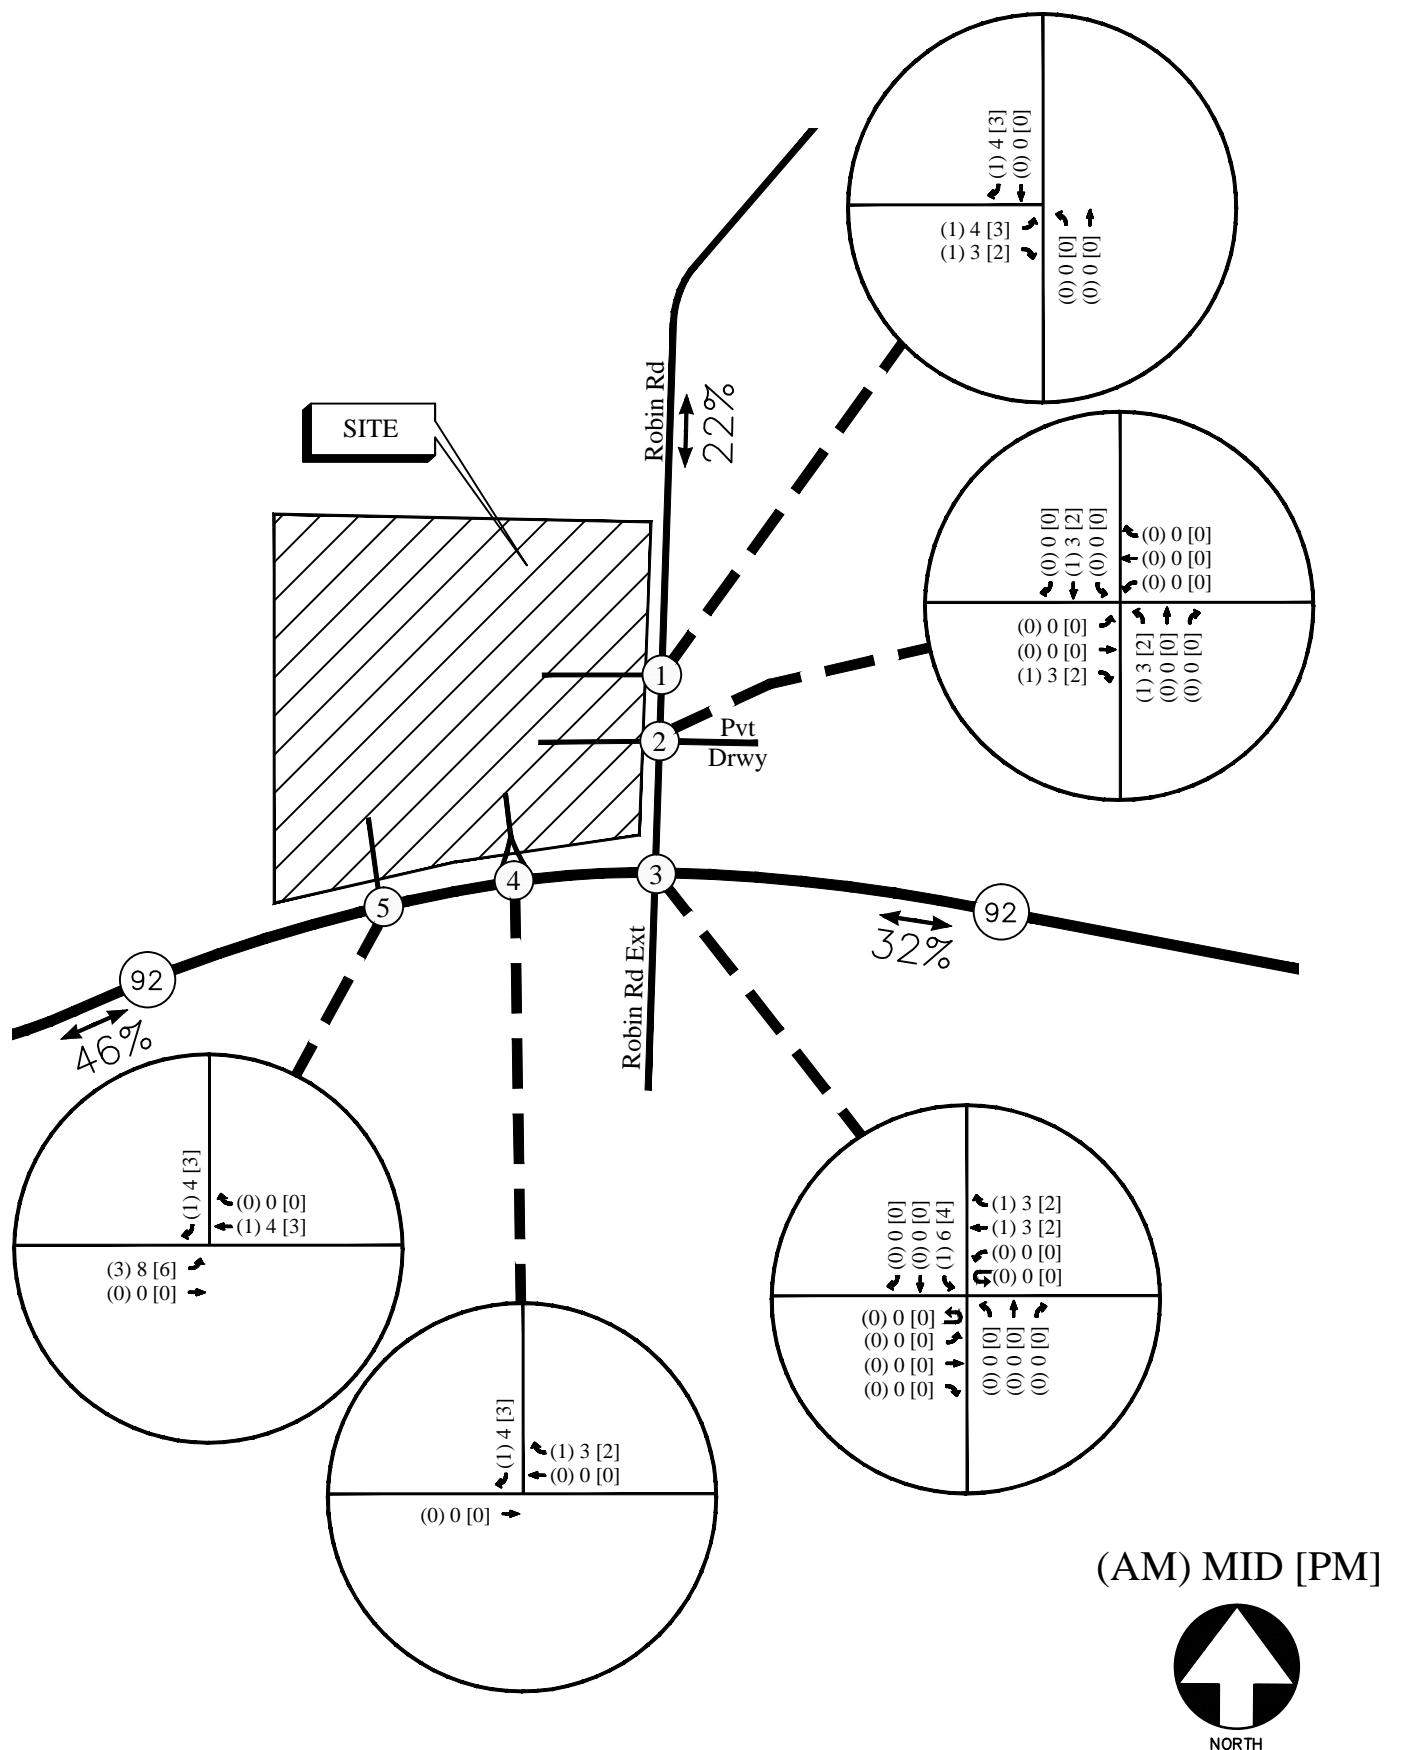

5.2 Trip Distribution

The trip distribution describes how traffic arrives and departs from the site. An overall trip distribution was developed for the site based on a review of the existing travel patterns in the area and the locations of major roadways and highways that will serve the development. The site-generated peak hour traffic volumes, shown in Table 5, were assigned to the study area intersections based on this distribution. The outer-leg distribution and the AM, Midday and PM peak hour site-generated traffic volumes for Scenario 1 (without median opening) and Scenario 2 (with median opening) are shown in Figure 3 and Figure 4, respectively.

PEAK HOUR VOLUMES (SCENARIO 1)

FIGURE 3
A&R Engineering Inc.

OUTER LEG TRIP DISTRIBUTION AND SITE-GENERATED
PEAK HOUR VOLUMES (SCENARIO 2)

FIGURE 4
A&R Engineering Inc.

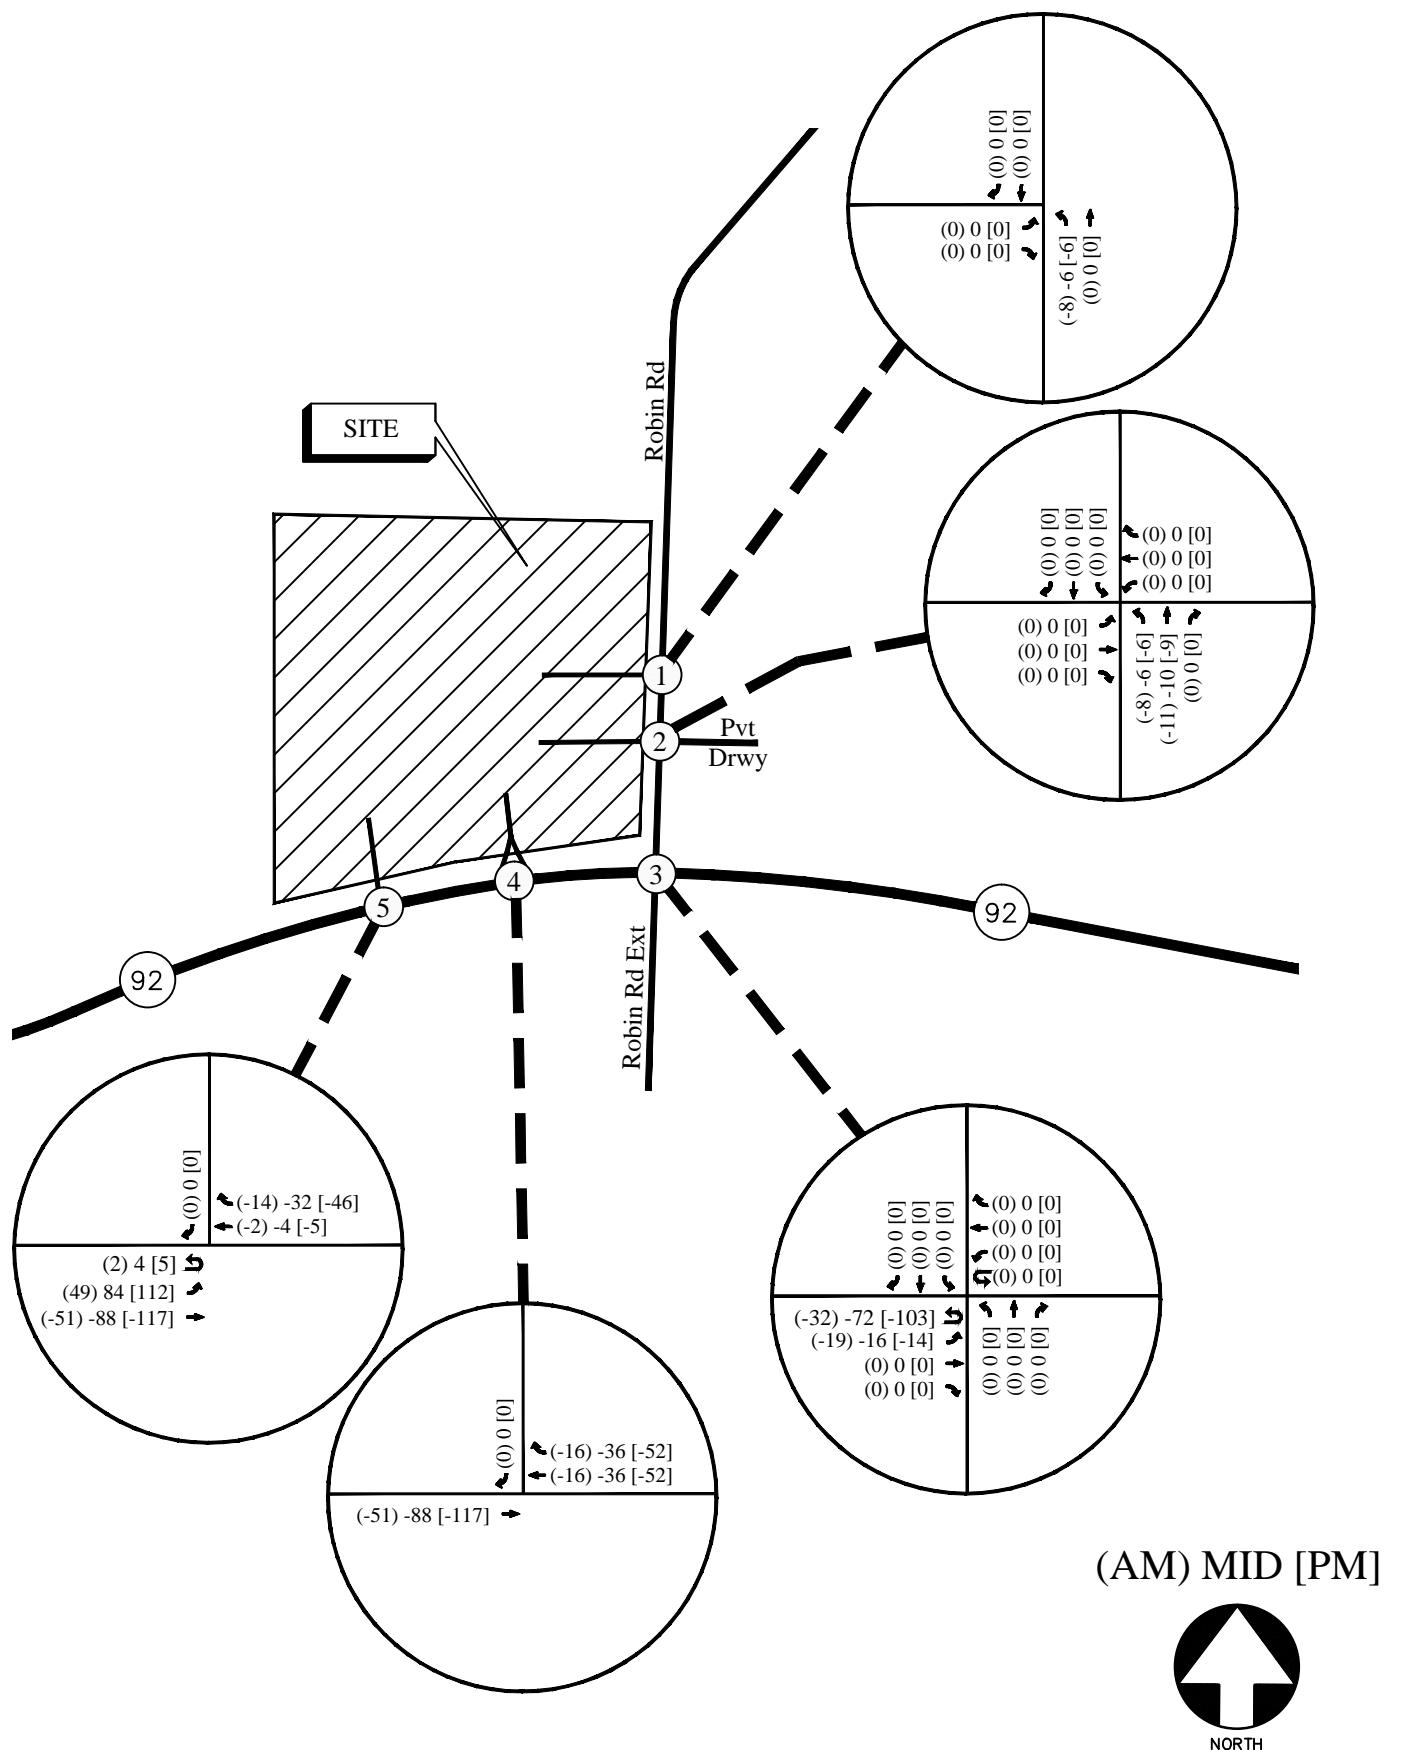

6.0 FUTURE TRAFFIC ANALYSIS

The future traffic operations provide a basis of reference for determining both the overall traffic conditions and any potential improvements needed to improve traffic operations. Note that survey and construction drawings would be needed to verify the feasibility and extent of additional right-of-way required for any recommended improvements. The future traffic operations are analyzed for the following two scenarios:

- **Scenario 1**
 - Evaluate anticipated operations with no median opening at the western driveway on SR 92.
- **Scenario 2**
 - Evaluate anticipated operations with left-in only median opening at the western driveway on SR 92.

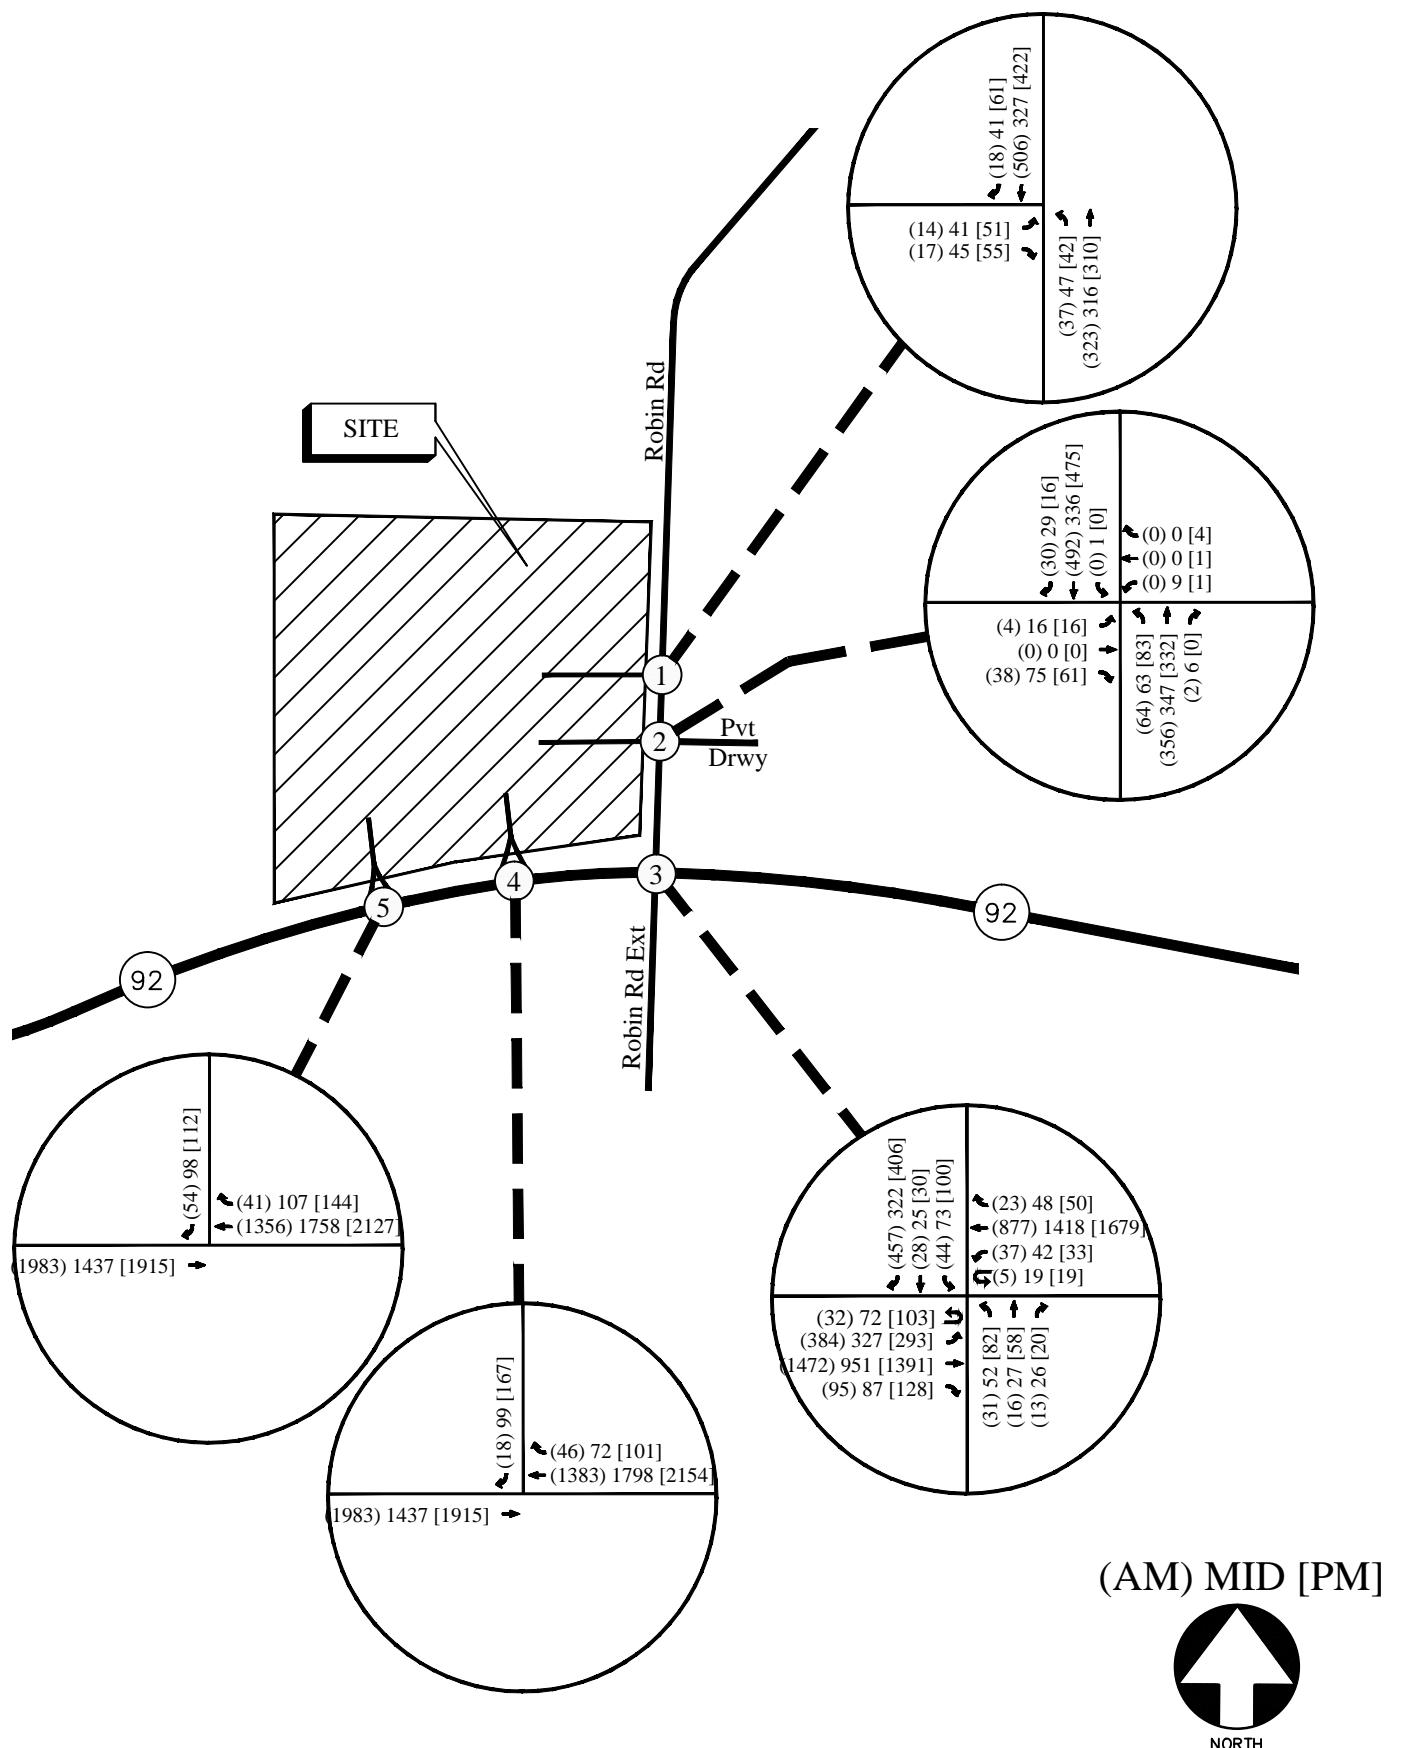

6.1 Future Traffic Volumes

Based on site observations, approximately 95% of the existing eastbound U-turns at the intersection of SR 92 and Robin Road are entering the site via the two right-in/right-out driveways on SR 92. Moreover, approximately 5% of the existing eastbound left turns at the intersection of SR 92 at Robin Road are entering the site via the two full-access driveways on Robin Road. For Scenario 2 operations, it has been assumed that 5% of the existing eastbound U-Turn movements will be able to make the same movement at the median opening; and 95% of the existing eastbound U-Turn as well as 5% of the existing left turn movements will use the median opening to turn left into the development. The shifted peak hour turning movements for Scenario 2 are shown in Figure 5. In order to evaluate the future traffic operations, the additional traffic volumes from the vacant space, shifted volumes (Scenario 2), and pass-by volumes were added to the existing volumes (Figure 2) to calculate the future traffic volumes at the study intersections. The future volumes for Scenario 1 (without median opening) are shown in Figure 6 and for Scenario 2 (with median opening) are shown in Figure 7.

SHIFTED EXISTING VOLUMES (SCENARIO 2)

FIGURE 5

6.2.1 Recommended Improvements

The results of the future intersection operations comparison indicate that with the installation of a left-in only median opening on SR 92 at the western driveway, the adjacent signalized intersection of SR 92 at Robin Road will operate at a better level-of-service during the AM, Midday, and PM peak hours. To accommodate the median opening, the existing eastbound left turn lane at the signal will need to be decreased in order to construct a dedicated left turn lane for left-in/U-Turn movements at the median opening; however, the results of the queue analysis show that the proposed storage lengths for each turn lane will be adequate during each peak hour. A concept plan of the left-in/U-Turn only median opening is included in the Appendix. It is recommended that permissive + overlap signal phasing be installed on the southbound right turn approach and a “No U-Turn” sign be installed on the eastbound left turn approach. This will help prevent conflicts that may occur between eastbound U-Turns and southbound right turns.

A&R Engineering Inc.

7.0 CONCLUSIONS AND RECOMMENDATIONS

The purpose of this study was to evaluate the traffic impacts that will result from a proposed left-in only median break on SR 92 to serve the Cherokee Commons Shopping Center in Acworth, Georgia. The proposed median-break will be located approximately 615 feet west of the existing signalized intersection of SR 92 at Robin Road. The traffic analysis evaluates the existing and future operations with the traffic generated by 70 percent of the vacant retail space for the following two scenarios:

- Scenario 1: Evaluate anticipated operations with no median opening
- Scenario 2: Evaluate anticipated operations with left-in only median opening

The Cherokee Commons Shopping Center currently has four driveways: two full-access driveways on Robin Road and two right-in/right-out driveways on SR 92. The results of the analysis are outlined in the following sections.

7.1 Scenario 1 (Without Median Opening)

The results of the future intersection operations for Scenario 1 indicate that without the installation of a left-in only median opening at the western driveway on SR 92, more site traffic will make U-Turn movements at the adjacent signalized intersection of SR 92 at Robin Road. The presence of a heavy eastbound U-Turn movement increases the demand on the southbound approach, which has an existing heavy conflicting right turn movement. This conflict causes the intersection to operate above its capacity.

7.2 Scenario 2 (With Left-In Only Median Opening)

The results of the future intersection operations for Scenario 2 indicated that with the installation of a left-in only median opening on SR 92 at the western driveway, the adjacent signalized intersection of SR 92 at Robin Road will operate at a better level-of-service during the AM, Midday, and PM peak hours. To accommodate the median opening, the existing eastbound left turn lane at the signal will need to be decreased in order to construct a dedicated left turn lane for left-in/U-Turn movements at the median opening; however, the results of the queue analysis show that the new storage lengths for each movement will be adequate during each peak hour.

7.3 Recommendations

A comparison of Scenario 1 and Scenario 2 indicates that installing a left-in only median break on SR 92 at the Cherokee Commons western driveway will help decrease delay as well as increase operational efficiency at the adjacent signalized intersection of SR 92 at Robin Road. Moreover, removing the existing U-Turn movements at the signal will increase the overall capacity for the heavy southbound right turn movement on Robin Road. Therefore, it is recommended that a left-in only median opening be installed on SR 92 per GDOT standards. It is also recommended that permissive + overlap signal phasing be installed on the southbound right turn approach and a “No U-Turn” sign be installed on the eastbound left turn approach. This will help prevent conflicts that may occur between eastbound U-Turns and southbound right turns

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 20 (11%), Referenced to phase 2:WBT and 6:EBT, Start of Green

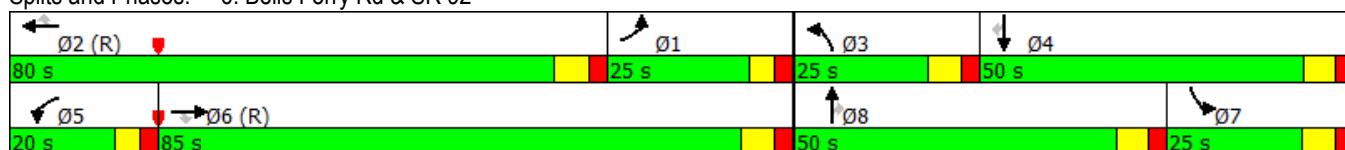

Natural Cycle: 150

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Bells Ferry Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 155 (86%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

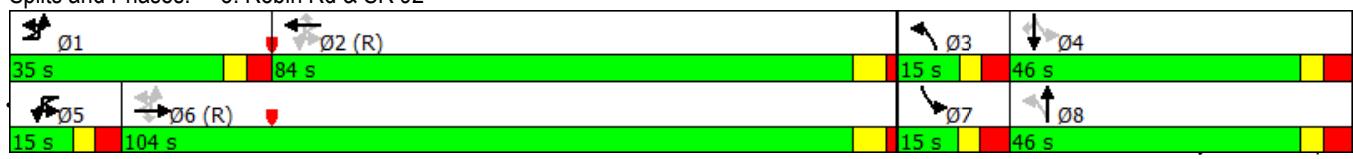

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: Robin Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 1 (1%), Referenced to phase 2:WBT and 6:EBT, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Bells Ferry Rd & SR 92

Intersection Summary

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 6 (4%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Robin Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 155 (86%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: Robin Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 1 (1%), Referenced to phase 2:WBT and 6:EBT, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Bells Ferry Rd & SR 92

Intersection Summary

Cycle Length: 140

Actuated Cycle Length: 140

Offset: 6 (4%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

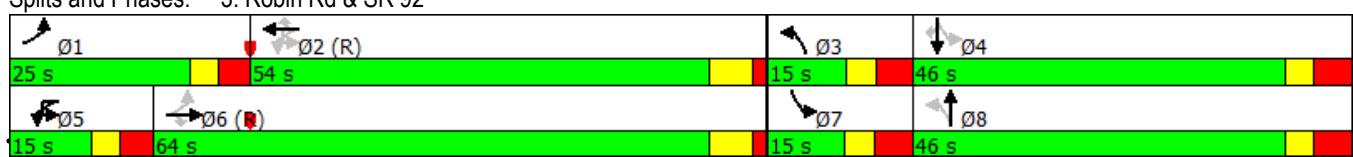

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 3: Robin Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 155 (86%), Referenced to phase 2:WBTL and 6:EBTL, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

Splits and Phases: 3: Robin Rd & SR 92

Intersection Summary

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 1 (1%), Referenced to phase 2:WBT and 6:EBT, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

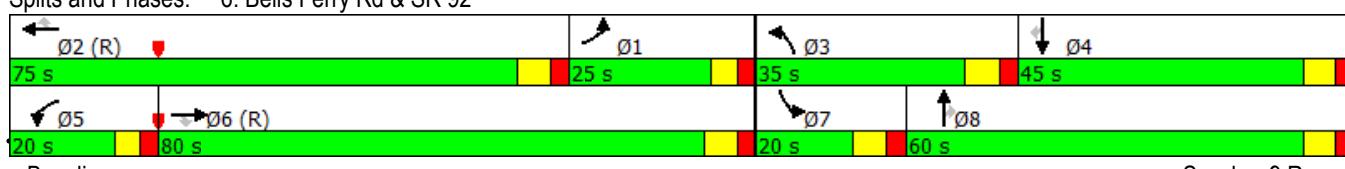

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

Splits and Phases: 6: Bells Ferry Rd & SR 92
