INTRODUCTION

I. PURPOSE

The purpose of this study guide is to provide information that is required to learn the necessary procedures and standards established by the Department to become qualified in Preparing and Testing Soils. The Sampling and Testing procedures and Standards Specifications were established to ensure that high quality materials, that meet Specifications, are incorporated into the work. The evidence of testing is an "approved" testreport.

The purpose and necessity for evidence of tests completed should be understood by all Contractors, Engineers and Technicians of the Department. It should not be thought that the purpose and only result of testing are test reports. However, this evidence of testing is needed and important, for it is the record of performed tasks. A test report must give complete, clear, and precise results.

It is the Contractor's responsibility to control the materials and construction in such a manner that the specifications are met. It is the Materials Testing Technician and Engineer's responsibility to evaluate materials and construction to verify that Specifications are met.

All information included within this guide will aid in the success of Laboratory Testing Technicians becoming proficient performing the essential tasks for Preparing, and Testing Soils used in roadway construction.

GEORGIA DEPARTMENT OF

TRANSPORTATION SOIL TESTING TECHNICIAN

CERTIFICATION PROGRAM

Definition:

A **Soil Level 1 Testing Technician**— is an individual who has demonstrated the knowledge and ability to properly perform, record, and report the results of basic laboratory procedures for soils.

Scope and Knowledge:

The program requires a working knowledge of the following:

AASHTO/ASTM standards:

- R 58-11(2019)—Standard Practice for Dry Preparation of Disturbed Soil and Soil-Aggregate Samples for Test
- r T 89-13(2021)—Standard Method of Test for Determining the Liquid Limit of Soils
- T 90-20— Standard Method of Test for Determining the Plastic Limit and Plasticity Index of Soils
- T 180-21 Method D Moisture-Density Relations of Soil Using a 10lb Rammer and 18in Drop, utilizing -3/4material in a 6" Mold
- T265-15(2019)—Standard Method of Test for Laboratory Determination of Moisture Content of Soils
- Note: Due to copyright laws, AASHTO Test Procedures are not provided. AASHTO Procedures may be obtained at <u>https://compass.astm.org</u>

External Companies (Non-GDOT) must provide their employees their own copy of AASHTO Standards due to the copyright laws

GDOT Standards/Specifications:

- GDT 4—Determining Gradation of Soils
- GDT 6—Determining Volume Change of Soils
- GDT 7—Determining Maximum Density of Soils
- Section 810—Roadway Materials
- Section 814—Soil Base Materials

Certification Requirements:

GDOT will grant certification only to those applicants who meet both of the following requirements:

- 1. A passing grade on the GDOT written examination, and
- 2. Successful completion of the GDOTperformance examination

Written Examination

The written examination is three hours, open-book, and consists of 100 multiple-choice

questions. To pass the written examination, both of the following conditions must be met:

- 1. At least 60% correct for each of the required standards, and
- 2. A minimum score of 75% overall.

The Technical College System of Georgia will administer the written examination. Examinees will be expected to pay a testing fee when the written portion of the examination is administered.

The campus locations where the written examinations will be administered are as follows.

Performance Examination

The performance examination will be administered by the Georgia Department of Transportation's Office of Materials and Testing staff at the Branch Laboratory associated with each of the Department's Field Districts.

The performance examination is closed-book and requires actual demonstration of the required standards. The examinee is judged on his/her ability to correctly perform or describe all the required procedures for the 8 standards listed. No performance examination is required for specifications Section. The performance examination must be passed within 90 days of passing the written examination.

During the examination the examinee will be judged on their ability to perform or describe all required procedures for each of the AASHTO or GDOT standards based on the criteria in the Performance Examination Checklists. Omission or incorrect performance on one or more of the prescribed procedures will constitute failure of that trial. The examinee will be allowed up to (2) trials on the day of the examination for each GDOT/AASHTO Standard. If during one trial the examinee feels an error has been made, he or she may suspend that trial and begin the procedure over. A voluntary suspension of a trial is not counted as a failure. Failure on any of the prescribed standards after two trials will constitute failure of the performance examination. The performance examination is graded on a pass/fail basis.

Re-Examination

Failure of either the written or performance examination by any of the criteria cited above will require the re-examination on the entire written exam or entire performance exam. It is the examinee's responsibility to request a re-examination.

To protect GDOT's Soil Technician Examinations from frivolous trial-and-error attempts and to encourage the examinee to properly prepare for testing, the following allowances are required.

- After first failed examination, the examinee must wait 30 days before re-testing.
- After second failed examination, the examinee must wait 90 days before re-testing.
- After third failed examination, the examinee must wait 12 months before re-testing.

Recertification

Technicians are not required to have any continuous education credit hours to maintain their Soils Testing Technician Certification after they have successfully passed the written and practical exams and become certified.

Regardless of re-certification status, for the purpose of fulfilling the requirements of SOP 30 as required by the FHWA, active technicians (those who performed acceptance testing in the last calendar year) are required to have an IA evaluation during each calendar year.

GEORGIA DEPARTMENT OF TRANSPORTATION SOIL TESTING TECHNICIAN CERTIFICATION

WORKBOOK TECHNICAL SECTIONS

Each section consists of:

- GDOT Specification/Standard or AASHTO Standard
- Study Questions
- Performance Checklist, if applicable

SECTION 1

AASHTO R 58-11(2019)

Standard Practice for Dry Preparation of

Disturbed Soil and Soil-Aggregate Samples for

Test

STUDY QUESTIONS

AASHTO R 58, Standard Practice for Dry Preparation of

Disturbed Soil and Soil-Aggregate Samples for Test

- 1. This method describes the _____preparation of soil and soil-aggregate samples?
- 2. A revolving drum, into which the soil sample and rubber-covered rollers are placed, is a suitable pulverizing device?
 - a) True
 - b) False
- 3. For the particle size analysis-T88, material passing a 2.00-mm (No. 10) sieve is required in amounts equal to approximately, 110g for______soils and approximately 60g for_____soils.
- 4. What is the minimum amount required, of material passing the 0.425-mm (No. 40) sieve, for performing physical testing?
- 5. Samples should be dried at a temperature not exceeding ?
- 6. Representative test samples of the amount required to perform the desired tests shall be taken with

or by_____and_____.

- 7. Samples dried in an oven or other drying apparatus at a temperature not exceeding 60°C [140°F] are air dried?
 - a) True
 - b) False
- 8. List the two alternate methods used to separate fraction sizes of the portion of the dried sample selected for particle-sized analysis and physical tests?
- 9. Fractions retained on the 4.75-mm (No. 4) sieve and the 2.00-mm (No. 10) sieve are not included in the sieve analysis and should be discarded?
 - a) True
 - b) False
- 10. What is the required sample mass of material passing the 2.00-mm (No. 10) sieve, for specific gravity, when the volumetric flask is to be used?
- 11. Physical tests are performed on materials passing the ______sieve?

PERFORMANCE CHECKLIST

AASHTO R 58, Standard Practice for Dry Preparation of

Disturbed Soil and Soil-Aggregate Samples for Test

Procedure

- 1. Dry the soil sample thoroughly in air or in the drying apparatus at a temperature not exceeding 60°C [140°F].
- 2. Obtain a test sample of the required mass to perform the desired tests (Section 4), with a sampler, or by splitting or quartering.
- 3. Pulverize the samples in such a way as to avoid reducing the natural size of individual particles.
- 4. Determine the mass of the portion of the dried sample selected for particle-sized analysis and physical tests (including specific gravity).
- 5. Record mass as the mass of total sample uncorrected for hygroscopic moisture.
- 6. Separate into fractions by one of the following methods:

Alternate Methods Using 2.00-mm (No. 10) Sieve

- 7. Separate the dried sample into two fractions using a 2.00-mm (No. 10) sieve.
- 8. Pulverize the material retained on the sieve until the aggregations of soil particles are broken into separate grains.
- 9. Re-sieve the ground soil on the 2.00-mm (No. 10) sieve.

Alternate Method Using 4.75-mm and 2.00-mm (Nos. 4 and 10) Sieves

- 10. Separate the dried sample into two fractions using a 4.75-mm (No. 4) sieve.
- 11. Pulverize the material retained on the sieve until the aggregations of soil particles are broken into separate grains.
- 12. Re-sieve the ground soil on the 4.75-mm (No. 4) sieve.
- 13. Thoroughly mix the fractions passing the 4.75-mm (No. 4) sieve.
- 14. By use of a sampler, or split and quarter the sample, obtain a representative portion adequate for the desired tests.
- 15. Separate the dried sample into two fractions using a 2.00-mm (No. 10)sieve.
- 16. Pulverize the material retained on the sieve until the aggregations of soil particles are broken into separate grains.
- 17. Re-sieve the ground soil on the 2.00-mm (No. 10) sieve.
- 18. Record the mass of the material from this split-off fraction that is retained on the 2.00-mm (No. 10) sieve for later use in coarse sieve analysis computations.

Procedure-continued

- 19. Set aside the fraction retained on the 2.00-mm (No. 10) sieve, or that retained on the 4.75-mm (No. 4) sieve, after the second sieving, for use in sieve analysis of the coarse material.
- 20. Thoroughly mix the fractions passing the 2.00-mm (No. 10) sieve.
- 21. By use of a sampler, or split and quarter the sample, obtain representative portions having approximate masses as follows: (1) for the hydrometer analysis and sieve analysis of the fraction passing the 2.00-mm sieve, 110 g for sandy soil and 60 g for silty or clayey soils; and (2) for specific gravity, 25 g when the volumetric flask is to be used and 10 g when the stoppered bottle is to be used.
- 22. Sieve the remaining portion of the material passing the 2.00-mm (No. 10) sieve over a 0.425-mm (No. 40) sieve.
- 23. Pulverize the fraction retained on the 0.425-mm (No. 40) sieve in such a manner as to break up the aggregations without fracturing the individual grains.
- 24. Separate the ground soil into two fractions by means of the 0.425-mm (No. 40) sieve, and regrind the material retained on the sieve.
- 25. Discard material retained on the 0.425-mm (No. 40) sieve when repeated grinding produces only a small quantity of soil passing the 0.425-mm sieve.
- 26. Thoroughly mix the several fractions passing the 0.425-mm sieve obtained from the grinding and sieving operations and set aside for use in performing the physical tests.

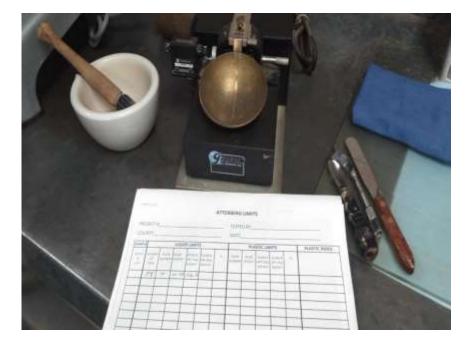

SECTION 2

AASHTO T89-13(2021)

Standard Method of Test for

Determining the Liquid Limit of

Soils

STUDY QUESTIONS

AASHTO T 89

Standard Method of Test for

Determining the Liquid Limit of

Soils

- 1. The liquid limit of a soil is that ______at which the soil passes from a plastic to a liquid state.
- 2. An______, _____ dish about 115 mm in diameter is preferred for mixing the sample.

3. The liquid limit device shall have a base made of _____ material.

List the two types of grooving tools used in this procedure	4.	List the two	types of gro	oving tools u	used in this	procedure.
---	----	--------------	--------------	---------------	--------------	------------

- 5. The flat grooving tool should be used interchangeably with the curved grooving tool?
 - a) True
 - b) False
- 6. Obtain a sample mass of about _____g of material passing _____-mm sieve for method "A".
- 7. Cup or base wear is considered excessive when the point of contact exceeds ______ in diameter.
- 8. The height of drop of the cup should be adjusted to ______ and checked ______ prior to testing.
- 9. What is the initial amount of water to be added to the sample?
 - a) Method "A":_____
 - b) Method "B":_____
- 10. It is ok to add dry soil material if too much moisture has been added to the sample.
 - a) True
 - b) False
- 11. A_____value may be obtained by adding water too fast.
- 12. What is the maximum thickness allowed when spreading material into the testing cup?
- 13. How many firm strokes of the grooving tool are allowed to divide the soil in the cup?
- 14. The cup containing the sample shall be______and_____by turning crank F at a rate of
 - approximately______revolutions per second.
- 15. What steps are taken should the sample slide on the cups surface during test?
- 16. The______and_____shall be washed and dried between test trials.
- 17. When performing procedure "A", obtain the first test sample in the range of ______to ____shocks.

 Water content of the soil shall be calculated as follows: Mass of Water Mass of oven drySoil X 100

- a) True
- b) False

19. The moisture content corresponding to the intersection of the flow curve with the ______-shock ordinate

shall be taken as the _____ of the soil.

20. Sample shall be seasoned in the ______ for _____ when performing referee testing.

PERFORMANCE CHECKLIST

AASHTO T 89

Standard Method of Test for

Determining the Liquid Limit of

METHOD A

Soils

Procedure

- Thoroughly mix the portion of material passing the 0.425-mm sieve and obtain a sample with a mass of about 100 g.
- 2. Thoroughly mix sample with 15 to 20 mL of distilled water by alternately and repeatedly stirring, kneading, and chopping with a spatula.
- 3. Continue mixing and add further additions of water, in increments of 1 to 3 mL, until the material forms a uniform mass of stiff consistency. Thoroughly mix each increment of water, as previously described in step No. 2, before another increment of water is added.
- 4. Place enough material in the cup and squeeze and spread, using as few strokes as possible.
- 5. Level with spatula and, at the same time, trim to a depth of 10 mm at the point of maximum thickness.

Curved Grooving Tool

6. Divide the soil in the cup with a firm stroke of the grooving tool. Up to six strokes, from front to back or back to front, may be used and only the last stroke should scrape the bottom of the cup.

Alternate Procedure (Flat GroovingTool)

7. Form a groove in the soil pat in accordance with Section 11.2 of ASTM D4318.

Procedure-Continued

- 8. Lift and drop the cup, at a rate of approximately two revolutions per second, until the two sides of the sample come in contact at the bottom of the groove along a distance of about 13 mm.
- 9. Record the number of shocks required to close the groove.
- 10. Remove a slice of soil the width of the spatula, extending from edge to edge of the soil cake at right angles to the groove and including that portion of the groove that flowed together, and place in a suitable container.
- 11. Dry the sample in accordance with T 265and determine the moisture content.
- 12. Transfer the soil remaining in the cup to the mixing dish and wash the cup and grooving tool.
- 13. Repeat procedure, adding sufficient water to bring the sample to a more fluid condition.
- 14. Obtain the first sample in the range of 25 to 35 shocks, the second sample in the range of 20 to 30 shocks, and the third sample in the range of 15 to 25 shocks. The range of the three determinations shall be at least 10 shocks.

15. Plot a "flow curve", on a semilogarithmic graph, representing the relation between moisture content and corresponding number of shocks. The moisture content corresponding to the intersection of the flow curve with the 25-shock ordinate shall be taken as the liquid limit of the soil.

METHOD B

Procedure

- Thoroughly mix the portion of material passing the 0.425-mm sieve and obtain a sample with a mass of about 50 g.
- 17. Using the curved grooving tool or the flat grooving tool the procedure shall be the same as prescribed in steps 2 through 12 except that the initial amount of water to be added shall be approximately 8to 10 mL.
- 18. Obtain the first sample in the range of 22 to 28 shocks, and immediately return the soil remaining to the mixing dish, without adding additional water, and repeat the test. If the second closure occurs in the acceptable range of 22 to 28 shocks and the second closure is within 2 shocks of the first closure, secure a moisture content specimen.

SECTION 3

AASHTO T 90-20

Standard Method of Test for

Determining the Plastic Limit and Plasticity Index of Soils

STUDY QUESTIONS

AASHTO T 90

Standard Method of Test for

Determining the Plastic Limit and Plasticity Index of Soils

1.	Theof a soil is the lowestat which the soil remains plastic.
2.	The plasticity index is the numerical difference between theand theof the soil.
3.	What method shall be used as the referee method?
4.	Wax paper would be an acceptable rolling surface?
	a) True
	b) False
5.	The container used for moisture content shall have ato prevent the loss of moisture from the
	samples before initial mass determination.
6.	f only the plastic limit is determined, what is the initial sample mass, of material passing the 0.425-mm (No. 40)
	sieve, required for this procedure?
7.	Tap water may be used for routine testing?
	a) True
	b) False
8.	The soil mass should be rolled into aat a rate ofper minute.
9.	What is the time limit for rolling the soil mass into a thread?
10.	When using the alternate procedure, you should not allow the soil thread to contact the of the
	plastic limit device?
11.	t is acceptable for crumbling to occur when the diameter isthan 3 mm, provided the solid has
	peen previously rolled into a threadin diameter?
12.	Attempts should be made to produce failure at exactly 3-mm by reducing hand pressure?
	a) True
	b) False
13.	soils require much pressure to deform the thread as they approach the plastic limit?
14.	What procedure should be used to determine the moisture content?
	The plastic limit of the soil is the moisture content expressed as a percentage of the?
	Report the plastic limit to the nearest?
17.	How is the plasticity index of a soil calculated?

PERFORMANCE CHECKLIST

AASHTO T 90

Standard Method of Test for

Determining the Plastic Limit and Plasticity Index of Soils

If Only Plastic Limit is Determined

- Take a quantity of soil with a mass of about 20 g from the thoroughly mixed portion of the material passing the 0.425-mm (No. 40)sieve.
- 2. Place test sample in a mixing dish and thoroughly mix with distilled, demineralized, or de-ionized water until the mass becomes plastic enough to be shaped into a ball.
- 3. Take about 10 g from this ball for the test sample.

If the Plasticity Index (Both Liquid and Plastic Limit) is to be Determined

- 4. Take a test sample with a mass about 10 g from the thoroughly wet and mixed portion of the soil prepared in accordance with T 89. Take sample at any stage in the mixing process when the mass can be easily shaped into a ball without sticking to fingers.
- 5. Set aside and allow to season in air until the liquid limit test has been completed.

Procedure

- 6. Determine and record the mass of the moisture container.
- 7. Take a 1.5 to 2.0-g portion from the 10-g mass ball of soil.
- 8. Roll the soil mass into a 3-mm-diameter thread using at a rate of 80 to 90 strokes per minute, counting a stroke as moving the hand forward and back to the starting position.

Hand Rolling Method

- 9. Roll mass between the palm or fingers and the unglazed paper or glass plate to a uniform diameter throughout its length.
- 10. Continue to deform the thread until its diameter reaches 3mm.
- 11. Take no more than 2 minutes to roll the test sample to a 3-mm-diameter.

Procedure Continued

- 12. When the diameter of the thread reaches 3 mm, form the mass back into an ellipsoidal shape using the thumbs and fingers.
- 13. Repeat hand rolling operation until the soil can no longer be rolled into a thread and begins to crumble.

- 14. Gather and place the portions of crumbled soil in moisture content container and cover with a close-fitting lid to prevent moisture loss.
- 15. Repeat hand rolling operation until the entire 10 g sample is tested.
- 16. Place all crumbled portions of soil in the same moisture content container.
- 17. Determine moisture content in accordance with T265.

SECTION 4

AASHTO T265-15(2019)

Standard Method of Test for

Laboratory Determination of Moisture Content of Soils

STUDY QUESTIONS

AASHTO T 265

Standard Method of Test for

Laboratory Determination of Moisture Content of Soils

1.	orof a soil is the ratio, expressed as a percentage, of the mass of water in a
	given mass of soil to the mass of the solid particles?
2.	Containers shall have close-fitting lids to preventfrom samples before initial weighing and to
	preventfrom the atmosphere following drying and before final weighing.
3.	If not indicated in the method of test, what is the minimum sample mass for a soil with a maximum particle size
	of 12.5-mm (1/2in.)?
4.	Test samples shall be dried in a drying oven maintained at a temperature of?
5.	Samples should be dried overnight (minimum ofhr.) or dry until the mass loss of the sample after 1h
	of additional drying is less thanpercent (constant mass)?
6.	Dried samples should be removed before placing wet samples in the oven?
	a) True
	b) False
7.	Oven-drying at $110 \pm 5^{\circ}$ C (230 $\pm 9^{\circ}$ F) does not result in reliable moisture content values for soil containing
	or other minerals having loosely bound water fromor for soil containing
	significant amounts of
8.	When is it acceptable to use a container without a tight-fitting lid?
9.	When calculating moisture content, $W_1 = $?

10. What is the single operator precision, acceptable range of two results, when testing a coarse aggregate-blend?

PERFORMANCE CHECKLIST

AASHTO T 265

Standard Method of Test for

Laboratory Determination of Moisture Content of Soils

- 1. Select a representative quantity of moist soil in the amount indicated in the method of test. If no amount is indicated, the minimum mass of the sample shall be in accordance with the table in T265.
- 2. Weigh a clean, dry container with its lid and place the moisture content sample in the container.
- 3. Immediately place lid on container and weigh the container, including the sample and lid.
- 4. Remove the lid and place the container with the moist sample in the drying oven.
- Dry the sample dry overnight (15 h minimum) at a temperature of 110 ± 5°C (230 ± 9°F) or until the mass loss of the sample after 1 h of additional drying is less than 0.1 percent(constant mass).
- 6. Remove the sample from the oven and immediately place lid on the container.
- 7. Allow sample to cool to room temperature.
- 8. Weigh container, including the sample and lid.
- 9. Calculate the moisture content to the nearest 0.1 percent.

STUDYQUESTIONS

AASHTO T 180 (Method D)

Moisture-Density Relations of Soils Using 10lb Rammer and an 18" and using material passing the # ¾ Sieve

1. The mold in this procedure will have an approximate diame	eter of	and height of
2. The metal rammer will have a diameter of	and a weight of	The rammer will be
dropped at a height offrom the surface the	of the soil.	
3. What size sample is taken and dried in a drying apparatus a	at a temperature not to	exceed what temperature?
,		
4. Any material retainedon theshall be con	sidered .	
,		
5. A representative sampleof approximately	of needed	to perform the test
S. Arepresentative sampleor approximately		
6. What should the initial moisture content of the sample be	nixed to?	

7. Each moisture content shall be compacted with _____blows and in _____layers?

- 8. After the mold has been compacted, the collar is removed, and the compacted material trimmed?
 - a) at the top of the mold
 - b) bottom of the mold
 - c) Both top and bottom
- 9. Calculate the wet weight of the compacted soil in pounds per cubic foot?

Weight of Mold 6595.3 g			
Weight of Mold +Sample 11614.5			
Mold Correction Factor	0.02942		
Wet Weight, lbs./ft3			
Weight of Mold	6595.3 g		
Weight of Mold Weight of Mold +Sample	6595.3 g 11733.8 g		

10. Samples for determining moisture content are obtained by slicing the compacted soil vertically through its center, and removing______or from______if the molded material falls apart?

11. Calculate the percent moisture content?

Weight of Wet Soil	1098 8
Weight of Dry Soil	928.6 g
Moisture %	

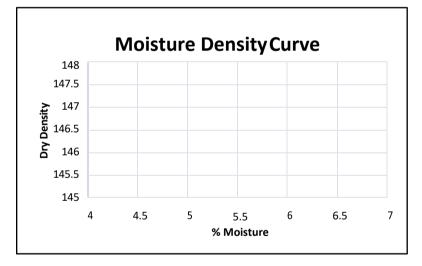

12. Moisture samples will be dried in an oven capable of maintaining what temperature?

13. Moisture will be increased at a rate approximately ______ and the material compacted until

14. The Theoretical Maximum Dry Density and Optimum Moisture will be measured from?

- a) Highest plotted density
- b) the plotted density after decline
- c) Highest moisture content
- d) the peak of the curve

DryDensity	% Moisture
145.5	5.1
146.5	5.3
147.8	5.9
146.4	6.7

Performance Checklist

AASHTO T180 (Method D)

Moisture- density relations of Soils Using a 10lb Rammer and an 18" Drop using material Passing the # ¾ Sieve

1. Obtain a representative sample that weighs a minimum of 25lbs after any material retained on the #3/4 sieve has been removed.

2. Dry the sample in air until friable or by using a drying apparatus that maintains a temperature not exceeding 140F (60C).

3. Break up any aggregations to pass through the 3/4 in (19 mm) sieve without reducing the natural size of the individual particles?

4. Grade over 3/4"sieve and weigh amount retained and set aside for testing outlined in Annex 1?

5. Use R76 to reduce the sample to approximately 25 lbs (11.34 kg)?

6. Thoroughly mix the selected representative sample with enough water to dampen it approximately 4 to 8 percent below optimum moisture?

7. Form a specimen by compacting the prepared material in the 6 in (152.4mm) diameter, 6 in (152.4 mm) high mold (with collar attached)?

8. Lightly tamp the soil prior to compaction until the material is no longer loose or in a fluffy state.

9. Compact the material in five equal layers so the total compacted depth is about 5 in (127 mm)?

10. Compact each layer with 56 uniformly distributed blows from the rammer?

- 11. After compacting the five layers, remove the collar and carefully trim the compacted material with the straightedge to be even with the top and bottom of the mold?
 - 12. Weigh the mold and moist material to the nearest 1g.?
 - 13. Calculate and record the wet weight in lbs/ft³ (kg/m³) as follows:

Wet weight = (weight of compacted specimen and mold – weight of the mold) x (13.33).

- 14. Remove the material from the mold by use of a sample extruder and slice it vertically through the center removing the center face of the sample for moisture testing?
- 15. If the material in the mold is not cohesive take the moisture sample from the center of the pile.?
- 16. Dry the sample at 230 ° ± 9 °F (110 ° ± 5 °C) in the oven in accordance with AASHTO T 265?
- 17. Thoroughly break up the remainder of the compacted material until at least 90% of the sample will pass a 3/4 in (19 mm) sieve?

18. Add this material to the original portion of the sample that passed the 3/4 in (19 mm) sieve and was not used before?

19. Add enough water to increase the moisture content of the sample by about 1 to 2 percent?

20. Repeat Procedures, steps 7 through 18. When the test indicates there is either a decrease or no change in the wet weight/ft³ (m³) of the compacted material perform one additional test to assure there is a minimum of two determinations below optimum.

SECTION 6

GDT 4

Determining Gradation of Soils

GDT 4

A. Scope

For a complete list of GDTs, refer to the STI (Sampling, Testing and Inspection) section of "The Source", which is the Georgia Department of Transportation's online referenceforcontractors.

Use this test method to quantitatively determine particle size in soils, soil aggregate, graded aggregate, and similar roadway materials.

B. Apparatus

The apparatus consists of the following:

- 1. Oven: A thermostatically controlled drying oven capable of maintaining temperatures of 230 ± 9 °F (110 ± 5 °C) for drying the sieve analysissamples.
- 2. Balance: The balance shall have sufficient capacity, be readable to 0.1 percent of the sample mass, or better, and con- form to the requirement of AASHTO M231.
- 3. Sieves: A series of sieves consisting of the #40, #60 and #200, constructed with a square mesh woven cloth, conforming to the requirements of ASTM E11.
- 4. Mechanical Sieve Shaker—A mechanical sieving device, if used, shall create motion of the sieves to cause the particles to bounce, tumble, or otherwise turn so as to present different orientations to the sieving surface. The sieving action shall be such that the criterion for adequacy of sieving described in Section D, Step No. 23, is met in a reasonable time period.
- 5. Large Pan: Suitable large pan made of material resistance to corrosion and subject to change in mass or disintegration from repeated use or other suitable device such as a large cloth.
- 6. Scoop: Suitable device for mixing and sampling thematerial.
- 7. Sample Splitter—A suitable riffle sampler or sample splitter for proportional splitting of the sample and capable of ob- taining representative portions of the sample without appreciable loss of fines. The width of the container used to feed the riffle sample splitter should be equal to the total combined width of the riffle chutes. Proportional splitting of the sample on a canvas cloth is also permitted.

Note—The procedure for proportional splitting is described in R 76.

- 8. Storage Cups: Use pint-sized (0.473 L) cups or other suitable containers identified numerically for storing a sample of the material.
- 9. Funnel: Use a funnel with at least a 3 in (75 mm) intake diameter and at least a 1/2 in outlet diameter to put soil into bottles without spilling.
- 10. Bottles: a or b
 - a. Use 8 oz (237 ml), wide-mouth bottles, approximately 1.3 in (33 mm) inside mouth diameter, 5.35 in (136 mm) high, and 4 in (102 mm) from the bottom to the bottom of the neck. This bottle requires a siphoning wand that has a reach of 3.5 in (89 mm) from the top of the bottle with a clearance from the bottom of the wand to the bottom of the bottle of 1.625 in $\pm 1/16$ in (41.3 mm ± 1.6 mm). The bottles must be clear and free from these.
 - b. Use 8 oz (237 ml), wide-mouth bottles, approximately 1.2 in (30 mm) inside mouth diameter, 5.5 in (140 mm) high, and 4 in (102 mm) from the bottom to the bottom of the neck. This bottle requires a siphoning wand that has a reach of 3.7 in (94 mm) from the top of the bottle with a clearance from the bottom of the wand to bottom of the bottle 1.625 in $\pm 1/16$ in (41.3 mm ± 1.6 mm). The bottles must be clear and free from chips.
- 11. Sodium Hexametaphosphate Solution: Use a mixture of 5 gal (19 L) potable water, and 10 oz (285 g) of Sodium Hex- ametaphosphate.
- 12. Timing Device: A watch or clock readable to the nearest second.
- 13. Evaporation Dishes: Use dishes to evaporate the water from the minus No. 10 (2.00 mm) sample.
- 14. Water Changing Assembly: Use a reversible-fill siphon assembly for changing the water in the bottle. The device shall consist of 1/4 in (6 mm) copper or stainless steel tubing of such length that when placed into the bottle, the end reaches 1.625 in $\pm 1/16$ in (41.3 mm ± 1.6 mm) from bottom of the bottle. The water supply should have an aspirator for the fill/empty cycle.

- 15. Bottle Flushing Assembly: Use a 3/16 in (4 to 6 mm) copper tube bent into an ogee shape and preferably mounted stationary on a working platform at eye level. The outlet end of the tube should be pointed up, and the middle of the tube should be oriented such that an evaporating dish will fit under it. Optional: The copper or stainless steel tube may be hand-held provided all the material is washed into the dish and the
- dish does notoverflow. 16. Bottle: Use a 5 gal (19 L) aspirator bottle.
- 17. tirring Device: Any nonporous device suitable for stirring the sample mixture without loss of material.

C. Sample Size and Preparation

- 1. Prepare the sample received from the field in accordance with AASHTO R 58, Standard Practice for Dry Preparation of Disturbed Soil and Soil-Aggregate Samples for Test.
- Separate the materials retained on the No. 10 (2.00 mm) sieve into a series of sizes 3 in., 2 in., 1 in., 3/8in., and the No. 4 (75, 50, 25, 9.5 and 4.75-mm) sieves and using other sieves as may be needed depending on the sample or on the specification for the material being testing.
- 3. Weigh and record the cumulative weights retained, for the coarse (plus No. 10) materials, in accordance with AASHTO T-27, Standard Method of Test for Sieve Analysis of Fine and Coarse Aggregate.
- 4. Transfer the portion of material passing the No. 10 (2.00 mm) sieve, obtained from the portion of the sample selected for particle analysis in step No. 1, into a large pan or onto a suitable cloth and mix itthoroughly.
- 5. Using a sampler, or by splitting or quartering, obtain representative portions, from the thoroughly mixed materials prepared in step No. 4, having the following masses: (1) for GDT 6 – volume change of soils, 1000 +/- 1g; (2) for GDT 7 – maximum dry density and optimum moisture, 3000g; and (3) for grading the minus No. 10 (2.00 mm) material by elutriation, a pint-sized storagecup.

D. Procedures

Grading the Minus No. 10 (2.00 mm) Material byelutriation.

Grade the minus No. 10 (2.00 mm) material by elutriation when the governing Standard Specifications call for GDT-4. The process is:

- 1. Using a sampler, or by splitting or quartering, obtain two 50g samples from the material in the pint-sized storage cup.
- 2. Place one sample in an evaporatingdish.
- 3. Dry the sample to a constant mass at a temperature of 230 ± 9 °F (110 ± 5 °C).
- 4. Weigh the sample and determine its mass to the nearest 0.1g. Record this mass as Sample No. 1. Use this value as the original dry weight to calculate the grading of the minus No. 10 (2.00 mm) material.
- 5. Fill a test bottle to approximately 2 in. (50mm) of sodium hexametaphosphate solution.
- 6. Use the funnel to place the second sample into the test bottle containing hexametaphosphate solution.
- 7. Bump the funnel a few times to ensure that the fines clinging to the surface fall into the test bottle.
- 8. Vigorously stir the soil with a suitable nonporous stirring device(e.g.) to reduce the cohesive forces of the clay.
- 9. Allow the test bottle, containing sodium hexametaphosphate solution and soil, to stand for a minimum of 10minutes.
- 10. Using the water change assembly, add water to the test bottle in a manner that will vigorously agitate the material. Continue to add water, using the agitating action, until the test bottle is filled to the height where the bottleneck begins.
- 11. Allow the test bottle, water, and sample to stand undisturbed for 8 to 10 minutes.
- 12. Using the water change assembly, siphon off the fluid level to about 3/4 in. (18mm) above the soil.
- 13. Using the water change assembly, refill the test bottle in a manner that will vigorously agitate the material. Continue to add water, using the agitating action, until the test bottle is filled to the height where the bottleneck begins.
- 14. Allow the test bottle, water, and sample to stand undisturbed for 8 to 10minutes.
- 15. Repeat steps No. 10 through No. 14 until the fluid above the sample becomes clear enough, after step No. 14, to read a watch on the opposite side of the test bottle.
- 16. Using the water change assembly, siphon off the water and transfer the soil and remaining water from the test bottle into an evaporating dish.
- 17. Flush the inside of the test bottle clean with two or three short spurts of water from the bottle flushing assembly into the

evaporating dish. Be careful not to lose any portion of the sample.

- 18. Allow the sample to stand in the evaporating dish until the liquid clears.
- 19. Decant excess water with care not to lose any of the finematerial.
- 20. Dry the material to constant mass at a temperature of $230 \pm 9^{\circ}F (110 \pm 5^{\circ}C)$.
- 21. Weigh the sample and determine its mass to the nearest 0.1g. Record this mass as Sample No.2.

- 22. Sieve the dry sample over a nest of sieves, the No. 40, No. 60, and No. 200, arranged in order of decreasing size from top to bottom.
- 23. Continue sieving for a sufficient period and in such manner that, after completion, not more than 0.5 percent by mass of the sample No. 2, as determined in step No. 21, passes any sieve during 1 min of continuous hand sieving performed as follows: Hold the individual sieve, provided with a snug-fitting pan and cover, in a slightly inclined position in one hand. Strike the side of the sieve sharply and with an upward motion against the heel of the other hand at the rate of about 150 times per minute, turn the sieve about one sixth of a revolution at intervals of about 25 strokes.
- 24. Determine the mass of each size increment to the nearest 0.1g.
- 25. The total mass of the material after sieving shouldn't differ by more than 0.3 percent of the total original dry mass of the sample placed on the sieves, sample No. 2. If the two amounts differ by more than 0.3 percent, based on the total original dry sample mass, the results should not be used for acceptance purposes.
- 26. Calculate percentages passing, total percentages retained, and clay percentage to the nearest 0.1 percent on the basis of the total mass of Sample No. 1, determined in step No. 4. These test results shall be used to classify soils, as established in GDOT Standard Specifications, Section 810-Materials, Table 1.
- 27. When required, compute the sieve analysis and clay percentage, of materials passing the No. 10 (2.00 mm) sieve, to represent the total sample as determined in Section E., Step No. 2 and Step No. 4.

E. Calculations

1. Retained (percent) = $100 (B \div A)$

Passing (percent) = $100 (A - B) \div A$

Check: percent retained + percent passing = 100.0 percent

Where:

- A = the total sample weight if the sieve is No. 10 (2.00 mm) or larger, or
- A = the weight of the 50.0 g sample (Sample No. 1) after it was dried to a constant weight if the sieveis smaller than the No. 10 (2.00 mm)
- B = cumulative weight retained on the specific sieve

Adjust the gradation of the minus No. 10 (2.00 mm) portion to represent the total sample as follows:

- $C = D x E \div 100$ where:
- C = percent of the total sample smaller than thespecific sieve
- D = percent passing the No. 10 (2.00 mm) sieve
- E = percent of the minus No. 10 (2.00 mm) portion that passed the specific sieve

Examples of Calculations:

Total Sample Weight = 28,650 g								
Gradation of Plus No. 10 (2.00 mm)								
Sieve Accumulative Weight Re- tained Percent of Total Sample								
		Retained	Passing					
1-1/2 (37.5 mm)	0	0	100.0					
3/4 (19.0 mm)	5,850	20.4	79.6					
10 (2.0 mm)	17,450	60.9	39.1					

Accumulative percent retained on and passing the 3/4 in (19.0 mm) sieve:

Retained on 3/4 in (19.0 mm) sieve = 100 (B ÷ A)

 $= 100 (5,850 \div 28,650) = 100 (0.204)$

= 20.4 percent retained

Passing 3/4 in (19.0 mm) sieve = 100 (A - B) \div A

 $= 100 (28,650 - 5,850) \div 28,650$

Check: percent retained + percent passing = 100.0percent 20.4 percent + 79.6 percent = 100.0 percent

	Gradation of Minus No. 10 (2.00 mm)									
Weigł	Adjusted for Total Sample Percent Pass- ing									
Sieve	Accumulative Weight Retained	Passing								
40 (425 µm)	19.5	39.7	60.3	23.6						
60 (250 µm)	27.1	55.2	44.8	17.5						
200 (75 µm)	40.0	81.5	18.5	7.2						
Total	44.1	89.8								
	Clay (effluent) =	10.2	4.0							

Retained on No. 60 (250 μ m) = 100 (B ÷ A)

```
= 100 (27.1 ÷ 49.1)
```

```
= 100 (0.552)
```

= 55.2 percent retained

Passing No. 60 (250 μ m) = 100 (A - B) ÷ A

$$= 100 (49.1 - 27.1) \div 49.1$$

 $= 100 (22.0) \div 49.1 = 44.8$ percent passing

Minus No. 60 (250 μ m) in total sample = (D x E) ÷ 100

$$= (39.1 \text{ x} 44.8) \div 100$$

 $= 1751.68 \div 100$

= 17.5 percent

Clay is the material washed from the 50 g sample; therefore, it is not in the washed sample.

Clay (percent) in minus No. 10 (2.00 mm)

$$= 100 (A - B) \div A$$

$$= 100 (49.1 - 44.1) \div 49.1 = 100 (0.102)$$

```
= 10.2 percent
```

4. Clay (percent) in total sample = $(D \times E) \div 100$

$$= (39.1 \text{ x } 10.2) \div 100$$

= 3.988 or 4.0 percent

F. Report

- 1. Report the percent passing each sieve to the nearest 0.1 percent.
- 2. Report the percent clay to the nearest 0.1 percent.

200 (75 µm)	39.8									
	Clay (effluent) =									

PERFORMANCE CHECKLIST

GDT 4

Determining Gradation of Soils

- 1. Prepare the sample received from the field in accordance with AASHTOR-58.
- Perform sieve analysis, on materials retained on the 2.00-mm (No. 10) sieve, in accordance with AASHTO T-27, Standard Method of Test for Sieve Analysis of Fine and Coarse Aggregate.
- 3. Use 3 in., 2 in., 1 in., 3/8in., and the No. 4 (75, 50, 25, 9.5 and 4.75-mm) sieves, other sieves may be needed depending on the sample or the specification for the material being tested.
- 4. Transfer the material passing the 2.00-mm (No. 10) sieve into a large pan or onto a suitable cloth and mix it thoroughly.
- Using a sampler, or by splitting or quartering, obtain representative portions having approximate masses as follows: (1) for GDT 6 – volume change of soils, 1000 +/- 1g; (2) for GDT 7 – maximum dry density and optimum moisture, 3000g; and (3) for physical tests, a pint-sized storage cup.

Procedure - Grading the minus No. 10 material

- 6. Using a sampler, or by splitting or quartering, obtain two 50g samples from the material in the pint-sized storage cup that was retained for physical testing.
- Place one sample into an evaporating dish and dry to a constant weight at a temperature of 230 ° ± 9 °F (110 ° ± 5 °C).
- 8. Remove sample from the oven and allow to cool to room temperature.
- 9. Record sample mass as the original dry mass to calculate the grading of the minus No. 10 (2.00 mm) sieve.
- 10. Fill test bottle, to approximately 2 in. (50mm), of sodium hexametaphosphate solution.
- 11. Place remaining 50g sample into test bottle and vigorously stir with a glass rod.
- 12. Allow the test bottle, containing sodium hexametaphosphate solution and soil, to stand undisturbed for a minimum of 10 minutes.
- 13. Use water changing assembly to add water to the test bottle, in a manner that will vigorously agitate the material, to the height where the bottle-neck begins.

- 14. Allow the test bottle, containing sodium hexametaphosphate solution, water, and soil, to stand undisturbed for a minimum for 8 to 10 minutes.
- 15. Use water changing assembly to siphon off the fluid to approximately 3/4 in (18 mm) above the sample.
- 16. Using the water change assembly, refill the test bottle in a manner that will vigorously agitate the material. Continue to add water, using the agitating action, until the test bottle is filled to the height where the bottle neck begins.
- 17. Repeat steps 13 through 16 until the fluid above the sample becomes clear enough, after step 16, to read a watch on the opposite side of the bottle.
- 18. Transfer the test sample to an evaporating dish.
- 19. Dry the test sample to a constant mass at a temperature of $230^{\circ} \pm 9^{\circ}$ F ($110^{\circ} \pm 5^{\circ}$ C).
- 20. Remove test sample from oven and allow to cool to roomtemperature.
- 21. Sieve the dry sample over the No. 40, No. 60, and No. 200 sieves.
- 22. Report the percent passing each sieve, and the percent clay, to the nearest0.1percent.

SECTION 7

GDT 6

Determining Volume Change of Soil

A. Scope

This method describes the procedure used to determine the volume change of soil caused by the absorption and loss of water.

B. Apparatus

The apparatus consists of the following:

- Swell Mold—A cylindrical metal mold approximately four 4 ± .02 in (100 ± 0.51 mm) inside diameter and 1 ± .01in (2.5 ± 0.13 mm) high. Each mold is fitted with a detachable perforated base plate and a removable extension approx.-imately 2 in (50.8 mm) high. (See Figure 1)(WM-08).
- 2. Shrinkage Mold—The same mold as the swell mold except it requires close tolerances. The height at any point is $1 \pm .005$ in (25 + 0.13 mm) and diameter at any point is $4 \pm .01$ in (100 + 0.25 mm). Paint the shrinkage mold a different color to distinguish it from the swell molds(WM-08).
- 3. Rammer—A metal rammer having a 2 in (50mm) diameter flat circular face and weighing 5.5 lbs. (2.49 kg). Has a controlled height of free-fall of 12 1/8 in ± 0.06 (303 ± 1.5 mm) (WR-1). When using a mechanical rammer, observe the following:
 - a. After use each day, oil the shaft with a thin lubricant.
 - b. Before use each day, wipe clean the shaft and allow to drop 25 times to standardize the shaft friction.
 - c. Check the mechanical rammer for tolerances semi-annually using the procedures in AASHTO T-99.
- 4. Water Vat—A pan at least 1½ in (38 mm) deep with a bottom flat enough that the water surface strikes the same point within 1/16 in (1.6 mm) on all mold assemblies in the vat. Place a screen wire or similar object in the vat to ensure that water can get under the molds.
- 5. Drying Rack—A flat perforated metal plate with five 3/8 in (10 mm) diameter holes located symmetrically under each specimen used to dry and cool shrinkagespecimen.
- 6. Absorbent Papers—Absorbent paper used in the swell test. Two types of absorbent paper are used: a Number 1 qualitative 4 in (100 mm) diameter paper placed in the bottom of the mold, and a double thickness paper towel measuring about 4½ in (114 mm) square is wet and placed on top of the specimen after the water level has been adjusted (WP-03-1).
- 7. Extruder—A cylindrical device 3.90 TO 3.97 in (99.1 to 100.8 mm) diameter used to remove the compacted shrinkage specimen from the mold(WS-9).
- Scales—A balance or scale having a capacity in excess of 2.2 lbs. (1000 g), sensitive to 0.0022 lbs (1.0 g). (WB-ELC-1).
- 9. Drying Oven—An oven with the temperature thermostatically controlled to $230^{\circ} \pm 9^{\circ}F(110^{\circ} \pm 5^{\circ}C)$ used to dry the shrinkage specimen.
- 10. Knife—A stiff sharp blade approximately 12 in (300 mm)long with the cutting edge straight to within 1/32 in (0.8 mm) throughout its length. Used for slicing the compacted specimen flush with the top of the mold-(WS-13-1).
- 11. Swell Thickness Measuring Device—Device consisting of a one 1 in (25.4 mm) travel micrometer dial readable to and sensitive to one-thousandth 0.001 in (0.025 mm) and the stand shown in <u>Figure 2</u>. Measure the original and final thickness with this device by lowering the foot gently until contact is made with the surface of the specimen. Exercise caution to avoidpenetration.
- 12. Shrinkage Thickness Measuring Device—A one 1 in (25.4 mm) travel micrometer dial readable to and sensitive to 0.001 in (0.025 mm). Use the stand shown in Figure 3 to measure the original and final thickness of the shrinkage specimen.
- Shrinkage Final Diameter Measuring Device—A device consisting of a 1 in (25.4 mm) travel micrometer dial readable to and sensitive to 0.001 in (0.025 mm) and the stand shown in Figure 4. The original diameter is four4±.005 in (101.6 + 0.13 mm) as given in step 2 above.
- 14. Calibration Tool—A calibration tool used to adjust each of the 3 measuring devices to read "zero" at a point that will allow gauge travel over therange of anticipated measurements. The constants, 6.35, 22.23, and 82.55, shown in

<u>Figure 5</u> are added to the shrinkage thickness, swell thickness, and shrinkage diameter dial readings respectively to produce the measurements of the specimen. All swell base plates are preadjusted to give a dial reading of zero (WG-8).

15. Plastic Bags — Bags with a 2 qt (2 L) capacity (WB-01).

16. Graduated Cylinders—A 3.4 oz (100 ml) graduate cylinder(Bit-04-100).

C. Sample Size and Preparation

No sample preparation isneeded.

D. Procedures

1. Take a 2.2 +0.0022 lbs (1000 + 1.0 g) sample of the minus No. 10 (2.00 mm) material from thematerial obtained according to

GDT 4, "Method of Test for Determining Gradation of Soils."

- 2. Place the sample in a plastic bag and thoroughly mix it with enough water to bring the moisture content to optimum as determined by GDT 7, "Method of Test for Determining Maximum Density of Soils" or by GDT 67. After mixing, seal the sample in a plastic bag for a minimum of 1 hour.
- 3. Swell Testing—Place a 4 in (100 mm) diameter absorbent paper in the assembled swell mold with the extension intact and placed under the rammer. Put half of the wet material into the mold and lower the rammer to touch the soil. Compact the material with 25 freefalls with therammer.

Remove the extension and carefully slice the surface of the specimen flush with the top of the mold. Separate the mold full of soil from the base plate with a twisting motion and remove from the base plate, invert, and replace on the absorbent paper and perforated base plate. (Use two different base plates to avoid excessive wing nut adjusting.) Ensure that each base plate for the swell test has the dial plate support preadjusted so the micrometer dial reads zero on the 0.875 in (22.22 mm) constant of the calibration tool when arranged as shown in Figure 2 with the mold removed. Using the measuring device in Figure 2, determine and record the original swell thicknessreading.

Place the assembled mold, base plate, and sample into the empty vat. After all the swell samples are in the vat, slowly put water into the vat until the water level is at the top of the mold side pin, but not covering it. Wet and place an absorbent paper measuring about 4½ in (114 mm) square on top of each swell specimen so each corner will drop into the water. After the specimen has remained in the vat undisturbed for 20 1/2 hours, carefully remove the paper and make and record a final thickness measurement. Since the specimen diameter is constant, the only change is in thickness; therefore, the percent swell is calculated as follows:

Swell %	=	100	*	<u>Final Dial Reading</u> - Original Dial Reading Original Dial Reading + 0.875
---------	---	-----	---	--

4. Shrinkage Testing—Place the other half of the wet material in step 2 into the assembled mold, base plate, and extension and put under the rammer. Lower the rammer to touch the soil and apply 25 tamps to compact the material. Remove the extension and carefully splice flush the surface of the specimen with the top of the mold. Separate the mold full of soil from the base plate with a twisting motion and remove from the base plate. Place the mold full of soil on the extruder and carefully push the mold from around the specimen. Carefully place the specimen on the measuring stand in Figure 3 and record the original thickness dial reading. Place the specimen on the drying rack and allow it to air dry for about 1 hour after compacting and measuring all specimens to be tested.

Place the rack of specimen in the oven for 20 1/2 hours. Remove the rack of samples from the oven and allow to cool for about 30 minutes. Determine the final thickness dial reading and final diameter dial reading using the devices in Figure 3 and Figure 4, respectively. In determining the final diameter dial reading, the circular end of the specimen faces the same direction as the dial to ensure proper centering of the specimen. Record the thickness dial reading and the mean diameter dial reading. Calculate the percent of shrinkage as follows:

Shrinkage %

Original Volume – Final Volume

Original Volume

riginal Volume, $in^3 = 0.7854 (4in)^2 (.250 in + B) [mm^3 = 0.784 (101.6 mm)^2 (6.35 mm + B)]$ Final Volume, $in^3 = 0.7854 (3.250 in + FD)^2 (.250 in + FD) [mm^3 = 0.7854 (82.55 mm + FD)^2 (6.35 mm + FT)]$ Where:

B = beginning dial reading for thickness FT = final

dial reading for thickness

FD = final dial reading fordiameter

If desired, the following simplified formula may be used:

% sh inkage = 100
$$(3250 + FD)^2$$
 (250+FT)
- .16(.250 +B)

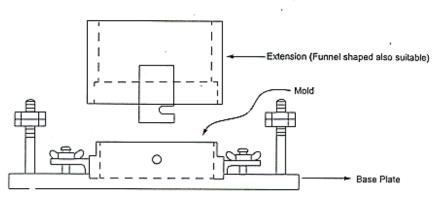

- 5. Correction for Plus No. 10 (2.00 mm) Material—Where the soil contains particles larger than the No. 10 (2.00 mm) sieve, the swell and shrinkage shall be corrected to reflect the percentage of Plus No. 10 (2.00 mm) material if the applicable specifications require volume change results on the total sample. Conversion factors for correcting the swell and shrinkage are given in the <u>Volume Change Conversion Tables</u>.
- 6. Total Volume Change—Calculate the total percentage points of volume change with the formula: Total Volume Change = Percent Swell + Percent Shrinkage

E. Calculations

No calculations are needed.

F. Report

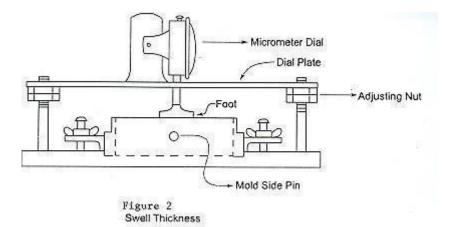

Report swell, shrinkage, and volume change to the nearest 0.0022 lb (1.0 g) for minus No. 10 (2.00 mm) or total sample, whichever is appropriate.

Assembled Mold, Base Plate, and Collar

Volume Change Conversion Tables

This table on thenext 12 pages gives a conversion factor for the related volume change of plus and minus No.10 materials combined to the minus No.10 material volume change.

Example OfApplication:

Suppose a soil sample has 25 percent plus No 10 material. The minus No. 10 material has a proctor density of 100 pounds per cubic foot and a shrinkage of 12 percent. To determine the composite soil (plus the minus No. 10 material) shrinkage, locate the 100 line in the left hand column, then follow this line right to the 25 percent column. The factor given is 0.804. Thus $12 \times .804 = 9.6$ percent shrinkage for the compositesoil.

STUDY QUESTIONS

GDT 6

Determining the Volume Change of Soils

- 1. It is ok to use the same mold for both the shrinkage test and the swell test?
 - a) True
 - b) False
- 2. The metal rammer used for this test shall have a _____ in diameter flat circular face and weigh _____ lbs.
- 3. When using a mechanical rammer, check the tolerances semi-annually using the procedures in AASHTO ?
- 4. What is the minimum depth of the water vat required for this test?
- 5. A flat perforated metalplate with ______ 3/8 in (10 mm) diameter holes located symmetrically under each specimen shall be used to ______ and _____ shrinkage specimens.
- 6. The three measuring devices shall be readable to and sensitive to ______in.?
- 7. The following device is used to measure_____?

- 8. A sample mass of _______should be taken from the materials passing the 2.00-mm (No.10) sieve as obtained according to _____?
- 9. Optimum moisture content used for this procedure should be determined by _____ or ____?
- 10. The test sample should be allowed to stand, in a ______, at ______, at _______, of 1 hour?
- 11. How many freefalls of the hammer are required to compact the swell test specimen?
- 12. Swell test base plates should be preadjusted, so the micrometer reads______on the

constant of the calibration tool, with the _____removed.

13. Swell specimens should remain in the water vat undisturbed for ______hours before removing the

and recording the final measurement?

14. Calculate the percentswell?

Original Dial Reading	.143"
Final Dial Reading	.180"
Swell %	<u>_%</u>

- 15. The original thickness measurement, when measuring shrinkage, shall be taken before the specimen is extruded from the mold?
 - a) True
 - b) False
- 16. Shrinkage specimens shall be allowed to ______ for about ______ hour after compacting and measuring all specimens to be tested?
- 17. When determining the final diameter dial reading, the ______ end of the specimen should face the same direction as the ______to ensure proper centering of the specimen?
- 18. Calculate the percentshrinkage?

B =	.758
FT =	.750
FD =	.740
Shrinkage %	%

19. Calculate the total volume change using the results from questions No. 14 and No. 18?

Total Volume Change = <u>%</u>

PERFORMANCE CHECKLIST

GDT 6

Determining the Volume Change of Soils

- 1. Place sample into a plastic bag and thoroughly mix it with enough water to bring the moisture content to optimum.
- 2. Seal the bag and allow the test sample to stand for a minimum of 1 hour.

Swell Test

- 3. Place a 4 in. (100 mm) diameter absorbent paper into the assembled swell mold.
- 4. Place the swell mold under the rammer and place 1/2 of the test sample into the mold.
- 5. Lower the rammer to touch the soil and compact the test sample with 25 freefalls of the rammer.
- 6. Remove the mold extension and slice the surface of the specimen flush with the top of the mold.
- 7. Separate the mold from the base plate, invert, and place onto the absorbent paper and perforated base plate.
- 8. Use the measuring device in Figure 2 to determine the original swell thickness reading.
- 9. Place the assembled mold, base plate, and test sample into an empty vat.
- 10. Slowly fill the vat until the water level is at the top of the mold side pin, but not covering it.
- 11. Place a wet, absorbent paper, measuring about 4 ½ in. (114 mm) square, on top of the swell specimen so that the corner will be in the water.
- 12. Allow test specimen to remain in the vat undisturbed for 20 and ½hours.
- 13. Remove the absorbent paper and record a final thickness measurement.

Shrinkage Test

- 14. Place remaining 1/2 of the test sample into the assembled mold, base plate, and extension.
- 15. Lower the rammer to touch the soil and compact the test sample with 25 freefalls of the rammer.
- 16. Remove the mold extension and slice the surface of the specimen flush with the top of the mold.
- 17. Separate the mold, full of soil, from the base plate.
- 18. Use an extruder to remove the soil cake from the mold.
- 19. Place the test sample on the measuring stand in Figure 3 and record the original shrinkage thickness dial reading.

- 20. Place the test specimen on a drying rack and allow to air dry for about 1hour.
- Place the drying rack, and test specimen, into the oven at a temperature 230° ± 9°F (110° ± 5°C) for 20 and 1/2 hours.
- 22. Remove the rack, and test specimen, from the oven and allow to cool for about 30 minutes.
- 23. Determine the final thickness dial reading and the final diameter dial reading using the devices in Figure 3 and Figure 4.

SECTION 8

GDT 7

Determining Maximum Density of Soils

A. Scope

For a complete list of GDTs, see the TableofContents.

Use this test method to determine the relation between moisture content and the theoretical or laboratory maximum dry density. Measure the density in a 1/30 ft³ (0.000943, \pm 0.000008 m³) (Reference ASTM D-698 Mold Volume Calibration) mold compacted by a 5.5 lb (2.5 kg)rammer.

B. Apparatus

The apparatus consists of the following:

Mold: Use a cylindrical metal mold with an approximate 4 in (101.6, ± 0.408 mm) diameter, 4.6 in (116.43, ± 0.1270 mm) high, and a volume of 1/30 ft³ (0.000943, ± 0.000008 m³). The mold is fitted with a detachable base plate and a removable extension approximately 2.5 in (63 mm) high (WM-05) (see Figure 7-1).

This volume to be 1/30 cubic ft., 4.59 " (1.060 mm³, 116 mm) (Reference ASTM D-698 MoldVolume Calibration)

- Rammer: Use a metal rammer with a 2 in (50.8, ± 0.127 mm) diameter, flat circular face, andweighing 5.5 lbs. (2.49 kg). The rammer must be equipped with a suitable arrangement to control the height ofdrop to a free fall of 12 in (304.8, ± 1.524 mm) above the soil(WR-1).
- 3. Scales and Balances: Use a scale of 20 kg capacity sensitive to and graduated in 0.1g, and a 500 g capacity balance sensitive to0.1g.
- 4. Drying Device: Use a stove or oven capable of rapidly drying the moisture determination samples (WS-12).
- 5. Straightedge: Use a steel straightedge 12 in (300 mm)long(WS-13-1).
- 6. Pans or Dishes: Use pie pans or evaporating dishes suitable for drying soil samples (WP-01 or WD-3).
- 7. Sieve: Use a No. 10 (2.00 mm) sieve that conforms to the "Standard Specifications for Sieves for Testing Purposes," AASHTO M 92(WS-08-#010).
- 8. Graduated Cylinder: Use a glass or plastic (WC-5-100) 3.4 oz. (100 ml) graduated cylinder used to measure the mixing water(Bit-04-100).
- 9. Mallet: Use a wooden mallet or rubber-covered pestle of suitable size(OH-06).
- 10. Cup: Use an 8 oz (237 ml), seamless tin cup (OC-11) for moisture-constantsamples.
- 11. Extruder (optional): Use a cylindrical piston slightly less than 4 in (100 mm) diameter or similar device for removing compacted specimens frommold.

C. Sample Size and Preparation

- 1. Break all the soil aggregations without reducing the natural size of individual particles.
- 2. Select a representative test sample (about 10 lbs. (5 kg)) by quartering or by using a sampler.
- 3. Dry the sample only enough to sift over a No. 10 (2.00 mm) sieve. Do not sift yet.
- 4. Weigh the sifted sample and record the weight as the weight of the total sample.
- 5. Split the sample into two portions with the No. 10(2.00mm)sieve.
- 6. Grind the fraction retained on the No. 10 (2.00 mm) sieve with a rubber-covered pestle or wooden mallet until the aggregations of soil particles are broken up into separategrains.

- 7. Separate the ground soil into two fractions again with the No. 10 (2.00mm)sieve.
- 8. Weigh the fraction retained on the No. 10 (2.00 mm) sieve after the second sieving.

9. Record the weight as the weight of material retained on the No. 10 (2.00 mm)sieve.

D. Procedures

- 1. Thoroughly mix both fractions that passed the No. 10 (2.00 mm) sieve in both sieving operations.
- 2. Take a 6.6 lb (3000 g) sample from the minus No. 10 (2.00 mm) material by quartering or by using a sampler.
- 3. Attach the extension to the cylinder.
- 4. Compact the sample in the cylinder in three equal layers.
 - a. Compact each layer with 25 blows from the rammer dropped from 1 ft (304.8 mm) above thesoil.
 - b. Rest the mold on a uniform, rigid foundation, such as a concrete block weighing at least 200 lbs (90 kg).
 - c. Uniformly distribute the blows over the surface of the compacted layer.
 - d. Remove the soil that adheres to the face of the rammer after every 25thblow.
- 5. After compacting, remove the extension and baseplate.
- 6. Carefully level the compacted soil to the top and bottom of the cylinder with the straightedge.
- 7. Weigh the cylinder and sampletogether.
- 8. Calculate the wet weight of the compacted soil in pounds per cubic foot as follows:
 Wet Weight of Compacted Soil(lbs./ft³) = (Ws-Wc)/453.6 or (Ws-Wc) * Mold Factor or (Ws-Wc) * C.F.C V 453.6

 $V = Volume in lbs./ft^3 of the Mold as calibrated Using (Reference ASTM D-698 MoldVolume Calibration)$

Mold Factor = calculated $1/volumelbs./ft^3$

C.F.C = Correction Factor Conversion =

MoldFactor/453.6 Ws = weight of the compacted soil

and mold, in grams

Wc = weight of the mold, in grams

If you weighed in grams, dividing by 453.6 converts grams to pounds. This will give you the wet weight in pounds per cubic foot.

- 9. Remove the compacted soil from the cylinder and slice it vertically through its center.
- 10. Take a 100 g sample from the center and weigh it immediately.
- 11. Dry the sample to a constant weight.
- 12. Calculate the moisture content of the soil as follows:
- 13. Moisture (%) = <u>A B</u> x 100

В

where:

A = weight of the wet soil

B = weight of the dry soil

- 14. Thoroughly pulverize the remaining material from the compacted sample.
- 15. Add enough water to increase the moisture content of the soil in predetermined increments (1 percent to2 percent for sandy soils, 2 percent to 3 percent for clay soils).
 - a. For a 5.94 lb (2.7 kg) sample, add 0.9 oz (27 ml) of water to increase the moisture content by 1 percent.

- b. For a 6.6 lb (3000 g) sample, add 1 oz (30 ml) of water.
- 16. Repeat steps 1 through 13 again, taking a moisture sample after each determination.
- 17. Repeat the procedure until the soil becomes very wet and the wet weight of the compacted soil substantially decreases.

E. Calculations (CVP 7)

 Calculate wetdensity: Wet Density = <u>(Ws - Wc)/453.6</u> or (<u>Ws - Wc) * Mold Factor</u> or (Ws - Wc) *

C.F.C. V 453.6

where:

V =	Volume of the Mold as calibrated Using (Ref. ASTM D-698, CVP
7) Mold Factor =	Calculated 1/volume lbs/ft ³ (Ref. CVP7)
C.F.C =	$Correction \ Factor \ Conversion \ (GDOT \ Correction \ Factor) = Mold \ Factor/453.6 \ (Ref.$
CVP 7)	
Wc =	Weight of mold in grams
Ws =	Weight of mold + wet soil in grams
2.	Calculate percentmoisture:

% Moisture =
$$\underline{A - B} \times 100$$

B

where:

A = Weight of wet soil B = Weight of dry soil

3. Calculate the density (dry weight), in pounds per cubic foot (kilograms per cubic meter), of the compacted soil asfollows:

English—Dry Density $(lb/ft^{3)} = \underline{Ww}$ x 100 M + 100

where:

Ww = wet weight of the compacted soil, in pounds per cubic foot (Procedures, step D.8)

M = moisture content, in percent, at which the wet weight was determined (Procedures, step D.12)

- 4. Moisture-Density Relationship
 - a. Calculate and record the percent moisture and dry density for each determinationintheseries.
 - b. When using the moisture-density relationship for compaction control:
 - i. Plot a moisture-density curve by plotting the dry densities against their respective moisturecontents.
 - ii. Draw a smooth curve through theresultingpoints.
 - iii. The peak of the curve represents the maximum dry density of the materialbeingtested, and the moisture content at this point represents the optimum moisturecontent.

- c. For classification purposes, interpret the maximum dry density as the highest densityobtained in the test series, and the optimum moisture as the moisture content at that respective density.
- 5. Correction for Plus No. 10 (2.00 mm)Material
 - d. If the soil contains material retained on the No. 10 (2.00 mm) sieve and the specifications show density requirements on the total sample, you must correct the maximum dry density to reflect the percentage of Plus No. 10 (2.00 mm) material.
 - e. When determining maximum densities for compaction control, always correct the densities for the percentage of Plus No. 10 (2.00 mm) material.
- f. Use the conversion factors for correcting the density in Tables 1D 7D, below.
- g. Use the conversion factors for correcting the moisture of Minus No. 10 (2.00 mm) for the Plus No. 10 (2.00 mm) 1n Tables 1M 10M, below.

F. Report

- 1. Record the maximum dry density and the optimum moisture content of the material being tested as the theoretical or laboratory maximum dry density on Form495.
- 2. Send the completed original form to the Office of Materials and Research in Forest Park.
- 3. Send copies of the form to the Branch Lab and the AreaEngineer.
- 4. Notify the department head of any material that fails.

STUDY QUESTIONS

GDT 7

Determining Maximum Density of Soils

1.	The metal mold used in this procedure shall have an approximate volume o?
2.	A representative test sample, weighing about, should be obtained by using a,
	or by?
3.	During sample preparation, asieve is used to split the sample into two portions?
4.	What size sample is obtained from the thoroughly mixed portion of the materials passing the No. 10 (2.00
	mm) sieve?
5.	Each layer of soil material shall be compacted in the mold, usingblows from the rammer,
	dropped fromabove the soil.
6.	How many layers of material are compacted in the mold?
7.	When compacting the test sample, the mold should rest on afoundation weighing at least
	?
8.	How often should the soil material be removed from the face of the rammer?

- 9. A______ is used to level the sample to the top and bottom of the cylinder mold?
- 10. Calculate the wet weight of the compacted soil in pounds per cubic foot?

Weight of Mold	2002g
Weight of Mold + Sample	3800g
Mold Correction Factor	0.0665
Wet Weight, lbs./ft3	

11. Samples for percent moisture are obtained by slicing the compacted soil through its center, and removing a

______gram sample from the ______of the compacted soil?

12. Calculate the percent moisture content?

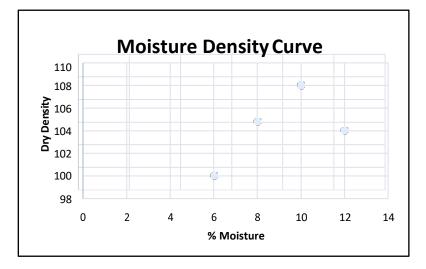

Weight of Wet Soil	100g
Weight of Dry Soil	94g
Moisture %	

13. What amount of water is needed to increase the moisture content of a 3000g sample by 1 percent?

- 14. Moisture content of the soil should be increased by, (1 percent to 2 percent for ______soils, 2 _____soils).
- 15. Repeat procedure until thesoil becomes ______and the _____of the compacted soil substantially _____?
- 16. Calculate the dry weight of the compacted soil in pounds per cubic foot?

Wet Weight, lbs./ft3	119.6
Moisture %	6.4
Dry Weight, lbs./ft3	

17. Plot the moisture density data points, draw a smooth curve connecting the points?

Dry Density	% Moisture
100.0	6.0
104.8	8.0
108.0	10.0
104.0	12.0

- 18. For______purposes, interpret the maximum dry density as the highest density obtained in the test series, and the optimum moisture as the moisture content at that respective density?
- 19. If the soil contains material retained on the No. 10 (2.00 mm) sieve and the ______show density requirements on the total sample, you must correct the ______to reflect the percentage of Plus No. 10 (2.00 mm) material?
- 20. It is not necessary to correct the density for percentage of Plus No. 10 (2.00 mm) material when determining maximum densities for compaction control?
 - a) True
 - b) False

21. Correct the maximum dry density and optimum moisture using the conversion factors in Tables 1D - 7D for maximum dry density and Tables 1M - 10M for optimum moisture?

- No. 10 Maximum DryDensity	108.0
- No. 10 Maximum OptimumMoisture	10.0
% Plus No. 10 Material	20.0
Corrected Maximum Dry Density	
Corrected OptimumMoisture	

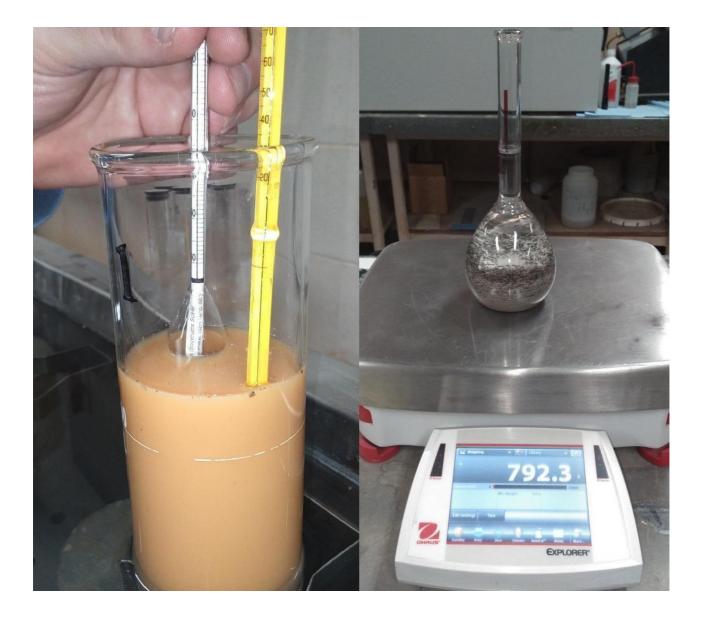

Determining Maximum Density of Soils

- Dry the soil sample thoroughly in air or in the drying apparatus at a temperature not exceeding 60°C [140°F].
- 2. Using a sampler, or by splitting or quartering, obtain a sample weighing approximately 10 lbs. (5 kg).
- 3. Record the sample mass and separate the sample into two portions using a No. 10 (2.00 mm) sieve.
- 4. Weigh and record the total mass of the sample.
- 5. Pulverize the sample in such a way as to avoid reducing the natural size of individual particles.
- 6. Separate the sample into two fractions using a 2.00-mm (No. 10) sieve.
- 7. Pulverize the material retained on the sieve until the aggregations of soil particles are broken into separate grains.
- 8. Re-sieve the ground soil on the 2.00-mm (No. 10) sieve.
- 9. Weigh and record the mass of material retained the 2.00-mm (No. 10) sieve.
- 10. Transfer the material passing the 2.00-mm (No. 10) sieve into a large pan or onto a suitable cloth and mix it thoroughly.
- 11. Using a sampler, or by splitting or quartering, obtain a sample with a mass of 6.6 lb. (3000 g).
- 12. Compact the test sample in the mold assembly in three equal layers.
 - Compact each layer with 25 blows from the rammer dropped from 1 ft (304.8 mm) above the soil.
 - Rest the mold on a uniform, rigid foundation, such as a concrete block weighing at least 200 lbs. (90 kg).
 - Uniformly distribute the blows over the surface of the compacted layer.
 - Remove the soil that adheres to the face of the rammer after every 25th blow.
- 13. After compacting, remove the extension and baseplate.
- 14. Carefully level the compacted soil to the top and bottom of the cylinder with the straightedge.
- 15. Weigh the cylinder and sample together.
- 16. Remove the compacted soil from the cylinder and slice it vertically through its center.
- 17. Take a 100 g sample from the center and weigh it immediately.

- 18. Dry the sample to a constant mass.
- 19. Thoroughly pulverize the remaining material from the compacted sample.
- 20. Add enough water to increase the moisture content of the soil in predetermined increments.
- 21. Repeat steps 12 through 18 until the soil becomes very wet and the wet weight of the compacted soil substantially decreases.
- 22. Repeat the procedure until the soil becomes very wet and the wet weight of the compacted soil substantially decreases.

SECTION 9

Georgia Department of Transportation Specifications, Section 810 – Roadway Materials

810.1 General Description

This section includes the requirements for the materials used in roadway construction.

810.1.1 Related References

A. Standard Specifications

General Provisions 101 through 150.

B. Referenced Documents

GDT 4

GDT 6

GDT 7

GDT 67

810.2 Materials

810.2.1 Roadway Materials

A. Requirements

Do not use materials containing logs, stumps, sod, weeds, or other perishable matter.

1. Classes

The materials are divided into six major classes. Classes I, II, and III are further subdivided and identified by description and physical property requirements specified in the table below and in Table 1. Classes IV, V, and VI are identified by descriptive requirements.

Class I			
IA1 and IA2	Medium- to well-graded sand or clayeysand.		
IA3	Fine-grained, silty, or clayey sand; usually less dense than IA1 or IA2.		
	These soils have an excellent bearing capacity.		
Class II			
IIB1, IIB2, and	Medium- to well-graded sandy clays, sandy silts, and clays with somemica.		
IIB3	These soils generally have low volume change properties and good densities that serve well as subgradematerial.		
IIB4	Similar to IIB1, IIB2, and IIB3, but generally contain more mica and are more sensitive to moisture. The bearing value of these soils is less predictable.		
	The soils may or may not be satisfactory for subgrade material. Analyze file data or		
	run laboratory and/or field tests for Class IIB4 when considering it for a subgrade material.		
Class III			

IIIC1, IIIC2, IIIC3 and IIIC4	Medium- to fine-graded micaceous sandy silts, micaceous clayey silts, chert clays, and shaly clays. Undesirable characteristics are high volume change properties and/or low densities.
	The bearing values are unpredictable. The Department recommends testing these materials in a laboratory, where possible, before use. One exception is District 6, where chert clay soils are prevalent.
	Chert clay soils (IIIC4) with less than 55% passing the No. 10 (2 mm) sieve may be considered suitable for subgrade materials. These soils are found generally in the northwest corner of the state in Dade, Walker, Catoosa, Whitfield, Murray, Chattooga, Gordon, and Floyd counties.
Class IV	Highly organic soils or peat, muck, and other unsatisfactory soils generally found in marshy or swampy areas.
Class V	Shaly materials that are not only finely laminated but have detrimental weathering properties and tend todisintegrate.
Class VI	Rock or boulders that cannot be readily incorporated into the embankment by layer construction, and that contain insufficient material to fill the interstices when they are placed.

Table 1: Physical Properties (Material Passing No. 10 (2.00 mm) Sieve)

Sub-Class	No. 60 (250 μm) Sieve	No. 200 (75 µm) Sieve	Clay, %	Volume Change, %	Maximum Dry Density lbs/ft ³
	% Passing	% Passing			(kg/m³)
		Clas	s I		
A1	15-65	0-25	0-12	0-10	115+ (1840+)
A2	15-85	0-35	0-16	0-12	100+ (1600+)
A3	15-100	0-25	0-12	0-18	98+ (1570+)
		Clas	ss II		
B1		0-30	0-20	0-10	120+ (1920+)
B2		0-45	0-30	0-15	110+ (1760+)
B3		0-60	0-50	0-20	105+ (1680+)
B4		0-75		0-25	90+ (1440+)
Class III					
C1		0-75		0-30	90+ (1440+)
C2				0-35	80+ (1280+)
C3				0-60	80+ (1280+)
C4*					80- (1280-)
*Chert clay soils in District 6 having less than 55% passing the No. 10 (2.00 mm) sieve may be considered suitable for subgrade material.					

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Test as follows:

Test	Method
Soil gradation	GDT 4
Volume change	GDT 6
Maximum density	GDT 7 or GDT 67

D. Materials Warranty

General Provisions 101 through 150.

STUDY QUESTIONS

Georgia Department of Transportation Specifications, Section 810 – Roadway Materials

- 1. Roadway materials are divided into _____ major classes?
- 2. What classes are identified by descriptive requirements?
- 3. Materials containing logs, stumps, sod, weeds, or other perishable matter are acceptable?
 - a) True
 - b) False
- 4. Physical properties for class I, II, and III soils, are determined on the materials passing the sieve.
- 5. Materials with physical properties meeting sub-class IIB3 requirements, would serve well as subgrade material?
 - a) True
 - b) False
- 6. Using the physical properties, determine the material sub-class?

% Passing No.40	20
% Passing No.60	32
% Passing No. 200	48
% Clay	50
% Volume Change	12
Maximum Dry Density lbs/ft3	103
Classification	

SECTION 10

Georgia Department of Transportation Specifications, Section 814 – Soil Base Materials

814.1 General Description

This section includes the requirements for soil base materials, including topsoil or sand-clay, soil-cement, sand for bituminous stabilization, and chert.

814.1.1 Related References

A. Standard Specifications

Section 209- Subgrade Construction Sec-

tion 301- Soil-Cement Construction Sec-

tion 800–Coarse Aggregate

Section 810–Roadway Materials

Section 831-Admixtures

B. Referenced Documents

AASHTO T 89 AASHTO T 90 ASTM D 516 GDT 4 GDT 6 GDT 7 GDT 65 GDT 67 GDT 98

814.2 Materials

814.2.1 Topsoil or Sand-Clay

A. Requirements

1. Use topsoil or sand-clay that is a natural or artificial mixture of clay or soil binder with sand or other aggregate. Do not use a mixture that contains substances detrimental to thematerial.

Obtain the materials from sources approved by the Engineer.

Ensure that the aggregate retained on No. 10 (2 mm) sieve (coarse aggregate) is of hard, durable particles.

- Sand and Binder
 Use hard, sharp, durable, siliceous particles. Use binder made from qualityclay.
- 3. Oversize

Remove particles with diameters greater than 2 in (50 mm) before depositing the topsoil or sand-clay on the road. Remove particles with screens or grizzlies, or by hand if few oversized pieces exist. You maycrush the oversized pieces and use them.

4. Topsoil

Use a topsoil that is a natural, generally pebblymaterial occurring in shallow surface deposits on usually levated areas.

5. Natural Sand-Clay

Use a natural sand-claythat is a mixture of natural material, largelysand and clayin proper proportions, occurring in deposits of considerable depth.

6. Artificial Sand-Clay

Use an artificial sand-claythat is largely a mixture of artificial sand and clay. You may make the mixture by combining clay or soil binder and sand or aggregate in the proper proportions.

7. Topsoil and Sand-Clay

Use topsoil and sand- clay with the following properties:

Sieve Size	Amount
Passing 2 in (50 mm)	100% by weight
Passing 1-1/2 in (37.5 mm)	80-100% by weight

Passing No. 40 (425 µm)	Liquid Limit (LL) of 25 orless
	Plasticity Index (PI) of 9 or less

8. Ensure that material passing the No. 10 (2 mm) sieve meets the following requirements:

Sieve Size	Percent Passing by Weight
Passing No. 10 (2 mm) sieve	100
Passing No. 60 (250 μm) sieve	15-85
Passing No. 200 (75 µm) sieve	9-35
Clay	9-25
Volume change, max.percent	12
Maximum density, lb/ft ³ (kg/m ³)	110+ (1760+)

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

The Department or Producer will test asfollows:

Test	Method
Soil gradation	GDT 4
Volume change	GDT 6
Maximum density	GDT 7 or GDT 67
Liquid Limit	AASHTO T 89
Plastic Limit and Plasticity Index	AASHTO T 90

D. Materials Warranty

General Provisions 101 through 150.

814.2.2 Soil-Cement Material

A. Requirements

- 1. Ensure that thematerial for soil-cement base will:
 - a. Meet the requirements of Subsection 810.2.01 for Classes IA1, IA2, IA3, or IIB1 with thefollowing modifications:

Clay content	5 to 25%
Volume change	18% maximum
Liquid Limit	25% maximum
Plasticity Index	10% maximum
Maximum dry density	95 lb/ft³ (1520 kg/m³)minimum
Sulfates	4000 ppm maximum
рН	4.0 minimum

- b. Be friable and not contain large amounts of heavy or plastic clay lumps, organic material, roots, or other substances that would interfere with how the Portland cement sets, plant production, or the finished surface of the base and meet the requirements of Subsection 301.3.05.A.2, "Pulverization" or Subsection 301.3.05.B.1, "Soil".
- c. Produce a laboratory unconfined compressive strength of at least 450 psi (3.1 MPa). To make the sample, mix in a minimum of 5% to a maximum of 9 percent Type I Portland cement, moist-cure for 7 days, and test with GDT 65.
- 2. Analyze the soil-cement design and create a Job Mix Formula for each Project where soil-cement base or subbase is specified. Have the Job Mix Formula approved by the Engineer before starting base or subbaseconstruction.
- 3. You may use flyash or slag that meets therequirements of Subsection 831.2.03 as admixtures for poorly reacting soils when the blend of soil and flyash, or slag, meets the design requirements in this Subsection.
- 4. Ensure that subgrade material used underneath the soil-cement base meets the sulfate and pH requirements of this subsection (See Subsection209.3.05.A.7).

B. Fabrication

General Provisions 101 through 150.

C. Acceptance

Test as follows:

Test	Method
Soil gradation	GDT 4
Volume Change	GDT 6
Maximum density	GDT 7 or GDT 67
Soil-Cement Design	GDT 65
рН	GDT 98
Sulfates	ASTM D 516

Liquid Limit	AASHTO T 89
Plastic Limit and Plasticity Index	AASHTO T 90

D. Materials Warranty

General Provisions 101 through 150.

STUDYQUESTIONS

Georgia Department of Transportation Specifications, Section 814 – Soil Base Materials

- 1. Subgrade material used underneath soil-cement base shall be tested for sulfate and pH?
 - a) True
 - b) False
- 2. For materials used as sand-clay base, the materials passing the _______sieve shall have a ______of 9 orless?
- 3. Particles with diametersgreater than ______shall be removed before depositing topsoil or sand-clay on the road?
- 4. Laboratory specimens for a soil-cement mix design should be cured for ______ days and should produce an unconfined compressive strength of at least ______ psi (______ MPa)?
- 5. Soils meeting classes IIB2 are suitable for use assoil-cement material?
 - a) True
 - b) False
- 6. Materials passing the No. 10 sieve, used in sand-clay base, shall have a maximum dry density of ______lbs/ft³?
- 7. What test method is required to perform PH testing for materials used in soil-cement base construction?
 - a) GDT 98
 - b) GDT6
 - c) T96
 - d) None of theabove

SECTION 11

Georgia Department of Transportation Appendix

Appendix A Answers to Study Questions

Section 1

AASHTO R 58, Standard Practice for Dry Preparation of

Disturbed Soil and Soil-Aggregate Samples for Test

- 1. This method describes the dry preparation of soil and soil-aggregate samples?
- 2. A revolving drum, into which the soil sample and rubber-covered rollers are placed, is a suitable pulverizing device?
 - a) True
 - b) False
- 3. For the particle size analysis-T88, material passing a 2.00-mm (No. 10) sieve is required in amounts equal to approximately, 110 g for sandy soils and approximately 60 g for silty or clayey soils.
- 4. What is the minimum amount required, of material passing the 0.425-mm (No. 40) sieve, for performing physical testing? <u>300g</u>
- 5. Samples should be dried at a temperature not exceeding 60°C[140°F]?
- Representative test samples of the amount required to perform the desired tests shall be taken with a <u>sampler</u>, or by <u>splitting or quartering</u>.
- Samples dried in an oven or other drying apparatus at a temperature not exceeding 60°C [140°F] are considered to be air dried?
 - a) <mark>True</mark>
 - b) False
- List the two alternate methods used to separate fraction sizes of the portion of the dried sample selected for particle-sized analysis and physical tests? <u>Alternate Methods Using 2.00-mm (No. 10) Sieve, Alternate Method</u> <u>Using 4.75-mm and 2.00-mm (Nos. 4 and 10)Sieves</u>

- 9. Fractions retained on the 4.75-mm (No. 4) sieve and the 2.00-mm (No. 10) sieve are not included in the sieve analysis and should be discarded?
 - a) True
 - b) <mark>false</mark>
- 10. What is the required sample mass of material passing the 2.00-mm (No. 10) sieve, for specific gravity, when the volumetric flask is to be used?^{25g}
- 11. Physical tests are performed on materials passing the 0.425-mm (No. 40) sieve?

Section 2

AASHTO T 89

Standard Method of Test for

Determining the Liquid Limit of

Soils

- 1. The liquid limit of a soil is that water content at which the soil passes from a plastic to a liquid state.
- 2. An unglazed, porcelain dish about 115 mm in diameter is preferred for mixing the sample.
- 3. The liquid limit device shall have a base made of resilient material.
- 4. List the two types of grooving tools used in this procedure. Curved grooving tool, flat grooving tool (alternate)
- 5. The flat grooving tool should be used interchangeably with the curved grooving tool?
 - a) true
 - <mark>b) false</mark>
- 6. Obtain a sample mass of about 100 g of material passing 0.425-mm sieve for method "A".
- 7. Cup or base wear is considered excessive when the point of contact exceeds 13 mm in diameter.
- 8. The height of drop of the cup should be adjust to 10.0 +/-0.2 mm and checked each day prior to testing.
- 9. What is the initial amount of water to be added to the sample?
 - a) Method "A": <u>15 to 20 mL</u>
 - b) Method "B": <u>8 to 10mL</u>
- 10. It is ok to add dry soil material if too much moisture has been added to the sample.
 - a) True
 - b) False

- 11. A false liquid limit value may be obtained by adding water too fast.
- 12. What is the maximum thickness allowed when spreading material into the testing cup? 10mm
- 13. How many firm strokes of the grooving tool are allowed to divide the soil in the cup? Up to six from front to back or back to front counting as one stroke
- The cup containing the sample shall be <u>lifted</u> and <u>dropped</u> by turning crank F at a rate of approximately <u>two</u> revolutions per second.
- 15. What steps are taken should the sample slide on the cups surface during test? Add more water to the sample and remix, then place soil-water mixture in cup, a groove cut and test repeated
- 16. The cup and grooving tool shall be washed and dried between test trials.
- 17. When performing procedure "A", obtain the first test sample in the range of 25 to 35 shocks.

18.	Water content of the soil shall be calculated as follows:	b) False	mass of water	— <i>X</i> 100
				- $A + 100$

a) True

19. The moisture content corresponding to the intersection of the flow curve with the <mark>25</mark>-<u>sh</u>ock ordinate shall be taken as the liquid limit of the soil.

20. Sample shall be seasoned in the humidifier for 30 min when performing referee testing.

Section 3

AASHTO T 90

Standard Method of Test for

Determining the Plastic Limit and Plasticity Index of Soils

1. The plastic limit of a soil is the lowest moisture content at which the soil remains plastic.

Mass of oven drysoil

- 2. The plasticity index is the numerical difference between the liquid limit and the plastic limit of the soil.
- 3. What method shall be used as the referee method? HandRolling Method
- 4. Wax paper would be an acceptable rolling surface?
 - a) True

b) False

- 5. The container used for moisture content shall have a close-fitting lid to prevent the loss of moisture from the samples before initial mass determination.
- If only the plastic limit is determined, what is the initial sample mass, of material passing the 0.425-mm (No. 40) sieve, required for this procedure?
- 7. Tap water may be used for routine
 - testing?
 - a) <mark>True</mark>
 - b) False
- 8. The soil mass should be rolled into a <mark>3-mm thread</mark> at a rate of 80 to 90 strokes per minute.
- 9. What is the time limit for rolling the soil mass into a thread? Shouldn't take longer than 2min
- 10. When using the alternate procedure, you should not allow the soil thread to contact the side rails of the plastic limit device?
- 11. It is acceptable for crumbling to occur when the diameter is greater than 3 mm, provided the solid has been previously rolled into a thread 3 mm in diameter?
- 12. Attempts should be made to produce failure at exactly 3-mm by reducing hand pressure?
 - a) True
 - <mark>b) False</mark>
- 13. Heavy clay soils require much pressure to deform the thread as they approach the plastic limit?
- 14. What procedure should be used to determine the moisture content? <u>T265</u>
- 15. The plastic limit of the soil is the moisture content expressed as a percentage of the oven-dry mass?
- 16. Report the plastic limit to the nearest whole number?
- 17. How is the plasticity index of a soil calculated? Plasticity index = plastic limit liquid limit

Section 4 AASHTO T 265

Standard Method of Test for

Laboratory Determination of Moisture Content of Soils

- 1. Moisture or water content of a soil is the ratio, expressed as a percentage, of the mass of water in a given mass of soil to the mass of the solid particles?
- 2. Containers shall have close-fitting lids to prevent loss of moisture from samples before initial weighing and to prevent absorption of moisture from the atmosphere following drying and before final weighing.
- 3. If not indicated in the method of test, what is the minimum sample mass for a soil with a maximum particle size of 12.5-mm (1/2 in.)? <u>300g</u>
- 4. Test samples shall be dried in a drying oven maintained at a temperature of $\frac{110 \pm 5^{\circ}C}{230 \pm 9^{\circ}F}$?
- 5. Samples should be dried overnight (minimum of 15 hr.) or dry until the mass loss of the sample after 1 h of additional drying is less than 0.1 percent (constant mass)?
- 6. Dried samples should be removed before placing wet samples in the oven?

<mark>a) True</mark>

b) False

- 7. Oven-drying at 110 ± 5°C (230 ± 9°F) does not result in reliable moisture content values for soil containing gypsum or other minerals having loosely bound water from <u>hydration</u> or for soil containing significant amounts of <u>organic</u> material.
- 8. When is it acceptable to use a container without a tight-fitting lid? provided the moist sample is weighed immediately after being taken, and provided the dried sample is weighed immediately after being removed from the oven or after cooling in a desiccator
- 9. When calculating moisture content, $W_1 = \frac{1}{1000} \frac{1}{1000$
- 10. What is the single operator precision, acceptable range of two results, when testing a coarse aggregate-blend?

<u>0.1</u>

Section 5 AASHTO T180 (Method D)

Moisture- Density Relation of Soils Using 10 lb. Rammer and an 18" Drop and using Material Passing the # ¾ Sieve

- 1. The mold in this procedure will have an approximate diameter of <mark>6 inches</mark> and height of <mark>4.584inches</mark>.
- 2. The metal rammer will have a diameter of <mark>2 in and a weight of 10lbs (4.536kg)</mark>. The rammer will be dropped at a height of 18 inches from the surface the soil.
- What size sample is taken and dried in a drying apparatus at a temperature not to exceed what temperature?
 25lb, 140°F(60°C)
- 4. Any material retained on the <u>³/₄ sieve</u>shall be considered oversized.
- 5. A representative sample of approximately 25lbs(11.34kg) of -3/4 material is needed to perform the test.
- 6. What should the initial moisture content of the sample be mixed to? 4 to 8 % below optimum

- 7. Each moisture content shall be compacted with <mark>56 uniform blows</mark> in five equal layers?
- 8. After the mold has been compacted, the collar is removed, and the compacted material timed where?
 - a) at the top of the mold
 - b) bottom of the mold
 - c) Both the top and the bottom
- 9. Calculate the wet weight of the compacted soil in pounds per cubic foot?

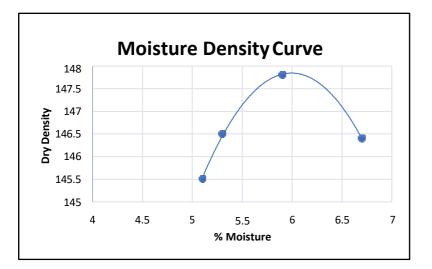

Weight of Mold	6595.3 g
Weight of Mold + Sample	11614.5 g
Mold Correction Factor	0.02942
Wet Weight, lbs./ft3	<mark>147.6</mark>
Weight of Mold	6595.3 g
Weight of Mold +Sample	11733.8 g
Mold Volume	0.07498
Wet Weight, lbs./ft3	<mark>151.1</mark>

- 10. Samples for determining moisture content ae obtained by slicing the compacted soil vertically through its center and removing the cut face or from the center of the pile if the molded material falls apart.
- 11. Calculate the percent moisture content?

Weight of Wet Soil	1098.8 g
Weight of Dry Soil	928.6 g
Moisture %	<mark>18.3</mark>

12. Moisture samples will be dried in an oven capable of maintain what temperature? 230°F(110°C)T

13. Moisture will be increased at a rate of approximately <u>1% to 2%</u>and material compacted until a <u>decreaseor no</u> change in the wet weight is reported.

Dry Density	% Moisture
145.5	5.1
146.5	5.3
147.8	5.9
146.4	6.7

14. Plot the moisture density data points, draw a smooth curve connecting the points?

- 15. The theoretical maximum dry density and optimum moisture will be measured from?
 - a) Highest plotted density
 - b) the plotted density after decline
 - c) Highest moisture content
 - d) the peak of the curve

Section 6 GDT 4

Determining Gradation of Soils

- 1. Glass bottles used for this procedure must be clear and free of chips?
- 2. A Sodium Hexametaphosphate solution mixture of <mark>5 gal (19 L)</mark> potable water, and <mark>10 oz (285 g)</mark> of Sodium

Hexametaphosphate is needed for this procedure?

- 3. A reversible siphon assembly is used for changing the water in the bottle?
- 4. Initial drying of the sample shall be performed at a temperature not exceeding 140°F(60°C)?
- 5. If coarse material is present, what test procedure is used to grade the aggregates? AASHTOT27
- Samples for density, and volume change are taken from materials that pass the No. 10 (2.00 mm)sieve?
 Procedure
- How many samples of material passing the No. 10 (2.00 mm) sieve are weighed out for grading and what are their individual masses? <u>Two samples, 50geach</u>
- The sample used for determining the original dry weight, for calculating the grading of the minus No. 10 (2.00 mm) material, should be dried overnight 20 hours ± 1/2 hour to a constant weight?
- 9. How much sodium hexametaphosphate solution should be in the test bottle when initially adding the test sample? <u>About 2in.</u>
- 10. The sample in the test bottle should be vigorously stirred with a glass rod to reduce the cohesive forces of the clay.
- 11. How long should the test sample and hexametaphosphate solution be allowed to stand before adding water?
 <u>At least 10 min</u>
- 12. After filling the test bottle with water, the test bottle should be allowed to stand undisturbed for 8 to 10 mins before the water is siphoned off?
- 13. Fluid should be siphoned off until it is about 3/4 in (18 mm) above the soil?
- 14. The refilling and siphoning process should continue until the fluid above the sample becomes clear enough to read a watch on the opposite side of the bottle.
- 15. Washed samples should be dried to a constant mass at a temperature of 230 ° ± 9 °F (110 °±5°C)?

16. When calculating the percent passing a sieve smaller than the No. 10 (2.00 mm), A = the weight of the 50.0 g sample after it was dried to a constant weight?

- <mark>a) True</mark>
- <mark>b)</mark> False

17. Calculate percent passing and adjusted for total percent passing:

Total Sample Weight = 28,000g			
Gradation of Plus No. 10 (2.00 mm)			
Sieve Accumulative Weight Retained		Percent of Total Sample	
		Retained	Passing
1-1/2 (37.5 mm)	0	0	100.0
3/4 (19.0 mm)	5,000	<mark>17.9</mark>	<mark>82.1</mark>
10 (2.0 mm)	17,000	<mark>60.7</mark>	<mark>39.3</mark>

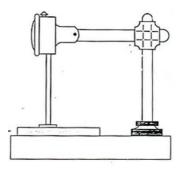

Gradation of Minus No. 10 (2.00 mm)				
Weig	Adjusted for Total Sample Percent Passing			
Sieve	Accumulative Weight Retained	Retained	Passing	
40 (425 µm)	16.3	<mark>32.9</mark>	<mark>67.1</mark>	<mark>26.4</mark>
60 (250 µm)	26.5	<mark>53.5</mark>	<mark>46.5</mark>	<mark>18.3</mark>
200 (75 µm)	39.8	<mark>80.4</mark>	<mark>19.6</mark>	<mark>7.7</mark>
Total	42.6	<mark>86.1</mark>		
Clay (effluent) =			<mark>13.9</mark>	<mark>5.5</mark>

Section 7

GDT 6

Determining the Volume Change of Soils

- 1. It is ok to use the same mold for both the shrinkage test and the swell test?
 - a) True
 - b) False
- 2. The metal rammer used for this test shall have a 2 in diameter flat circular face and weigh 5.5 lbs.
- 3. When using a mechanical rammer, check the tolerances semi-annually using the procedures in AASHTO<mark>T-99</mark>?
- 4. What is the minimum depth of the water vat required for this test? $\frac{11}{11}$ in (38 mm) deep
- 5. A flat perforated metal plate with five 3/8 in (10 mm) diameter holes located symmetrically under each specimen shall be used to dry and cool shrinkage specimens.
- 6. The three measuring devices shall be readable to and sensitive to one-thousandth 0.001 in.?
- 7. The following device is used to measure shrinkage thickness?

- 8. A sample mass of 2.2 +0.0022 lbs. (1000 + 1.0 g) should be taken from the materials passing the 2.00-mm (No. 10) sieve as obtained according to GDT4?
- 9. Optimum moisture content used for this procedure should be determined by GDT 7 or GDT 67?
- 10. The test sample should be allowed to stand, in a plastic bag, at optimum moisture content, for a minimum of 1 hour?
- 11. How many freefalls of the hammer are required to compact the swell test specimen? 25 freefalls

- Swell test base plates should be preadjusted, so the micrometer reads zero on the 0.875 in. (22.22 mm) constant of the calibration tool, with the mold removed.
- 13. Swell specimens should remain in the water vat undisturbed for 20 ½ hours before removing the paper and recording the final thickness measurement?
- 14. Calculate the percentswell?

Original Dial Reading	.143"
Final Dial Reading	.180"
Swell %	<mark>3.6 %</mark>

- 15. The original thickness measurement, when measuring shrinkage, shall be taken before the specimen is extruded from the mold?
 - a) True
 - <mark>b) False</mark>
- 16. Shrinkage specimens shall be allowed to air dry for about 1 hour after compacting and measuring all specimens to be tested?
- 17. When determining the final diameter dial reading, the circular end of the specimen should face the same direction as the dial to ensure proper centering of the specimen?
- 18. Calculate the percentshrinkage?

B =	.758
FT =	.750
FD =	.740
Shrinkage %	<mark>1.3</mark>

19. Calculate the total volume change using the results from questions No. 14 and No. 18?

Total Volume Change = <u>4.9%</u>

Section 8

GDT 7

Determining Maximum Density of Soils

- 1. The metal mold used in this procedure shall have an approximate volume of 1/30 ft³ (0.000943, ± 0.000008 m³)?_
- 2. A representative test sample, weighing about 10 lbs. (5 kg), should be obtained by using a <u>sampler</u>, or by <u>splitting</u> and <u>quartering</u>?
- 3. During sample preparation, a No. 10 (2.00 mm) sieve is used to split the sample into two portions?
- 4. What size sample is obtained from the thoroughly mixed portion of the materials passing the No. 10 (2.00 mm) sieve? <u>6.6 lb. (3000 g)sample</u>
- Each layer of soil material shall be compacted in the mold, using <u>25</u>blows from the rammer, dropped from <u>1 ft</u>
 (304.8 mm) above the soil.
- 6. How many layers of material are compacted in the mold? 3
- 7. When compacting the test sample, the mold should rest on a rigid foundation weighing at least 200 lbs. (90 kg)?
- 8. How often should the soil material be removed from the face of the rammer? after every 25th blow
- 9. A straightedge is used to level the sample to the top and bottom of the cylinder mold?
- 10. Calculate the wet weight of the compacted soil in pounds per cubic foot?

Weight of Mold	2002g
Weight of Mold +Sample	3800g
Mold CorrectionFactor	0.0665
Wet Weight, lbs./ft3	<mark>119.6</mark>

- 11. Samples for percent moisture are obtained by slicing the compacted soil through its center, and removing a <u>100</u> gram sample from the center of the compacted soil?
- 12. Calculate the percent moisture content?

Weight of Wet Soil	100g
Weight of Dry Soil	94g
Moisture %	<mark>6.4</mark>

13. What amount of water needed to increase the moisture content of a 3000g sample by 1 percent? 1 oz (30 ml)

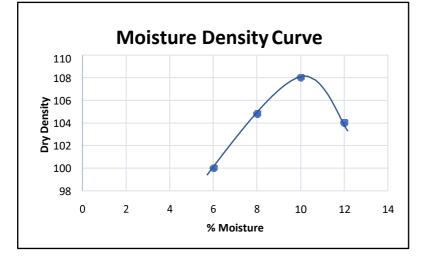

- 14. Moisture content of the soil should be increased by, (1 percent to 2 percent for sandy soils, 2 percent to 3 percent for clay soils).
- 15. Repeat procedure until the soil becomes very wet and the wet weight of the compacted soil substantially de-

<mark>creases</mark>?

16. Calculate the dry weight of the compacted soil in pounds per cubic foot?

Wet Weight, lbs./ft3	119.6
Moisture %	6.4
Dry Weight, lbs./ft3	<mark>112.4</mark>

17. Plot the moisture density data points, draw a smooth curve connecting the points?

Dry Density	% Moisture
100.0	6.0
104.8	8.0
108.0	10.0
104.0	12.0

- 18. For classification purposes, interpret the maximum dry density as the highest density obtained in the test series, and the optimum moisture as the moisture content at that respective density?
- 19. If the soil contains material retained on the No. 10 (2.00 mm) sieve and the specifications show density requirements on the total sample, you must correct the maximum dry density to reflect the percentage of Plus No. 10 (2.00 mm) material?
- 20. It is not necessary to correct the density for percentage of Plus No. 10 (2.00 mm) material when determining maximum densities for compaction control?
 - a) True
 - <mark>b) False</mark>

21. Correct the maximum dry density and optimum moisture using the conversion factors in Tables 1D - 7D for maximum dry density and Tables 1M - 10M for optimum moisture?

- No. 10 Maximum DryDensity	108.0
- No. 10 Maximum OptimumMoisture	10.0
% Plus No. 10 Material	20.0
Corrected Maximum Dry Density	<mark>113.9</mark>
Corrected OptimumMoisture	<mark>8.5</mark>

Section 9 Georgia Department of Transportation Specifications, Section 810 – Roadway Materials

- 1. Roadway materials are divided into six majorclasses?
- 2. What classes are identified by descriptive requirements? Classes IV, V, and VI
- 3. Materials containing logs, stumps, sod, weeds, or other perishable matter are acceptable?
 - a) True
 - <mark>b) False</mark>
- 4. Physical properties for class I, II, and III soils, are determined on the materials passing the No. 10(2.00 mm) sieve.

5. Materials with physical properties meeting sub-class IIB3 requirements, would serve well as subgrade material?

<mark>a) True</mark>

- b) False
- 6. Using the physical properties, determine the material sub-class?

% Passing No.40	20
% Passing No.60	32
% Passing No. 200	48
% Clay	50
% Volume Change	12
Maximum Dry Density lbs/ft3	103
Classification	<mark>IIB4</mark>

Section 10

Georgia Department of Transportation Specifications, Section 814 – Soil Base Materials

- 1. Subgrade material used underneath soil-cement base shall be tested for sulfate and pH?
 - a) <mark>True</mark>
 - b) False
- For materials used as sand-clay base, the materials passing the <u>No. 40</u> sieve shall have a <u>Plasticity</u> <u>Index (PI)</u> of 9 or less?
- 3. Particles with diameters greater than 2 in (50 mm) shall be removed before depositing topsoil or sand-clay on the road?
- 4. Laboratory specimens for a soil-cement mix design should be cured for <mark>7</mark> days and should produce an unconfined compressive strength of at least 450 psi (3.1MPa)?
- 5. Soils meeting classes IIB2 are suitable for use as soil-cement material?
 - a) True
 - b) <u>False</u>
- 6. Materials passing the No. 10 sieve, used in sand-clay base, shall have a maximum dry density of <u>110+</u>lbs/ft³?
- 7. What test method is required to perform PH testing for materials used in soil-cement base construction?
 - a) <mark>GDT98</mark>
 - b) GDT6
 - c) T96
 - d) None of the above
